95% CI of LS mean	(-6.20, 5.22)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Body (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Body (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=CS, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Digestion (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Eat (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Eat (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Emotion (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Health Perceptions (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Physical (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Physical (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=CS, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Treatment Burden (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

P-value	<0.0001

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Treatment Burden (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

Full Analysis Set

Domain: Vitality (Parents/Caregivers Form)
Region = North America

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Vitality (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Weight (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean: Least Squares Mean; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value.
- MMRM includes data from all available visits up to Week 24. The model includes fixed categorical effect visit and genotype group (F/MF vs rest), with baseline CFQ-R Weight (Parents/Caregivers Form) Domain score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 24 is estimated by averaging Weeks 16 and 24.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done; 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.

- For the Parent Study Efficacy Period, MMRM is based on the parent study Full Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes all OL visits up to OL Week 96 and is based on the OL Full Analysis Set for subjects enrolled in parent study.
- MMRM model uses absolute change from parent study baseline as the dependent variable. The model includes fixed categorical effects for genotype group and visit, with baseline CFQ-R non-RD score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
- Average change through OL Part A Week 96 for treatment effect is estimated by averaging from OL Part A Week 24 up to OL Part A Week 96.

North America	45 (60.0)
Rest of the World	30 (40.0)

- [1]: Female n is the denominator
- [2]: Female n with no childbearing potential is the denominator
- Sex and childbearing potential are based on data collected in the OL study. Race and Ethnicity are based on data collected in the parent study.
- For reporting purposes, North America includes subjects from the United States, and Rest of the World includes subjects from Europe and Australia.

- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Parent Study Efficacy Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits and is based on the OL Full Analysis Set. The model includes fixed categorical effects for genotype (F/F, F/MF, Other) and visit, with baseline ppFEV1 as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.

Table 14.2.2.2c1a
MMRM Analysis of Absolute Change from Baseline in $ppFEV_1$ (percentage points) at Each Visit - Parent Study Efficacy Period and OL Efficacy Period for Part A
Parent Study Efficacy Analysis Set and OL Full Analysis Set - Cohort 1

	VNZ/TEZ/D-IVA
Absolute change at OL Part A Week 96	
n	62
LS mean (SE)	-2.2 (1.1)
95% CI of LS mean	(-4.3, -0.1)

- Baseline is defined as the pre-dose Day 1 value in the parent study. For subjects who are on stable ELX/TEZ/IVA prior to the parent study, if the pre-dose Day 1 value in the parent study is missing, parent study screening assessments will be used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Parent Study Efficacy Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits and is based on the OL Full Analysis Set. The model includes fixed categorical effects for genotype (F/F, F/MF, Other) and visit, with baseline ppFEV1 as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.

Table 14.2.3.1c1a
Summary of Pulmonary Exacerbations During the Cumulative Efficacy Period for Part A
Cumulative Efficacy Set

	VNZ/TEZ/D-IVA N = 78
Total number of days (years) in the Cumulative Efficacy Period for Part A	61503 (183.0)
Pulmonary exacerbations (PEx)	
Number of subjects with events, n (%)	19 (24.4)
Total number of events	45
Observed event rate per year	0.25
PEx requiring hospitalization	
Number of subjects with events, n (%)	6 (7.7)
Total number of events	10
Observed event rate per year	0.05
PEx requiring IV antibiotic therapy	
Number of subjects with events, n (%)	6 (7.7)
Total number of events	10
Observed event rate per year	0.05
PEx requiring hospitalization or IV antibiotic therapy	
Number of subjects with events, n (%)	6 (7.7)
Total number of events	10
Observed event rate per year	0.05

- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms
- Total number of days = sum of the individual duration (actual number of days) in the Cumulative Efficacy Period for Part A across all subjects in the analysis set. Total number of years = total number of days / 336; for analysis purposes, 1 year is defined as 48 weeks or 336 days.
- Observed event rate per year = total number of events * 336 / total number of days in the Cumulative Efficacy Period for Part A

Table 14.2.4.1c1a

- Baseline is defined as the pre-dose Day 1 value in the parent study. For subjects who are on stable ELX/TEZ/IVA prior to the parent study, if the pre-dose Day 1 value in the parent study is missing, parent study screening assessments will be used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Parent Study Efficacy Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits and is based on the OL Full Analysis Set. The model includes fixed categorical effects for genotype (F/F, F/MF, Other) and visit, with baseline weight-for-age z-score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.

- Baseline is defined as the pre-dose Day 1 value in the parent study. For subjects who are on stable ELX/TEZ/IVA prior to the parent study, if the pre-dose Day 1 value in the parent study is missing, parent study screening assessments will be used as baseline.
- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Parent Study Efficacy Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits and is based on the OL Full Analysis Set. The model includes fixed categorical effects for genotype (F/F, F/MF, Other) and visit, with baseline height-for-age z-score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.

Grade 5/Death	0	0

- MedDRA version 28.0.
- A subject with multiple events within a category (Any, System Organ Class [SOC], or Preferred Term [PT]) is counted within the maximum severity in that category.
- Table is sorted in descending order of frequency of the OL study (121-106 Cohort 1 Part A) column by SOC, and by PT within each SOC.

Parent Study Efficacy Analysis Set and OL Full Analysis Set - Cohort 1

Domain: Vitality (Parents/Caregivers Form)

- For the Parent Study Efficacy Period, MMRM is the same as the parent study analysis and is based on the Parent Study Efficacy Analysis Set.
- For the OL Efficacy Period for Part A, MMRM includes data from all available visits and is based on the OL Full Analysis Set for Cohort 1. The model includes fixed categorical effects for genotype (F/F, F/MF, Other) and visit, with baseline CFQ-R Vitality (Parents/Caregivers Form) score as a continuous covariate. Covariance structure=UN, DF=Kenward-Roger.
