Table 2.1.1: Completion rate at instrument level-EORTC QLQ-C30
Full Analysis Set

Treatment/Timepoint	PRO assessment expected	Completion rate[a] (minimum requirements for scoring)	Unadjusted Completion rate[b] (minimum requirements for scoring)
Cemiplimab (N=209)			
Baseline	208	192 (92.3%)	192 (91.9%)
Cycle 2 - Day 1	175	156 (89.1%)	156 (74.6%)
Cycle 3 - Day 1	155	140 (90.3%)	140 (67.0%)
Cycle 4 - Day 1	138	125 (90.6%)	125 (59.8%)
Placebo (N=206)			
Baseline	203	190 (93.6%)	190 (92.2%)
Cycle 2 - Day 1	179	159 (88.8%)	159 (77.2%)
Cycle 3 - Day 1	146	132 (90.4%)	132 (64.1%)
Cycle 4 - Day 1	123	116 (94.3%)	116 (56.3%)

[a] Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients with a PRO assessments expected. Minimum requirements for scoring is defined as at least one scale with non-missing values.
[b] Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients in the FAS population.

Note(s): [a]: Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients with a PRO assessments expected. Minimum requirements for scoring is defined as at least half of the items within the scale with non-missing values.
[b] Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients in the FAS population.

	Cemiplimab (N=209)				Placebo (N=206)				Cemiplimab vs Placebo		
Timepoint	N [1]	Baseline Value: Mean (SD)	Score Value: Mean (SD)	Change from Baseline: LSMean (SE), [95% CI]	N [1]	Baseline Value: Mean (SD)	Score Value: Mean (SD)	Change from Baseline: LSMean (SE), [95% CI]	Observed diff in Mean change	Diff. in Mean Change [2] [95% CI], nominal p-value	SMD as Hedges' g [95% CI]
Overall	164	11.18 (19.28)	9.59 (16.26)	-1.56 (1.29), [-4.10, 0.98]	163	9.61 (19.85)	9.10 (15.76)	-0.58 (1.33), [-3.21, 2.05]	-1.08	-0.98 [-3.95, 1.99], 0.516	-0.07 [-0.29, 0.15]
Cycle 2 - Day 1	151	11.04 (19.14)	9.27 (19.31)	-1.50 (1.56), [-4.57, 1.57]	153	10.24 (20.33)	8.71 (17.84)	-1.85 (1.58), [-4.96, 1.26]	-0.24	0.35 [-3.44, 4.14], 0.855	0.02 [-0.20, 0.25]
Cycle 3 - Day 1	136	11.52 (19.19)	9.31 (18.00)	-0.97 (1.56), [-4.04, 2.11]	123	6.50 (15.77)	9.49 (17.35)	-0.34 (1.64), [-3.57, 2.88]	-5.19	-0.62 [-4.56, 3.31], 0.755	-0.04 [-0.28, 0.21]
Cycle 4 - Day 1	127	12.07 (20.00)	9.45 (18.26)	-2.21 (1.53), [-5.22, 0.80]	110	7.88 (18.02)	9.39 (19.23)	0.46 (1.62), [-2.72, 3.64]	-4.14	-2.67 [-6.52, 1.18], 0.173	-0.18 [-0.43, 0.08]

Note(s): A negative change from baseline value indicates improvement of symptoms. A negative difference in mean change from baseline favors Cemiplimab over Placebo.

[1] N is the number of subjects with a baseline and a post-baseline score at corresponding timepoint. For Overall, N is the number of subjects with a baseline and at least one post-baseline score.

[2] Estimates are based on a mixed model repeated measures treating time categorical: Change=Treatment arm + Time + Baseline PRO Value + Anatomic region of resected high-risk tumor + Geographic Region Geographical region+ Time*Baseline PRO Value +Timepoint*Treatment arm.

The model assumed an unstructured covariance among the within subject repeated measurement.

CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SD: Standard deviation; SE: Standard error; SMD: Standardized mean difference.

This analysis will include only regular cycle visits.

Baseline value for the first row is based on subjects who had an assessment at Baseline and at least one post-baseline assessment; Baseline value for the second-fourth row is based on those subjects who had an assessment at Baseline and Cycle X - Day 1.

Note(s): A positive change from baseline value indicates improvement in functioning and Global health status/QoL. A positive difference in mean change from baseline favors Cemiplimab over Placebo.

Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.

[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.

CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error.

The model assumed an unstructured covariance among the random intercept and random coefficient.

Month 39	-3.94 (1.90), [-7.68, -0.20]	-0.22 (2.23), [-4.62, 4.18]	-3.72 [-9.20, 1.76], 0.182

Note(s): A positive change from baseline value indicates improvement in functioning and Global health status/QoL. A positive difference in mean change from baseline favors Cemiplimab over Placebo.

Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.

[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.

CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error.

The model assumed an unstructured covariance among the random intercept and random coefficient.

Note(s): A negative change from baseline value indicates improvement of symptoms. A negative difference in mean change from baseline favors Cemiplimab over Placebo.

Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.

[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.

CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error.

The model assumed an unstructured covariance among the random intercept and random coefficient.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	5.82 (-1.85, 13.49)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	7.86 (-2.10, 17.81)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	3.24 (-4.89, 11.37)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Risk Difference	0.1492	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio (95% CI)	1.127 (0.635, 1.998)	
P-value for Odds Ratio	0.6830	
Relative Risk (95% CI)	1.13 (0.74, 1.73)	
P-value for Relative Risk	0.5718	
Risk difference (95% CI)	0.81 (-9.41, 11.04)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Relative Risk	0.4030	
Risk difference (95% CI)	-2.78 (-8.70, 3.14)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Risk Difference	0.4895	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	-1.47 (-10.46, 7.53)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Improvement		
P-value for Risk Difference	0.1372	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	4.32 (-7.10, 15.74)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	-1.48 (-34.35, 31.39)	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Table 2.1.1: Completion rate at instrument level-EORTC QLQ-C30
Full Analysis Set

Treatment/Timepoint	PRO assessment expected	Completion rate[a] (minimum requirements for scoring)	Unadjusted Completion rate[b] (minimum requirements for scoring)
Cemiplimab (N=209)			
Baseline	208	192 (92.3%)	192 (91.9%)
Cycle 2 - Day 1	182	163 (89.6%)	163 (78.0%)
Cycle 3 - Day 1	173	159 (91.9%)	159 (76.1%)
Cycle 4 - Day 1	158	145 (91.8%)	145 (69.4%)
Placebo (N=206)			
Baseline	203	191 (94.1%)	191 (92.7%)
Cycle 2 - Day 1	185	165 (89.2%)	165 (80.1%)
Cycle 3 - Day 1	162	147 (90.7%)	147 (71.4%)
Cycle 4 - Day 1	142	133 (93.7%)	133 (64.6%)

[a] Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients with a PRO assessments expected. Minimum requirements for scoring is defined as at least one scale with non-missing values.
[b] Completion rate is calculated as the number of patients with minimum requirements for scoring divided by the number of patients in the FAS population.

Month 30	-4.56 (1.34), [-7.19, -1.93]	-2.02 (1.55), [-5.08, 1.03]	-2.53 [-6.20, 1.13], 0.175	-0.15 [-0.35, 0.06]
Month 33	-4.66 (1.43), [-7.47, -1.86]	-1.95 (1.67), [-5.24, 1.34]	-2.72 [-6.70, 1.27], 0.181	-0.16 [-0.36, 0.05]
Month 36	-4.77 (1.52), [-7.77, -1.77]	-1.87 (1.80), [-5.41, 1.67]	-2.90 [-7.23, 1.43], 0.188	-0.17 [-0.37, 0.03]
Month 39	-4.87 (1.63), [-8.07, -1.67]	-1.79 (1.93), [-5.59, 2.01]	-3.08 [-7.76, 1.60], 0.195	-0.18 [-0.38, 0.02]

Note(s): A positive change from baseline value indicates improvement in functioning and Global health status/QoL. A positive difference in mean change from baseline favors Cemiplimab over Placebo.
Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.
[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.
CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; SMD: Standardized mean difference.
The model assumed an unstructured covariance among the random intercept and random coefficient.
The Hedges' g is based on the pooled standard deviation at Baseline.

Note(s): A positive change from baseline value indicates improvement in functioning and Global health status/QoL. A positive difference in mean change from baseline favors Cemiplimab over Placebo.
Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.
[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.
CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; SMD: Standardized mean difference.
The model assumed an unstructured covariance among the random intercept and random coefficient.
The Hedges' g is based on the pooled standard deviation at Baseline.

Note(s): A negative change from baseline value indicates improvement of symptoms. A negative difference in mean change from baseline favors Cemiplimab over Placebo.
Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.
[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.
CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; SMD: Standardized mean difference.
The model assumed an unstructured covariance among the random intercept and random coefficient.
The Hedges' g is based on the pooled standard deviation at Baseline.

Month 36	1.44 (1.71), [-1.94, 4.82]	0.07 (2.04), [-3.95, 4.09]	1.37 [-3.59, 6.33], 0.587	0.07 [-0.13, 0.27]
Month 39	1.63 (1.85), [-2.01, 5.27]	0.13 (2.20), [-4.22, 4.47]	1.50 [-3.91, 6.90], 0.585	0.07 [-0.13, 0.27]

Note(s): A negative change from baseline value indicates improvement of symptoms. A negative difference in mean change from baseline favors Cemiplimab over Placebo.
Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.
[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.
CI: Confidence interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; SMD: Standardized mean difference.
The model assumed an unstructured covariance among the random intercept and random coefficient.
The Hedges' g is based on the pooled standard deviation at Baseline.

Improvement		
P-value for Risk Difference	0.0567	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Relative Risk	0.6171	
Risk difference (95% CI)	NE (NE, NE)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	5.75 (-10.13, 21.64)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Risk Difference	0.5758	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Relative Risk (95% CI)	1.34 (0.77, 2.32)	
P-value for Relative Risk	0.3007	
Risk difference (95% CI)	5.99 (-4.51, 16.49)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio (95% CI)	NE (NE, NE)	
P-value for Odds Ratio	NE	
Relative Risk (95% CI)	0.50 (0.04, 7.10)	
P-value for Relative Risk	0.6171	
Risk difference (95% CI)	NE (NE, NE)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Relative Risk (95% CI)	1.11 (0.52, 2.40)	
P-value for Relative Risk	0.7843	
Risk difference (95% CI)	-0.34 (-6.79, 6.10)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Relative Risk	0.9320	
Risk difference (95% CI)	-3.13 (-18.76, 12.50)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Relative Risk	0.4769	
Risk difference (95% CI)	3.91 (-22.70, 30.52)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio (95% CI)	0.735 (0.408, 1.324)	
P-value for Odds Ratio	0.3052	
Relative Risk (95% CI)	0.78 (0.48, 1.26)	
P-value for Relative Risk	0.3082	
Risk difference (95% CI)	-4.57 (-13.10, 3.96)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Relative Risk	0.4880	
Risk difference (95% CI)	7.94 (-9.57, 25.46)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Risk difference (95% CI)	12.29 (12.29, 12.29)*	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

P-value for Risk Difference	0.9931	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For functional scales the following was used: deterioration is defined as a decrease of 10 or more points with respect to Baseline; improvement is defined as an increase of 10 or more points with respect to Baseline.
For symptom scales the following was used: deterioration is defined as an increase of 10 or more points with respect to Baseline; improvement is defined as a decrease of 10 or more points with respect to Baseline; any change from Baseline between (-10, 10) points is considered as Stable.

Month 21	-1.88 (1.06), [-3.97, 0.21]	-0.51 (1.19), [-2.86, 1.84]	-1.37 [-4.15, 1.41], 0.333
Month 24	-1.96 (1.14), [-4.20, 0.28]	-0.48 (1.29), [-3.02, 2.07]	-1.48 [-4.54, 1.57], 0.339
Month 27	-2.04 (1.22), [-4.44, 0.37]	-0.44 (1.41), [-3.21, 2.33]	-1.60 [-4.96, 1.76], 0.350
Month 30	-2.11 (1.32), [-4.71, 0.48]	-0.40 (1.53), [-3.42, 2.61]	-1.71 [-5.41, 1.99], 0.362
Month 33	-2.19 (1.42), [-5.00, 0.61]	-0.37 (1.66), [-3.64, 2.91]	-1.83 [-5.88, 2.23], 0.375
Month 36	-2.27 (1.53), [-5.29, 0.75]	-0.33 (1.80), [-3.88, 3.22]	-1.94 [-6.37, 2.48], 0.387
Month 39	-2.35 (1.65), [-5.60, 0.90]	-0.29 (1.94), [-4.12, 3.54]	-2.06 [-6.87, 2.75], 0.399

Note(s): A positive change from baseline value indicates improvement of symptoms. A positive difference in mean change from baseline favors Cemiplimab over Placebo.

Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.

[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.

CI: Confidence interval; EQ-5D-3L: EuroQoL 5 Dimensions 3; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; VAS: Visual Analogue Scale.

The model assumed an unstructured covariance among the random intercept and random coefficient.

Timepoint/Category	Cemiplimab (N=209)	Placebo (N=206)
Improvement		
P-value for Risk Difference	0.4818	

Data cut-off as of October 4, 2024. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For VAS the following was used: deterioration is defined as a decrease of 7 or more points with respect to Baseline; improvement is defined as an increase of 7 or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Data cut-off as of October 4, 2024.CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; NE: Not Estimable; VAS: Visual Analogue Scale.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW); *The estimate is either invalid or at a limit of its range for some observations.
Note(s): For VAS the following was used: deterioration is defined as a decrease of 15% or more points with respect to Baseline; improvement is defined as an increase of 15% or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW); *The estimate is either invalid or at a limit of its range for some observations.
Note(s): For VAS the following was used: deterioration is defined as a decrease of 15% or more points with respect to Baseline; improvement is defined as an increase of 15% or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Month 36	-2.71 (1.41), [-5.48, 0.06]	-1.26 (1.64), [-4.49, 1.98]	-1.45 [-5.46, 2.56], 0.476	-0.10 [-0.30, 0.11]
Month 39	-2.82 (1.50), [-5.79, 0.15]	-1.36 (1.76), [-4.84, 2.12]	-1.46 [-5.80, 2.88], 0.508	-0.10 [-0.30, 0.11]

Note(s): A positive change from baseline value indicates improvement of symptoms. A positive difference in mean change from baseline favors Cemiplimab over Placebo.
Only patients with a baseline and at least one post-baseline score are included in the analysis. All assessments are included in this linear mixed model, up to the earliest timepoint where at least 10 patients per treatment arm had available data within the corresponding 3-month interval. All the subsequent assessments after the earliest timepoint where less than 10 patients per treatment arm had available data were excluded from the model.

[a] The overall treatment effect is presented, rather than at specific timepoints.
[b] Estimates are based on a mixed model repeated measures treating time as continuous: Change=random intercept + random coefficient *Time (in months) +Baseline PRO score + Time*Baseline PRO score + treatment arm +treatment*time+ Anatomic region of resected high-risk tumor + Geographic Region.
CI: Confidence interval; EQ-5D-3L: EuroQoL 5 Dimensions 3; FAS: Full analysis set; LS: Least-squares; QoL: Quality of Life; SE: Standard error; SMD: Standardized mean difference; VAS: Visual Analogue Scale.
The model assumed an unstructured covariance among the random intercept and random coefficient.
The Hedges' g is based on the pooled standard deviation at Baseline.

P-value for Relative Risk	0.4788	
Risk difference (95% CI)	-1.34 (-15.17, 12.49)	

Data cut-off as of April 07, 2025. EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; GHS: Global Health Status; FAS: Full analysis set; NE: Not Estimable; QoL: Quality of Life.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For VAS the following was used: deterioration is defined as a decrease of 7 or more points with respect to Baseline; improvement is defined as an increase of 7 or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Note(s): For VAS the following was used: deterioration is defined as a decrease of 7 or more points with respect to Baseline; improvement is defined as an increase of 7 or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Data cut-off as of April 07, 2025. CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; NE: Not Estimable; VAS: Visual Analogue Scale.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and (geographical region North America vs Australia/New Zealand vs ROW);*The estimate is either invalid or at a limit of its range for some observations.
Note(s): For VAS the following was used: deterioration is defined as a decrease of 15% or more points with respect to Baseline; improvement is defined as an increase of 15% or more points with respect to Baseline.
Analysis includes only patients with a baseline and at least one post-baseline assessment. Percentages are calculated using the number of patients in FAS expected to complete the patient-reported outcome assessment at the specific visit.

Risk difference (95% CI)	5.84 (-2.49, 14.16)	
P-value for Risk Difference	0.1687	
Actinic keratosis	20 (9.8%)	16 (7.8%)
Odds ratio (95% CI)	1.299 (0.650, 2.598)	
P-value for Odds Ratio	0.4581	
Relative Risk (95% CI)	1.27 (0.68, 2.39)	
P-value for Relative Risk	0.4570	
Risk difference (95% CI)	1.95 (-3.56, 7.45)	
P-value for Risk Difference	0.4875	
Dry skin	9 (4.4%)	5 (2.5%)
Odds ratio (95% CI)	1.880 (0.607, 5.827)	
P-value for Odds Ratio	0.2731	
Relative Risk (95% CI)	1.83 (0.63, 5.31)	

Data cut-off as of October 4, 2024.
TEAE: Treatment-emergent adverse event. All adverse events were coded using MedDRA Version 27.0.
A patient is counted only once for multiple occurrences within a system organ class/preferred term. For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW)
