Zusatzanalysen zur Studie VX20-121-103

Table 2.3.2.3.1
Study VX20-121-103: Treatment by Subgroup Factor Interactions for Serious TEAEs by SOC and PT
Safety Set

System Organ Class Preferred Term Subgroup	P-value for Interaction Based on Relative Risk
Subjects with any TEAEs	
$ppFEV_1$ at baseline (<70 % vs. ≥70 %)	0.7126
Age at screening (<18 years vs. ≥18 years)	0.0336
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.4743
Sex (Male vs. Female)	0.3740
Region (North America vs. Rest of the World)	0.2542

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by "*".
- P-values are reported at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, p-value will be reported if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- N/C: model does not converge.

Study VX20-121-103: Summary of Serious TEAEs by SOC and PT by Each Applicable Subgroup Factor for Additional Subgroups
(Excluding Infective Pulmonary Exacerbation of Cystic Fibrosis)
Safety Set

Genotype group F/F

System Organ Class Preferred Term	ELX/TEZ/IVA N = 224 n (%)	VNZ/TEZ/D-IVA N = 222 n (%)
Subjects with any serious TEAEs	24 (10.71)	18 (8.11)
Relative Risk (RR) (95% CI)		0.7568 (0.4228, 1.3546)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]		0.3481
Odds Ratio (OR) (95% CI)		0.7353 (0.3871, 1.3966)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.3475
Risk Difference (RD) (95% CI)		-0.0261 (-0.0802, 0.0281)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		0.3453

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- "-" indicates that point estimate, CI or p-value is not estimable.

Table 2.3.2.4.1
Study VX20-121-103: Treatment by Subgroup Factor Interactions for TEAEs Leading to Treatment Discontinuation
Safety Set

	P-value for Interaction Based on Relative Risk
Subjects with any TEAEs leading to treatment discontinuation	
$ppFEV_1$ at baseline (<70 % vs. ≥70 %)	0.0573
Age at screening (<18 years vs. ≥18 years)	0.2529
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.1237
Sex (Male vs. Female)	0.2039
Region (North America vs. Rest of the World)	0.5161

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- P-values are reported only if 1) there are at least 10 subjects in each subgroup (per factor); and 2) there are at least 10 subjects with events in at least one of the subgroups (per factor).
- N/C: model does not converge.

Table 2.3.2.4.1.1

- [1] P-values are for relative risk obtained from Generalized Linear Model: treatment, subgroup, treatment*subgroup, with adjustment for continuous baseline $ppFEV_1$, baseline sweat chloride, age at screening (<18 vs ≥18 years), and &geno. as covariates; Distribution: binomial with log link.
- [2] P-values are for relative risk obtained from Generalized Linear Model: treatment, subgroup, treatment*subgroup, with adjustment for continuous baseline $ppFEV_1$, baseline sweat chloride and &geno. as covariates; Distribution: binomial with log link.
- [3] P-values are for relative risk obtained from Generalized Linear Model: treatment, subgroup, treatment*subgroup, with adjustment for continuous baseline $ppFEV_1$, baseline sweat chloride and age at screening (<18 vs ≥18 years) as covariates; Distribution: binomial with log link.
-If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
-N/C: model does not converge.

Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]	-	0.8154
Risk Difference (RD) (95% CI)		N/C
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]	-	N/C
Subjects with at least one Pulmonary Exacerbation Requiring IV Antibiotics or Hospitalization	16 (6.4)	14 (5.8)
Relative Risk (RR) (95% CI)		0.9172 (0.4525, 1.8591)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]	-	0.8104
Odds Ratio (OR) (95% CI)		0.9138 (0.4286, 1.9482)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]	-	0.8154

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- [1] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- [2] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with logit link.
- [3] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with identity link.
- For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- N/C: model does not converge.

Relative Risk (RR) (95% CI)		1.0326 (0.5235, 2.0367)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]	-	0.9263
Odds Ratio (OR) (95% CI)		1.0625 (0.5090, 2.2175)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]	-	0.8718

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- [1] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- [2] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with logit link.
- [3] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with identity link.
- For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- N/C: model does not converge.

Relative Risk (RR) (95% CI)		0.0000 (-, -)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [1]	-	-
Odds Ratio (OR) (95% CI)		0.0000 (-, -)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]	-	-
Risk Difference (RD) (95% CI)		N/C
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]	-	N/C

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- [1] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- [2] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with logit link.
- [3] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), genotype, and baseline $ppFEV_1$ and baseline sweat chloride as covariates; Distribution: binomial with identity link.
- For "Genotype group" subgroup factor, genotype covariate is removed from the model.
- N/C: model does not converge.

Figure 2.2.2.6.2
Study VX20-121-103: Kaplan-Meier Plot for Time-to-First Pulmonary Exacerbation through Week 52 by Subgroups
Full Analysis Set

Subgroup: $ppFEV_1$ at Baseline <70 %

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
- Cox regression: time is the time-to-first pulmonary exacerbation or censoring, with adjustment for treatment, baseline $ppFEV_1$, baseline sweat chloride, and age at screening (<18 vs ≥18 years), genotype. Hazard ratio, CI and p-values from Cox regression.
- For "Age at screening" subgroup factor, age covariate is removed from analysis model.

Subgroup: Age at Screening ≥ 18 years

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
- Cox regression: time is the time-to-first pulmonary exacerbation or censoring, with adjustment for treatment, baseline ppFEV$_1$, baseline sweat chloride, and age at screening (<18 vs ≥18 years), genotype. Hazard ratio, CI and p-values from Cox regression.
- For "Age at screening" subgroup factor, age covariate is removed from analysis model.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

Zusatzanalysen zur Studie VX20-121-103

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

Genotype group: F/RF

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.

Genotype group: F/F

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1) at least 10 subjects in each subgroup (per factor), and 2) for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Genotype group" subgroup factor, genotype covariate is removed from the model.

SwCl at baseline <30 mmol/L

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from Week 52. The model includes fixed categorical effects for treatment, genotype group (F/F, non-F/F), with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- N is the number of subjects in the parent study FAS (Parent Study Efficacy Period) and OL FAS (OL Efficacy Period for Part A), respectively.
- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging across all available visit in OL Part A.

- Parent study baseline is defined as the average of the two most recent pre-dose, non-missing values on or after the parent study Day -14 visit, including unscheduled visits. If only 1 non-missing value is available during this interval, the available value is considered as baseline.
- N1: number of subjects with non-missing SwCl at the given visit
- n: number of subjects at a given visit with SwCl <30 mmol/L
- 95% CI is based on the Clopper-Pearson method.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Study 103 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-103. The model includes fixed categorical effects for treatment (as randomized in the parent study), visit, age at screening in the parent study (<18 vs ≥18 years), genotype group, and treatment-by-visit interaction, with parent study baseline $ppFEV_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

Study 102 Full Analysis Set and OL Full Analysis Set - Subjects from Study 102

Domain: Convenience

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis with weights based on all subjects 12 to <18 years old and is based on the Study 102 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-102. The model includes fixed categorical effects for treatment (as randomized in the parent study), visit, and treatment-by-visit interaction, with parent study baseline ppFEV$_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

95% CI of LS mean	(0.8, 11.7)	(2.6, 13.9)

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis with weights based on all subjects 12 to <18 years old and is based on the Study 103 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-103. The model includes fixed categorical effects for treatment (as randomized in the parent study), genotype group (F/F, F/G, F/RF, TCR/non-F), visit, and treatment-by-visit interaction, with parent study baseline $ppFEV_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Study 102 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-102. The model includes fixed categorical effects for treatment (as randomized in the parent study), visit, age at screening in the parent study (<18 vs ≥18 years), and treatment-by-visit interaction, with parent study baseline $ppFEV_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

- N is the number of subjects in the specified analysis set who are ≤20 years of age at parent study baseline.
- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Study 103 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-103. The model includes fixed categorical effects for treatment (as randomized in the parent study), visit, genotype group, and treatment-by-visit interaction, with parent study baseline $ppFEV_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

- Parent study baseline is defined as the pre-dose Day 1 value in the parent study. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the parent study Day -14 visit, including unscheduled visits, is used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Study 102 Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits up to OL Part A Week 96 and is based on the OL Full Analysis Set for subjects from parent study 121-102. The model includes fixed categorical effects for treatment (as randomized in the parent study), visit, age at screening in the parent study (<18 vs ≥18 years), and treatment-by-visit interaction, with parent study baseline $ppFEV_1$ and parent study baseline SwCl as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

Grade 5/Death	0	0	0

- MedDRA version 28.0.
- A subject with multiple events within a category (Any, System Organ Class [SOC], or Preferred Term [PT]) is counted only once with the maximum severity in that category.
- Table is sorted in descending order of frequency of the Any VNZ/TEZ/D-IVA column by SOC, and by PT within each SOC.

Table 14.3.1.5a
Treatment-Emergent Adverse Events by System Organ Class and Preferred Term and by Maximum Severity - Parent Study Safety Period and OL Safety Period for Part A
Pooled Safety Set and OL Safety Set

- MedDRA version 28.0.
- A subject with multiple events within a category (Any, System Organ Class [SOC], or Preferred Term [PT]) is counted only once with the maximum severity in that category.
- Table is sorted in descending order of frequency of the Any VNZ/TEZ/D-IVA column by SOC, and by PT within each SOC.

- MedDRA version 28.0.
- A subject with multiple events within a category (Any, System Organ Class [SOC], or Preferred Term [PT]) is counted only once with the maximum severity in that category.
- Table is sorted in descending order of frequency of the Any VNZ/TEZ/D-IVA column by SOC, and by PT within each SOC.

Table 14.3.1.5a
Treatment-Emergent Adverse Events by System Organ Class and Preferred Term and by Maximum Severity - Parent Study Safety Period and OL Safety Period for Part A
Pooled Safety Set and OL Safety Set

- MedDRA version 28.0.
