SOCs, and PTs with >=10% in any arm OR number of patients with AE by SOC and PT (any severity) with at least 10 patients with the respective AE and >1% in any arm will be presented.

Table 14.3.1.2 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1)
(Safety Analysis Set)

Primary System Organ Class Preferred Term	Cemiplimab (N=205)	Placebo (N=204)
Dry skin		
P-value for Relative Risk	0.2683	
Risk difference (95% CI)	1.61 (-5.30, 8.52)	
P-value for Risk Difference	0.6470	
Infections and infestations	87 (42.4%)	78 (38.2%)
Odds ratio (95% CI)	1.167 (0.780, 1.746)	
P-value for Odds Ratio	0.4511	
Relative Risk (95% CI)	1.11 (0.88, 1.39)	
P-value for Relative Risk	0.3964	
Risk difference (95% CI)	3.24 (-6.23, 12.71)	
P-value for Risk Difference	0.5013	
COVID-19	15 (7.3%)	18 (8.8%)
Odds ratio (95% CI)	0.773 (0.374, 1.598)	
P-value for Odds Ratio	0.4864	
Relative Risk (95% CI)	0.79 (0.41, 1.53)	
P-value for Relative Risk	0.4876	

Data cut-off as of October 4, 2024.
TEAE: Treatment-emergent adverse event. All adverse events were coded using MedDRA Version 27.0.
A patient is counted only once for multiple occurrences within a system organ class/preferred term. For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW)
SOCs, and PTs with >=10% in any arm OR number of patients with AE by SOC and PT (any severity) with at least 10 patients with the respective AE and >1% in any arm will be presented.

Data cut-off as of October 4, 2024.
TEAE: Treatment-emergent adverse event. All adverse events were coded using MedDRA Version 27.0.
A patient is counted only once for multiple occurrences within a system organ class/preferred term. For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW)
SOCs, and PTs with >=10% in any arm OR number of patients with AE by SOC and PT (any severity) with at least 10 patients with the respective AE and >1% in any arm will be presented.

Table 14.3.1.2 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1)
(Safety Analysis Set)

Primary System Organ Class Preferred Term	Cemiplimab (N=205)	Placebo (N=204)
Bowen's disease		
P-value for Risk Difference	0.7374	
Squamous cell carcinoma of skin	16 (7.8%)	20 (9.8%)
Odds ratio (95% CI)	0.793 (0.394, 1.597)	
P-value for Odds Ratio	0.5157	
Relative Risk (95% CI)	0.81 (0.44, 1.52)	
P-value for Relative Risk	0.5132	
Risk difference (95% CI)	-1.66 (-7.36, 4.04)	
P-value for Risk Difference	0.5669	
Basal cell carcinoma	14 (6.8%)	16 (7.8%)
Odds ratio (95% CI)	0.903 (0.418, 1.952)	
P-value for Odds Ratio	0.7948	
Relative Risk (95% CI)	0.89 (0.46, 1.75)	
P-value for Relative Risk	0.7408	
Risk difference (95% CI)	1.77 (-4.05, 7.59)	

Data cut-off as of October 4, 2024.

Data cut-off as of October 4, 2024.
TEAE: Treatment-emergent adverse event. All adverse events were coded using MedDRA Version 27.0.
A patient is counted only once for multiple occurrences within a system organ class/preferred term. For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW)
SOCs, and PTs with >=10% in any arm OR number of patients with AE by SOC and PT (any severity) with at least 10 patients with the respective AE and >1% in any arm will be presented.

Table 14.3.5.2 Treatment-Emergent Adverse Events with Grade >=3 by System Organ Class, Preferred Term (Part 1)
(Safety Analysis Set)

Primary System Organ Class Preferred Term	Cemiplimab (N=205)	Placebo (N=204)
Number of participants with at least one such TEAE	49 (23.9%)	29 (14.2%)
Odds ratio (95% CI)	1.864 (1.116, 3.115)	
P-value for Odds Ratio	0.0175	
Relative Risk (95% CI)	1.62 (1.07, 2.46)	
P-value for Relative Risk	0.0236	
Risk difference (95% CI)	9.93 (2.48, 17.37)	
P-value for Risk Difference	0.0091	
Infections and infestations	10 (4.9%)	11 (5.4%)
Odds ratio (95% CI)	0.771 (0.310, 1.918)	
P-value for Odds Ratio	0.5758	
Relative Risk (95% CI)	0.79 (0.35, 1.79)	
P-value for Relative Risk	0.5715	
Risk difference (95% CI)	-0.25 (-4.19, 3.70)	
P-value for Risk Difference	0.9017	
Vascular disorders	6 (2.9%)	4 (2.0%)
Odds ratio (95% CI)	1.263 (0.340, 4.685)	
P-value for Odds Ratio	0.7265	
Relative Risk (95% CI)	1.27 (0.37, 4.42)	

Data cut-off as of October 4, 2024.
TEAE: Treatment-emergent adverse event. All adverse events were coded using MedDRA Version 27.0. NCI grades were coded using CTCAE Version 5.
A patient is counted only once for multiple occurrences within a system organ class/preferred term. For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN) and geographical region North America vs Australia/New Zealand vs ROW)

Heterogeneity p-value [c][e]	0.7108	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value from stratified log-rank test
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors. Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Median (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	0.6909	
HR (95% CI) [c][d]	1.230 (0.443, 3.414)	
Heterogeneity p-value [c][e]	0.2629	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value from stratified log-rank test
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors. Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

HR (95% CI) [c][d]	0.395 (0.169, 0.921)	
Heterogeneity p-value [c][e]	0.6537	

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Median (95% CI), (months)[a]	NR (NE, NE)	49.4 (5.5, NE)

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

54 months	83.6 (72.0, 90.7)	45.7 (20.5, 68.0)
60 months	NE (NE, NE)	NE (NE, NE)

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Table 14.2.2.2.1 Test of Proportional Hazards Assumption for Disease Free Survival by Subgroup
(Full Analysis Set)

PD-L1 Protein Expression: TPS<1%

	Cemiplimab (N=42)	Placebo (N=43)
Number of events, n (%)	8 (19.0%)	16 (37.2%)
Disease recurrences, n (%)	7 (16.7%)	15 (34.9%)
Deaths, n (%)	1 (2.4%)	1 (2.3%)
Number of censored participants, n (%)	34 (81.0%)	27 (62.8%)
Proportionality Test p-value[a][b]	0.8401	
Hazard ratio(interaction)	0.912 (0.373, 2.232)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.2.2.1 Test of Proportional Hazards Assumption for Disease Free Survival by Subgroup
(Full Analysis Set)

Dosing Regimen: 350 mg Q3W only

	Cemiplimab (N=38)	Placebo (N=43)
Number of events, n (%)	7 (18.4%)	16 (37.2%)
Disease recurrences, n (%)	6 (15.8%)	15 (34.9%)
Deaths, n (%)	1 (2.6%)	1 (2.3%)
Number of censored participants, n (%)	31 (81.6%)	27 (62.8%)
Proportionality Test p-value[a][b]	0.7775	
Hazard ratio(interaction)	1.095 (0.582, 2.062)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.2.2.1 Test of Proportional Hazards Assumption for Disease Free Survival by Subgroup
(Full Analysis Set)

Dosing Regimen: 350 mg Q3W + 700 mg Q6W

	Cemiplimab (N=171)	Placebo (N=163)
Number of events, n (%)	17 (9.9%)	49 (30.1%)
Disease recurrences, n (%)	12 (7.0%)	46 (28.2%)
Deaths, n (%)	5 (2.9%)	3 (1.8%)
Number of censored participants, n (%)	154 (90.1%)	114 (69.9%)
Proportionality Test p-value[a][b]	0.9394	
Hazard ratio(interaction)	1.025 (0.537, 1.956)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Deaths, n (%)	2 (2.7%)	2 (2.8%)
Number of censored participants, n (%)	65 (89.0%)	47 (65.3%)
Q1 (95% CI), (months)[a]	NR (30.3, NE)	6.2 (3.8, 17.1)
Median (95% CI), (months)[a]	NR (51.5, NE)	NR (29.2, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	0.0002	
HR (95% CI) [c][d]	0.207 (0.084, 0.510)	
Heterogeneity p-value [c][e]	0.4059	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

60 months	77.2 (64.3, 85.9)	55.4 (43.2, 66.0)

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Stratified log-rank test p-value [b][c]	0.0132	
HR (95% CI) [c][d]	0.108 (0.013, 0.905)	
Heterogeneity p-value [c][e]	0.8397	

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Table 14.2.2.9.1 Freedom from Distant Recurrence by Subgroup
(Full Analysis Set)

Age group 2: >=65 and <75

	Cemiplimab (N=80)	Placebo (N=69)
Number of events, n (%)	3 (3.8%)	9 (13.0%)
Distant recurrence, n (%)	3 (3.8%)	9 (13.0%)
Number of censored participants, n (%)	77 (96.3%)	60 (87.0%)
Q1 (95% CI), (months)[a]	NR (37.6, NE)	48.5 (21.7, NE)
Median (95% CI), (months)[a]	NR (NE, NE)	NR (48.5, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	0.0493	
HR (95% CI) [c][d]	0.278 (0.072, 1.078)	
Heterogeneity p-value [c][e]	0.9271	

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

54 months	89.4 (77.0, 95.3)	NE (NE, NE)
60 months	NE (NE, NE)	NE (NE, NE)

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Number of events, n (%)	2 (2.4%)	8 (9.0%)
Odds ratio (95% CI)	0.257 (0.053, 1.256)	
P-value for Odds Ratio	0.0933	
Relative Risk (95% CI)	0.28 (0.06, 1.28)	
P-value for Relative Risk	0.0997	
Heterogeneity p-value of RR	0.4771	
Risk difference (95% CI)	-5.79 (-20.06, 8.47)	
P-value for Risk Difference	0.4261	

Data cut-off as of April 07, 2025.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

54 months	NE (NE, NE)	77.8 (44.4, 92.5)
60 months	NE (NE, NE)	NE (NE, NE)

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events. Non-white includes not reported and unknown values.

HR (95% CI) [c][d]	1.155 (0.192, 6.930)	
Heterogeneity p-value [c][e]	0.2351	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided nominal p-value, no multiplicity adjustment.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events. Non-white includes not reported and unknown values.

HR (95% CI) [c][d]	0.266 (0.096, 0.735)	
Heterogeneity p-value [c][e]	0.6480	

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

48 months	92.6 (80.1, 97.4)	54.1 (38.2, 67.5)
54 months	92.6 (80.1, 97.4)	36.0 (9.6, 64.1)
60 months	NE (NE, NE)	36.0 (9.6, 64.1)

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Proportionality Test p-value[a][b]	0.6844	
Hazard ratio(interaction)	0.576 (0.040, 8.256)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

54 months	86.0 (70.0, 93.8)	66.2 (51.8, 77.2)
60 months	86.0 (70.0, 93.8)	66.2 (51.8, 77.2)

Data cut-off as of October 4, 2024.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Number of events, n (%)	7 (8.3%)	25 (28.1%)
Received Cemiplimab in Part 2, n (%)	0	20 (22.5%)
Post Radiotherapy, n (%)	1 (1.2%)	1 (1.1%)
Post Other Systemic Therapy, n (%)	0	1 (1.1%)
Death, n (%)	6 (7.1%)	3 (3.4%)
Number of censored participants, n (%)	77 (91.7%)	64 (71.9%)
Proportionality Test p-value[a][b]	0.5909	
Hazard ratio(interaction)	0.758 (0.276, 2.080)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.3.4.1 Time to First Subsequent Therapy by Subgroup
(Full Analysis Set)

Age group 1: <65

	Cemiplimab (N=56)	Placebo (N=65)
Number of events, n (%)	4 (7.1%)	22 (33.8%)
Received Cemiplimab in Part 2, n (%)	0	19 (29.2%)
Post Radiotherapy, n (%)	1 (1.8%)	2 (3.1%)
Post Other Systemic Therapy, n (%)	3 (5.4%)	1 (1.5%)
Number of censored participants, n (%)	52 (92.9%)	43 (66.2%)
Q1 (95% CI), (months)[a]	NR (25.8, NE)	10.0 (6.1, 28.2)
Median (95% CI), (months)[a]	NR (NE, NE)	NR (28.2, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	0.0004	
HR (95% CI) [c][d]	0.177 (0.060, 0.521)	
Heterogeneity p-value [c][e]	0.6809	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Median (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	<0.0001	
HR (95% CI) [c][d]	0.171 (0.087, 0.338)	
Heterogeneity p-value [c][e]	0.2862	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.3.6.1 Time to First Subsequent Therapy or Death by Subgroup
(Full Analysis Set)

Age group 1: <65

	Cemiplimab (N=56)	Placebo (N=65)
Number of events, n (%)	6 (10.7%)	22 (33.8%)
Received Cemiplimab in Part 2, n (%)	0	19 (29.2%)
Post Radiotherapy, n (%)	1 (1.8%)	2 (3.1%)
Post Other Systemic Therapy, n (%)	3 (5.4%)	1 (1.5%)
Death, n (%)	2 (3.6%)	0
Number of censored participants, n (%)	50 (89.3%)	43 (66.2%)
Q1 (95% CI), (months)[a]	NR (25.8, NE)	10.0 (6.1, 28.2)
Median (95% CI), (months)[a]	NR (NE, NE)	NR (28.2, NE)
Q3 (95% CI), (months)[a]	NR (NE, NE)	NR (NE, NE)
Stratified log-rank test p-value [b][c]	0.0028	
HR (95% CI) [c][d]	0.268 (0.107, 0.672)	

Data cut-off as of April 07, 2025.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value. Significance threshold is set to 0.00455 using the OBrien Fleming alpha spending function.
[c] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[d] Based on stratified proportional hazards model (cemiplimab vs placebo).
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Non-white includes not reported and unknown values. Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of October 4, 2024.CI= Confidence Interval.
[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of October 4, 2024.CI= Confidence Interval.
[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of April 07, 2025. CI= Confidence Interval.
[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Non Head and Neck	12 (13.3%)	10 (11.1%)
Total number of SPTs	58	103
Total patient-years followed	225.3	178.8
Unadjusted SPT rate [1]	0.3	0.6
Adjusted annualized SPT rate [2] (95% CI)	0.734 (0.389,1.385)	1.703 (0.770,3.766)

Data cut-off as of April 07, 2025. CI= Confidence Interval.
[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of April 07, 2025. CI= Confidence Interval.
[1] The total number of SPT that occurred during study period divided by the total number of patient-years followed.
[2] Derived using negative binomial model with the total number of SPTs during study period as the response variable, with the treatment group, anatomical region of resected high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor), and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) as covariate, and log-transformed standardized observation duration as an offset variable.
Odds ratio, relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and (geographical regionNorth America vs Australia/New Zealand vs ROW; except when subgroup was geographical region.
*The estimate is either invalid or at a limit of its range for some observations.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

	Heterogeneity p-value[e][d]		0.6376

Data cut-off as of October 4, 2024.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

	Q3 [95% CI]	NYR [13.80, NC]	27.47 [8.41, NC]
	p-value[b][d]		0.209
	HR [95 % CI][c][d]		1.71 [0.74, 3.98]
	Heterogeneity p-value[e][d]		0.6865

Data cut-off as of October 4, 2024.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

	HR [95 % CI][c][d]		1.02 [0.74, 1.40]
	Heterogeneity p-value[e][d]		0.8807

Data cut-off as of October 4, 2024.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Data cut-off as of October 4, 2024.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Data cut-off as of October 4, 2024.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Hazard ratio(interaction)	0.954 (0.469, 1.939)	

Data cut-off as of October 4, 2024.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
