Separater Anhang 4-G: Ergänzende Unterlagen

Inhaltsverzeichnis

1 Auswertungen zu Nerandomilast (als zu bewertendes Arzneimittel) 3
1.1 Auswertungen zur Studie FIBRONEER®-ILD 3
1.1.1 Database Lock 2 3
1.1.2 Database Lock 1 613
2 Auswertungen zu Nintedanib (für den indirekten Vergleich) 910
2.1 Auswertungen zur Studie INBUILD® aus dem Jahr 2026 910
2.2 Kaplan-Meier-Plots zur Studie INBUILD® aus dem Jahr 2020 915
2.3 Auswertungen zur Studie 1199.434 917
2.4 Metaanalyse der Nintedanib-Studien 1247
3 Auswertungen zum indirekten Vergleich 1702
3.1 Indirekter Vergleich von FIBRONEER®-ILD und Metaanalyse der Nintedanib-Studien 1702
3.2 Indirekter Vergleich von FIBRONEER®-ILD und INBUILD® 1938

1 Auswertungen zu Nerandomilast (als zu bewertendes Arzneimittel)

1.1 Auswertungen zur Studie FIBRONEER®-ILD

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb). The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, h:Number of hospitalizations for respiratory cause, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment,
baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline total score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline cough domain score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline fatigue domain score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline shortness of breath score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Impact total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Impact total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 100																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 26																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Cough domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 44																	
Placebo		66	31.2	3.3	66 (90.4%)	3.0	2.6	-2.2	8.1								

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Cough domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 12																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Cough domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Cough domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Dyspnea domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Unclassifiable IIP																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Dyspnea domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Baseline																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Dyspnea domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Fatigue domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Fatigue domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 52														0.8102			

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline L-PF Symptoms Fatigue domain score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline PGI-S for Cough at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline PGI-S for Cough at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline PGI-S for Cough at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline PGI-S for Shortness of Breath at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline PGI-S for Shortness of Breath at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline FVC [mL] at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline FVC [mL] at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline FVC [mL] at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline FVC [mL] at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Week 12														0.9597			

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Anxiety total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Anxiety total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Anxiety total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Anxiety total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Depression total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Depression total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline HADS for Depression total score at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Week 6														0.8739			

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Baseline																	

Study: 1305-0023. N: Number of patients in analysis set, n1: Number of patients with observed data at visit, ^: Interaction p-value.
n2: Number of patients analysed at visit, i.e. patients with measured baseline and at least one post-baseline (% based on baseline n2)
Model is based on fixed, categorical effects of treatment at each visit, baseline HRCT pattern (UIP-like/Other fibrotic patterns) at each visit, continuous baseline EQ-5D VAS at each visit as fixed effect(s) and unstructured covariance for repeated measures.
Data up until week 64 is included and analysed in the model.
Subgroup models include treatment by subgroup by visit interaction. Covariate removed from model if also used as the subgroup.
Hedges´g will be presented in case of a significant treatment comparison. NC: Not calculable

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Study: 1305-0023. MedDRA version: 27.1. Missing CTCAE grade is assigned to >= 3.
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb). The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline impact total score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb), baseline cough domain score. The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb). The subgroup model additionally includes the subgroup and treatment by subgroup interaction. Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined). N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk. NC=not calculable.

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb). The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed or suspected acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
e:Number of confirmed acute ILD exacerbations, d:Number of deaths, NC:Not calculable
If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. MedDRA version: 27.1
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).
Subgroup analyses are only performed in case of a significant p-value for the overall comparison (at 5% level).

Study: 1305-0023. MedDRA version: 27.1. Missing CTCAE grade is assigned to >= 3.
N = number of patients, n = number of patients with at least one event, NC = not calculable.
Confidence intervals (CIs): Wald asymptotic CI for risk ratios and odds ratios, Newcombe Hybrid Score CI for risk differences.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
*Pearson Chi2 test ** Cochran's Q-Test for homogeneity of risk ratios (treatment by subgroup interaction).

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb). The subgroup model additionally includes the subgroup and treatment by subgroup interaction. Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined). N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk. e:Number of confirmed acute ILD exacerbations, d:Number of deaths, NC:Not calculable If multiple components occur on the day of first event, the patient is counted only in the first component according to the order of the abbreviations.

Study: 1305-0023. Based on a Cox regression model estimated in overall with categorical treatment, baseline HRCT pattern (UIP-like/Other fibrotic patterns), continuous age, baseline FVC % predicted, baseline DLCO % predicted (corrected for Hb).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.
Subgroups are only analysed if at least 10 events occurred in at least one category (both treatments combined).
N:Number of patients analysed, n:Number of patients with event, °Incidence rate, events per 100 patient years at risk.
NC=not calculable.

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +28 days.
Subgroups with all categories are only presented, where at least one subgroup category has >= 10 events.
AEs meeting the protocol definition of an acute ILD exacerbation are excluded from the analysis.

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio is not computed because the data are too sparse.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

	N	n	%	N	n	%	p-value [1]	RR	Lower	Upper	OR	Lower	Upper	RD	Lower	Upper	p-value [3]
Overall summary																	
All patients	27	0	0.0	54	1	1.9	0.477							0.02	(-0.02 | 0.05)	
Age group																	
<65 years	9	0	0.0	25	0	0.0								0.00	(0.00 | 0.00)	
>=65 years	18	0	0.0	29	1	3.4	0.426							0.03	(-0.03 | 0.10)	
Gender																	
Male	11	0	0.0	26	0	0.0								0.00	(0.00 | 0.00)	
Female	16	0	0.0	28	1	3.6	0.444							0.04	(-0.03 | 0.10)	
HRCT pattern																	
UIP-like pattern only	23	0	0.0	45	1	2.2	0.471							0.02	(-0.02 | 0.07)	
Other fibrotic patterns	4	0	0.0	9	0	0.0								0.00	(0.00 | 0.00)	
Baseline FVC % predicted																	
<=70%	10	0	0.0	17	1	5.9	0.434							0.06	(-0.05 | 0.17)	
>70%	17	0	0.0	37	0	0.0								0.00	(0.00 | 0.00)	
Underlying ILD Diagnosis in Groups																	
Hypersensitivity pneumonitis	0	0	0.0	1	0	0.0											
Idiopathic nonspecific interstitial pneumonia	7	0	0.0	11	0	0.0								0.00	(0.00 | 0.00)	
Unclassifiable idiopathic interstitial pneumonia	3	0	0.0	2	0	0.0								0.00	(0.00 | 0.00)	
Autoimmune ILDs	12	0	0.0	34	1	2.9	0.548							0.03	(-0.03 | 0.09)	
Other ILDs	5	0	0.0	6	0	0.0								0.00	(0.00 | 0.00)	

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

gba434\tlf\prop-saf.sas 23JUN2026

Table 3.8.1 Proportion of patients with adverse events on PT level over the whole trial by treatment, primary SOC and preferred term and by subgroup - Treated Set

Body System or Organ Class: Cardiac disorders
Dictionary-Derived Term: Arteriosclerosis coronary artery
