Table 14.2.10.1.1 Time to first deterioration in EORTC QLQ-C30 scales (excluding death) by Subgroup
(Full Analysis Set)

Age group 1: <65
Global health status/QoL (Deterioration threshold = 10)

	Statistic	Cemiplimab (N=56)	Placebo (N=65)
Total number of patients[a]	n	56	65
Number of patients with events	n (%)	29 (51.8%)	32 (49.2%)
Number of censored cases	n (%)	27 (48.2%)	33 (50.8%)
No baseline score	n (%)	4 (7.1%)	1 (1.5%)
No post-baseline score	n (%)	0	1 (1.5%)
No deterioration possible	n (%)	0	0
No first deterioration	n (%)	23 (41.1%)	31 (47.7%)
Time to first deterioration (months)	Q1 [95% CI]	5.55 [2.83, 5.65]	5.55 [2.86, 7.06]
	Median [95% CI]	11.30 [5.65, NC]	9.33 [7.06, NC]
	Q3 [95% CI]	NYR [29.31, NC]	49.05 [38.90, NC]
	p-value[b][d]		0.558
	HR [95 % CI][c][d]		1.17 [0.69, 1.98]
	Heterogeneity p-value[e][d]		0.5843

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

	Heterogeneity p-value[e][d]		0.7523

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EORTC QLQ-C30: European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire; FAS: Full analysis set; GHS: Global Health Status; HR: Hazard Ration; QoL: Quality of Life; NYR: Not Yet Reached; NC: Non Countable; QoL: Quality of Life.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Table 14.2.11.1.1 Time to first deterioration in EQ-5D-3L VAS scale (excluding death) (7 points) by Subgroup
(Full Analysis Set)

Age group 1: <65
EQ-5D-3L VAS Score (Deterioration threshold = 7)

	Statistic	Cemiplimab (N=56)	Placebo (N=65)
Total number of patients[a]	n	56	65
Number of patients with events	n (%)	29 (51.8%)	31 (47.7%)
Number of censored cases	n (%)	27 (48.2%)	34 (52.3%)
No baseline score	n (%)	9 (16.1%)	4 (6.2%)
No post-baseline score	n (%)	1 (1.8%)	1 (1.5%)
No deterioration possible	n (%)	0	0
No first deterioration	n (%)	17 (30.4%)	29 (44.6%)
Time to first deterioration (months)	Q1 [95% CI]	2.89 [2.79, 5.62]	5.55 [2.79, 5.82]
	Median [95% CI]	10.64 [5.59, 25.59]	9.95 [5.82, NC]
	Q3 [95% CI]	NYR [21.68, NC]	NYR [38.90, NC]
	p-value[b][d]		0.301
	HR [95 % CI][c][d]		1.31 [0.78, 2.23]
	Heterogeneity p-value[e][d]		0.7235

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; FAS: Full analysis set; HR: Hazard Ration; VAS: Visual Analogue Scale.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Total number of patients[a]	n	80	69
Number of patients with events	n (%)	42 (52.5%)	31 (44.9%)
Number of censored cases	n (%)	38 (47.5%)	38 (55.1%)
No baseline score	n (%)	8 (10.0%)	9 (13.0%)
No post-baseline score	n (%)	1 (1.3%)	0
No deterioration possible	n (%)	0	0
No first deterioration	n (%)	29 (36.3%)	29 (42.0%)
Time to first deterioration (months)	Q1 [95% CI]	5.55 [2.89, 8.28]	3.84 [2.86, 8.44]
	Median [95% CI]	13.90 [8.34, 30.62]	14.36 [8.44, 23.95]
	Q3 [95% CI]	34.96 [30.16, NC]	NYR [18.20, NC]
	p-value[b][d]		0.982
	HR [95 % CI][c][d]		0.99 [0.61, 1.63]
	Heterogeneity p-value[e][d]		0.6034

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; FAS: Full analysis set; HR: Hazard Ration; VAS: Visual Analogue Scale.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.9.1.1 Test of Proportional Hazards Assumption for Time to first deterioration in EQ-5D-3L VAS scale (excluding death) (7 points) by Subgroup
(Full Analysis Set)

ECOG status: 1
EQ5D01-EQ VAS Score (Deterioration threshold = 7)

	Cemiplimab (N=76)	Placebo (N=75)
Number of events, n (%)	44 (57.9%)	33 (44.0%)
Number of censored participants, n (%)	32 (42.1%)	42 (56.0%)
Proportionality Test p-value[a][b]	0.2403	
Hazard ratio(interaction)	0.654 (0.322, 1.328)	

Data cut-off as of April 07, 2025.
[a] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
[b] proportional hazards assumption was tested by including time dependent covariate in the model for treatment arm*log(time)
Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.

Table 14.2.11.3.1 Time to first deterioration in EQ-5D-3L VAS scale (excluding death) (15% of the scale range) by Subgroup (Full Analysis Set)

Age group 1: <65
EQ-5D-3L VAS Score (Deterioration threshold = 15)

	Statistic	Cemiplimab (N=56)	Placebo (N=65)
Total number of patients[a]	n	56	65
Number of patients with events	n (%)	21 (37.5%)	23 (35.4%)
Number of censored cases	n (%)	35 (62.5%)	42 (64.6%)
No baseline score	n (%)	9 (16.1%)	4 (6.2%)
No post-baseline score	n (%)	1 (1.8%)	1 (1.5%)
No deterioration possible	n (%)	0	0
No first deterioration	n (%)	25 (44.6%)	37 (56.9%)
Time to first deterioration (months)	Q1 [95% CI]	5.65 [2.89, 14.49]	8.31 [5.55, 9.95]
	Median [95% CI]	29.73 [10.87, NC]	38.90 [9.95, NC]
	Q3 [95% CI]	NYR [NC, NC]	NYR [NC, NC]
	p-value[b][d]		0.720
	HR [95 % CI][c][d]		1.12 [0.60, 2.09]
	Heterogeneity p-value[e][d]		0.5655

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; FAS: Full analysis set; HR: Hazard Ration; VAS: Visual Analogue Scale.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

	HR [95 % CI][c][d]		1.00 [0.60, 1.66]
	Heterogeneity p-value[e][d]		0.3025

Data cut-off as of April 07, 2025.
Note(s): [a] The thresholds for clinically meaningful deterioration are based on literature. CI: Confidence Interval; EQ-5D-3L: EuroQoL 5 Dimensions 3 Levels; FAS: Full analysis set; HR: Hazard Ration; VAS: Visual Analogue Scale.
[b] Stratified log-rank test. [c]Hazard ratio (HR) is based on a stratified Cox regression model.
[d] Stratified by high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region) per EDC.
The analysis will be performed on the FAS population, with all PRO assessments (including EOT and FU assessments). Non-white includes not reported and unknown values.
Subgroup analyses were performed only if all subgroups had >=10 patients per treatment arm and at least one subgroup in any treatment arm had >=10 events.
[e] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE: Treatment-emergent adverse event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE: Treatment-emergent adverse event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Age group 1: >=65

Primary System Organ Class Preferred Term	Cemiplimab (N=151)	Placebo (N=139)
Rash		
P-value for Risk Difference	0.1193	
Investigations	28 (18.5%)	11 (7.9%)
Odds ratio (95% CI)	2.612 (1.229, 5.552)	
P-value for Odds Ratio	0.0128	
Relative Risk (95% CI)	2.27 (1.17, 4.40)	
P-value for Relative Risk	0.0157	
Heterogeneity p-value of RR	0.1322	
Risk difference (95% CI)	11.32 (2.88, 19.77)	
P-value for Risk Difference	0.0087	
Alanine aminotransferase increased	10 (6.6%)	1 (0.7%)
Odds ratio (95% CI)	9.456 (1.169, 76.472)	
P-value for Odds Ratio	0.0353	
Relative Risk (95% CI)	8.77 (1.12, 68.65)	
P-value for Relative Risk	0.0388

Odds ratio (95% CI)	1.270 (0.451, 3.572)	
P-value for Odds Ratio	0.6488	

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Odds ratio (95% CI)	NE (NE, NE)	
P-value for Odds Ratio	NE	

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

P-value for Risk Difference	0.1258	
Metabolism and nutrition disorders	27 (14.5%)	14 (7.5%)

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Race: White

Primary System Organ Class Preferred Term	Cemiplimab (N=186)	Placebo (N=187)
Metabolism and nutrition disorders		
Odds ratio (95% CI)	2.192 (1.100, 4.369)	
P-value for Odds Ratio	0.0259	
Relative Risk (95% CI)	1.99 (1.08, 3.68)	
P-value for Relative Risk	0.0280	
Heterogeneity p-value of RR	0.1620	
Risk difference (95% CI)	8.02 (0.72, 15.32)	
P-value for Risk Difference	0.0315	
Hepatobiliary disorders	10 (5.4%)	1 (0.5%)
Odds ratio (95% CI)	12.090 (1.516, 96.430)	
P-value for Odds Ratio	0.0188	
Relative Risk (95% CI)	11.30 (1.45, 87.85)	
P-value for Relative Risk	0.0206	
Heterogeneity p-value of RR	NE	
Risk difference (95% CI)	6.15 (-2.61, 14.91)	

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.

Relative Risk (95% CI)	2.28 (0.49, 10.71)	
P-value for Relative Risk	0.2906	

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Hypothyroidism	12 (9.8%)	1 (0.9%)
Odds ratio (95% CI)	13.322 (1.675, 105.966)	
P-value for Odds Ratio	0.0146	

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

High risk feature: Nodal

Hepatobiliary disorders	0	1 (2.3%)

Data cut-off as of October 4, 2024. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

TEAE = Treatment-emergent adverse event. SAE = Serious Adverse Event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of April 07, 2025.
TEAE: Treatment-emergent adverse event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

Data cut-off as of April 07, 2025.
TEAE: Treatment-emergent adverse event. NCI grades were coded using CTCAE Version 5.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events.

P-value for Risk Difference	0.0343	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Age group 2: <65

Heterogeneity p-value of RR	0.3654	
Risk difference (95% CI)	7.55 (0.26, 14.84)	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Gender group: Male

Primary System Organ Class Preferred Term	Cemiplimab (N=171)	Placebo (N=172)

Heterogeneity p-value of RR	0.5034	
Risk difference (95% CI)	7.29 (-3.84, 18.43)	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Hepatobiliary disorders		
P-value for Risk Difference	0.1396	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Race: Non-white

Primary System Organ Class Preferred Term	Cemiplimab (N=19)	Placebo (N=17)
Skin and subcutaneous tissue disorders	8 (42.1%)	7 (41.2%)
Odds ratio (95% CI)	1.185 (0.260, 5.391)

Odds ratio (95% CI)	2.131 (0.497, 9.145)	
P-value for Odds Ratio	0.3036	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Odds ratio (95% CI)	5.207 (1.695, 15.991)	
P-value for Odds Ratio	0.0041	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

High risk feature: Nodal

Primary System Organ Class Preferred Term	Cemiplimab (N=123)	Placebo (N=116)

For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.1.2.1 Treatment-Emergent Adverse Events by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

PD-L1 Protein Expression: TPS<1%

Primary System Organ Class Preferred Term	Cemiplimab (N=40)	Placebo (N=43)
Endocrine disorders		
Heterogeneity p-value of RR	0.0404	
Risk difference (95% CI)	-0.12 (-15.73, 15.49)	
P-value for Risk Difference	0.9878	
Hypothyroidism	4 (10.0%)	4 (9.3%)
Odds ratio (95% CI)	1.152 (0.254, 5.221)	
P-value for Odds Ratio	0.8530	
Relative Risk (95% CI)	1.16 (0.31, 4.33)	
P-value for Relative Risk	0.8243	
Heterogeneity p-value of RR	0.0708	
Risk difference (95% CI)	-0.12 (-15.73, 15.49)	
P-value for Risk Difference	0.9878	
Hyperthyroidism	0	1 (2.3%)
Odds ratio (95% CI)	NE (NE, NE)	
P-value for Odds Ratio	NE	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).

P-value for Relative Risk	0.0350	
Heterogeneity p-value of RR	0.5210	
Risk difference (95% CI)	5.68 (-2.33, 13.69)	
P-value for Risk Difference	0.1643	

Data cut-off as of April 07, 2025. All adverse events were coded using MedDRA Version 27.0.
TEAE: Treatment-emergent adverse event. A patient is counted only once for multiple occurrences within a system organ class/preferred term.
For SOCs, the table is sorted by decreasing frequency in the cemiplimab group. Within each SOC, PTs are sorted by decreasing frequency in the cemiplimab group.
Odds ratio and relative risk and risk difference were derived from logistic regression, adjusting for the following stratification factors: high-risk tumor (HN vs non-HN; except when subgroup was high-risk tumor) and geographical region (North America vs Australia/New Zealand vs ROW; except when subgroup was geographical region).
Subgroup analyses were performed only when all of the following criteria were met: (1) each subgroup contained >=10 patients per treatment arm; (2) at least one subgroup in any treatment arm had >=10 events, and (3) the main analysis showed statistically significant relative risk ($p<0.05$).

Table 14.3.5.2.1 Treatment-Emergent Adverse Events with Grade >=3 by System Organ Class, Preferred Term (Part 1) by Subgroup
(Safety Analysis Set)

Primary System Organ Class Preferred Term	Cemiplimab (N=205)	Placebo (N=204)

No record met criteria
