## Gemeinsamer Bundesausschuss

Daratumumab (new therapeutic indication; reassessment of an orphan drug after exceeding the 50 million euro limit)

Resolution of: 15 February 2018 / 15 September 2022
Valid until: unlimited
Entry into force on: 15 February 2018 / 15 September 2022
Federal Gazette, BAnz AT 15032018 B3/ 13102022 B1

New therapeutic indication (according to the marketing authorisation of 28 April 2017):
Darzalex is indicated in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone, for the treatment of adult patients with multiple myeloma who have received at least one prior therapy.

## Therapeutic indication (according to the marketing authorisation of 20 May 2016):

Darzalex is indicated as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy.

## Therapeutic indication of the resolution (resolution of 15 September 2022):

Darzalex is indicated in combination with lenalidomide and dexamethasone, or bortezomib and dexamethasone, for the treatment of adult patients with multiple myeloma who have received at least one prior therapy.

1. Additional benefit of the medicinal product in relation to the appropriate comparator therapy
a) Adults with multiple myeloma who have received at least one prior therapy

## Appropriate comparator therapy:

- bortezomib in combination with pegylated liposomal doxorubicin
or
- bortezomib in combination with dexamethasone
or
- lenalidomide in combination with dexamethasone
or
- elotuzumab in combination with lenalidomide and dexamethasone
or
- carfilzomib in combination with lenalidomide and dexamethasone
or
- carfilzomib in combination with dexamethasone

Extent and probability of the additional benefit of daratumumab in combination with lenalidomide and dexamethasone, or with bortezomib and dexamethasone compared with lenalidomide in combination with dexamethasone, or bortezomib in combination with dexamethasone:

Proof of a considerable additional benefit.
b) Daratumumab as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy.

## Appropriate comparator therapy:

A patient-individual therapy according to the doctor's instructions, in particular depending on the prior therapies as well as the severity and duration of the response and in compliance with the marketing authorisation of the respective medicinal products.

Extent and probability of the additional benefit compared to the appropriate comparator therapy:

An additional benefit is not proven.

## Study results according to endpoints ${ }^{1}$ :

a) Adults with multiple myeloma who have received at least one prior therapy

## Summary of results for relevant clinical endpoints

| Endpoint category | Direction <br> of effect/ <br> risk of <br> bias | Summary |
| :--- | :--- | :--- |
| Mortality | $\uparrow \uparrow$ | Advantage in overall survival |
| Morbidity | $\leftrightarrow$ | No relevant differences for the benefit assessment |
| Health-related quality <br> of life | $\leftrightarrow$ | No relevant differences for the benefit assessment |
| Side effects | $\downarrow \downarrow$ | Disadvantage in the endpoint of severe adverse <br> events (CTCAE grade $\geq 3$ ) and, in detail, of specific <br> adverse events |
| Explanations: <br> $\uparrow:$ statistically significant and relevant positive effect with low/unclear reliability of data <br> $\downarrow$ : statistically significant and relevant negative effect with low/unclear reliability of data <br> $\uparrow \uparrow:$ statistically significant and relevant positive effect with high reliability of data <br> $\downarrow:$ statistically significant and relevant negative effect with high reliability of data |  |  |
| $\leftrightarrow:$ no statistically significant or relevant difference |  |  |
| $\varnothing$ : There are no usable data for the benefit assessment. |  |  |
| n.a.: not assessable |  |  |

[^0]CASTOR study (data cut-off: 28.06.2021):
Daratumumab + bortezomib + dexamethasone vs bortezomib + dexamethasone
Study design: randomised, open-label, actively controlled
POLLUX study (data cut-off: 30.09.2021):
Daratumumab + lenalidomide + dexamethasone vs lenalidomide + dexamethasone
Study design: randomised, open-label, actively controlled

a Absolute difference (AD) given only in the case of a statistically significant difference; own calculation
${ }^{\text {b }}$ Data from: Dossier on daratumumab Module 4A dated 31.03.2022
c Time to first deterioration. An increase in score by $\geq 10$ points compared to the start of the study is considered a clinically relevant deterioration (scale range 0 to 100).
${ }^{d}$ Time to first deterioration. A decrease in score by $\geq 15$ points compared to the start of the study is considered a clinically relevant deterioration (scale range 0 to 100).
e Time to first deterioration. A decrease in score by $\geq 10$ points compared to the start of the study is considered a clinically relevant deterioration (scale range 0 to 100).
f The evaluation submitted by the pharmaceutical company is not suitable for the benefit assessment, but the results underlying the endpoint are additionally recorded via the specific AEs.
${ }^{g}$ This AE is specific for the active ingredient bortezomib and therefore, not relevant for the POLLUX study.
${ }^{\text {h }}$ IQWiG calculation
Abbreviations used:
AD = absolute difference; NRE = not recorded elsewhere; CTCAE = Common Terminology Criteria for Adverse Events; EORTC = European Organisation for Research and Treatment of Cancer; HLT = high level term; HR = hazard ratio; ISS = International Staging System; $\mathrm{CI}=$ confidence interval; N $=$ number of patients evaluated; $\mathrm{n}=$ number of patients with (at least one) event; n.c. $=$ not calculable; n.a. = not achieved; QLQ-C30 = Quality of Life Questionnaire - Core 30; VAS = visual analogue scale; vs = versus
b) Daratumumab as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy.

No data are available to allow an assessment of the additional benefit.
2. Number of patients or demarcation of patient groups eligible for treatment
a) Adults with multiple myeloma who have received at least one prior therapy
approx. 4,700 to 7,000 patients
b) Daratumumab as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy.
approx. 2,300 patients

## 3. Requirements for a quality-assured application

The requirements in the product information are to be taken into account. The European Medicines Agency (EMA) provides the contents of the product information (summary of product characteristics, SmPC) for Darzalex (active ingredient: daratumumab) at the following publicly accessible link (last access: 1 June 2022):
https://www.ema.europa.eu/en/documents/product-information/darzalex-epar-productinformation en.pdf

Treatment with daratumumab should only be initiated and monitored by specialists in internal medicine, haematology and oncology experienced in the treatment of patients with multiple myeloma.

In accordance with the European Medicines Agency (EMA) requirements regarding additional risk minimisation measures, the pharmaceutical company must provide training material and a patient identification card. The training material for medical professionals and blood banks contains instructions on how to manage the risk of daratumumab interfering with blood typing (indirect antihuman globulin test or indirect Coombs test). Interference with blood typing induced by daratumumab may persist for up to 6 months after the last infusion of the medicinal product; therefore, medical professionals should advise patients to carry their patient identification card with them for up to 6 months after the end of the treatment.

## 4. Treatment costs

## Annual treatment costs ${ }^{2}$ :

The annual treatment costs shown refer to the first year of treatment.
a) Adults with multiple myeloma who have received at least one prior therapy

| Designation of the therapy | Annual treatment costs/ patient |  |
