Anhang 4-H zu Modul 4 A
Ergebnisse der Studie ROBIN

Behandlung von Erwachsenen mit postpartaler Depression (PPD) nach Entbindung

Stand: 15.07.2026

Inhaltsverzeichnis

1 Baseline Charakteristika 13
1.1 Dargestellt nach der ITT-Population . . . 13
1.2 Dargestellt nach der Safety-Population . . . 19
1.3 PPD-Schweregrad . . . 25

2 SF-36 31
2.1 MCS . . . 31
2.1.1 MMRM . . . 31
2.1.1.1 ITT-Population . . . 31
2.1.1.2 Subgruppen . . . 33
2.1.1.2 .1 Interaktionstest . . . 33
2.1.1.2 .2 Subgruppenanalysen . . . 35
2.1.1.2 .3 Darstellung über die Zeit . . . 52
2.1.2 Ansprechen . . . 69
2.1.2.1 Responder-Analysen . . . 69
2.1.2.1 .1 ITT-Population . . . 69
2.1.2.1 .2 Subgruppen . . . 71
2.1.2.2 TTE-Analysen . . . 94
2.1.2.2 .1 ITT-Population . . . 94
2.1.2.2 .2 Subgruppen . . . 96
2.1.3 Verschlechterung . . . 132
2.1.3.1 Responder-Analysen . . . 132
2.1.3.1 .1 ITT-Population . . . 132
2.1.3.1 .2 Subgruppen . . . 134
2.1.3.2 TTE-Analysen . . . 140
2.1.3.2 .1 ITT-Population . . . 140
2.1.3.2 .2 Subgruppen . . . 142
2.2 PCS . . . 145
2.2.1 MMRM . . . 145
2.2.1.1 ITT-Population . . . 145
2.2.1.2 Subgruppen . . . 147
2.2.1.2 .1 Interaktionstest . . . 147
2.2.1.2 .2 Subgruppenanalysen . . . 149
2.2.1.2 .3 Darstellung über die Zeit . . . 166
2.2.2 Ansprechen . . . 183
2.2.2.1 Responder-Analysen . . . 183
2.2.2.1 .1 ITT-Population . . . 183
2.2.2.1 .2 Subgruppen . . . 185
2.2.2.2 TTE-Analysen . . . 208
2.2.2.2 .1 ITT-Population . . . 208

2.2.2.2 .2 Subgruppen . . . 210
2.2.3 Verschlechterung . . . 246
2.2.3.1 Responder-Analysen . . . 246
2.2.3.1 .1 ITT-Population . . . 246
2.2.3.1 .2 Subgruppen . . . 248
2.2.3.2 TTE-Analysen . . . 255
2.2.3.2 .1 ITT-Population . . . 255
2.2.3.2 .2 Subgruppen . . . 257
2.3 körperliche Funktionsfähigkeit . . . 260
2.3.1 MMRM . . . 260
2.3.1.1 ITT-Population . . . 260
2.3.1.2 Subgruppen . . . 262
2.3.1.2 .1 Interaktionstest . . . 262
2.3.1.2 .2 Subgruppenanalysen . . . 264
2.3.1.2 .3 Darstellung über die Zeit . . . 281
2.3.2 Ansprechen . . . 298
2.3.2.1 Responder-Analysen . . . 298
2.3.2.1 .1 ITT-Population . . . 298
2.3.2.1 .2 Subgruppen . . . 300
2.3.2.2 TTE-Analysen . . . 323
2.3.2.2 .1 ITT-Population . . . 323
2.3.2.2 .2 Subgruppen . . . 325
2.3.3 Verschlechterung . . . 361
2.3.3.1 Responder-Analysen . . . 361
2.3.3.1 .1 ITT-Population . . . 361
2.3.3.1 .2 Subgruppen . . . 363
2.3.3.2 TTE-Analysen . . . 370
2.3.3.2 .1 ITT-Population . . . 370
2.3.3.2 .2 Subgruppen . . . 372
2.4 körperliche Rollenfunktion . . . 375
2.4.1 MMRM . . . 375
2.4.1.1 ITT-Population . . . 375
2.4.1.2 Subgruppen . . . 377
2.4.1.2 .1 Interaktionstest . . . 377
2.4.1.2 .2 Subgruppenanalysen . . . 379
2.4.1.2 .3 Darstellung über die Zeit . . . 396
2.4.2 Ansprechen . . . 413
2.4.2.1 Responder-Analysen . . . 413
2.4.2.1 .1 ITT-Population . . . 413
2.4.2.1 .2 Subgruppen . . . 415
2.4.2.2 TTE-Analysen . . . 438
2.4.2.2 .1 ITT-Population . . . 438
2.4.2.2 .2 Subgruppen . . . 440

2.4.3 Verschlechterung . . . 476
2.4.3.1 Responder-Analysen . . . 476
2.4.3.1 .1 ITT-Population . . . 476
2.4.3.1 .2 Subgruppen . . . 478
2.4.3.2 TTE-Analysen . . . 485
2.4.3.2 .1 ITT-Population . . . 485
2.4.3.2 .2 Subgruppen . . . 487
2.5 körperliche Schmerzen . . . 490
2.5.1 MMRM . . . 490
2.5.1.1 ITT-Population . . . 490
2.5.1.2 Subgruppen . . . 492
2.5.1.2 .1 Interaktionstest . . . 492
2.5.1.2 .2 Subgruppenanalysen . . . 494
2.5.1.2 .3 Darstellung über die Zeit . . . 511
2.5.2 Ansprechen . . . 528
2.5.2.1 Responder-Analysen . . . 528
2.5.2.1 .1 ITT-Population . . . 528
2.5.2.1 .2 Subgruppen . . . 530
2.5.2.2 TTE-Analysen . . . 553
2.5.2.2 .1 ITT-Population . . . 553
2.5.2.2 .2 Subgruppen . . . 555
2.5.3 Verschlechterung . . . 591
2.5.3.1 Responder-Analysen . . . 591
2.5.3.1 .1 ITT-Population . . . 591
2.5.3.1 .2 Subgruppen . . . 593
2.5.3.2 TTE-Analysen . . . 600
2.5.3.2 .1 ITT-Population . . . 600
2.5.3.2 .2 Subgruppen . . . 602
2.6 allg. Gesundheitswahrnehmung . . . 605
2.6.1 MMRM . . . 605
2.6.1.1 ITT-Population . . . 605
2.6.1.2 Subgruppen . . . 607
2.6.1.2 .1 Interaktionstest . . . 607
2.6.1.2 .2 Subgruppenanalysen . . . 609
2.6.1.2 .3 Darstellung über die Zeit . . . 626
2.6.2 Ansprechen . . . 643
2.6.2.1 Responder-Analysen . . . 643
2.6.2.1 .1 ITT-Population . . . 643
2.6.2.1 .2 Subgruppen . . . 645
2.6.2.2 TTE-Analysen . . . 668
2.6.2.2 .1 ITT-Population . . . 668
2.6.2.2 .2 Subgruppen . . . 670
2.6.3 Verschlechterung . . . 706

2.6.3.1 Responder-Analysen . . . 706
2.6.3.1 .1 ITT-Population . . . 706
2.6.3.1 .2 Subgruppen . . . 708
2.6.3.2 TTE-Analysen . . . 715
2.6.3.2 .1 ITT-Population . . . 715
2.6.3.2 .2 Subgruppen . . . 717
2.7 Vitalität . . . 720
2.7.1 MMRM . . . 720
2.7.1.1 ITT-Population . . . 720
2.7.1.2 Subgruppen . . . 722
2.7.1.2 .1 Interaktionstest . . . 722
2.7.1.2 .2 Subgruppenanalysen . . . 724
2.7.1.2 .3 Darstellung über die Zeit . . . 741
2.7.2 Ansprechen . . . 758
2.7.2.1 Responder-Analysen . . . 758
2.7.2.1 .1 ITT-Population . . . 758
2.7.2.1 .2 Subgruppen . . . 760
2.7.2.2 TTE-Analysen . . . 783
2.7.2.2 .1 ITT-Population . . . 783
2.7.2.2 .2 Subgruppen . . . 785
2.7.3 Verschlechterung . . . 821
2.7.3.1 Responder-Analysen . . . 821
2.7.3.1 .1 ITT-Population . . . 821
2.7.3.1 .2 Subgruppen . . . 823
2.7.3.2 TTE-Analysen . . . 830
2.7.3.2 .1 ITT-Population . . . 830
2.7.3.2 .2 Subgruppen . . . 832
2.8 soziale Funktionsfähigkeit . . . 835
2.8.1 MMRM . . . 835
2.8.1.1 ITT-Population . . . 835
2.8.1.2 Subgruppen . . . 837
2.8.1.2 .1 Interaktionstest . . . 837
2.8.1.2 .2 Subgruppenanalysen . . . 839
2.8.1.2 .3 Darstellung über die Zeit . . . 856
2.8.2 Ansprechen . . . 873
2.8.2.1 Responder-Analysen . . . 873
2.8.2.1 .1 ITT-Population . . . 873
2.8.2.1 .2 Subgruppen . . . 875
2.8.2.2 TTE-Analysen . . . 898
2.8.2.2 .1 ITT-Population . . . 898
2.8.2.2 .2 Subgruppen . . . 900
2.8.3 Verschlechterung . . . 936
2.8.3.1 Responder-Analysen . . . 936

2.8.3.1 .1 ITT-Population . . . 936
2.8.3.1 .2 Subgruppen . . . 938
2.8.3.2 TTE-Analysen . . . 945
2.8.3.2 .1 ITT-Population . . . 945
2.8.3.2 .2 Subgruppen . . . 947
2.9 emotionale Rollenfunktion . . . 950
2.9.1 MMRM . . . 950
2.9.1.1 ITT-Population . . . 950
2.9.1.2 Subgruppen . . . 952
2.9.1.2 .1 Interaktionstest . . . 952
2.9.1.2 .2 Subgruppenanalysen . . . 954
2.9.1.2 .3 Darstellung über die Zeit . . . 971
2.9.2 Ansprechen . . . 988
2.9.2.1 Responder-Analysen . . . 988
2.9.2.1 .1 ITT-Population . . . 988
2.9.2.1 .2 Subgruppen . . . 990
2.9.2.2 TTE-Analysen . . . 1013
2.9.2.2 .1 ITT-Population . . . 1013
2.9.2.2 .2 Subgruppen . . . 1015
2.9.3 Verschlechterung . . . 1051
2.9.3.1 Responder-Analysen . . . 1051
2.9.3.1 .1 ITT-Population . . . 1051
2.9.3.1 .2 Subgruppen . . . 1053
2.9.3.2 TTE-Analysen . . . 1060
2.9.3.2 .1 ITT-Population . . . 1060
2.9.3.2 .2 Subgruppen . . . 1062
2.10 psychisches Wohlbefinden . . . 1065
2.10.1 MMRM . . . 1065
2.10.1.1 ITT-Population . . . 1065
2.10.1.2 Subgruppen . . . 1067
2.10.1.2 .1 Interaktionstest . . . 1067
2.10.1.2 .2 Subgruppenanalysen . . . 1069
2.10.1.2 .3 Darstellung über die Zeit . . . 1086
2.10.2 Ansprechen . . . 1103
2.10.2.1 Responder-Analysen . . . 1103
2.10.2.1 .1 ITT-Population . . . 1103
2.10.2.1 .2 Subgruppen . . . 1105
2.10.2.2 TTE-Analysen . . . 1128
2.10.2.2 .1 ITT-Population . . . 1128
2.10.2.2 .2 Subgruppen . . . 1130
2.10.3 Verschlechterung . . . 1166
2.10.3.1 Responder-Analysen . . . 1166
2.10.3.1 .1 ITT-Population . . . 1166

2.10.3.1 .2 Subgruppen 1168
2.10.3.2 TTE-Analysen 1175
2.10.3.2 .1 ITT-Population 1175
2.10.3.2 .2 Subgruppen 1177

3 BIMF 1181
3.1 BIMF Gesamtwert 1181
3.1.1 MMRM 1181
3.1.1.1 ITT-Population 1181
3.1.1.2 Subgruppen 1185
3.1.1.2 .1 Interaktionstest 1185
3.1.1.2 .2 Subgruppenanalysen 1187
3.1.1.2 .3 Darstellung über die Zeit 1238
3.1.2 Ansprechen 1255
3.1.2.1 Responder-Analysen 1255
3.1.2.1 .1 ITT-Population 1255
3.1.2.1 .2 Subgruppen 1260

2.1.2 Ansprechen

2.1.2.1 Responder-Analysen

2.1.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Mental Component Summary Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	47 (62.7)	50 (65.8)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.058
95% CI for the RR		(0.835, 1.341)
p-value for RR		0.6393
OR - Odds Ratio (Zuranolone vs. Placebo)		1.176
95% CI for the OR		(0.599, 2.307)
p-value for OR		0.6376
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.042
95% CI for the ARR		(-0.110, 0.195)
p-value for ARR		0.5843

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution.

[1] Number of subjects with non-missing SF-36 Mental Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Mental Component Summary score response (9.6 points (15% of total scale range) or greater increase in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.1.2.1 .2 Subgruppen

2.1.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Mental Component Summary Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	47 (62.7)	50 (65.8)	
Number of subjects with response at Day 45, n (%)	48 (64.0)	59 (77.6)	
Age Group (years)			0.6564
Day 15			
18 - 24, n / N (%)	14/25 (56.0)	11/17 (64.7)	
25 - 45, n / N (%)	33/50 (66.0)	39/59 (66.1)	
Day 45			
18 - 24, n / N (%)	15/25 (60.0)	13/17 (76.5)	
25 - 45, n / N (%)	33/50 (66.0)	46/59 (78.0)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 Mental Component Summary score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 Mental Component Summary score response is defined as 9.6 points (15% of total scale range) or greater increase in score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.
Source: biib125/v_a/germany_amnog/t-sf36-ment-resp15-201-int.sas:t-sf36-ment-resp15-201-int-itta.rtf **Run Date:** 24SEP2025

Summary of Short-Form 36 (SF-36) Mental Component Summary Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 2 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			0.0827
Day 15			
<28, n / N (%)	16/22 (72.7)	18/30 (60.0)	
>=28, n / N (%)	31/53 (58.5)	32/46 (69.6)	
Day 45			
<28, n / N (%)	17/22 (77.3)	23/30 (76.7)	
>=28, n / N (%)	31/53 (58.5)	36/46 (78.3)	
Race Group (Black or African American, White)			0.4123
Day 15			
Black or African American, n / N (%)	17/32 (53.1)	21/31 (67.7)	
White, n / N (%)	28/40 (70.0)	28/44 (63.6)	
Day 45			
Black or African American, n / N (%)	21/32 (65.6)	25/31 (80.6)	
White, n / N (%)	25/40 (62.5)	33/44 (75.0)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 Mental Component Summary score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 Mental Component Summary score response is defined as 9.6 points (15% of total scale range) or greater increase in score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(0.877, 2.606)
p-value for RR		0.1365

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline SF-36 Mental Component Summary score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.
[1] Number of subjects with non-missing SF-36 Mental Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Mental Component Summary score response (9.6 points (15% of total scale range) or greater increase in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Mental Component Summary Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 Mental Component Summary score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 Mental Component Summary score response is defined as 9.6 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, and treatment.

Yes, n / N (%)	9/13 (69.2)	14/16 (87.5)	0.0636
No, n / N (%)	50/62 (80.6)	52/60 (86.7)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 Mental Component Summary score response is defined as 9.6 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Mental Component Summary Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

Page: 10 of 17

BMI (kg/m^2) Group 2 = 25-29.9

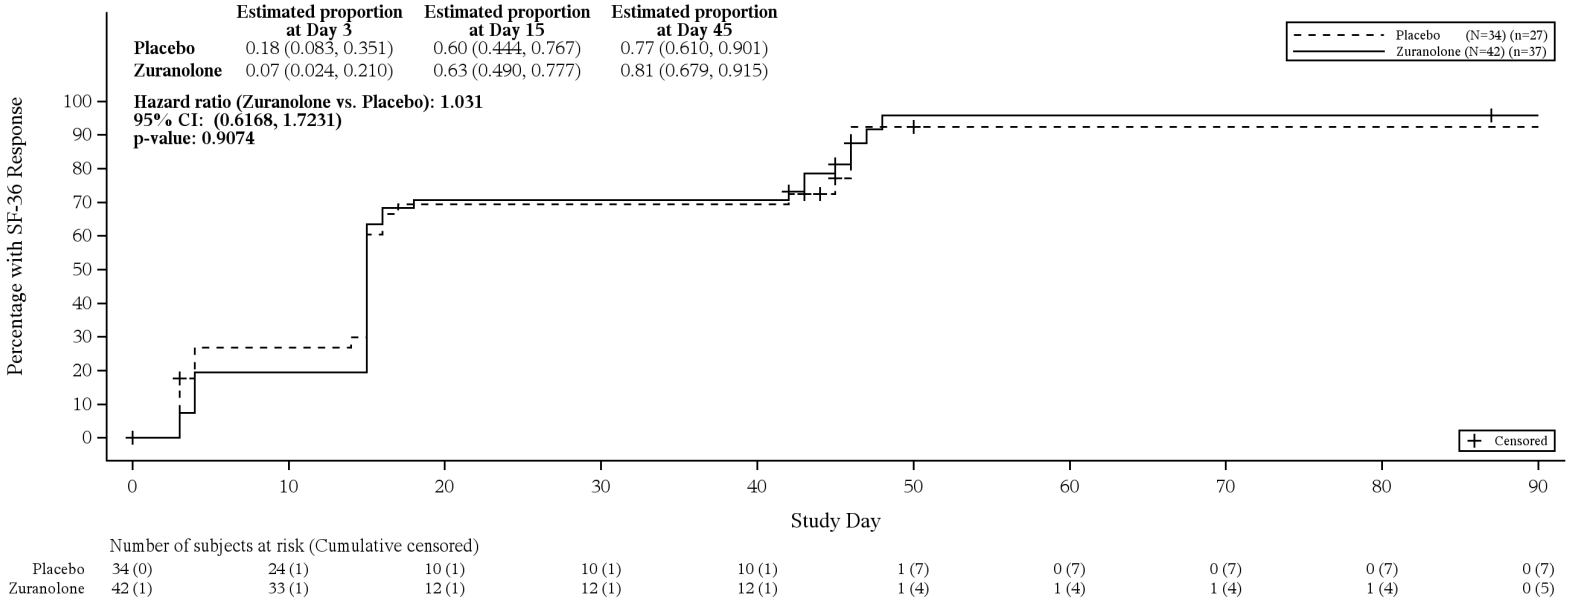
Number of subjects at risk (Cumulative censored)

Placebo	20 (0)	17 (0)	8 (0)	8 (0)	8 (0)	1 (4)
Zuranolone	21 (0)	15 (0)	6 (1)	6 (1)	5 (2)	0 (4)

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 Mental Component Summary score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 Mental Component Summary score response is defined as 9.6 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, and treatment.
Source: biib125/v_a/amnog_kmplots/f-sf36-ment-wors15-tte-201-by.sas:f-sf36-ment-wors15-tte-201-by-itta.rtf **Run Date:** 12DEC2025

Summary of Time to First Short-Form 36 (SF-36) Mental Component Summary Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

	Placebo (N=76)	Zuranolone (N=77)
Number of evaluable subjects [1]	75	76
Number of subjects with response, n (%) [2]	2 (2.7)	3 (3.9)
Time to first Mental Component Summary worsening (days) [3]		
25th percentile - Q1 (95% CI)	NE (NE, NE)	NE (NE, NE)
50th percentile - median (95% CI)	NE (NE, NE)	NE (NE, NE)
75th percentile - Q3 (95% CI)	NE (NE, NE)	NE (NE, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.334
95% CI for the HR		(0.2176 , 8.1809)
p-value for the HR		0.7553

NOTE 1: SF-36 Mental Component Summary score worsening is defined as 9.6 points (15% of total scale range) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
[1] Number of subjects with non-missing SF-36 Mental Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Mental Component Summary score worsening. The denominator for the percentage is the number of evaluable subjects.
[3] Kaplan-Meier estimates. NE=not estimable.
[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 Mental Component Summary score, and treatment.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.2.2.1 Responder-Analysen

2.2.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Physical Component Summary Scores Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	9 (12.0)	15 (19.7)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.500
95% CI for the RR		(0.718, 3.133)
p-value for RR		0.2802
OR - Odds Ratio (Zuranolone vs. Placebo)		1.670
95% CI for the OR		(0.646, 4.315)
p-value for OR		0.2899
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 Physical Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Physical Component Summary score response (9.4 points (15% of total scale range) or greater increase in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Day 45			
18 - 24, n / N (%)	2/25 (8.0)	3/17 (17.6)	
25 - 45, n / N (%)	5/50 (10.0)	9/59 (15.3)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis. NE: Not estimable due to model non-convergence across all four tested models.
NOTE 2: SF-36 Physical Component Summary score response is defined as 9.4 points (15% of total scale range) or greater increase in score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Short-Form 36 (SF-36) Physical Component Summary Scores Response (>=15% of total scale range increase from baseline) by Baseline Antidepressant Use: 217-PPD-201B - ITT population

Page: 1 of 2

Antidepressant Use at Baseline = Yes

Study Visit Statistics	Placebo (N=13)	Zuranolone (N =16)
Number of evaluable subjects [1]	13	16
Day 15		
Number of subjects with a response, n (%) [2]	1 (7.7)	1 (6.3)
Number of subjects with missing evaluation, n (%)	0	1 (6.3)
RR - Relative Risk (Zuranolone vs. Placebo)		0.596
95% CI for the RR		(0.039, 9.165)
p-value for RR		0.7108
Day 45		
Number of subjects with a response, n (%) [2]	1 (7.7)	3 (18.8)
Number of subjects with missing evaluation, n (%)	2 (15.4)	1 (6.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.789
95% CI for the RR		(0.185, 17.312)
p-value for RR		0.6154

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline SF-36 Physical Component Summary score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Physical Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Physical Component Summary score response (9.4 points (15% of total scale range) or greater increase in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.2.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Component Summary Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 Physical Component Summary score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 Physical Component Summary score response is defined as 9.4 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, and treatment.
Source: biib125/v_a/amnog_kmplots/f-sf36-phys-resp15-tte-201-ovr.sas:f-sf36-phys-resp15-tte-201-ovr-itta.rtf **Run Date:** 12DEC2025

2.2.2.2 .2 .1 Interaktionstest

Summary of Time to First Short-Form 36 (SF-36) Physical Component Summary Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	12 (16.0)	22 (28.9)	
Age Group (years)			
18 - 24, n / N (%)	4/25 (16.0)	7/17 (41.2)	0.9839
25 - 45, n / N (%)	8/50 (16.0)	15/59 (25.4)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	4/22 (18.2)	8/30 (26.7)	0.5115
>=28, n / N (%)	8/53 (15.1)	14/46 (30.4)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	9/32 (28.1)	11/31 (35.5)	0.2240
White, n / N (%)	3/40 (7.5)	11/44 (25.0)	
Antidepressant Use at Baseline			
Yes, n / N (%)	1/13 (7.7)	3/16 (18.8)	0.7428
No, n / N (%)	11/62 (17.7)	19/60 (31.7)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 Physical Component Summary score response is defined as 9.4 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.
Source: biib125/v_a/germany_amnog/t-sf36-phys-resp15-tte-201-int.sas:t-sf36-phys-resp15-tte-201-int-itta.rtf **Run Date:** 24SEP2025

Summary of Time to First Short-Form 36 (SF-36) Physical Component Summary Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 2 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
BMI (kg/m^2) Group			
<=24.9, n / N (%)	3/21 (14.3)	3/13 (23.1)	0.5053(a)
25-29.9, n / N (%)	6/20 (30.0)	7/21 (33.3)	0.7792(b)
>=30, n / N (%)	3/34 (8.8)	12/42 (28.6)	0.2644(c)
Onset of PPD			
3rd Trimester, n / N (%)	6/32 (18.8)	11/32 (34.4)	0.7856
Postpartum, n / N (%)	6/43 (14.0)	11/44 (25.0)	
Family History of PPD			
Yes, n / N (%)	1/10 (10.0)	1/10 (10.0)	0.6010
No/Unknown, n / N (%)	11/65 (16.9)	21/66 (31.8)	
History of PPD			
1st Episode, n / N (%)	9/59 (15.3)	22/66 (33.3)	0.9905
Recurrent Episode, n / N (%)	3/16 (18.8)	0/10	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			
<20, n / N (%)	0/8	3/10 (30.0)	NA
>=20, n / N (%)	12/67 (17.9)	19/66 (28.8)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 Physical Component Summary score response is defined as 9.4 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: Subjects with non-missing SF-36 Physical Component Summary score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 Physical Component Summary score response is defined as 9.4 points (15% of total scale range) or greater increase in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis. NA: Not available due to non-convergence of the statistical model.

2.2.3 Verschlechterung

2.2.3.1 Responder-Analysen

2.2.3.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Physical Component Summary Scores Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with worsening, n (%) [2]	10 (13.3)	4 (5.3)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.475
95% CI for the RR		(0.177, 1.275)
p-value for RR		0.1395
OR - Odds Ratio (Zuranolone vs. Placebo)		0.363
95% CI for the OR		(0.082, 1.602)
p-value for OR		0.1809
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 Physical Component Summary score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Physical Component Summary score worsening (9.4 points (15% of total scale range) or greater reduction in score from baseline). Missing score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

2.2.3.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Physical Component Summary Scores Worsening (>=15% of total scale range reduction from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	10 (13.3)	4 (5.3)	
Number of subjects with response at Day 45, n (%)	9 (12.0)	6 (7.9)	
Age Group (years)			NA
Day 15			
18 - 24, n / N (%)	4/25 (16.0)	0/17	
25 - 45, n / N (%)	6/50 (12.0)	4/59 (6.8)	
Day 45			
18 - 24, n / N (%)	4/25 (16.0)	0/17	
25 - 45, n / N (%)	5/50 (10.0)	6/59 (10.2)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 Physical Component Summary score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis. NE: Not estimable due to model non-convergence across all four tested models.
NOTE 2: SF-36 Physical Component Summary score worsening is defined as 9.4 points (15% of total scale range) or greater reduction in score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with worsening in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Component Summary Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 Physical Component Summary score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 Physical Component Summary score worsening is defined as 9.4 points (15% of total scale range) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 Physical Component Summary score, and treatment.

2.3.2.1 Responder-Analysen

2.3.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	25 (33.3)	32 (42.1)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.166
95% CI for the RR		(0.799, 1.701)
p-value for RR		0.4252
OR - Odds Ratio (Zuranolone vs. Placebo)		1.317
95% CI for the OR		(0.616, 2.817)
p-value for OR		0.4772
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Physical Functioning subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 Physical Functioning subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Physical Functioning subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 2 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Day 45		
Number of subjects with a response, n (%) [2]	26 (34.7)	35 (46.1)
Number of subjects with missing evaluation, n (%)	6 (8.0)	3 (3.9)
RR - Relative Risk (Zuranolone vs. Placebo)		1.226
95% CI for the RR		(0.847, 1.775)
p-value for RR		0.2796
OR - Odds Ratio (Zuranolone vs. Placebo)		1.525
95% CI for the OR		(0.705, 3.302)
p-value for OR		0.2839
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Physical Functioning subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 Physical Functioning subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Physical Functioning subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	25 (33.3)	32 (42.1)	
Number of subjects with response at Day 45, n (%)	26 (34.7)	35 (46.1)	
Age Group (years)			0.2524
Day 15			
18 - 24, n / N (%)	7/25 (28.0)	9/17 (52.9)	
25 - 45, n / N (%)	18/50 (36.0)	23/59 (39.0)	
Day 45			
18 - 24, n / N (%)	6/25 (24.0)	10/17 (58.8)	
25 - 45, n / N (%)	20/50 (40.0)	25/59 (42.4)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Physical Functioning subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Physical Functioning subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Physical Functioning subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

p-value for RR		0.1872
Day 45		
Number of subjects with a response, n (%) [2]	5 (31.3)	2 (20.0)
Number of subjects with missing evaluation, n (%)	2 (12.5)	1 (10.0)
RR - Relative Risk (Zuranolone vs. Placebo)		0.64
95% CI for the RR		(0.152, 2.693)
p-value for RR		0.5427

NOTE 1: Normal approximation method has been used to estimate relative risk and it's p-value.

[1] Number of subjects with non-missing SF-36 Physical Functioning subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Physical Functioning subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.3.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.3.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

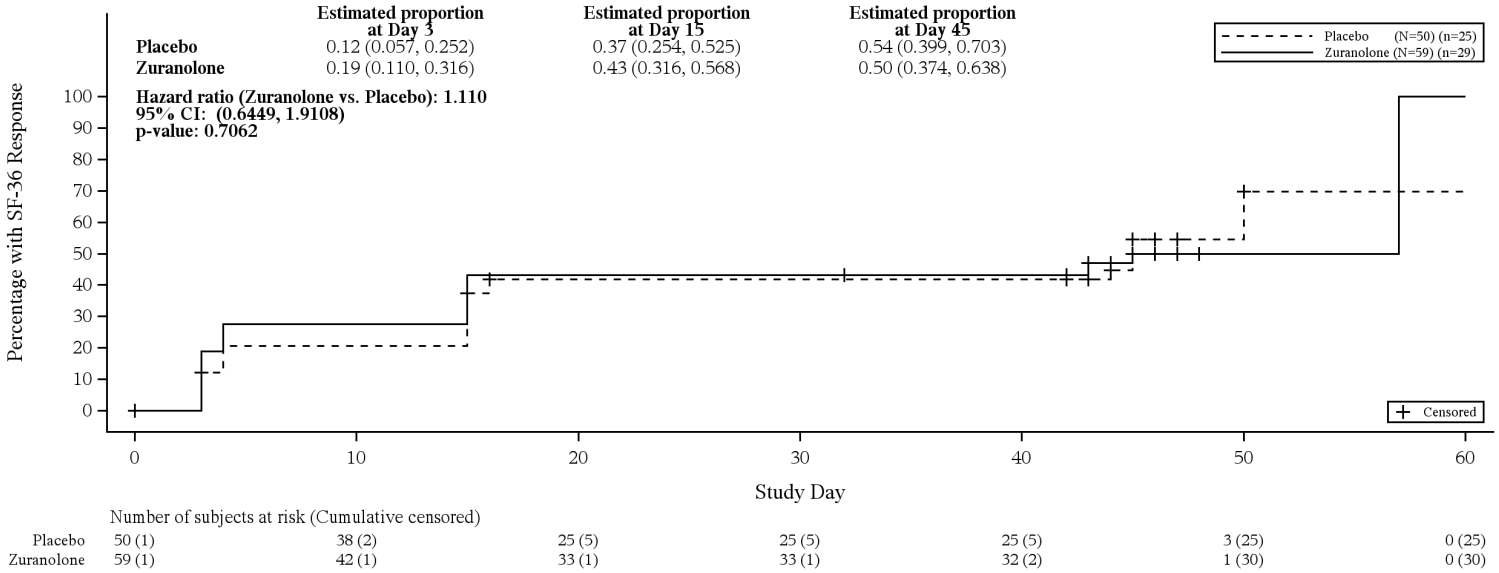
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Functioning Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

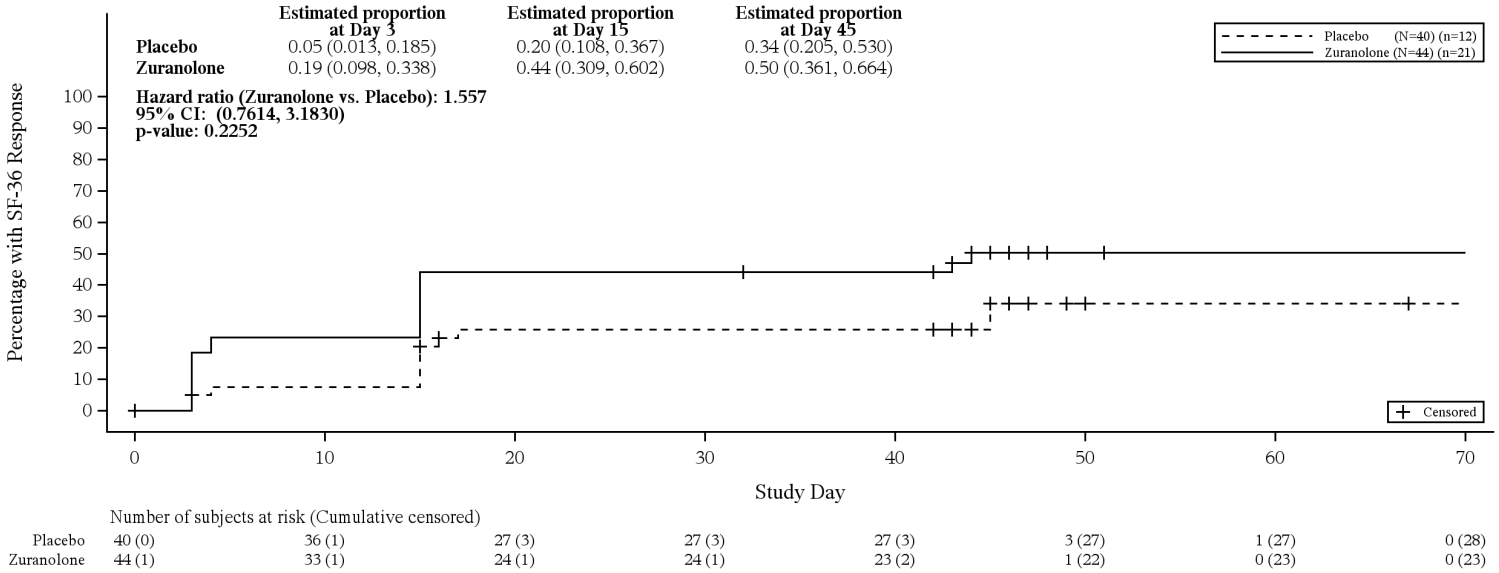
Page: 5 of 17

Race Group = Black or African American

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Physical Functioning Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

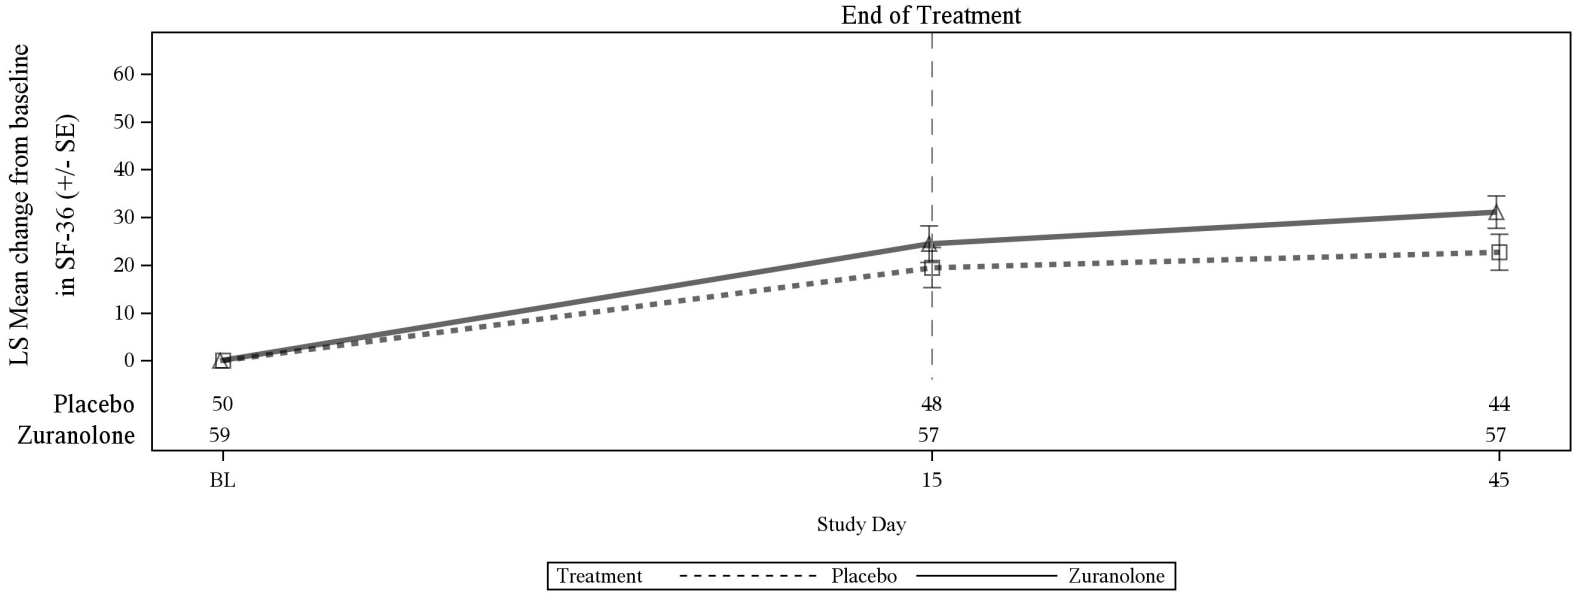
Abbreviations: LS = Least-squares; SE = Standard error; BL = Baseline; * = $p < 0.05$.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.



NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.4.2 Ansprechen

2.4.2.1 Responder-Analysen

2.4.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Role-Physical Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	36 (48.0)	47 (61.8)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.181
95% CI for the RR		(0.893, 1.563)
p-value for RR		0.2425
OR - Odds Ratio (Zuranolone vs. Placebo)		1.626
95% CI for the OR		(0.758, 3.485)
p-value for OR		0.2116
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Role-Physical subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 Role-Physical subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Role-Physical subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.4.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Role-Physical Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	36 (48.0)	47 (61.8)	
Number of subjects with response at Day 45, n (%)	38 (50.7)	50 (65.8)	
Age Group (years)			0.6728
Day 15			
18 - 24, n / N (%)	11/25 (44.0)	13/17 (76.5)	
25 - 45, n / N (%)	25/50 (50.0)	34/59 (57.6)	
Day 45			
18 - 24, n / N (%)	14/25 (56.0)	14/17 (82.4)	
25 - 45, n / N (%)	24/50 (48.0)	36/59 (61.0)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Number of subjects with missing evaluation, n (%)	1 (10.0)	0
RR - Relative Risk (Zuranolone vs. Placebo)		0.759
95% CI for the RR		(0.376, 1.533)
p-value for RR		0.4422

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Role-Physical subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Role-Physical subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Role-Physical subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.4.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Role-Physical Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

75th percentile - Q3 (95% CI)	47.0 (16.0, NE)	NE (15.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		0.882
95% CI for the HR		(0.3127 , 2.4891)
p-value for the HR		0.8128

NOTE 1: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 subscale score (for the respective parameter) response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.4.3.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Role-Physical Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with worsening, n (%) [2]	6 (8.0)	5 (6.6)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.932
95% CI for the RR		(0.308, 2.824)
p-value for RR		0.9016
OR - Odds Ratio (Zuranolone vs. Placebo)		0.954
95% CI for the OR		(0.269, 3.381)
p-value for OR		0.9421
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Role-Physical subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 Role-Physical subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Role-Physical subscale score (for the respective parameter) worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening; NE=Not Estimable.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

95% CI for Hedges' g		0.1276, 0.7944

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.5.2 Ansprechen

2.5.2.1 Responder-Analysen

2.5.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Bodily Pain Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	32 (42.7)	40 (52.6)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.204
95% CI for the RR		(0.877, 1.652)
p-value for RR		0.2513
OR - Odds Ratio (Zuranolone vs. Placebo)		1.478
95% CI for the OR		(0.751, 2.905)
p-value for OR		0.2578
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.089
95% CI for the ARR		(-0.045, 0.224)
p-value for ARR		0.1934

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Bodily Pain subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution.

[1] Number of subjects with non-missing SF-36 Bodily Pain subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Bodily Pain subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.5.2.1 .2 Subgruppen

2.5.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Bodily Pain Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	32 (42.7)	40 (52.6)	
Number of subjects with response at Day 45, n (%)	29 (38.7)	44 (57.9)	
Age Group (years)			0.4810
Day 15			
18 - 24, n / N (%)	10/25 (40.0)	10/17 (58.8)	
25 - 45, n / N (%)	22/50 (44.0)	30/59 (50.8)	
Day 45			
18 - 24, n / N (%)	8/25 (32.0)	11/17 (64.7)	
25 - 45, n / N (%)	21/50 (42.0)	33/59 (55.9)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.
Source: biib125/v_a/germany_amnog/t-sf36-bp-resp15-201-int.sas:t-sf36-bp-resp15-201-int-itta.rtf **Run Date:** 24SEP2025

Summary of Short-Form 36 (SF-36) Bodily Pain Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 5 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Onset of PPD			0.9132
Day 15			
3rd Trimester, n / N (%)	13/32 (40.6)	18/32 (56.3)	
Postpartum, n / N (%)	19/43 (44.2)	22/44 (50.0)	
Day 45			
3rd Trimester, n / N (%)	14/32 (43.8)	20/32 (62.5)	
Postpartum, n / N (%)	15/43 (34.9)	24/44 (54.5)	
Family History of PPD			0.0871
Day 15			
Yes, n / N (%)	5/10 (50.0)	5/10 (50.0)	
No/Unknown, n / N (%)	27/65 (41.5)	35/66 (53.0)	
Day 45			
Yes, n / N (%)	7/10 (70.0)	5/10 (50.0)	
No/Unknown, n / N (%)	22/65 (33.8)	39/66 (59.1)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).

2.5.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Bodily Pain Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.
Source: biib125/v_a/amnog_kmplots/f-sf36-bp-resp15-tte-201-ovr.sas:f-sf36-bp-resp15-tte-201-ovr-itta.rtf **Run Date:** 12DEC2025

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Bodily Pain Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

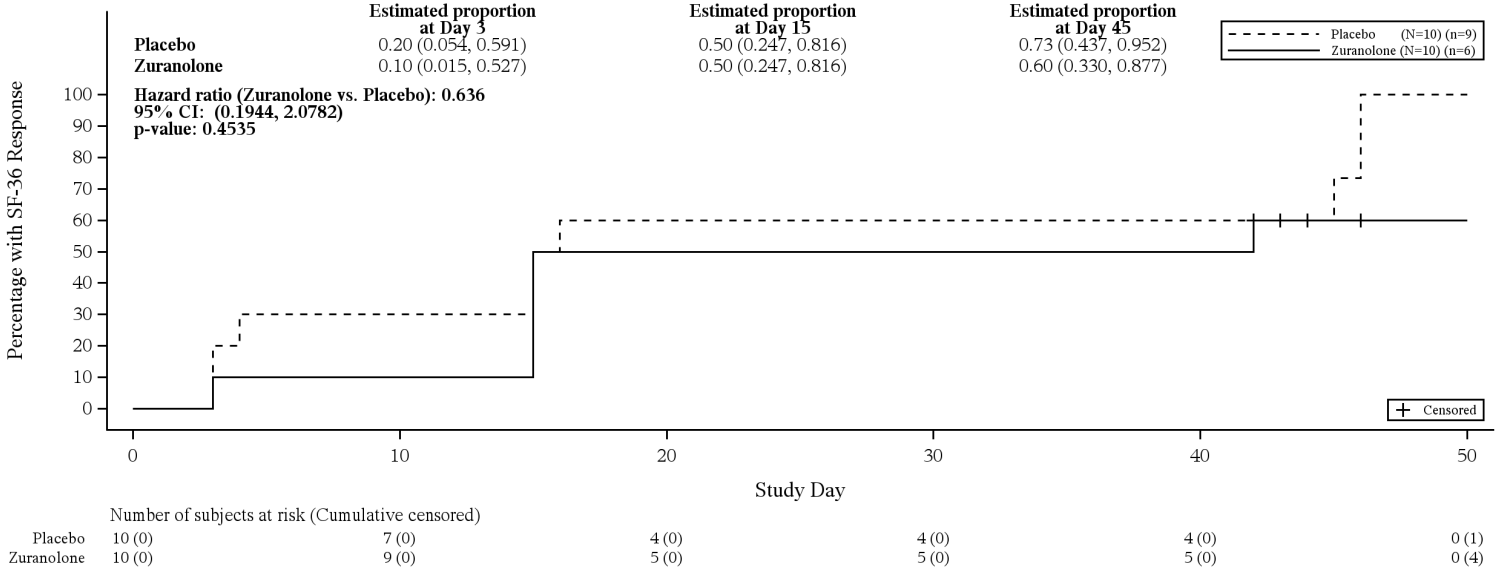
Page: 13 of 17

Onset of PPD = Postpartum

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

2.5.3 Verschlechterung

2.5.3.1 Responder-Analysen

2.5.3.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Bodily Pain Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with worsening, n (%) [2]	13 (17.3)	6 (7.9)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.490
95% CI for the RR		(0.202, 1.193)
p-value for RR		0.1163
OR - Odds Ratio (Zuranolone vs. Placebo)		0.424
95% CI for the OR		(0.147, 1.223)
p-value for OR		0.1126
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Bodily Pain subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 Bodily Pain subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Bodily Pain subscale score worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

2.5.3.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Bodily Pain Subscale Worsening (>=15% of total scale range reduction from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	13 (17.3)	6 (7.9)	
Number of subjects with response at Day 45, n (%)	8 (10.7)	5 (6.6)	
Age Group (years)			NA
Day 15			
18 - 24, n / N (%)	5/25 (20.0)	1/17 (5.9)	
25 - 45, n / N (%)	8/50 (16.0)	5/59 (8.5)	
Day 45			
18 - 24, n / N (%)	5/25 (20.0)	1/17 (5.9)	
25 - 45, n / N (%)	3/50 (6.0)	4/59 (6.8)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis. NE: Not estimable due to model non-convergence across all four tested models.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with worsening in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis. NE: Not estimable due to model non-convergence across all four tested models.

NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline.

NOTE 3: n / N (%) = number of evaluable subjects with worsening in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).

(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Bodily Pain Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.6.1.2 .2 .8 PPD in der Anamnese

Model-based Results on Change from Baseline in Short-Form 36 (SF-36) General Health Subscale by History of PPD: 217-PPD-201B - ITT population

Page: 1 of 2

History of PPD = 1st Episode

	Placebo (N=60)	Zuranolone (N=67)
Day 15		
n	59	64
LS Mean (SE)	6.02 (1.851)	8.38 (1.772)
95% CI for the LS Mean	2.35, 9.68	4.87, 11.89
Difference (Zuranolone - Placebo)		
LS Mean (SE)		2.36 (2.563)
95% CI for the LS Mean		-2.71, 7.44
p-value		0.3589
Hedges' g (Zuranolone vs. Placebo)		0.165
95% CI for Hedges' g		-0.1891, 0.5195
Day 45		
n	55	64
LS Mean (SE)	7.29 (2.133)	10.97 (1.994)
95% CI for the LS Mean	3.07, 11.51	7.02, 14.91
Difference (Zuranolone - Placebo)		
LS Mean (SE)		3.68 (2.920)
95% CI for the LS Mean		-2.11, 9.46
p-value		0.2104
Hedges' g (Zuranolone vs. Placebo)		0.230
95% CI for Hedges' g		-0.1315, 0.5916

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.6.2.1 Responder-Analysen

2.6.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	19 (25.3)	24 (31.6)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.308
95% CI for the RR		(0.821, 2.084)
p-value for RR		0.2593
OR - Odds Ratio (Zuranolone vs. Placebo)		1.424
95% CI for the OR		(0.698, 2.906)
p-value for OR		0.3311
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 General Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 General Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 General Health subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 2 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Day 45		
Number of subjects with a response, n (%) [2]	22 (29.3)	29 (38.2)
Number of subjects with missing evaluation, n (%)	6 (8.0)	3 (3.9)
RR - Relative Risk (Zuranolone vs. Placebo)		1.227
95% CI for the RR		(0.770, 1.957)
p-value for RR		0.3897
OR - Odds Ratio (Zuranolone vs. Placebo)		1.566
95% CI for the OR		(0.759, 3.230)
p-value for OR		0.2252
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 General Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 General Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 General Health subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	19 (25.3)	24 (31.6)	
Number of subjects with response at Day 45, n (%)	22 (29.3)	29 (38.2)	
Age Group (years)			0.2747
Day 15			
18 - 24, n / N (%)	5/25 (20.0)	3/17 (17.6)	
25 - 45, n / N (%)	14/50 (28.0)	21/59 (35.6)	
Day 45			
18 - 24, n / N (%)	5/25 (20.0)	3/17 (17.6)	
25 - 45, n / N (%)	17/50 (34.0)	26/59 (44.1)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

2.6.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.6.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

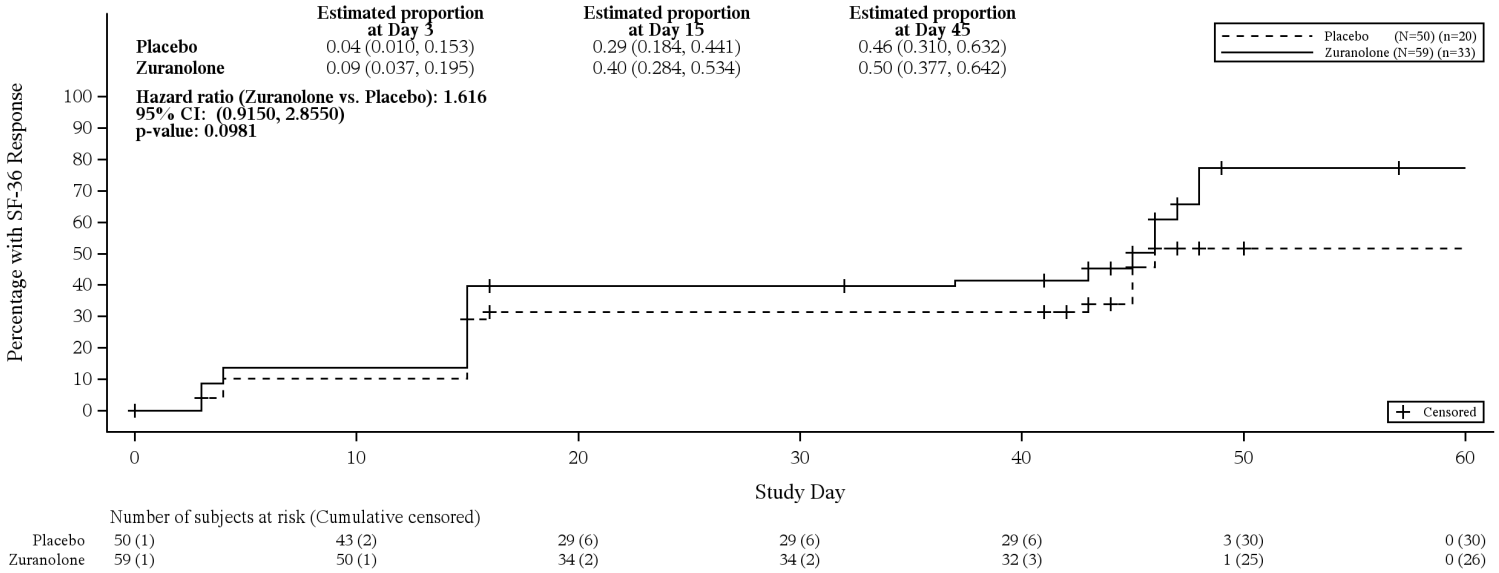
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) General Health Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

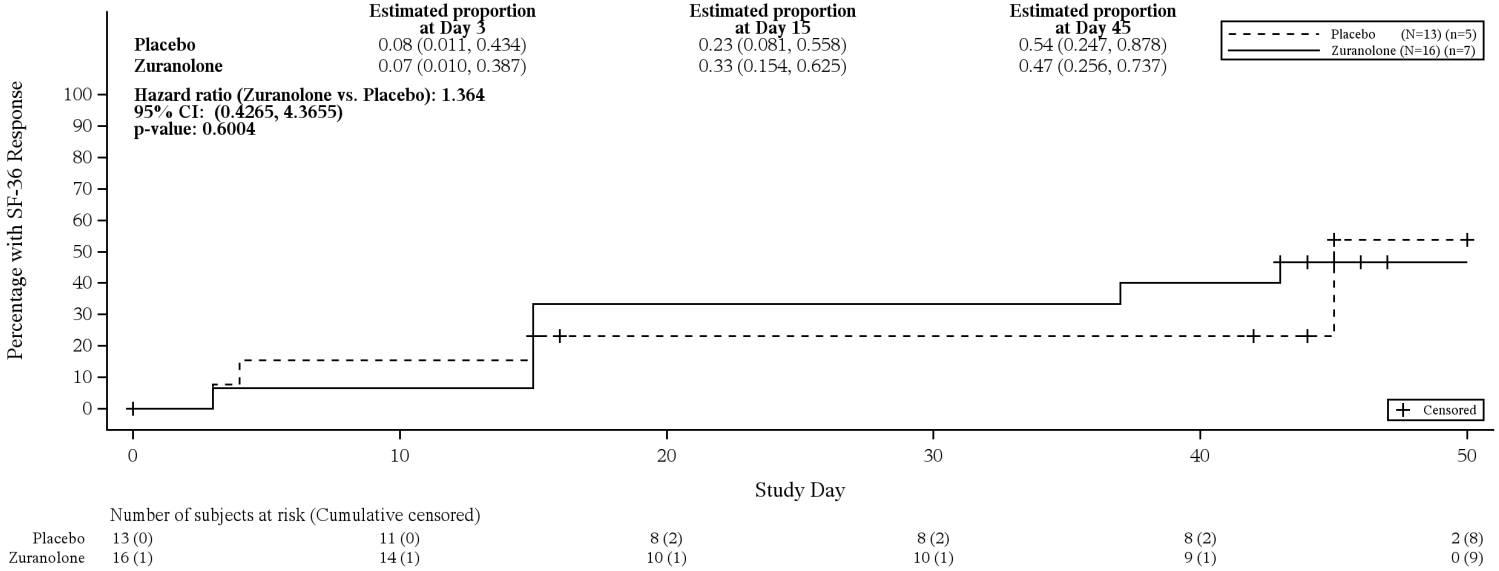
Page: 6 of 17

Race Group = White

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

2.6.3 Verschlechterung

2.6.3.1 Responder-Analysen

2.6.3.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) General Health Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with worsening, n (%) [2]	5 (6.7)	2 (2.6)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.402
95% CI for the RR		(0.080, 2.021)
p-value for RR		0.2684
OR - Odds Ratio (Zuranolone vs. Placebo)		0.376
95% CI for the OR		(0.068, 2.091)
p-value for OR		0.2639
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 General Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 General Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 General Health subscale score worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) General Health Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

95% CI for Hedges' g		-0.1254, 0.6647

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

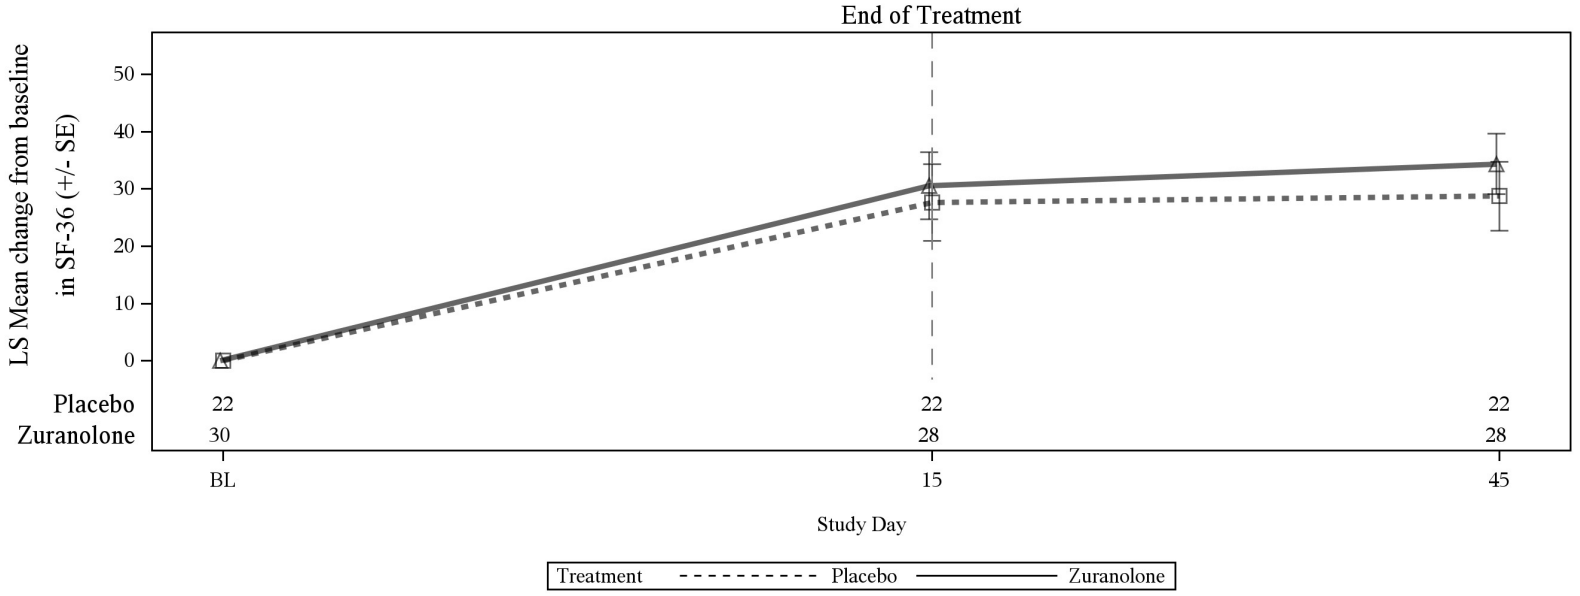
Abbreviations: LS = Least-squares; SE = Standard error; BL = Baseline; * = $p < 0.05$.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.



NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

2.7.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Vitality Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	40 (53.3)	45 (59.2)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.104
95% CI for the RR		(0.840, 1.451)
p-value for RR		0.4779
OR - Odds Ratio (Zuranolone vs. Placebo)		1.218
95% CI for the OR		(0.638, 2.326)
p-value for OR		0.5498
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.051
95% CI for the ARR		(-0.105, 0.206)
p-value for ARR		0.5226

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Vitality subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.

[1] Number of subjects with non-missing SF-36 Vitality subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Vitality subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.7.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Vitality Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	40 (53.3)	45 (59.2)	
Number of subjects with response at Day 45, n (%)	42 (56.0)	54 (71.1)	
Age Group (years)			0.6700
Day 15			
18 - 24, n / N (%)	13/25 (52.0)	9/17 (52.9)	
25 - 45, n / N (%)	27/50 (54.0)	36/59 (61.0)	
Day 45			
18 - 24, n / N (%)	14/25 (56.0)	11/17 (64.7)	
25 - 45, n / N (%)	28/50 (56.0)	43/59 (72.9)	

NOTE 1: p-value is derived using Method 1, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

[1] Number of subjects with non-missing SF-36 Vitality subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Vitality subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.7.2.2 TTE-Analysen

2.7.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Vitality Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 subscale score (for the respective parameter) response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.7.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Vitality Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

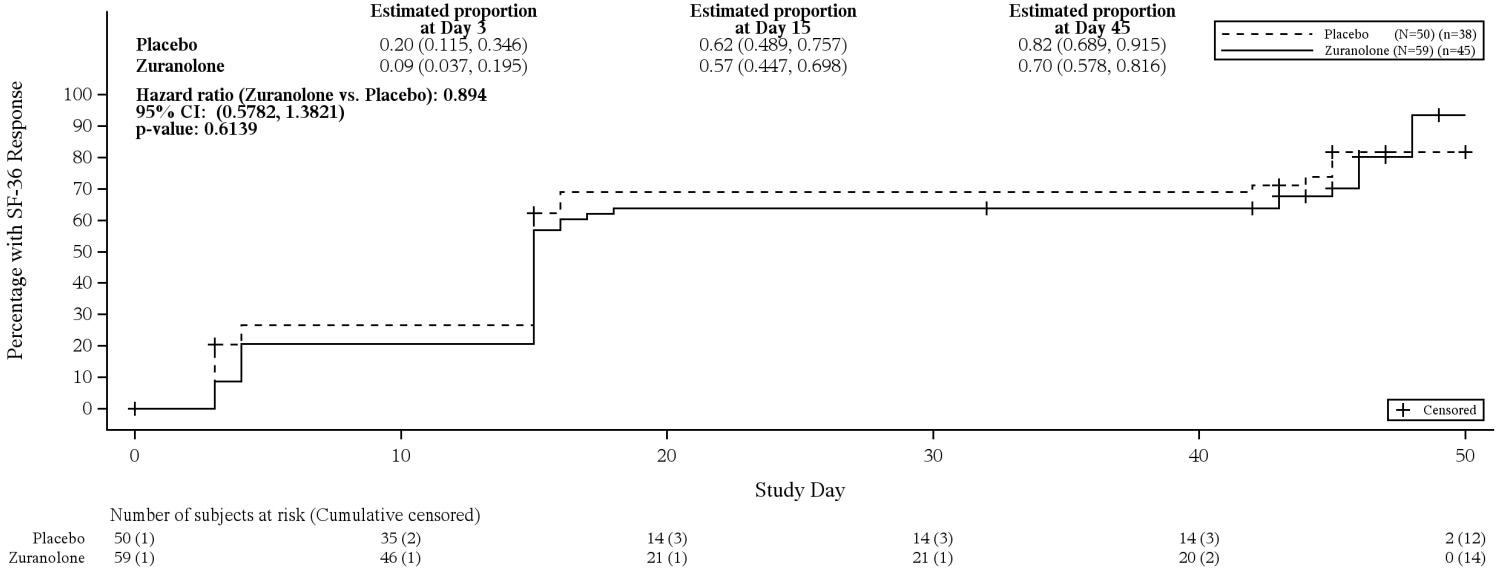
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Day 45		
Number of subjects with worsening, n (%) [2]	2 (2.7)	0
Number of subjects with missing evaluation, n (%)	6 (8.0)	3 (3.9)
RR - Relative Risk (Zuranolone vs. Placebo)		0.20
95% CI for the RR		(0.010, 4.044)
p-value for RR		0.2923
OR - Odds Ratio (Zuranolone vs. Placebo)		0.19
95% CI for the OR		(0.009, 4.070)
p-value for OR		0.2897
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		-0.03
95% CI for the ARR		(-0.070, 0.018)
p-value for ARR		0.2388

NOTE 1: Normal approximation method has been used to estimate relative risk, odds ratio, and absolute risk reduction.
[1] Number of subjects with non-missing SF-36 Vitality subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Vitality subscale score worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

Model-based Results on Change from Baseline in Short-Form 36 (SF-36) Social Functioning Subscale: Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 2 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
BMI (kg/m^2) Group			
<=24.9	21	13	0.1416(a)
25-29.9	20	21	0.1544(b)
>=30	34	42	0.8197(c)
Onset of PPD			
3rd Trimester	32	32	0.1865
Postpartum	43	44	
Family History of PPD			
Yes	10	10	0.0990
No/Unknown	65	66	
History of PPD			
1st Episode	59	66	0.4480
Recurrent Episode	16	10	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			
<20	8	10	NA
>=20	67	66	

NOTE 1: p-value is based on the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction as fixed effects with unstructured covariance structure. NA indicates criteria not met for subgroup/interaction analysis.

NOTE 2: The SF-36 Health Survey is a subject-reported 36-item instrument for measuring functional health and well-being in 8 dimensions (physical functioning, role physical, bodily pain, general health, vitality, social functioning, role emotional, and mental health). The Physical Component Summary and the Mental Component Summary are derived from the 8 dimensions. All dimension and component summary scores are norm-based. A positive change indicates improvement.

(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

2.8.2 Ansprechen

2.8.2.1 Responder-Analysen

2.8.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Social Functioning Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	43 (57.3)	50 (65.8)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.149
95% CI for the RR		(0.899, 1.470)
p-value for RR		0.2671
OR - Odds Ratio (Zuranolone vs. Placebo)		1.398
95% CI for the OR		(0.716, 2.728)
p-value for OR		0.3266
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.077
95% CI for the ARR		(-0.075, 0.228)
p-value for ARR		0.3202

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Social Functioning subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.

[1] Number of subjects with non-missing SF-36 Social Functioning subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Social Functioning subscale score (for the respective parameter) response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.8.2.1 .2 Subgruppen

2.8.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Social Functioning Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	43 (57.3)	50 (65.8)	
Number of subjects with response at Day 45, n (%)	49 (65.3)	62 (81.6)	
Age Group (years)			0.1894
Day 15			
18 - 24, n / N (%)	12/25 (48.0)	13/17 (76.5)	
25 - 45, n / N (%)	31/50 (62.0)	37/59 (62.7)	
Day 45			
18 - 24, n / N (%)	14/25 (56.0)	13/17 (76.5)	
25 - 45, n / N (%)	35/50 (70.0)	49/59 (83.1)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Day 15			
Yes, n / N (%)	6/10 (60.0)	6/10 (60.0)	
No/Unknown, n / N (%)	37/65 (56.9)	44/66 (66.7)	
Day 45			
Yes, n / N (%)	8/10 (80.0)	8/10 (80.0)	
No/Unknown, n / N (%)	41/65 (63.1)	54/66 (81.8)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(1.057, 1.847)
p-value for RR		0.0189

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Social Functioning subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Social Functioning subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Social Functioning subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.8.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Social Functioning Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

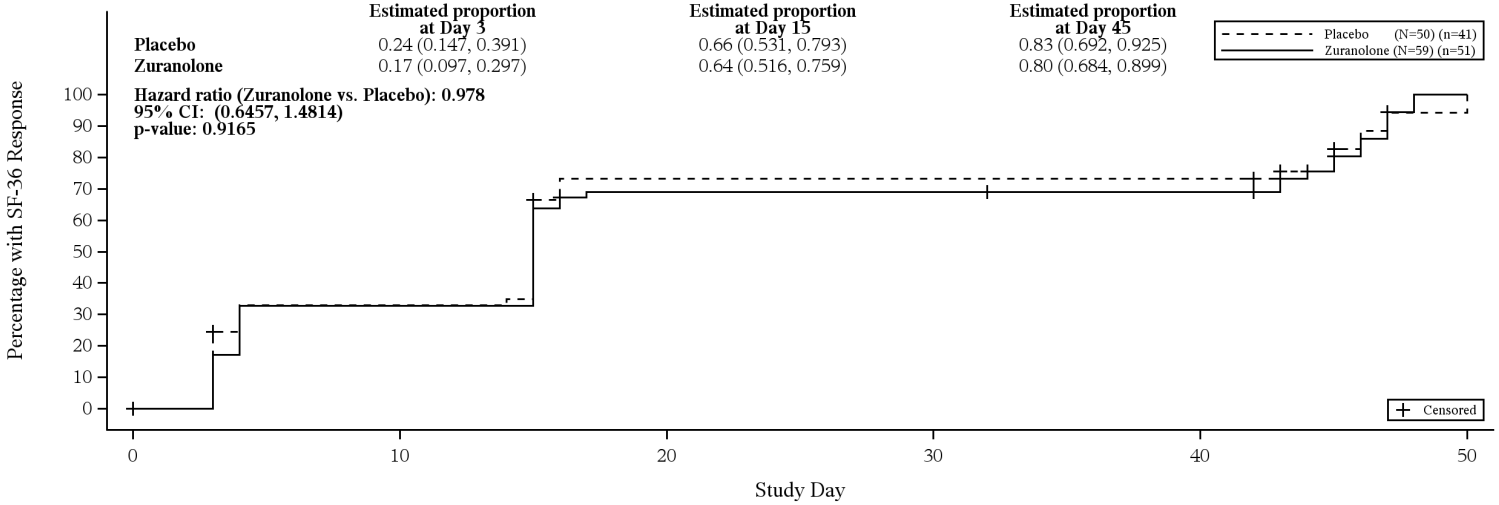
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

>=20, n / N (%)	10/67 (14.9)	4/66 (6.1)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with worsening in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

2.9.2 Ansprechen

2.9.2.1 Responder-Analysen

2.9.2.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Role-Emotional Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with a response, n (%) [2]	54 (72.0)	53 (69.7)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.977
95% CI for the RR		(0.802, 1.191)
p-value for RR		0.8206
OR - Odds Ratio (Zuranolone vs. Placebo)		0.903
95% CI for the OR		(0.441, 1.846)
p-value for OR		0.7788
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		-0.017
95% CI for the ARR		(-0.160, 0.126)
p-value for ARR		0.8151

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Role-Emotional subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.
[1] Number of subjects with non-missing SF-36 Role-Emotional subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Role-Emotional subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.9.2.1 .2 Subgruppen

2.9.2.1 .2 .1 Interaktionstest

Summary of Short-Form 36 (SF-36) Role-Emotional Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	54 (72.0)	53 (69.7)	
Number of subjects with response at Day 45, n (%)	51 (68.0)	57 (75.0)	
Age Group (years)			0.7320
Day 15			
18 - 24, n / N (%)	18/25 (72.0)	14/17 (82.4)	
25 - 45, n / N (%)	36/50 (72.0)	39/59 (66.1)	
Day 45			
18 - 24, n / N (%)	15/25 (60.0)	11/17 (64.7)	
25 - 45, n / N (%)	36/50 (72.0)	46/59 (78.0)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Black or African American, n / N (%)	22/32 (68.8)	23/31 (74.2)	
White, n / N (%)	26/40 (65.0)	33/44 (75.0)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

2.9.2.2 .1 ITT-Population

Kaplan-Meier Plot for First Short-Form 36 (SF-36) Role-Emotional Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.9.2.2 .2 Subgruppen

2.9.2.2 .2 .1 Interaktionstest

Summary of Time to First Short-Form 36 (SF-36) Role-Emotional Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	64 (85.3)	64 (84.2)	
Age Group (years)			
18 - 24, n / N (%)	20/25 (80.0)	15/17 (88.2)	0.2877
25 - 45, n / N (%)	44/50 (88.0)	49/59 (83.1)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	19/22 (86.4)	24/30 (80.0)	0.7878
>=28, n / N (%)	45/53 (84.9)	40/46 (87.0)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	28/32 (87.5)	27/31 (87.1)	0.8805
White, n / N (%)	33/40 (82.5)	36/44 (81.8)	
Antidepressant Use at Baseline			
Yes, n / N (%)	10/13 (76.9)	15/16 (93.8)	0.0560
No, n / N (%)	54/62 (87.1)	49/60 (81.7)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Page: 3 of 3

BMI (kg/m^2) Group 2 = >=30

	Placebo (N=34)	Zuranolone (N=42)
Number of evaluable subjects [1]	34	42
Number of subjects with response, n (%) [2]	30 (88.2)	38 (90.5)
Time to first Role-Emotional Subscale response (days) [3]		
25th percentile - Q1 (95% CI)	4.0 (3.0 , 15.0)	4.0 (3.0 , 15.0)
50th percentile - median (95% CI)	15.0 (4.0 , 15.0)	15.0 (NE, NE)
75th percentile - Q3 (95% CI)	16.0 (15.0 , 46.0)	16.0 (15.0 , 46.0)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.019
95% CI for the HR		(0.6278 , 1.6542)
p-value for the HR		0.9390

NOTE 1: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 subscale score (for the respective parameter) response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.9.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for First Short-Form 36 (SF-36) Role-Emotional Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

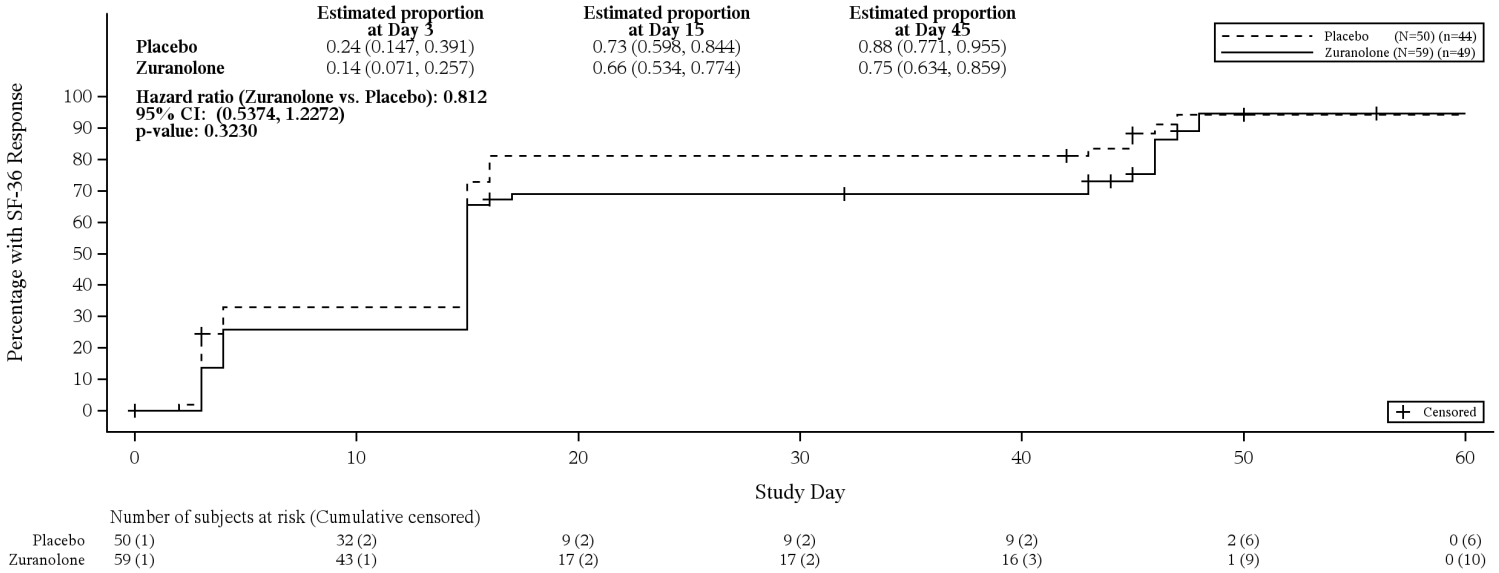
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

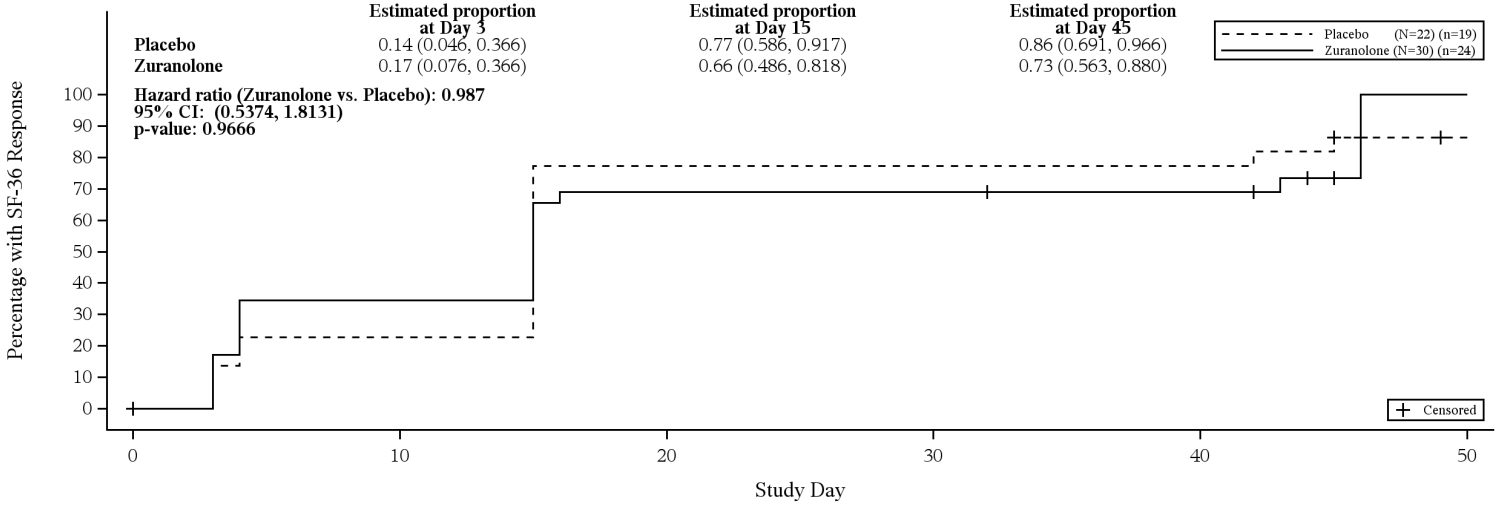
Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Recurrent Episode, n / N (%)	2/16 (12.5)	1/10 (10.0)	
Day 45			
1st Episode, n / N (%)	3/59 (5.1)	1/66 (1.5)	
Recurrent Episode, n / N (%)	2/16 (12.5)	0/10	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			NA
Day 15			
<20, n / N (%)	0/8	1/10 (10.0)	
>=20, n / N (%)	5/67 (7.5)	4/66 (6.1)	
Day 45			
<20, n / N (%)	1/8 (12.5)	1/10 (10.0)	
>=20, n / N (%)	4/67 (6.0)	0/66	

NOTE 1: NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with worsening in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Kaplan-Meier Plot for First Short-Form 36 (SF-36) Role-Emotional Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

p-value for RR		0.2253
OR - Odds Ratio (Zuranolone vs. Placebo)		1.549
95% CI for the OR		(0.775, 3.098)
p-value for OR		0.2157
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.110
95% CI for the ARR		(-0.038, 0.258)
p-value for ARR		0.1464

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Health subscale score (for the respective parameter), treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution.

[1] Number of subjects with non-missing SF-36 Mental Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Mental Health subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) Mental Health Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	47 (62.7)	54 (71.1)	
Number of subjects with response at Day 45, n (%)	50 (66.7)	62 (81.6)	
Age Group (years)			0.7202
Day 15			
18 - 24, n / N (%)	17/25 (68.0)	15/17 (88.2)	
25 - 45, n / N (%)	30/50 (60.0)	39/59 (66.1)	
Day 45			
18 - 24, n / N (%)	17/25 (68.0)	12/17 (70.6)	
25 - 45, n / N (%)	33/50 (66.0)	50/59 (84.7)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(1.068, 1.760)
p-value for RR		0.0134

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Mental Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Mental Health subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Summary of Short-Form 36 (SF-36) Mental Health Subscale Response (>=15% of total scale range increase from baseline) by History of PPD: 217-PPD-201B - ITT population

Page: 2 of 2

History of PPD = Recurrent Episode

Study Visit Statistics	Placebo (N=16)	Zuranolone (N =10)
Number of evaluable subjects [1]	16	10
Day 15		
Number of subjects with a response, n (%) [2]	8 (50.0)	6 (60.0)
Number of subjects with missing evaluation, n (%)	2 (12.5)	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.252
95% CI for the RR		(0.596, 2.631)
p-value for RR		0.5532
Day 45		
Number of subjects with a response, n (%) [2]	10 (62.5)	9 (90.0)
Number of subjects with missing evaluation, n (%)	2 (12.5)	1 (10.0)
RR - Relative Risk (Zuranolone vs. Placebo)		1.502
95% CI for the RR		(0.874, 2.582)
p-value for RR		0.1406

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing SF-36 Mental Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Mental Health subscale score response (15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

2.10.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Mental Health Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

2.10.2.2 .2 .1 Interaktionstest

Summary of Time to First Short-Form 36 (SF-36) Mental Health Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	62 (82.7)	69 (90.8)	
Age Group (years)			
18 - 24, n / N (%)	22/25 (88.0)	17/17 (100.0)	0.3366
25 - 45, n / N (%)	40/50 (80.0)	52/59 (88.1)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	20/22 (90.9)	26/30 (86.7)	0.5922
>=28, n / N (%)	42/53 (79.2)	43/46 (93.5)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	26/32 (81.3)	30/31 (96.8)	0.7326
White, n / N (%)	33/40 (82.5)	38/44 (86.4)	
Antidepressant Use at Baseline			
Yes, n / N (%)	10/13 (76.9)	14/16 (87.5)	0.3062
No, n / N (%)	52/62 (83.9)	55/60 (91.7)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 subscale score (for the respective parameter) response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for baseline SF-36 subscale score (for the respective parameter), and treatment.

2.10.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Short-Form 36 (SF-36) Mental Health Subscale Response (>=15% of total scale range increase from baseline) by Subgroup: 217-PPD-201B - ITT population

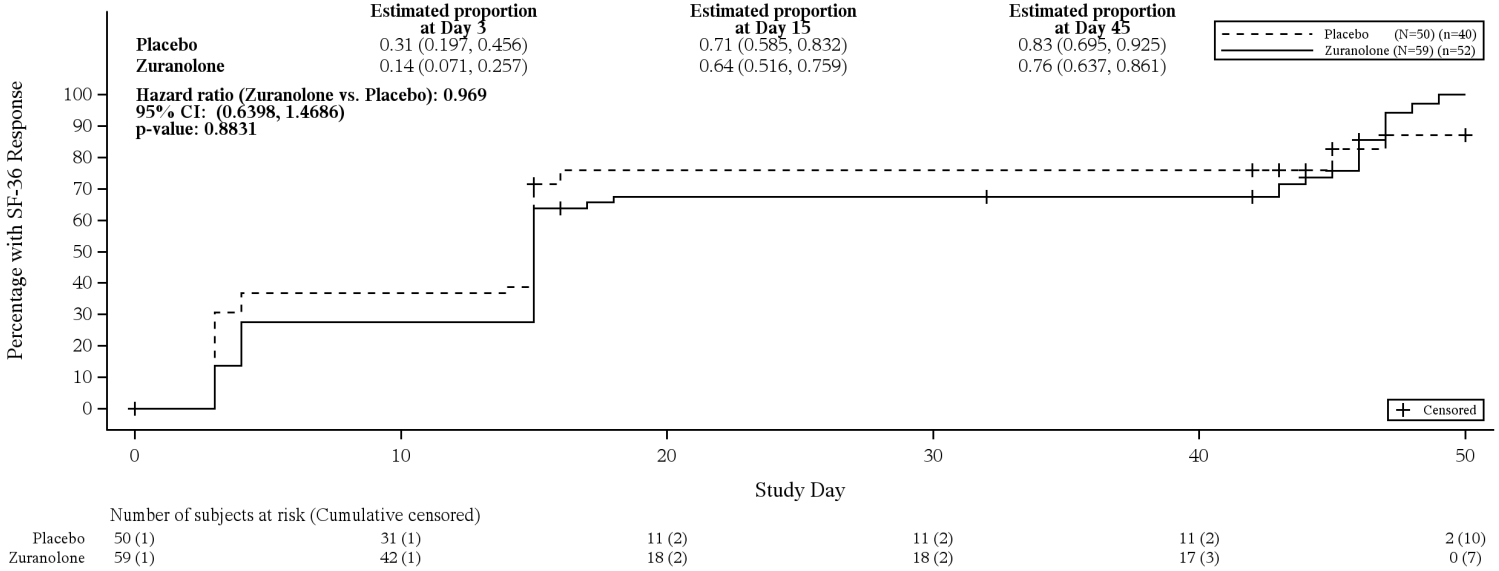
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

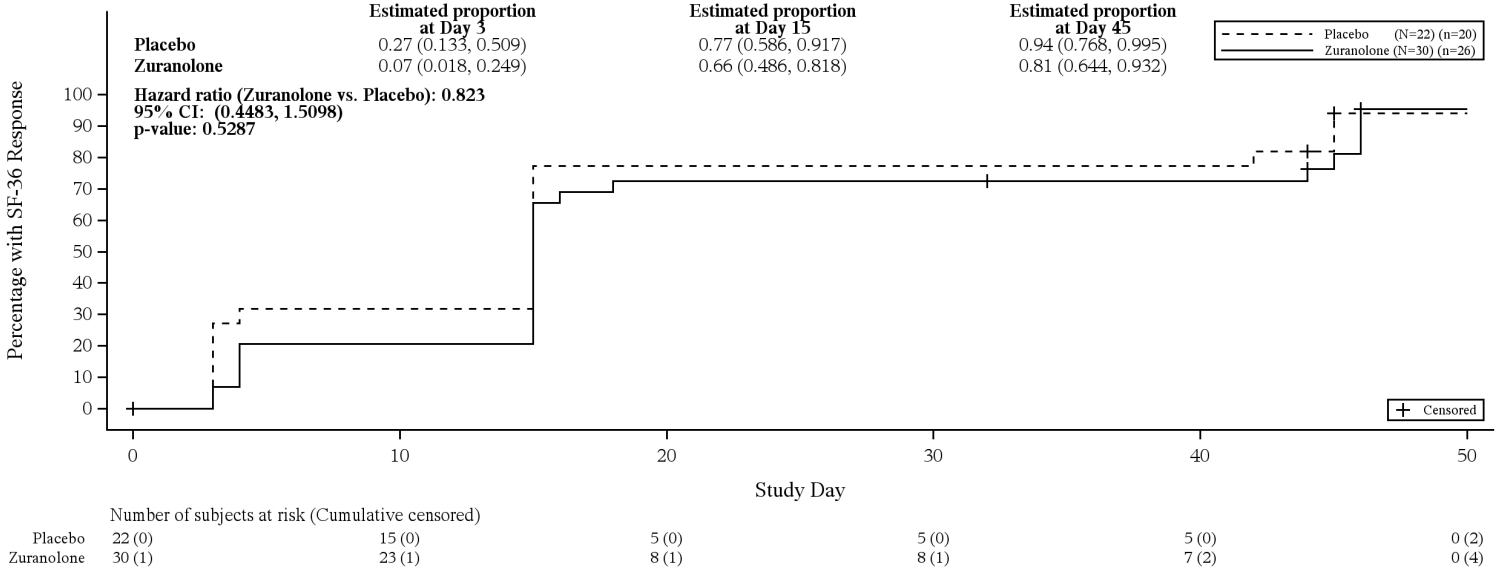
Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: SF-36 subscale score (for the respective parameter) response is defined as 15 points (15% of total scale range 0-100) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

2.10.3.1 .1 ITT-Population

Summary of Short-Form 36 (SF-36) Mental Health Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 2

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 15		
Number of subjects with worsening, n (%) [2]	2 (2.7)	1 (1.3)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		0.471
95% CI for the RR		(0.041, 5.374)
p-value for RR		0.5443
OR - Odds Ratio (Zuranolone vs. Placebo)		0.447
95% CI for the OR		(0.035, 5.702)
p-value for OR		0.5350
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing SF-36 Mental Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a SF-36 Mental Health subscale score worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.
