[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

Other ILDs	5	0	0.0	6	0	0.0								0.00	(0.00	0.00)	

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

[1] p-value based on Chi-Square test.
[2] Risk ratios and odds ratios with confidence intervals (CIs) are estimated by Cochran-Mantel-Haenszel method.
Risk differences with CIs are estimated by the method described in Greenland and Robins (1985).
A ratio less than one or risk difference less than zero indicates less risk for Nint 150bid.
[3] Treatment by subgroup interaction p-value for homogeneity of the odds ratio, based on the Breslow-Day test.
Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
MedDRA version used for reporting: 27.0

1.3.10 Adverse events leading to treatment discontinuation on SOC and PT level

Table 3.10.1 Frequency of patients with adverse events leading to treatment discontinuation by treatment, primary SOC and preferred term over the whole trial - Treated Set

System organ class/ Preferred term	Placebo N	Placebo %	Nintedanib N	Nintedanib %
Number of patients	27	100.0	54	100.0
Number of patients with at least one adverse event leading to premature treatment discontinuation	1	3.7	10	18.5
Cardiac disorders	0	0.0	1	1.9
Angina unstable	0	0.0	1	1.9
Arteriosclerosis coronary artery	0	0.0	1	1.9
Gastrointestinal disorders	0	0.0	2	3.7
Abdominal pain upper	0	0.0	1	1.9
Diarrhoea	0	0.0	1	1.9
Nausea	0	0.0	1	1.9
Vomiting	0	0.0	1	1.9
Hepatobiliary disorders	0	0.0	3	5.6
Liver injury	0	0.0	3	5.6
Infections and infestations	1	3.7	2	3.7
COVID-19	0	0.0	1	1.9
Pneumonia	1	3.7	1	1.9
Investigations	0	0.0	1	1.9
Hepatic enzyme increased	0	0.0	1	1.9
Skin and subcutaneous tissue disorders	0	0.0	1	1.9
Alopecia	0	0.0	1	1.9

[1] Only treatment emergent AEs are displayed: AEs with an onset date between first trial drug intake and last drug intake +7 days.
[2] Treatment discontinuations are premature and permanent.
[3] Percentages are calculated using total number of patients per treatment as the denominator.
MedDRA version used for reporting: 27.0

Rest of the World								

The fixed-effect model was calculated using the inverse-variance method. Heterogeneity p-value was based on Cochran's Q test.
Estimates for the comparison of Nintedanib versus Placebo are only presented if estimates from both studies are available, enabling a meta-analysis to be performed. NC = not calculable, Wt = study weight in the meta-analysis.
The estimates from trial 1199-0247 and 1199-0434 are based on a Cox regression model estimated in overall with categorical treatment and stratified by baseline HRCT pattern (UIP-like/Other fibrotic patterns).
The subgroup model additionally includes the subgroup and treatment by subgroup interaction.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Disease-related events were defined as confirmed acute ILD exacerbations.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Rest of the World										

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Rest of the World										

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Rest of the World										

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Rest of the World									

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Rest of the World								

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.
Only adverse events reported in study 1199-0247 that met the minimum occurrence threshold
(incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

Rest of the World										

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

The fixed-effect model was calculated using the Mantel-Haenszel method. A treatment-arm continuity correction was applied in trials with zero events.
N = number of patients, n = number of patients with at least one event, NC = not calculable, Wt = study weight in the meta-analysis.
Heterogeneity p-value was based on Cochran's Q test. The omission of an estimate indicates that no data is available
for the corresponding treatment comparison and that a Meta-analysis could not be calculated. Only treatment-emergent adverse events
with an onset date between the first intake of the trial drug and the last intake +28 days (+7 days in 1199-0434) are displayed.

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434. An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable. Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434. An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable. Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434. An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable. Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434. An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable. Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on a meta-analysis of studies 1199-0247 and 1199-0434.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 5% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Only adverse events reported in study 1305-0023 that met the minimum occurrence threshold (incidence in either arm >= 10% or both incidence >=1% and >=10 patients affected in either arm) are presented.
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).

Estimates for the comparison of Nerandomilast versus Placebo refer to the 18 mg dosage of Nerandomilast in the non-AF background population of trial 1305-0023. Estimates for the comparison of Nintedanib versus Placebo are based on trial 1199-0247.
An indirect treatment comparison is only performed if both contributing comparisons are available. NC: Not calculable.
Estimates for the comparison of Nintedanib versus Placebo are only presented if a corresponding estimate for Nerandomilast versus Placebo is available. Interaction p-value based on the Cochran's Q-Test for homogeneity (treatment by subgroup interaction).
Subgroup analyses for the ITC are only performed in case of a significant p-value for the overall comparison (at 5% level).
