- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

n	210	213
LS mean (SE)	0.49 (0.79)	0.62 (0.78)
95% CI of LS mean	(-1.06, 2.03)	(-0.91, 2.16)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.14 (-2.04, 2.31)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 23	VNZ/TEZ/D-IVA N = 23
Absolute Change at Week 24 (MMRM)		
n	23	22
LS mean (SE)	2.44 (2.31)	1.99 (2.36)
95% CI of LS mean	(-2.23, 7.11)	(-2.78, 6.77)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.45 (-7.14, 6.24)
Week 52		
n	23	23
Mean (SD)	78.44 (16.97)	80.87 (16.97)
Absolute Change at Week 52		
n	23	22
Mean (SD)	5.04 (12.81)	0.00 (16.46)
Week 52 (MMRM)		
n	23	23
LS mean (SE)	78.98 (3.52)	80.33 (3.52)
95% CI of LS mean	(71.87, 86.09)	(73.22, 87.45)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.35 (-8.73, 11.44)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	75.44 (5.01)	83.75 (5.29)
95% CI of LS mean	(65.23, 85.66)	(72.98, 94.51)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	8.31 (-6.57, 23.18)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.95 (-10.32, 8.42)
Absolute Change through Week 52 (MMRM)		
n	20	17
LS mean (SE)	0.47 (2.50)	-2.71 (2.70)
95% CI of LS mean	(-4.63, 5.57)	(-8.20, 2.79)
P-value within Treatment	0.8517	0.3233
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-3.18 (-10.86, 4.50)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.4055
Hedges' G (SE)		-0.28 (0.32)
Hedges' 95% CI		(-0.94, 0.38)
Hedges' P-value		0.3961

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Social

Genotype group: F/F

	ELX/TEZ/IVA N = 224	VNZ/TEZ/D-IVA N = 222
Week 16 (MMRM)		
n	211	211
LS mean (SE)	75.68 (1.19)	76.73 (1.19)
95% CI of LS mean	(73.34, 78.02)	(74.39, 79.07)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.05 (-2.26, 4.36)
Absolute Change at Week 16 (MMRM)		
n	206	209
LS mean (SE)	1.91 (0.94)	1.48 (0.93)
95% CI of LS mean	(0.07, 3.75)	(-0.35, 3.31)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.43 (-3.02, 2.17)
Week 24 (MMRM)		
n	212	211
LS mean (SE)	74.84 (1.20)	77.31 (1.20)
95% CI of LS mean	(72.48, 77.21)	(74.95, 79.67)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.47 (-0.88, 5.81)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 2.2.2.9.3.2.2

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	1.23 (2.49)	2.20 (2.40)
95% CI of LS mean	(-3.72, 6.18)	(-2.59, 6.99)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.97 (-5.99, 7.93)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-10.74, 4.83)	(-9.94, 5.87)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.92 (-10.22, 12.06)
Week 52		
n	20	16
Mean (SD)	71.11 (25.08)	80.56 (16.48)
Absolute Change at Week 52		
n	18	16
Mean (SD)	1.85 (15.83)	2.78 (8.61)
Week 52 (MMRM)		
n	19	15
LS mean (SE)	70.86 (4.93)	78.09 (5.17)
95% CI of LS mean	(60.82, 80.89)	(67.58, 88.60)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	7.23 (-7.34, 21.80)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.8087
Hedges' G (SE)		-0.07 (0.30)
Hedges' 95% CI		(-0.67, 0.52)
Hedges' P-value		0.8069

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-3.67, 8.22)	(-4.81, 6.95)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-1.21 (-9.64, 7.22)
Week 24 (MMRM)		
n	36	37
LS mean (SE)	90.58 (1.99)	88.24 (1.97)
95% CI of LS mean	(86.61, 94.55)	(84.30, 92.17)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-2.34 (-7.99, 3.31)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.74 (-6.05, 13.52)
Absolute Change through Week 52 (MMRM)		
n	17	17
LS mean (SE)	-0.24 (2.30)	0.95 (2.32)
95% CI of LS mean	(-4.93, 4.45)	(-3.77, 5.66)
P-value within Treatment	0.9172	0.6852
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.19 (-5.51, 7.88)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.7200
Hedges' G (SE)		0.12 (0.34)
Hedges' 95% CI		(-0.56, 0.80)
Hedges' P-value		0.7183

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

n	226	218
LS mean (SE)	63.42 (1.35)	65.50 (1.37)
95% CI of LS mean	(60.76, 66.07)	(62.81, 68.19)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.08 (-1.70, 5.87)
Absolute Change at Week 16 (MMRM)		
n	220	215
LS mean (SE)	-1.55 (1.02)	-1.06 (1.03)
95% CI of LS mean	(-3.56, 0.46)	(-3.09, 0.97)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.49 (-2.37, 3.35)
Week 24 (MMRM)		
n	225	214
LS mean (SE)	62.23 (1.39)	64.44 (1.42)
95% CI of LS mean	(59.49, 64.97)	(61.65, 67.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.21 (-1.70, 6.13)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Hedges' 95% CI		(-0.08, 0.32)
Hedges' P-value		0.2379

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	80.27 (4.88)	84.04 (4.82)
95% CI of LS mean	(70.53, 90.01)	(74.43, 93.65)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.77 (-10.08, 17.62)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(83.48, 101.37)	(83.87, 101.62)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.32 (-12.30, 12.94)
Absolute Change at Week 8 (MMRM)		
n	22	21
LS mean (SE)	-4.34 (3.84)	1.41 (3.91)
95% CI of LS mean	(-12.09, 3.41)	(-6.49, 9.31)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	5.75 (-5.34, 16.84)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	1.52 (11.47)	7.42 (12.06)
95% CI of LS mean	(-24.84, 27.88)	(-21.90, 36.73)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	5.90 (-35.90, 47.69)
Week 16 (MMRM)		
n	4	3
LS mean (SE)	86.90 (8.30)	89.10 (9.31)
95% CI of LS mean	(69.04, 104.75)	(69.52, 108.69)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.20 (-25.66, 30.07)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 52 (MMRM)		
n	4	7
LS mean (SE)	10.23 (12.12)	11.34 (9.45)
95% CI of LS mean	(-17.08, 37.54)	(-10.20, 32.88)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.12 (-34.15, 36.38)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-21.53, 17.15)	(-7.63, 24.27)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	10.51 (-14.60, 35.62)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(53.33, 85.29)	(70.46, 97.02)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	14.43 (-6.44, 35.31)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-103: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52 by Subgroups
Full Analysis Set

Version: Parents/Caregivers Version

Domain: Treatment Burden
Sex = Female

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Full Analysis Set

Version: Parents/Caregivers Version

Domain: Digestion
Prior CFTR modulator use: Yes

	ELX/TEZ/IVA N = 13	VNZ/TEZ/D-IVA N = 13

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, genotype group (F/F, non-F/F) and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 2.2.2.12.1.2

Full Analysis Set

Domain: Side Effects
SwCl at baseline <30 mmol/L

	ELX/TEZ/IVA N = 8	VNZ/TEZ/D-IVA N = 11
Absolute Change at Week 52 (MMRM)		
n	8	9
LS mean (SE)	-4.93 (5.82)	2.30 (5.37)
95% CI of LS mean	(-17.90, 8.04)	(-9.66, 14.26)
P-value within Treatment	0.4168	0.6775
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	7.23 (-13.44, 27.90)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.4537
Hedges' G (SE)		0.42 (0.47)
Hedges' 95% CI		(-0.57, 1.42)
Hedges' P-value		0.3806

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, genotype group (F/F, F/G, F/RF, TCR/non-F) and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Hedges' P-value		0.5505

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, genotype group (F/F, non-F/F) and with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, genotype group (F/F, non-F/F) and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, genotype group (F/F, F/G, F/RF, TCR/non-F) and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from MMRM.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- N/C: model does not converge.

Table 2.2.2.12.1.2.1
Study VX20-121-103: MMRM Analysis of Absolute Change from Baseline in TSQM Domain Score at Week 52 by Subgroups for Subjects Aged ≥ 12 Years to <18 Years at the Date of Informed Consent for Additional Subgroups
Full Analysis Set

Domain: Global Satisfaction
Genotype group: TCR/non-F

	ELX/TEZ/IVA N = 2	VNZ/TEZ/D-IVA N = 4

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effects for treatment, and with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from MMRM.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.9485
Risk Difference (RD) (95% CI)		0.0015 (-0.0447, 0.0477)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		0.9485
Decreased appetite	8 (2.77)	3 (1.06)
Relative Risk (RR) (95% CI)		0.3816 (0.1023, 1.4239)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]		0.1516
Odds Ratio (OR) (95% CI)		0.3750 (0.0985, 1.4281)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.1505
Risk Difference (RD) (95% CI)		-0.0171 (-0.0395, 0.0052)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		0.1332

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Study VX20-121-103: Summary of TEAEs by SOC and PT, and by Maximum Severity
(Excluding Infective Pulmonary Exacerbation of Cystic Fibrosis)
Safety Set

System Organ Class Preferred Term Maximum Severity	ELX/TEZ/IVA N = 289 n (%)	VNZ/TEZ/D-IVA N = 284 n (%)
Viral upper respiratory tract infection	17 (5.88)	20 (7.04)
Relative Risk (RR) (95% CI)		1.1972 (0.6405, 2.2377)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]		0.5728
Odds Ratio (OR) (95% CI)		1.2121 (0.6213, 2.3649)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.5727
Risk Difference (RD) (95% CI)		0.0116 (-0.0287, 0.0519)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		0.5724
Grade 1/Mild	15 (5.19)	15 (5.28)
Relative Risk (RR) (95% CI)		1.0176 (0.5070, 2.0424)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]		0.9608
Odds Ratio (OR) (95% CI)		1.0186 (0.4883, 2.1246)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.9608

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

(Excluding Infective Pulmonary Exacerbation of Cystic Fibrosis)
Safety Set

System Organ Class Preferred Term Maximum Severity	ELX/TEZ/IVA N = 289 n (%)	VNZ/TEZ/D-IVA N = 284 n (%)
Risk Difference (RD) (95% CI)		0.0000 (-, -)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		-

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Table 2.3.2.1.1
Study VX20-121-103: Treatment by Subgroup Factor Interactions for TEAEs by SOC and PT
(Excluding Infective Pulmonary Exacerbation of Cystic Fibrosis)
Safety Set

System Organ Class Preferred Term Subgroup	P-value for Interaction Based on Relative Risk
Subjects with any TEAEs	
$ppFEV_1$ at baseline (<70 % vs. ≥70 %)	0.2497
Age at screening (<18 years vs. ≥18 years)	0.9229
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.4758
Sex (Male vs. Female)	0.2889
Region (North America vs. Rest of the World)	0.1362

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- P-values are reported at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, p-value will be reported if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.
