NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline SF-36 Mental Health subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing SF-36 Mental Health subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a SF-36 Mental Health subscale score worsening (15 points (15% of total scale range 0-100) or greater reduction in subscale score from baseline). Missing subscale score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing SF-36 subscale score (for the respective parameter) at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: SF-36 subscale score (for the respective parameter) worsening is defined as 15 points (15% of total scale range 0-100) or greater reduction in score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline SF-36 subscale score (for the respective parameter), and treatment.

Hedges' g (Zuranolone vs. Placebo)		0.210
95% CI for Hedges' g		-0.1145, 0.5339

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

3.1.1.2 Subgruppen

3.1.1.2 .1 Interaktionstest

Model-based Results on Change from Baseline in Barkin Index of Maternal Functioning (BIMF) Total Score: Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Age Group (years)			
18 - 24	25	17	0.8738
25 - 45	50	59	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28	22	30	0.7586
>=28	53	46	
Race Group (Black or African American, White)			
Black or African American	32	31	0.3133
White	40	44	
Antidepressant Use at Baseline			
Yes	13	16	0.8672
No	62	60	

NOTE 1: p-value is based on the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction as fixed effects with unstructured covariance structure. NA indicates criteria not met for subgroup interaction analysis.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

p-value		0.1252
Hedges' g (Zuranolone vs. Placebo)		0.438
95% CI for Hedges' g		-0.1268, 1.0032

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

95% CI for Hedges' g		-0.4002, 0.5092

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

n	63	64
LS Mean (SE)	13.29 (2.109)	19.45 (2.085)
95% CI for the LS Mean	9.11, 17.46	15.32, 23.58
Difference (Zuranolone - Placebo)		
LS Mean (SE)		6.17 (2.974)
95% CI for the LS Mean		0.28, 12.05
p-value		0.0402
Hedges' g (Zuranolone vs. Placebo)		0.366
95% CI for Hedges' g		0.0150, 0.7165
Day 21		
n	63	64
LS Mean (SE)	15.94 (2.179)	20.39 (2.155)
95% CI for the LS Mean	11.62, 20.25	16.12, 24.66
Difference (Zuranolone - Placebo)		
LS Mean (SE)		4.45 (3.073)
95% CI for the LS Mean		-1.63, 10.54
p-value		0.1497
Hedges' g (Zuranolone vs. Placebo)		0.256
95% CI for Hedges' g		-0.0935, 0.6050

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

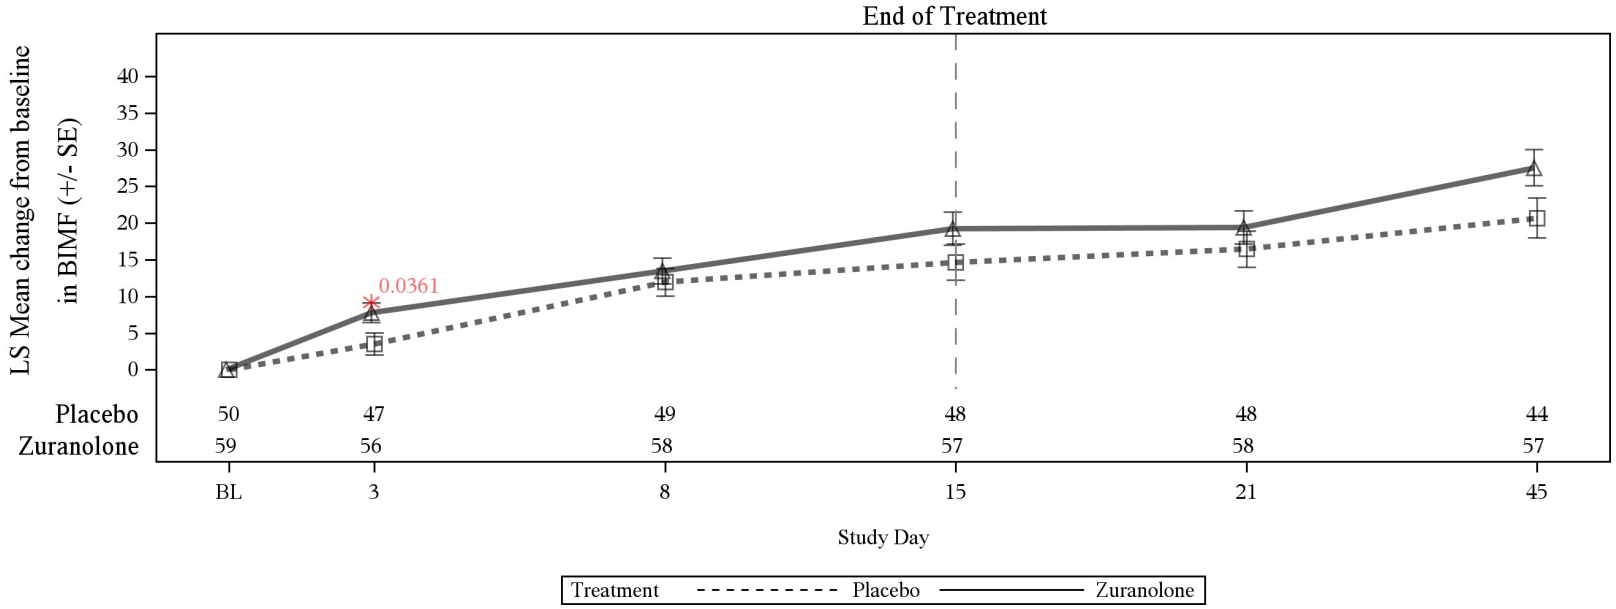
Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.



NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

3.1.2 Ansprechen

3.1.2.1 Responder-Analysen

3.1.2.1 .1 ITT-Population

Summary of Barkin Index of Maternal Functioning (BIMF) Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	7 (9.3)	11 (14.5)
Number of subjects with missing evaluation, n (%)	3 (4.0)	4 (5.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.451
95% CI for the RR		(0.600, 3.508)
p-value for RR		0.4081
OR - Odds Ratio (Zuranolone vs. Placebo)		1.355
95% CI for the OR		(0.496, 3.700)
p-value for OR		0.5529
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing BIMF total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a BIMF total score response (18 points (15% of total scale range 0-120) or greater increase in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

3.1.2.1 .2 Subgruppen

3.1.2.1 .2 .1 Interaktionstest

Summary of Barkin Index of Maternal Functioning (BIMF) Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	20 (26.7)	35 (46.1)	
Number of subjects with response at Day 45, n (%)	37 (49.3)	49 (64.5)	
Age Group (years)			0.5672
Day 15			
18 - 24, n / N (%)	6/25 (24.0)	7/17 (41.2)	
25 - 45, n / N (%)	14/50 (28.0)	28/59 (47.5)	
Day 45			
18 - 24, n / N (%)	13/25 (52.0)	10/17 (58.8)	
25 - 45, n / N (%)	24/50 (48.0)	39/59 (66.1)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Day 45			
<28, n / N (%)	14/22 (63.6)	20/30 (66.7)	
>=28, n / N (%)	23/53 (43.4)	29/46 (63.0)	
Race Group (Black or African American, White)			0.2594
Day 15			
Black or African American, n / N (%)	7/32 (21.9)	11/31 (35.5)	
White, n / N (%)	11/40 (27.5)	24/44 (54.5)	
Day 45			
Black or African American, n / N (%)	18/32 (56.3)	20/31 (64.5)	
White, n / N (%)	17/40 (42.5)	29/44 (65.9)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF total score response (18 points (15% of total scale range 0-120) or greater increase in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF total score response (18 points (15% of total scale range 0-120) or greater increase in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Number of subjects with a response, n (%) [2]	19 (44.2)	23 (52.3)
Number of subjects with missing evaluation, n (%)	0	1 (2.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.046
95% CI for the RR		(0.676, 1.619)
p-value for RR		0.8390

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF total score response (18 points (15% of total scale range 0-120) or greater increase in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

3.1.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Barkin Index of Maternal Functioning (BIMF) Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing BIMF total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF total score, and treatment.

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	49 (65.3)	53 (69.7)	
Age Group (years)			
18 - 24, n / N (%)	16/25 (64.0)	11/17 (64.7)	0.5662
25 - 45, n / N (%)	33/50 (66.0)	42/59 (71.2)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	16/22 (72.7)	21/30 (70.0)	0.3352
>=28, n / N (%)	33/53 (62.3)	32/46 (69.6)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	23/32 (71.9)	20/31 (64.5)	0.0407
White, n / N (%)	24/40 (60.0)	32/44 (72.7)	
Antidepressant Use at Baseline			
Yes, n / N (%)	9/13 (69.2)	12/16 (75.0)	0.4783
No, n / N (%)	40/62 (64.5)	41/60 (68.3)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline BIMF total score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

50th percentile - median (95% CI)	23.0 (15.0 , 45.0)	15.0 (9.0 , 45.0)
75th percentile - Q3 (95% CI)	47.0 (44.0, NE)	48.0 (43.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.025
95% CI for the HR		(0.5887 , 1.7850)
p-value for the HR		0.9301

NOTE 1: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing BIMF total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF total score response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline BIMF total score, and treatment.

BMI (kg/m^2) Group 2 = 25-29.9

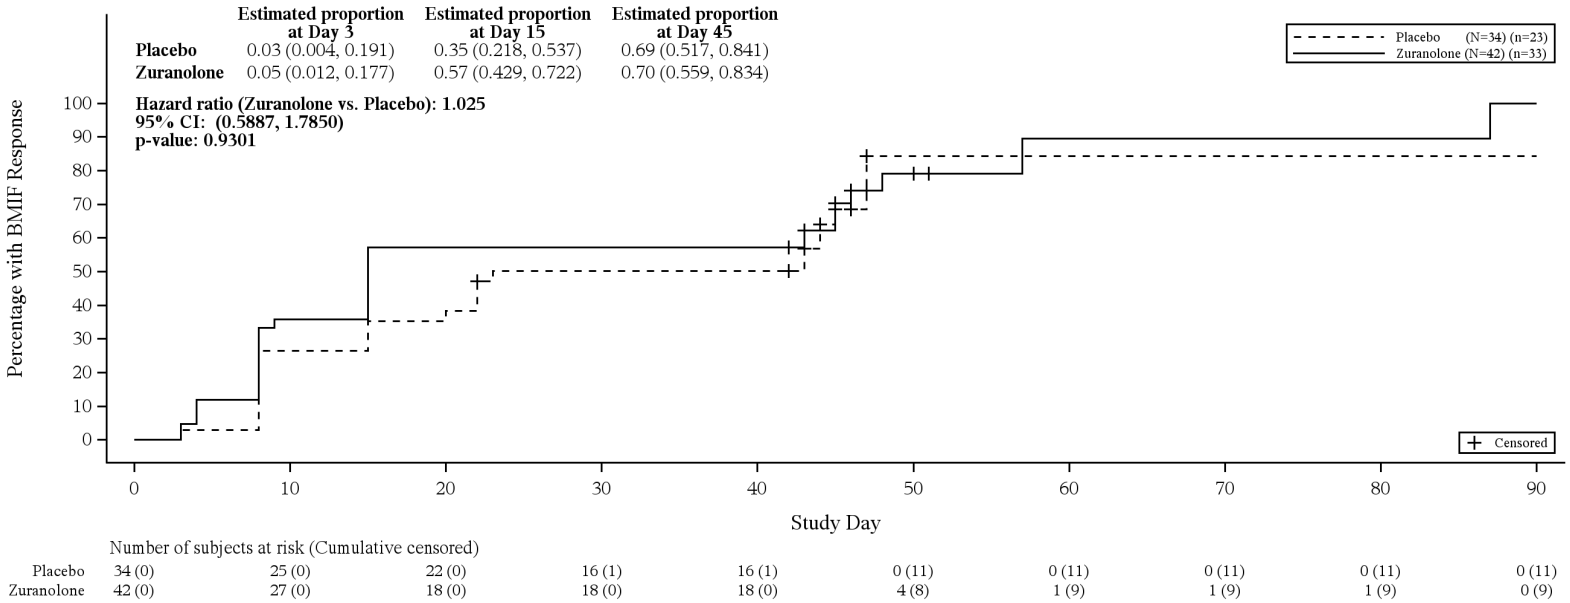
Number of subjects at risk (Cumulative censored)

Placebo	20 (0)	16 (0)	14 (0)	7 (0)	7 (0)	1 (5)	0 (5)
Zuranolone	21 (0)	13 (0)	12 (0)	10 (1)	9 (2)	1 (8)	0 (9)

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing BIMF total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: BIMF total score response is defined as 18 points (15% of total scale range 0-120) or greater increase in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Barkin Index of Maternal Functioning (BIMF) Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing BIMF total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF total score worsening is defined as 18 points (15% of total scale range 0-120) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF total score, and treatment.

Hedges' g (Zuranolone vs. Placebo)		-0.131
95% CI for Hedges' g		-0.7474, 0.4861

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

LS Mean (SE)	1.71 (1.091)	1.65 (1.110)
95% CI for the LS Mean	-0.48, 3.90	-0.58, 3.87
Difference (Zuranolone - Placebo)		
LS Mean (SE)		-0.06 (1.559)
95% CI for the LS Mean		-3.19, 3.06
p-value		0.9685
Hedges' g (Zuranolone vs. Placebo)		-0.010
95% CI for Hedges' g		-0.5165, 0.4962
Day 8		
n	31	31
LS Mean (SE)	4.16 (1.245)	2.72 (1.247)
95% CI for the LS Mean	1.67, 6.65	0.23, 5.22
Difference (Zuranolone - Placebo)		
LS Mean (SE)		-1.44 (1.765)
95% CI for the LS Mean		-4.97, 2.09
p-value		0.4185
Hedges' g (Zuranolone vs. Placebo)		-0.204
95% CI for Hedges' g		-0.7035, 0.2948

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

Hedges' g (Zuranolone vs. Placebo)		0.349
95% CI for Hedges' g		-0.0176, 0.7158

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

p-value		0.4147
Hedges' g (Zuranolone vs. Placebo)		0.147
95% CI for Hedges' g		-0.2075, 0.5015

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

Line Plot of LS Mean (+/- SE) Change from Baseline in Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Score by Subgroup: 217-PPD-201B - ITT population

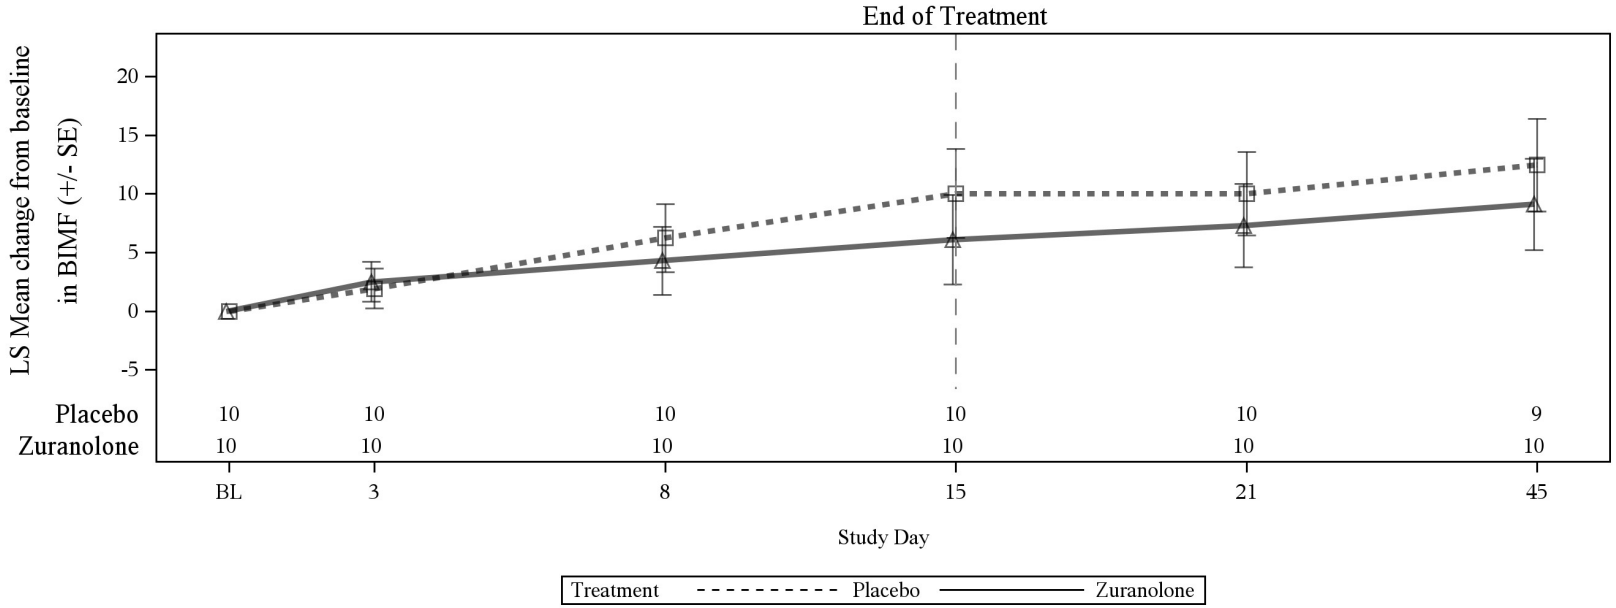
Page: 13 of 17

Onset of PPD = Postpartum

Abbreviations: LS = Least-squares; SE = Standard error; BL = Baseline; * = p < 0.05.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.



NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

3.2.2 Ansprechen

3.2.2.1 Responder-Analysen

3.2.2.1 .1 ITT-Population

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	8 (10.7)	7 (9.2)
Number of subjects with missing evaluation, n (%)	3 (4.0)	4 (5.3)
RR - Relative Risk (Zuranolone vs. Placebo)		0.703
95% CI for the RR		(0.280, 1.766)
p-value for RR		0.4536
OR - Odds Ratio (Zuranolone vs. Placebo)		0.525
95% CI for the OR		(0.162, 1.696)
p-value for OR		0.2814
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing BIMF Mom's competency subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's competency subscale score response (9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

3.2.2.1 .2 .1 Interaktionstest

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	19 (25.3)	27 (35.5)	
Number of subjects with response at Day 45, n (%)	24 (32.0)	41 (53.9)	
Age Group (years)			0.2338
Day 15			
18 - 24, n / N (%)	7/25 (28.0)	5/17 (29.4)	
25 - 45, n / N (%)	12/50 (24.0)	22/59 (37.3)	
Day 45			
18 - 24, n / N (%)	9/25 (36.0)	10/17 (58.8)	
25 - 45, n / N (%)	15/50 (30.0)	31/59 (52.5)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's competency subscale score response is defined as 9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

>=30, n / N (%)	11/34 (32.4)	24/42 (57.1)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's competency subscale score response is defined as 9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Response (>=15% of total scale range increase from baseline) by Age Group: 217-PPD-201B - ITT population

Page: 1 of 6

Age Group (years) = 18-24

Study Visit Statistics	Placebo (N=26)	Zuranolone (N =18)
Number of evaluable subjects [1]	25	17
Day 3		
Number of subjects with a response, n (%) [2]	3 (12.0)	2 (11.8)
Number of subjects with missing evaluation, n (%)	0	1 (5.9)
RR - Relative Risk (Zuranolone vs. Placebo)		0.559
95% CI for the RR		(0.128, 2.442)
p-value for RR		0.4392
Day 8		
Number of subjects with a response, n (%) [2]	6 (24.0)	5 (29.4)
Number of subjects with missing evaluation, n (%)	0	0
RR - Relative Risk (Zuranolone vs. Placebo)		0.698
95% CI for the RR		(0.303, 1.608)
p-value for RR		0.3987

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's competency subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's competency subscale score response (9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's competency subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's competency subscale score response (9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

95% CI for the RR		(0.307, 4.140)
p-value for RR		0.8565

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's competency subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's competency subscale score response (9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

p-value for RR		0.1936

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's competency subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's competency subscale score response (9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Kaplan-Meier Plot for Time to First Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing BIMF Mom's competency subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF Mom's competency subscale score response is defined as 9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, and treatment.

Summary of Time to First Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	35 (46.7)	45 (59.2)	
Age Group (years)			
18 - 24, n / N (%)	13/25 (52.0)	10/17 (58.8)	0.1662
25 - 45, n / N (%)	22/50 (44.0)	35/59 (59.3)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	12/22 (54.5)	19/30 (63.3)	0.2407
>=28, n / N (%)	23/53 (43.4)	26/46 (56.5)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	14/32 (43.8)	14/31 (45.2)	0.0265
White, n / N (%)	19/40 (47.5)	30/44 (68.2)	
Antidepressant Use at Baseline			
Yes, n / N (%)	8/13 (61.5)	10/16 (62.5)	0.8668
No, n / N (%)	27/62 (43.5)	35/60 (58.3)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's competency subscale score response is defined as 9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

BMI (kg/m^2) Group 2 = 25-29.9

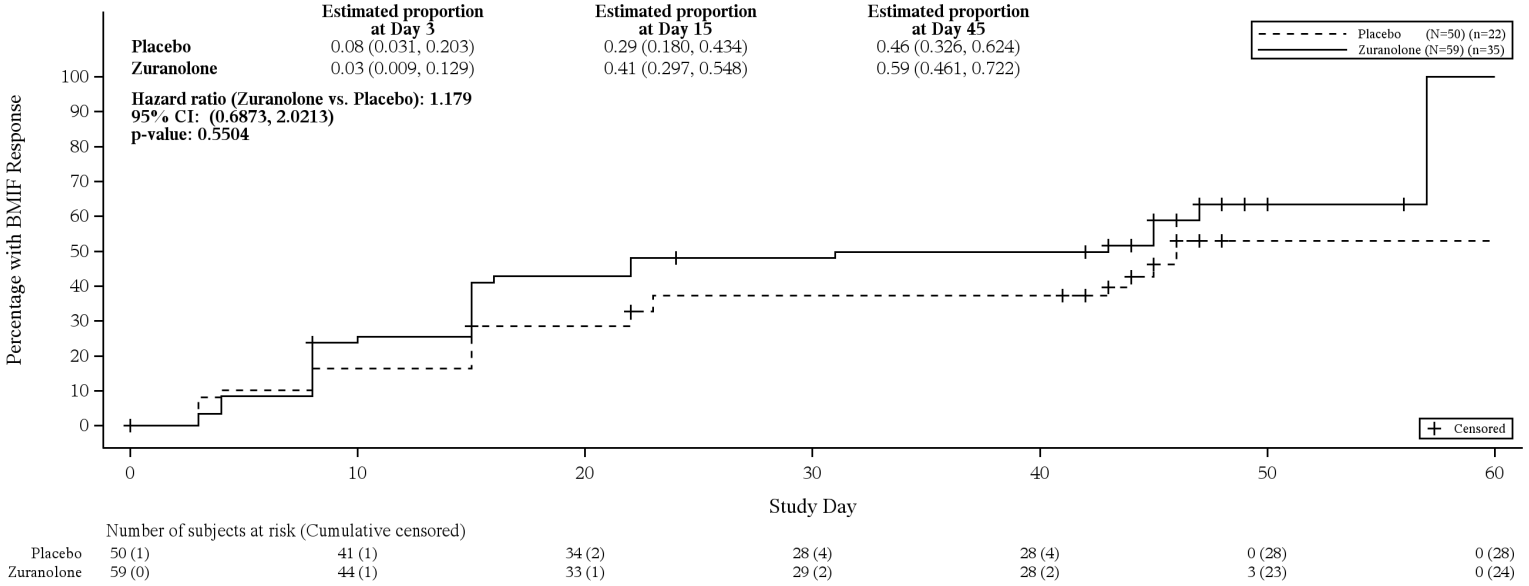
Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing BIMF Mom's competency subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: BIMF Mom's competency subscale score response is defined as 9.9 points (15% of total scale range 0-66) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Barkin Index of Maternal Functioning (BIMF) Mom's Competency Subscale Worsening (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing BIMF Mom's competency subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF Mom's competency subscale score worsening is defined as 9.9 points (15% of total scale range 0-66) or greater reduction in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's competency subscale score, and treatment.

LS Mean (SE)		1.01 (1.979)
95% CI for the LS Mean		-2.99, 5.01
p-value		0.6132
Hedges' g (Zuranolone vs. Placebo)		0.157
95% CI for Hedges' g		-0.4599, 0.7742

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

95% CI for the LS Mean		-0.37, 6.36
p-value		0.0804
Hedges' g (Zuranolone vs. Placebo)		0.366
95% CI for Hedges' g		-0.0464, 0.7779

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.
NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

95% CI for Hedges' g		-0.4142, 0.5903

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

Line Plot of LS Mean (+/- SE) Change from Baseline in Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Score by Subgroup: 217-PPD-201B - ITT population

Page: 12 of 17

Onset of PPD = 3rd trimester

Abbreviations: LS = Least-squares; SE = Standard error; BL = Baseline; * = $p < 0.05$.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

NOTE 2: The BIMF total score was calculated as the sum of the 20 individual item scores (where questions 16 and 18 were reverse-scored), with a range from 0 to 120. The Mom's Competency subscale score was calculated as the sum of items 1, 3, 4, 5, 10, 12, 14, 15, 17, 19, and 20; the Mom's Needs subscale score was calculated as the sum of items 2, 6, 7, 8, 9, 11, and 13. A positive change indicates improvement.

3.3.2 Ansprechen

3.3.2.1 Responder-Analysen

3.3.2.1 .1 ITT-Population

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	12 (16.0)	17 (22.4)
Number of subjects with missing evaluation, n (%)	3 (4.0)	4 (5.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.372
95% CI for the RR		(0.706, 2.665)
p-value for RR		0.3505
OR - Odds Ratio (Zuranolone vs. Placebo)		1.409
95% CI for the OR		(0.625, 3.176)
p-value for OR		0.4080
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing BIMF Mom's needs subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a BIMF Mom's needs subscale score response (6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

3.3.2.1 .2 Subgruppen

3.3.2.1 .2 .1 Interaktionstest

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	33 (44.0)	35 (46.1)	
Number of subjects with response at Day 45, n (%)	41 (54.7)	50 (65.8)	
Age Group (years)			0.4535
Day 15			
18 - 24, n / N (%)	10/25 (40.0)	8/17 (47.1)	
25 - 45, n / N (%)	23/50 (46.0)	27/59 (45.8)	
Day 45			
18 - 24, n / N (%)	15/25 (60.0)	10/17 (58.8)	
25 - 45, n / N (%)	26/50 (52.0)	40/59 (67.8)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

BMI (kg/m^2) Group			0.4882(a) 0.9559(b) 0.3988(c)
Day 15			
<=24.9, n / N (%)	8/21 (38.1)	5/13 (38.5)	
25-29.9, n / N (%)	8/20 (40.0)	11/21 (52.4)	
>=30, n / N (%)	17/34 (50.0)	19/42 (45.2)	
Day 45			
<=24.9, n / N (%)	9/21 (42.9)	7/13 (53.8)	
25-29.9, n / N (%)	13/20 (65.0)	15/21 (71.4)	
>=30, n / N (%)	19/34 (55.9)	28/42 (66.7)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Response (>=15% of total scale range increase from baseline) by Age Group: 217-PPD-201B - ITT population

Page: 1 of 6

Age Group (years) = 18-24

Study Visit Statistics	Placebo (N=26)	Zuranolone (N =18)
Number of evaluable subjects [1]	25	17
Day 3		
Number of subjects with a response, n (%) [2]	3 (12.0)	1 (5.9)
Number of subjects with missing evaluation, n (%)	0	1 (5.9)
RR - Relative Risk (Zuranolone vs. Placebo)		0.489
95% CI for the RR		(0.056, 4.293)
p-value for RR		0.5184
Day 8		
Number of subjects with a response, n (%) [2]	11 (44.0)	7 (41.2)
Number of subjects with missing evaluation, n (%)	0	0
RR - Relative Risk (Zuranolone vs. Placebo)		0.933
95% CI for the RR		(0.464, 1.876)
p-value for RR		0.8456

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's needs subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's needs subscale score response (6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's needs subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's needs subscale score response (6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing BIMF Mom's needs subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's needs subscale score response (6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline). Missing subscale score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Kaplan-Meier Plot for Time to First Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Response (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing BIMF Mom's needs subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, and treatment.

25th percentile - Q1 (95% CI)	8.0 (4.0 , 8.0)	8.0 (4.0 , 8.0)
50th percentile - median (95% CI)	15.0 (8.0 , 22.0)	15.0 (8.0 , 44.0)
75th percentile - Q3 (95% CI)	47.0 (28.0, NE)	47.0 (46.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		0.912
95% CI for the HR		(0.6241 , 1.3316)
p-value for the HR		0.6322

NOTE 1: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing BIMF Mom's needs subscale score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a BIMF Mom's needs subscale score response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, and treatment.

Summary of Time to First Barkin Index of Maternal Functioning (BIMF) Mom's Needs Subscale Response (>=15% of total scale range increase from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	55 (73.3)	54 (71.1)	
Age Group (years)			
18 - 24, n / N (%)	19/25 (76.0)	11/17 (64.7)	0.5604
25 - 45, n / N (%)	36/50 (72.0)	43/59 (72.9)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	16/22 (72.7)	20/30 (66.7)	0.6169
>=28, n / N (%)	39/53 (73.6)	34/46 (73.9)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	23/32 (71.9)	19/31 (61.3)	0.0573
White, n / N (%)	29/40 (72.5)	35/44 (79.5)	
Antidepressant Use at Baseline			
Yes, n / N (%)	9/13 (69.2)	12/16 (75.0)	0.7003
No, n / N (%)	46/62 (74.2)	42/60 (70.0)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Zuranolone	16 (0)	7 (0)	6 (0)	6 (0)	6 (0)	0 (4)

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing BIMF Mom's needs subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF Mom's needs subscale score response is defined as 6.3 points (15% of total scale range 0-42) or greater increase in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing BIMF Mom's needs subscale score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: BIMF Mom's needs subscale score worsening is defined as 6.3 points (15% of total scale range 0-42) or greater reduction in subscale score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline BIMF Mom's needs subscale score, and treatment.

Number of subjects with a response, n (%) [2]	33 (44.0)	49 (64.5)
Number of subjects with missing evaluation, n (%)	1 (1.3)	1 (1.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.525
95% CI for the RR		(1.129, 2.061)
p-value for RR		0.0060
OR - Odds Ratio (Zuranolone vs. Placebo)		2.357
95% CI for the OR		(1.227, 4.531)
p-value for OR		0.0101
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.213
95% CI for the ARR		(0.059, 0.368)
p-value for ARR		0.0068

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.1.2.1 .2 Subgruppen

4.1.2.1 .2 .1 Interaktionstest

Summary of Hamilton Rating Scale for Depression (HAMD-17) Response (>=50% reduction from baseline in total score): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	35 (46.7)	53 (69.7)	
Number of subjects with response at Day 45, n (%)	39 (52.0)	55 (72.4)	
Age Group (years)			0.5600
Day 15			
18 - 24, n / N (%)	10/25 (40.0)	10/17 (58.8)	
25 - 45, n / N (%)	25/50 (50.0)	43/59 (72.9)	
Day 45			
18 - 24, n / N (%)	14/25 (56.0)	10/17 (58.8)	
25 - 45, n / N (%)	25/50 (50.0)	45/59 (76.3)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: HAMD-17 response is defined as 50% or greater reduction in total score from baseline.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

p-value for RR		0.0303

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.1.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Hamilton Rating Scale for Depression (HAMD-17) Response (>=50% reduction from baseline in total score): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing HAMD-17 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: HAMD-17 response is defined as 50% or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline HAMD-17 total score, and treatment.

Summary of Time to First Hamilton Rating Scale for Depression (HAMD-17) Response (>=50% reduction from baseline in total score) by Baseline Antidepressant Use: 217-PPD-201B - ITT population

Page: 1 of 2

Antidepressant Use at Baseline = Yes

	Placebo (N=13)	Zuranolone (N=16)
Number of evaluable subjects [1]	13	16
Number of subjects with response, n (%) [2]	9 (69.2)	15 (93.8)
Time to first HAMD-17 response (days) [3]		
25th percentile - Q1 (95% CI)	4.0 (3.0 , 22.0)	4.0 (3.0 , 8.0)
50th percentile - median (95% CI)	22.0 (3.0, NE)	8.0 (4.0 , 15.0)
75th percentile - Q3 (95% CI)	45.0 (8.0, NE)	15.0 (8.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.923
95% CI for the HR		(0.8131 , 4.5489)
p-value for the HR		0.1365

NOTE 1: HAMD-17 response is defined as 50% or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for baseline HAMD-17 total score, and treatment.

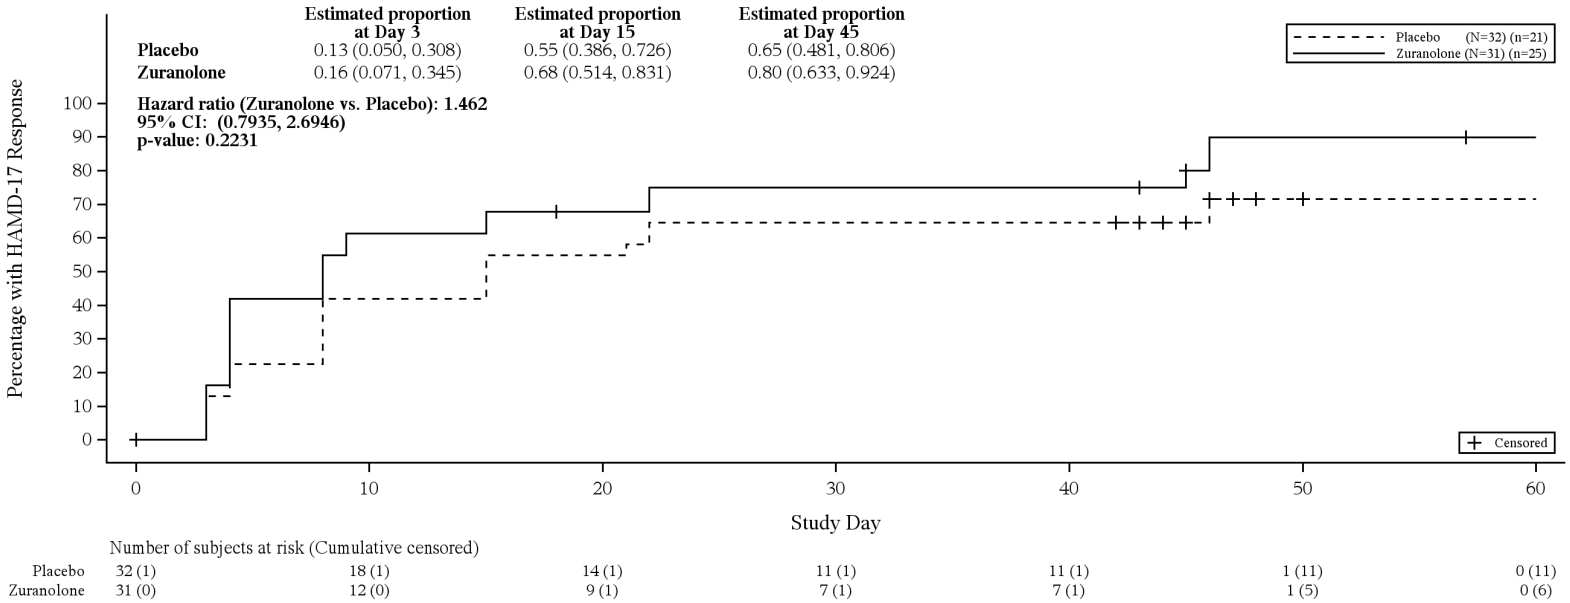
Baseline HAMD-17 Total Score Category >= 28 (Median of Baseline HAM-D Total Score)

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing HAMD-17 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: HAMD-17 response is defined as 50% or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline HAMD-17 total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

4.1.3 Remission

4.1.3.1 Responder-Analysen

4.1.3.1 .1 ITT-Population

Summary of Hamilton Rating Scale for Depression (HAMD-17) Remission: 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a remission, n (%) [2]	4 (5.3)	14 (18.4)
Number of subjects with missing evaluation, n (%)	1 (1.3)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		3.420
95% CI for the RR		(1.187, 9.859)
p-value for RR		0.0228
OR - Odds Ratio (Zuranolone vs. Placebo)		3.889
95% CI for the OR		(1.236, 12.235)
p-value for OR		0.0202
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 remission (defined as HAMD-17 total score <=7). Missing HAMD-17 total score at the visit has been imputed as "no remission". The denominator for the percentage is the number of evaluable subjects.

25 - 45, n / N (%)	9/50 (18.0)	26/59 (44.1)	
Day 45			
18 - 24, n / N (%)	8/25 (32.0)	8/17 (47.1)	
25 - 45, n / N (%)	13/50 (26.0)	31/59 (52.5)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: HAMD-17 remission is defined as HAMD-17 total score <=7.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Hamilton Rating Scale for Depression (HAMD-17) Remission by Baseline HAMD-17 Total Score: 217-PPD-201B - ITT population

Page: 3 of 6

Baseline HAMD-17 Total Score Category < 28 (Median of Baseline HAM-D Total Score)

Study Visit Statistics	Placebo (N=22)	Zuranolone (N =30)
Day 45		
Number of subjects with a remission, n (%) [2]	7 (31.8)	15 (50.0)
Number of subjects with missing evaluation, n (%)	0	2 (6.7)
RR - Relative Risk (Zuranolone vs. Placebo)		1.766
95% CI for the RR		(0.856, 3.643)
p-value for RR		0.1239

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAMD-17 total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure and "Log" link function.
[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a HAMD-17 remission (defined as HAMD-17 total score <=7). Missing HAMD-17 total score at the visit has been imputed as "no remission". The denominator for the percentage is the number of evaluable subjects.

4.1.3.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Hamilton Rating Scale for Depression (HAMD-17) Remission: 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with remission.
NOTE 1: Subjects with non-missing HAMD-17 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: HAMD-17 remission is defined as HAMD-17 total score <=7. Days are calculated from the date of the first dose. Subjects who are not responders are censored at the day of the last available evaluation.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline HAMD-17 total score, and treatment.

Summary of Time to First Hamilton Rating Scale for Depression (HAMD-17) Remission by Age Group: 217-PPD-201B - ITT population

Page: 1 of 2

Age Group (years) = 18-24

	Placebo (N=26)	**Zuranolone (N=18)**
Number of evaluable subjects [1]	25	17
Number of subjects with response, n (%) [2]	13 (52.0)	13 (76.5)
Time to first HAMD-17 remission (days) [3]		
25th percentile - Q1 (95% CI)	15.0 (8.0 , 22.0)	5.0 (3.0 , 15.0)
50th percentile - median (95% CI)	45.0 (15.0, NE)	15.0 (4.0 , 45.0)
75th percentile - Q3 (95% CI)	NE (NE, NE)	51.0 (15.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.977
95% CI for the HR		(0.9055 , 4.3184)
p-value for the HR		0.0871

NOTE 1: HAMD-17 remission is defined as having a HAMD-17 total score <=7. Days are calculated from the date of the first dose. Subjects with no remission are censored at the day of the last available HAMD-17 evaluation.

[1] Number of subjects with non-missing HAMD-17 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAMD-17 remission. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline HAMD-17 total score, and treatment.

4.2.2.1 .2 Subgruppen

4.2.2.1 .2 .1 Interaktionstest

Summary of Montgomery-Asberg Depression Rating Scale (MADRS) Response (>=50% reduction from baseline in total score): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	35 (46.7)	54 (71.1)	
Number of subjects with response at Day 45, n (%)	39 (52.0)	54 (71.1)	
Age Group (years)			0.9233
Day 15			
18 - 24, n / N (%)	12/25 (48.0)	12/17 (70.6)	
25 - 45, n / N (%)	23/50 (46.0)	42/59 (71.2)	
Day 45			
18 - 24, n / N (%)	13/25 (52.0)	10/17 (58.8)	
25 - 45, n / N (%)	26/50 (52.0)	44/59 (74.6)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: MADRS response is defined as 50% or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: MADRS response is defined as 50% or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.
Source: biib125/v_a/germany_amnog/t-madrs-resp50-201-int.sas:t-madrs-resp50-201-int-itta.rtf **Run Date:** 29JUL2025

Summary of Montgomery-Asberg Depression Rating Scale (MADRS) Response (>=50% reduction from baseline in total score): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 6 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
History of PPD			0.2347
Day 15			
1st Episode, n / N (%)	30/59 (50.8)	47/66 (71.2)	
Recurrent Episode, n / N (%)	5/16 (31.3)	7/10 (70.0)	
Day 45			
1st Episode, n / N (%)	33/59 (55.9)	48/66 (72.7)	
Recurrent Episode, n / N (%)	6/16 (37.5)	6/10 (60.0)	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			NA
Day 15			
<20, n / N (%)	5/8 (62.5)	9/10 (90.0)	
>=20, n / N (%)	30/67 (44.8)	45/66 (68.2)	
Day 45			
<20, n / N (%)	6/8 (75.0)	7/10 (70.0)	
>=20, n / N (%)	33/67 (49.3)	47/66 (71.2)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: MADRS response is defined as 50% or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(0.703, 1.636)
p-value for RR		0.7456

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a MADRS response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a MADRS response (50% or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.2.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Montgomery-Asberg Depression Rating Scale (MADRS) Response (>=50% reduction from baseline in total score): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing MADRS total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: MADRS response is defined as 50% or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline MADRS total score, and treatment.

Time to first MADRS response (days) [3]		
25th percentile - Q1 (95% CI)	8.0 (3.0 , 15.0)	3.0 (3.0 , 8.0)
50th percentile - median (95% CI)	15.0 (8.0, NE)	6.0 (3.0 , 22.0)
75th percentile - Q3 (95% CI)	NE (15.0, NE)	22.0 (4.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.270
95% CI for the HR		(0.2586 , 6.2338)
p-value for the HR		0.7687

NOTE 1: MADRS response is defined as 50% or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a MADRS response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline MADRS total score, and treatment.

4.2.3 Remission

4.2.3.1 Responder-Analysen

4.2.3.1 .1 ITT-Population

Summary of Montgomery-Asberg Depression Rating Scale (MADRS) Remission: 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a remission, n (%) [2]	7 (9.3)	18 (23.7)
Number of subjects with missing evaluation, n (%)	1 (1.3)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		2.472
95% CI for the RR		(1.102, 5.549)
p-value for RR		0.0282
OR - Odds Ratio (Zuranolone vs. Placebo)		2.874
95% CI for the OR		(1.108, 7.459)
p-value for OR		0.0300
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		0.135
95% CI for the ARR		(0.017, 0.253)
p-value for ARR		0.0249

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.
[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a MADRS remission (defined as MADRS total score <=10). Missing MADRS total score at the visit has been imputed as "no remission". The denominator for the percentage is the number of evaluable subjects.

95% CI for the ARR		(-0.063, 0.235)
p-value for ARR		0.2586

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively.

[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a MADRS remission (defined as MADRS total score <=10). Missing MADRS total score at the visit has been imputed as "no remission". The denominator for the percentage is the number of evaluable subjects.

4.2.3.1 .2 Subgruppen

4.2.3.1 .2 .1 Interaktionstest

Summary of Montgomery-Asberg Depression Rating Scale (MADRS) Remission: Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	22 (29.3)	40 (52.6)	
Number of subjects with response at Day 45, n (%)	26 (34.7)	43 (56.6)	
Age Group (years)			0.5795
Day 15			
18 - 24, n / N (%)	9/25 (36.0)	10/17 (58.8)	
25 - 45, n / N (%)	13/50 (26.0)	30/59 (50.8)	
Day 45			
18 - 24, n / N (%)	8/25 (32.0)	7/17 (41.2)	
25 - 45, n / N (%)	18/50 (36.0)	36/59 (61.0)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: MADRS remission is defined as MADRS total score <=10.
NOTE 3: n / N (%) = number of evaluable subjects with remission in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Number of subjects with missing evaluation, n (%)	1 (2.0)	1 (1.7)
RR - Relative Risk (Zuranolone vs. Placebo)		1.075
95% CI for the RR		(0.648, 1.784)
p-value for RR		0.7786

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline MADRS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing MADRS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a MADRS remission (defined as MADRS total score <=10). Missing MADRS total score at the visit has been imputed as "no remission". The denominator for the percentage is the number of evaluable subjects.

4.2.3.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Montgomery-Asberg Depression Rating Scale (MADRS) Remission: 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with remission.
NOTE 1: Subjects with non-missing MADRS total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: MADRS remission is defined as MADRS total score <=10. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline MADRS total score, and treatment.

4.2.3.2 .2 .1 Interaktionstest

Summary of Time to First Montgomery-Asberg Depression Rating Scale (MADRS) Remission: Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response, n (%)	40 (53.3)	59 (77.6)	
Age Group (years)			
18 - 24, n / N (%)	12/25 (48.0)	14/17 (82.4)	0.2101
25 - 45, n / N (%)	28/50 (56.0)	45/59 (76.3)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	11/22 (50.0)	20/30 (66.7)	0.6593
>=28, n / N (%)	29/53 (54.7)	39/46 (84.8)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	16/32 (50.0)	20/31 (64.5)	0.4055
White, n / N (%)	23/40 (57.5)	38/44 (86.4)	
Antidepressant Use at Baseline			
Yes, n / N (%)	9/13 (69.2)	14/16 (87.5)	0.9839
No, n / N (%)	31/62 (50.0)	45/60 (75.0)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline MADRS total score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: MADRS remission is defined as having a MADRS total score <=10. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with remission in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

4.2.3.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Montgomery-Asberg Depression Rating Scale (MADRS) Remission by Subgroup: 217-PPD-201B - ITT population

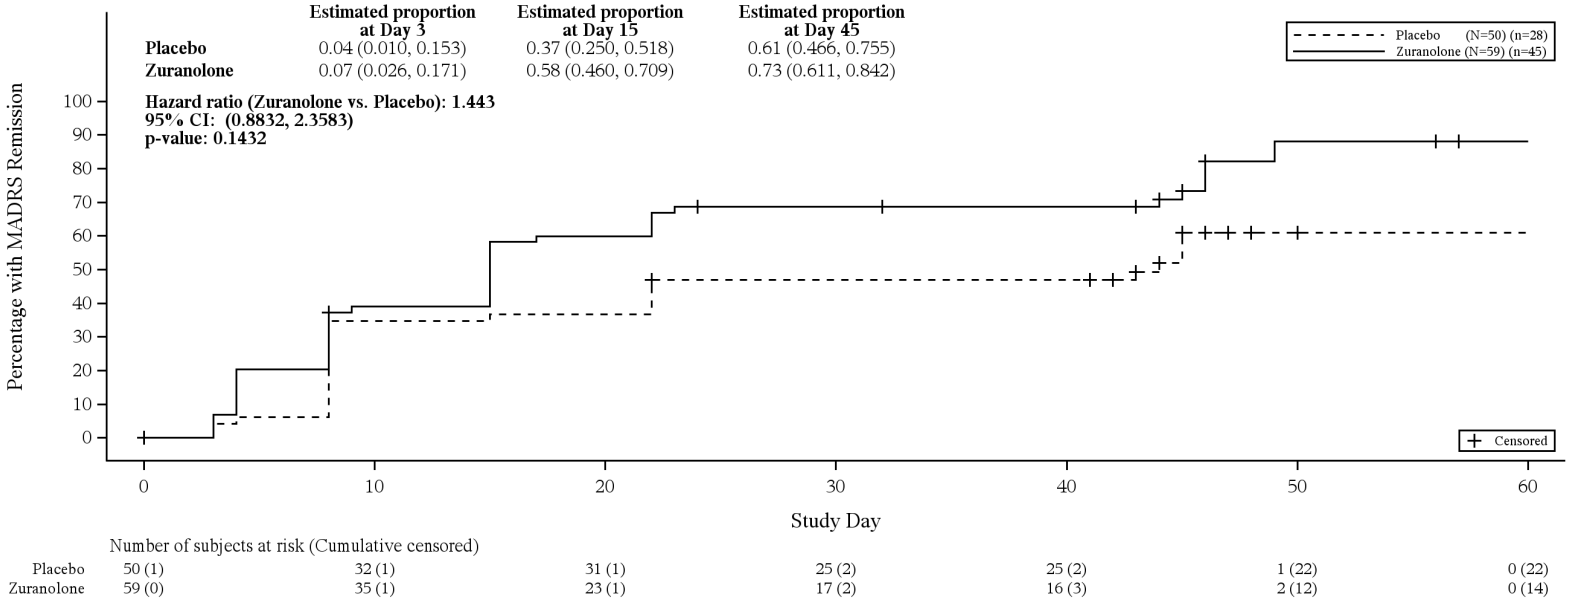
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with remission.

NOTE 1: Subjects with non-missing MADRS total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: MADRS remission is defined as MADRS total score <=10. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline MADRS total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

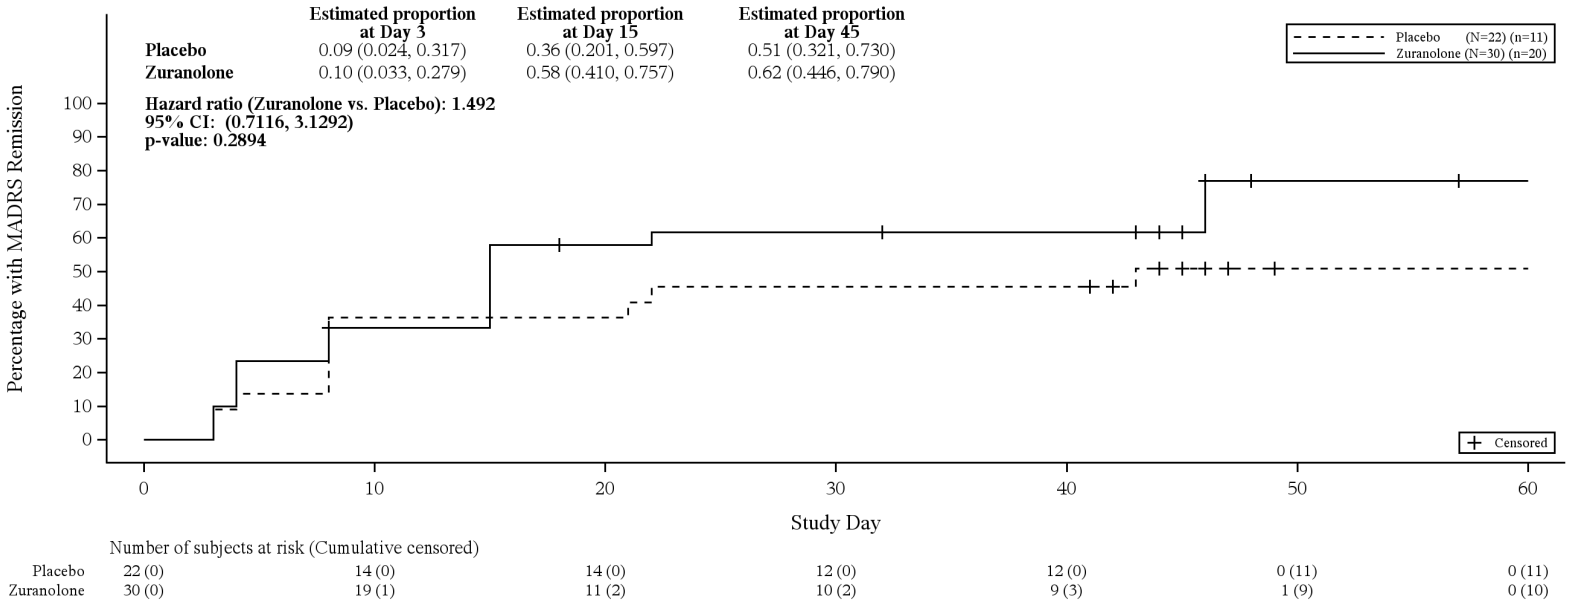
NOTE 2: MADRS remission is defined as MADRS total score <=10. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline MADRS total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

NOTE 1: Model used is the Mixed Model for Repeated Measures (MMRM) with baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction as fixed effects with unstructured covariance structure.

NOTE 2: The EPDS total score was calculated as the sum of the 10 individual item scores, where higher scores indicate more severe symptoms. A negative change indicates improvement.

4.3.2 Ansprechen

4.3.2.1 Responder-Analysen

4.3.2.1 .1 ITT-Population

Summary of Edinburgh Postpartum Depression Scale (EPDS) Response (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	19 (25.3)	18 (23.7)
Number of subjects with missing evaluation, n (%)	3 (4.0)	4 (5.3)
RR - Relative Risk (Zuranolone vs. Placebo)		0.959
95% CI for the RR		(0.554, 1.660)
p-value for RR		0.8816
OR - Odds Ratio (Zuranolone vs. Placebo)		0.906
95% CI for the OR		(0.433, 1.896)
p-value for OR		0.7925
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Day 15		
Number of subjects with a response, n (%) [2]	47 (62.7)	56 (73.7)
Number of subjects with missing evaluation, n (%)	2 (2.7)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.196
95% CI for the RR		(0.970, 1.473)
p-value for RR		0.0933
OR - Odds Ratio (Zuranolone vs. Placebo)		1.766
95% CI for the OR		(0.874, 3.569)
p-value for OR		0.1129
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.3.2.1 .2 Subgruppen

4.3.2.1 .2 .1 Interaktionstest

Summary of Edinburgh Postpartum Depression Scale (EPDS) Response (>=15% of total scale range reduction from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	47 (62.7)	56 (73.7)	
Number of subjects with response at Day 45, n (%)	50 (66.7)	64 (84.2)	
Age Group (years)			0.1598
Day 15			
18 - 24, n / N (%)	15/25 (60.0)	16/17 (94.1)	
25 - 45, n / N (%)	32/50 (64.0)	40/59 (67.8)	
Day 45			
18 - 24, n / N (%)	17/25 (68.0)	15/17 (88.2)	
25 - 45, n / N (%)	33/50 (66.0)	49/59 (83.1)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: EPDS response is defined as 4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(0.394, 1.585)
p-value for RR		0.5068
Day 8		
Number of subjects with a response, n (%) [2]	30 (60.0)	32 (54.2)
Number of subjects with missing evaluation, n (%)	1 (2.0)	1 (1.7)
RR - Relative Risk (Zuranolone vs. Placebo)		0.948
95% CI for the RR		(0.689, 1.304)
p-value for RR		0.7429

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure and "Log" link function.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Number of subjects with a response, n (%) [2]	1 (7.7)	3 (18.8)
Number of subjects with missing evaluation, n (%)	0	2 (12.5)
RR - Relative Risk (Zuranolone vs. Placebo)		2.605
95% CI for the RR		(0.306, 22.137)
p-value for RR		0.3806
Day 8		
Number of subjects with a response, n (%) [2]	7 (53.8)	9 (56.3)
Number of subjects with missing evaluation, n (%)	0	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.116
95% CI for the RR		(0.596, 2.090)
p-value for RR		0.7311

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.
[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Number of evaluable subjects [1]	32	32
Day 3		
Number of subjects with a response, n (%) [2]	10 (31.3)	13 (40.6)
Number of subjects with missing evaluation, n (%)	1 (3.1)	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.328
95% CI for the RR		(0.700, 2.518)
p-value for RR		0.3853
Day 8		
Number of subjects with a response, n (%) [2]	17 (53.1)	19 (59.4)
Number of subjects with missing evaluation, n (%)	1 (3.1)	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.141
95% CI for the RR		(0.743, 1.753)
p-value for RR		0.5456

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Day 3		
Number of subjects with a response, n (%) [2]	4 (25.0)	2 (20.0)
Number of subjects with missing evaluation, n (%)	2 (12.5)	0
RR - Relative Risk (Zuranolone vs. Placebo)		0.795
95% CI for the RR		(0.197, 3.199)
p-value for RR		0.7463
Day 8		
Number of subjects with a response, n (%) [2]	6 (37.5)	5 (50.0)
Number of subjects with missing evaluation, n (%)	1 (6.3)	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.324
95% CI for the RR		(0.610, 2.877)
p-value for RR		0.4778

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline EPDS total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response (4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.3.2.2 TTE-Analysen

4.3.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Edinburgh Postpartum Depression Scale (EPDS) Response (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing EPDS total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: EPDS response is defined as 4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline EPDS total score, and treatment.

25th percentile - Q1 (95% CI)	8.0 (3.0 , 9.0)	8.0 (3.0 , 8.0)
50th percentile - median (95% CI)	9.0 (8.0 , 23.0)	8.0 (8.0 , 15.0)
75th percentile - Q3 (95% CI)	23.0 (8.0, NE)	15.0 (8.0, NE)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.774
95% CI for the HR		(0.7647 , 4.1146)
p-value for the HR		0.1819

NOTE 1: EPDS response is defined as 4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a EPDS response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for baseline EPDS total score, and treatment.

4.3.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Edinburgh Postpartum Depression Scale (EPDS) Response (>=15% of total scale range reduction from baseline) by Subgroup: 217-PPD-201B - ITT population

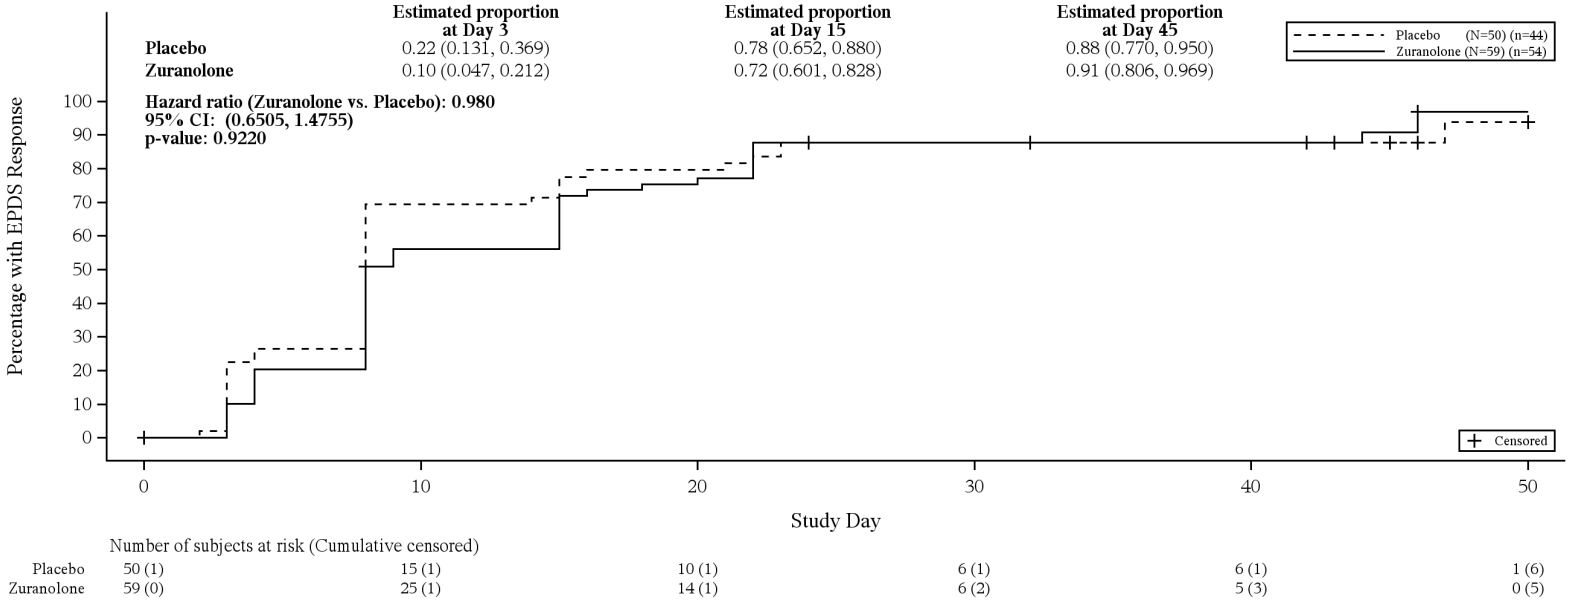
Page: 1 of 19

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing EPDS total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: EPDS response is defined as 4.5 points (15% of total scale range 0-30) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline EPDS total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

NOTE 1: Normal approximation method has been used to estimate relative risk, odds ratio, and absolute risk reduction.
[1] Number of subjects with non-missing EPDS total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a EPDS worsening (4.5 points (15% of total scale range 0-30) or greater increase in total score from baseline). Missing total score at the visit has been imputed as "no worsening". The denominator for the percentage is the number of evaluable subjects.

Model-based Results on Change from Baseline in Patient Health Questionnaire (PHQ-9) Total Score: Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 2 of 2

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
BMI (kg/m^2) Group			
<=24.9	21	13	0.9064(a)
25-29.9	20	21	0.4084(b)
>=30	34	42	0.4495(c)
Onset of PPD			
3rd Trimester	32	32	0.8222
Postpartum	43	44	
Family History of PPD			
Yes	10	10	0.5353
No/Unknown	65	66	
History of PPD			
1st Episode	59	66	0.7392
Recurrent Episode	16	10	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			
<20	8	10	NA
>=20	67	66	

NOTE 1: p-value is based on the Mixed Model for Repeated Measures (MMRM) with antidepressant use at baseline, baseline PHQ-9 total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction as fixed effects with unstructured covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: The PHQ-9 total score was calculated as the sum of the 9 individual item scores. A lower value indicates better outcome.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

4.4.2 Ansprechen

4.4.2.1 Responder-Analysen

4.4.2.1 .1 ITT-Population

Summary of Patient Health Questionnaire (PHQ-9) Response (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	19 (25.3)	24 (31.6)
Number of subjects with missing evaluation, n (%)	3 (4.0)	4 (5.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.242
95% CI for the RR		(0.754, 2.043)
p-value for RR		0.3948
OR - Odds Ratio (Zuranolone vs. Placebo)		1.381
95% CI for the OR		(0.678, 2.813)
p-value for OR		0.3739
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline PHQ-9 total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.
[1] Number of subjects with non-missing PHQ-9 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a PHQ-9 response (4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.4.2.1 .2 Subgruppen

4.4.2.1 .2 .1 Interaktionstest

Summary of Patient Health Questionnaire (PHQ-9) Response (>=15% of total scale range reduction from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	45 (60.0)	56 (73.7)	
Number of subjects with response at Day 45, n (%)	49 (65.3)	63 (82.9)	
Age Group (years)			0.4540
Day 15			
18 - 24, n / N (%)	14/25 (56.0)	10/17 (58.8)	
25 - 45, n / N (%)	31/50 (62.0)	46/59 (78.0)	
Day 45			
18 - 24, n / N (%)	16/25 (64.0)	13/17 (76.5)	
25 - 45, n / N (%)	33/50 (66.0)	50/59 (84.7)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline PHQ-9 total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

>=30, n / N (%)	20/34 (58.8)	35/42 (83.3)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline PHQ-9 total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline PHQ-9 total score, treatment, assessment time point, and time point-by-treatment interaction with exchangeable covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing PHQ-9 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a PHQ-9 response (4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

1st Episode, n / N (%)	53/59 (89.8)	64/66 (97.0)	0.5304
Recurrent Episode, n / N (%)	12/16 (75.0)	10/10 (100.0)	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			
<20, n / N (%)	5/8 (62.5)	9/10 (90.0)	NA
>=20, n / N (%)	60/67 (89.6)	65/66 (98.5)	

NOTE 1: p-value is based on the Cox proportional hazards model with factors for antidepressant use at baseline, baseline PHQ-9 total score, treatment, subgroup, and subgroup-by-treatment interaction. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Onset of PPD = Postpartum

	Placebo (N=44)	Zuranolone (N=45)
Number of evaluable subjects [1]	43	44
Number of subjects with response, n (%) [2]	38 (88.4)	43 (97.7)
Time to first PHQ-9 response (days) [3]		
25th percentile - Q1 (95% CI)	8.0 (3.0 , 8.0)	5.5 (3.0 , 8.0)
50th percentile - median (95% CI)	15.0 (8.0 , 15.0)	8.0 (8.0 , 9.0)
75th percentile - Q3 (95% CI)	22.0 (15.0 , 50.0)	15.0 (8.0 , 43.0)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.612
95% CI for the HR		(1.0292 , 2.5246)
p-value for the HR		0.0370

NOTE 1: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing PHQ-9 total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a PHQ-9 response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline PHQ-9 total score, and treatment.

4.4.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Patient Health Questionnaire (PHQ-9) Response (>=15% of total scale range reduction from baseline) by Subgroup: 217-PPD-201B - ITT population

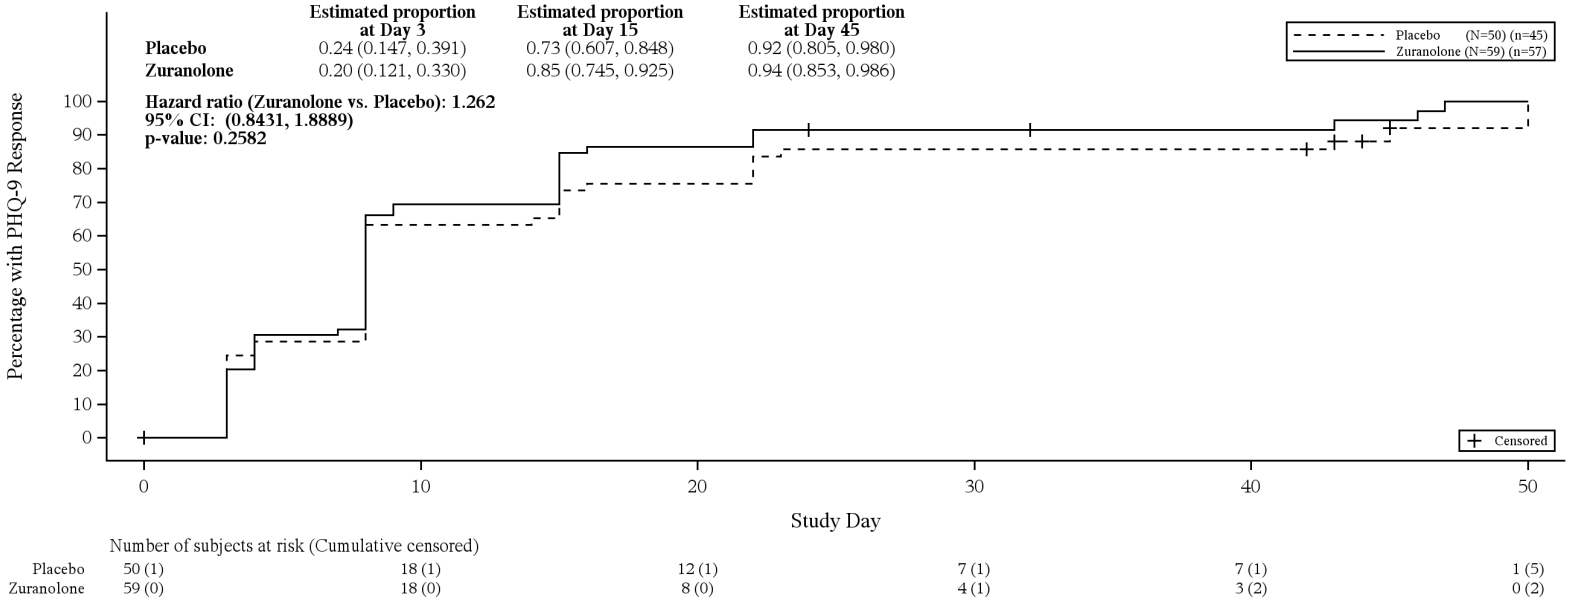
Page: 1 of 19

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing PHQ-9 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline PHQ-9 total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Patient Health Questionnaire (PHQ-9) Response (>=15% of total scale range reduction from baseline) by Subgroup: 217-PPD-201B - ITT population

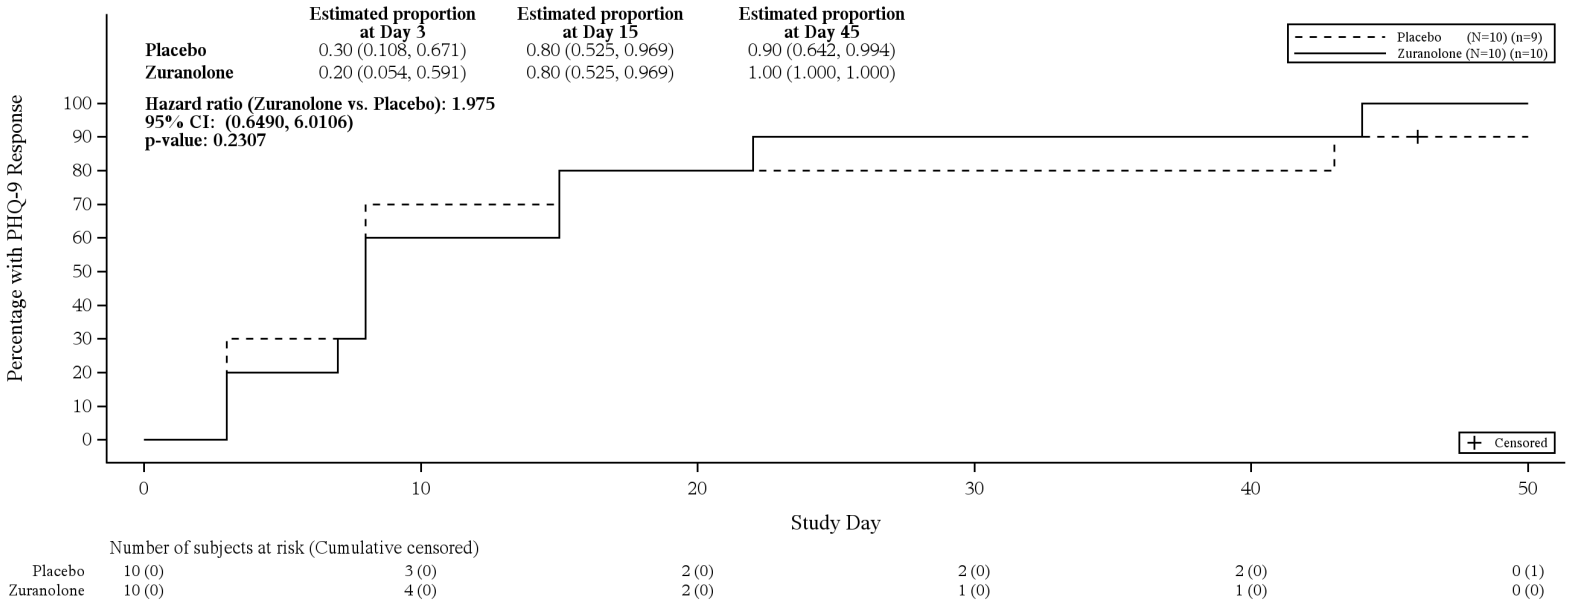
Page: 13 of 19

Onset of PPD = Postpartum

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing PHQ-9 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: PHQ-9 response is defined as 4.05 points (15% of total scale range 0-27) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline PHQ-9 total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

Kaplan-Meier Plot for Time to First Patient Health Questionnaire (PHQ-9) Worsening (>=15% of total scale range increase from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with worsening.
NOTE 1: Subjects with non-missing PHQ-9 total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: PHQ-9 worsening is defined as 4.05 points (15% of total scale range 0-27) or greater increase in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline PHQ-9 total score, and treatment.

25 - 45, n / N (%)	33/50 (66.0)	46/59 (78.0)	
Day 45			
18 - 24, n / N (%)	16/25 (64.0)	14/17 (82.4)	
25 - 45, n / N (%)	34/50 (68.0)	48/59 (81.4)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline HAM-A total score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: HAM-A response is defined as 8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Hamilton Rating Scale for Anxiety (HAM-A) Response (>=15% of total scale range reduction from baseline) by Age Group: 217-PPD-201B - ITT population

Page: 1 of 6

Age Group (years) = 18-24

Study Visit Statistics	Placebo (N=26)	Zuranolone (N =18)
Number of evaluable subjects [1]	25	17
Day 3		
Number of subjects with a response, n (%) [2]	13 (52.0)	13 (76.5)
Number of subjects with missing evaluation, n (%)	0	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.407
95% CI for the RR		(0.895, 2.210)
p-value for RR		0.1391
Day 8		
Number of subjects with a response, n (%) [2]	15 (60.0)	16 (94.1)
Number of subjects with missing evaluation, n (%)	0	0
RR - Relative Risk (Zuranolone vs. Placebo)		1.500
95% CI for the RR		(1.053, 2.137)
p-value for RR		0.0246

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAM-A total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAM-A total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAM-A response (8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

p-value for RR		0.4967

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAM-A total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAM-A total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAM-A response (8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

RR - Relative Risk (Zuranolone vs. Placebo)		1.222
95% CI for the RR		(0.976, 1.532)
p-value for RR		0.0808

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline HAM-A total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAM-A total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAM-A response (8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

RR - Relative Risk (Zuranolone vs. Placebo)		0.991
95% CI for the RR		(0.602, 1.629)
p-value for RR		0.9708
Day 8		
Number of subjects with a response, n (%) [2]	27 (62.8)	33 (75.0)
Number of subjects with missing evaluation, n (%)	0	1 (2.3)
RR - Relative Risk (Zuranolone vs. Placebo)		1.211
95% CI for the RR		(0.910, 1.611)
p-value for RR		0.1885

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline HAM-A total score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing HAM-A total score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a HAM-A response (8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline). Missing total score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing HAM-A total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: HAM-A response is defined as 8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline HAM-A total score, and treatment.

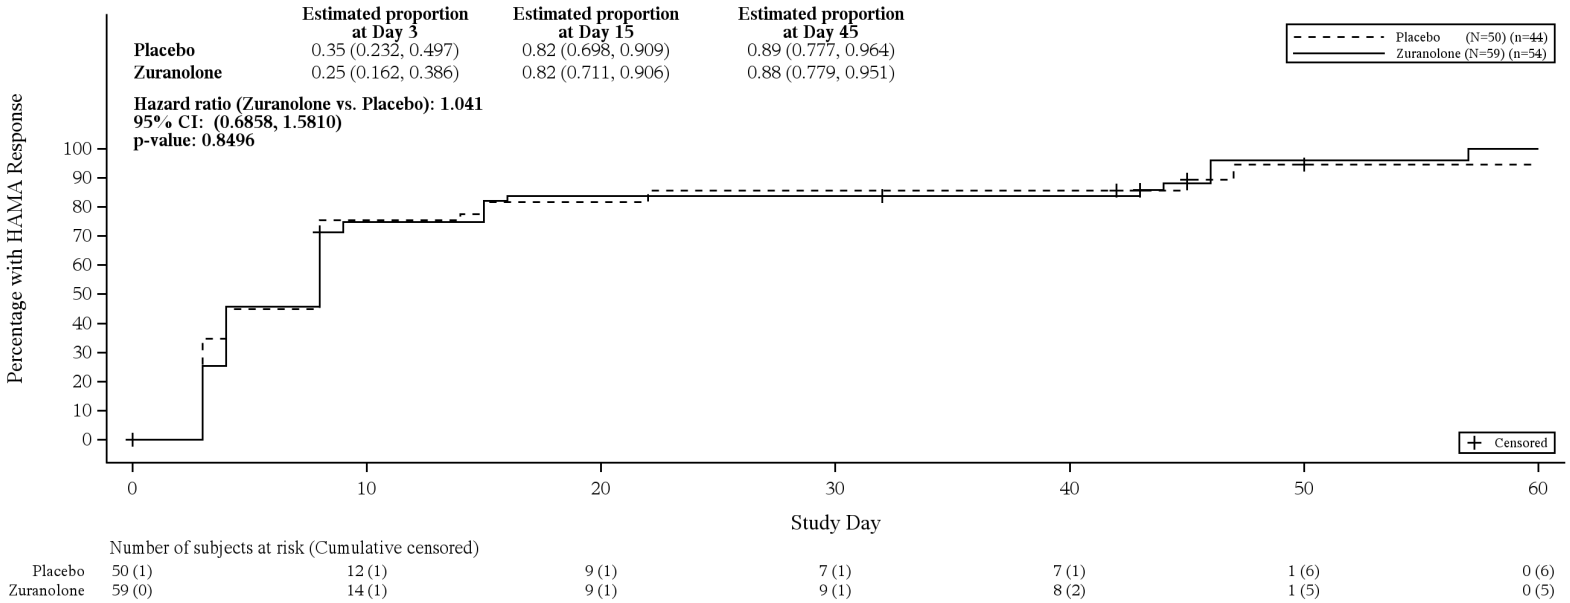
NOTE 1: Subjects with non-missing HAM-A total score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: HAM-A response is defined as 8.4 points (15% of HAM-A total scale range 0-56) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline HAM-A total score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

4.6.2.1 Responder-Analysen

4.6.2.1 .1 ITT-Population

Summary of Clinical Global Impression - Severity (CGI-S) Response (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 5

Study Visit Statistics	Placebo (N=76)	Zuranolone (N =77)
Number of evaluable subjects [1]	75	76
Day 3		
Number of subjects with a response, n (%) [2]	18 (24.0)	31 (40.8)
Number of subjects with missing evaluation, n (%)	1 (1.3)	2 (2.6)
RR - Relative Risk (Zuranolone vs. Placebo)		1.618
95% CI for the RR		(1.011, 2.588)
p-value for RR		0.0447
OR - Odds Ratio (Zuranolone vs. Placebo)		1.982
95% CI for the OR		(0.957, 4.103)
p-value for OR		0.0655
ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing CGI-S score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a CGI-S response (1.05 points (15% of total scale range 0-7) or greater reduction in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

ARR - Absolute Risk Reduction (Zuranolone vs. Placebo)		NE
95% CI for the ARR		NE
p-value for ARR		NE

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure. Relative risk, odds ratio, and absolute risk reduction are estimated from the same GEE model with "Log", "Logit", and "Identity" link function respectively. Relative risk is based on Poisson distribution. NE indicates not estimable due to model not converging.

[1] Number of subjects with non-missing CGI-S score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a CGI-S response (1.05 points (15% of total scale range 0-7) or greater reduction in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.6.2.1 .2 .1 Interaktionstest

Summary of Clinical Global Impression - Severity (CGI-S) Response (>=15% of total scale range reduction from baseline): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 5

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	75	76	
Number of subjects with response at Day 15, n (%)	36 (48.0)	53 (69.7)	
Number of subjects with response at Day 45, n (%)	37 (49.3)	58 (76.3)	
Age Group (years)			0.3462
Day 15			
18 - 24, n / N (%)	12/25 (48.0)	11/17 (64.7)	
25 - 45, n / N (%)	24/50 (48.0)	42/59 (71.2)	
Day 45			
18 - 24, n / N (%)	13/25 (52.0)	10/17 (58.8)	
25 - 45, n / N (%)	24/50 (48.0)	48/59 (81.4)	

NOTE 1: p-value is derived using Method 3, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: CGI-S response is defined as 1.05 points (15% of total scale range 0-7) or greater reduction in score from baseline.
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

95% CI for the RR		(0.932, 1.856)
p-value for RR		0.1186

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for baseline CGI-S score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.

[1] Number of subjects with non-missing CGI-S score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a CGI-S response (1.05 points (15% of total scale range 0-7) or greater reduction in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

p-value for RR		0.2439

NOTE 1: Model used is a generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, and time point-by-treatment interaction with unstructured covariance structure, "Log" link function and Poisson distribution.
[1] Number of subjects with non-missing CGI-S score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
[2] Number of subjects with a CGI-S response (1.05 points (15% of total scale range 0-7) or greater reduction in score from baseline). Missing score at the visit has been imputed as "no response". The denominator for the percentage is the number of evaluable subjects.

4.6.2.2 TTE-Analysen

4.6.2.2 .1 ITT-Population

Kaplan-Meier Plot for Time to First Clinical Global Impression - Severity (CGI-S) Response (>=15% of total scale range reduction from baseline): 217-PPD-201B - ITT population

Page: 1 of 1

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.
NOTE 1: Subjects with non-missing CGI-S score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.
NOTE 2: CGI-S response is defined as 1.05 points (15% of total scale range 0-7) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.
NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline CGI-S score, and treatment.

75th percentile - Q3 (95% CI)	NE (46.0, NE)	15.0 (15.0 , 45.0)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.774
95% CI for the HR		(1.2157 , 2.5878)
p-value for the HR		0.0029

NOTE 1: CGI-S response is defined as 1.05 points (15% of total scale range 0-7) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing CGI-S score at Baseline. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

[2] Number of subjects with a CGI-S response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline CGI-S score, and treatment.

4.6.2.2 .2 .3 Kaplan-Meier-Plots

Kaplan-Meier Plot for Time to First Clinical Global Impression - Severity (CGI-S) Response (>=15% of total scale range reduction from baseline) by Subgroup: 217-PPD-201B - ITT population

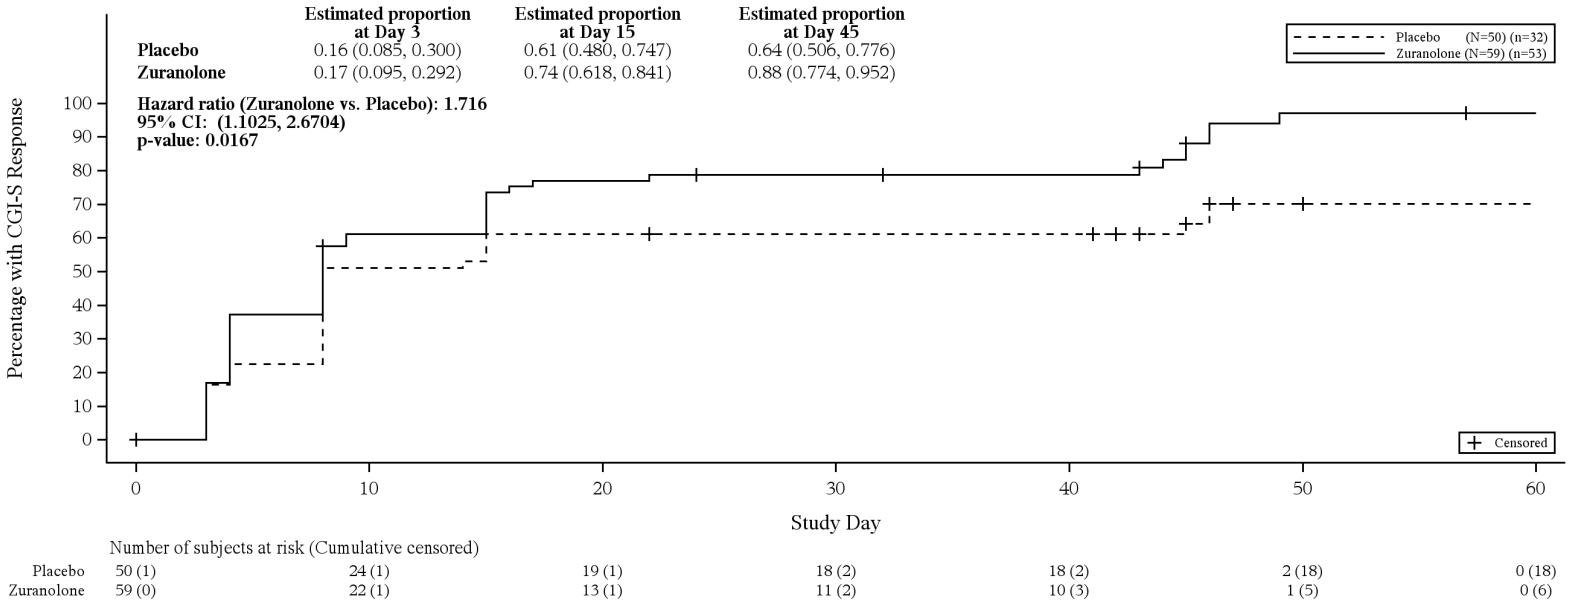
Page: 1 of 17

Age Group (years) = 18-24

Abbreviations: N=number of evaluable subjects; n=number of subjects with response.

NOTE 1: Subjects with non-missing CGI-S score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: CGI-S response is defined as 1.05 points (15% of total scale range 0-7) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline CGI-S score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

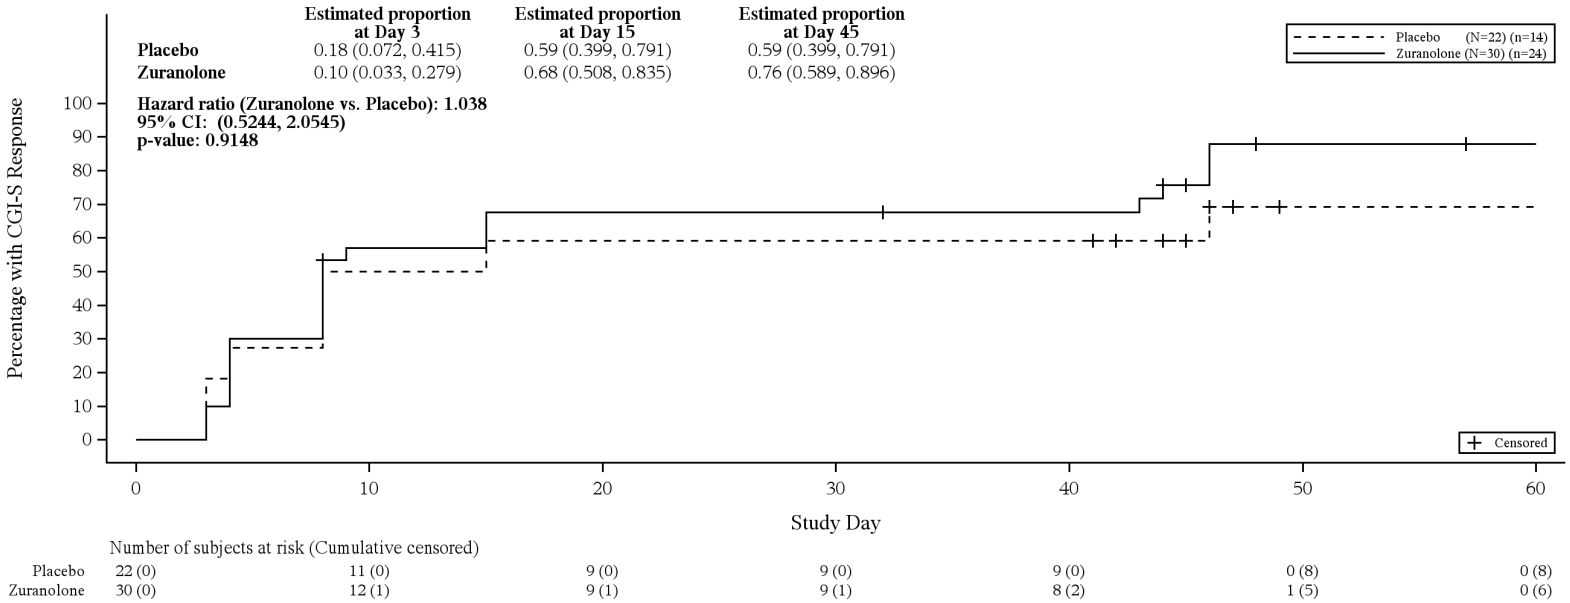
NOTE 1: Subjects with non-missing CGI-S score at Baseline are included in the analysis. Baseline is defined as the last non-missing evaluation prior to the first dose of investigational product.

NOTE 2: CGI-S response is defined as 1.05 points (15% of total scale range 0-7) or greater reduction in total score from baseline. Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.



NOTE 3: The estimated proportion of subjects with event are based on Kaplan-Meier product limit method. Hazard ratio, 95% confidence interval and p-value are based on Cox proportional hazard model adjusted for antidepressant use at baseline, baseline CGI-S score, and treatment. Model covariate antidepressant use at baseline is removed from antidepressant use at baseline subgroup analysis.

4.7.2.1 .2 Subgruppen

4.7.2.1 .2 .1 Interaktionstest

Summary of Clinical Global Impression - Improvement (CGI-I) Response (much and very much improved): Treatment by Subgroup Interaction: 217-PPD-201B - ITT population

Page: 1 of 6

Subgroup Subgroup Category	Placebo (N=76)	Zuranolone (N=77)	p-value for Treatment by Subgroup Interaction Test
Number of evaluable subjects	74	76	
Number of subjects with response at Day 15, n (%)	38 (51.4)	53 (69.7)	
Number of subjects with response at Day 45, n (%)	38 (51.4)	52 (68.4)	
Age Group (years)			0.8019
Day 15			
18 - 24, n / N (%)	13/25 (52.0)	11/17 (64.7)	
25 - 45, n / N (%)	25/49 (51.0)	42/59 (71.2)	
Day 45			
18 - 24, n / N (%)	11/25 (44.0)	8/17 (47.1)	
25 - 45, n / N (%)	27/49 (55.1)	44/59 (74.6)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: CGI-I response is defined as having a CGI-I score of "much improved" or "very much improved".
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Day 15			
<28, n / N (%)	12/22 (54.5)	19/30 (63.3)	
>=28, n / N (%)	26/52 (50.0)	34/46 (73.9)	
Day 45			
<28, n / N (%)	14/22 (63.6)	19/30 (63.3)	
>=28, n / N (%)	24/52 (46.2)	33/46 (71.7)	
Race Group (Black or African American, White)			0.1839
Day 15			
Black or African American, n / N (%)	17/31 (54.8)	20/31 (64.5)	
White, n / N (%)	19/40 (47.5)	32/44 (72.7)	
Day 45			
Black or African American, n / N (%)	18/31 (58.1)	20/31 (64.5)	
White, n / N (%)	19/40 (47.5)	31/44 (70.5)	

NOTE 1: p-value is derived using Method 2, which is the first among the four sequentially evaluated methods to yield an estimate without any warnings or errors. Method 1: Generalized Estimating Equations (GEE) with covariates including antidepressant use at baseline, baseline CGI-S score, treatment, assessment time point, subgroup, subgroup-by-treatment interaction, subgroup-by-time point interaction, time point-by-treatment interaction, and subgroup-by-time point-by-treatment interaction with unstructured covariance, "Log" link function, and the binomial distribution. Method 2: Same as Method 1 but with a Poisson distribution. Method 3: Same as Method 2 but excluding the subgroup-by-time point-by-treatment covariate. Method 4: Same as Method 3 but exchangeable covariance structure. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 2: CGI-I response is defined as having a CGI-I score of "much improved" or "very much improved".
NOTE 3: n / N (%) = number of evaluable subjects with response in the subgroup / number of evaluable subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Summary of Time to First Clinical Global Impression - Improvement (CGI-I) Response (much and very much improved) by Age Group: 217-PPD-201B - ITT population

Page: 2 of 2

Age Group (years) = 25-45

	Placebo (N=50)	Zuranolone (N=59)
Number of evaluable subjects [1]	49	59
Number of subjects with response, n (%) [2]	35 (71.4)	52 (88.1)
Time to first CGI-I response (days) [3]		
25th percentile - Q1 (95% CI)	4.0 (3.0 , 8.0)	4.0 (3.0 , 8.0)
50th percentile - median (95% CI)	8.0 (8.0 , 22.0)	8.0 (8.0 , 9.0)
75th percentile - Q3 (95% CI)	46.0 (22.0, NE)	15.0 (9.0 , 45.0)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.440
95% CI for the HR		(0.9344 , 2.2184)
p-value for the HR		0.0985

NOTE 1: CGI-I response is defined as having a CGI-I score of "much improved" or "very much improved". Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing CGI-I score at any visit.

[2] Number of subjects with a CGI-I response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline CGI-S score, and treatment.

4.7.2.2 .2 .2 .8 PPD in der Anamnese

Summary of Time to First Clinical Global Impression - Improvement (CGI-I) Response (much and very much improved) by History of PPD: 217-PPD-201B - ITT population

Page: 1 of 2

History of PPD = 1st Episode

	Placebo (N=60)	Zuranolone (N=67)
Number of evaluable subjects [1]	59	66
Number of subjects with response, n (%) [2]	44 (74.6)	59 (89.4)
Time to first CGI-I response (days) [3]		
25th percentile - Q1 (95% CI)	4.0 (3.0 , 8.0)	4.0 (3.0 , 8.0)
50th percentile - median (95% CI)	8.0 (8.0 , 15.0)	8.0 (NE, NE)
75th percentile - Q3 (95% CI)	46.0 (15.0, NE)	15.0 (9.0 , 45.0)
HR - Hazard Ratio (Zuranolone vs. Placebo) [4]		1.385
95% CI for the HR		(0.9336 , 2.0560)
p-value for the HR		0.1054

NOTE 1: CGI-I response is defined as having a CGI-I score of "much improved" or "very much improved". Days are calculated from the date of the first dose. Subjects are censored at the day of the last available evaluation if the event of interest is not observed.

[1] Number of subjects with non-missing CGI-I score at any visit.

[2] Number of subjects with a CGI-I response. The denominator for the percentage is the number of evaluable subjects.

[3] Kaplan-Meier estimates. NE=not estimable.

[4] From Cox proportional hazards model with factors for antidepressant use at baseline, baseline CGI-S score, and treatment.

5.1.1.2 Subgruppen

5.1.1.2 .1 Interaktionstest

Number of Subjects with at Least One Treatment-Emergent Adverse Event: Treatment by Subgroup Interaction: 217-PPD-201B - Safety population

Page: 1 of 2

Subgroup Subgroup Category	Placebo (N=73)	Zuranolone (N=78)	p-value for Treatment by Subgroup Interaction Test
Number of subjects with >=1 TEAE, n(%)	38 (52.1)	47 (60.3)	
Age Group (years)			
18 - 24, n / N (%)	12/25 (48.0)	9/17 (52.9)	0.9820
25 - 45, n / N (%)	26/48 (54.2)	38/61 (62.3)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	8/21 (38.1)	20/31 (64.5)	0.1166
>=28, n / N (%)	30/52 (57.7)	27/47 (57.4)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	12/32 (37.5)	24/31 (77.4)	0.0018
White, n / N (%)	24/39 (61.5)	21/45 (46.7)	
Antidepressant Use at Baseline			
Yes, n / N (%)	8/13 (61.5)	11/16 (68.8)	0.9051
No, n / N (%)	30/60 (50.0)	36/62 (58.1)	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

1st Episode, n / N (%)	30/57 (52.6)	41/68 (60.3)	0.9088
Recurrent Episode, n / N (%)	8/16 (50.0)	6/10 (60.0)	
Depression with Elevated Anxiety , by Baseline HAMA Total Score			
<20, n / N (%)	4/8 (50.0)	5/10 (50.0)	NA
>=20, n / N (%)	34/65 (52.3)	42/68 (61.8)	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

5.1.2.2 .1 Interaktionstest

Number of Subjects with Treatment-Emergent Adverse Event by System Organ Class: Treatment by Subgroup Interaction: 217-PPD-201B - Safety Population

Page: 1 of 12

Nervous system disorders

Subgroup Subgroup Category	Placebo (N=73)	Zuranolone (N=78)	p-value for Treatment by Subgroup Interaction Test
Number of subjects with >=1 TEAE, n(%)	19 (26.0)	27 (34.6)	
Age Group (years)			
18 - 24, n / N (%)	4/25 (16.0)	4/17 (23.5)	0.7683
25 - 45, n / N (%)	15/48 (31.3)	23/61 (37.7)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	3/21 (14.3)	11/31 (35.5)	0.2463
>=28, n / N (%)	16/52 (30.8)	16/47 (34.0)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	5/32 (15.6)	14/31 (45.2)	0.0463
White, n / N (%)	13/39 (33.3)	12/45 (26.7)	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function and "Poisson" distribution. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
NOTE 4: Includes SOC >=10% in any arm OR number of subjects with AE by SOC with at least 10 subjects with the respective AE and >=1% in any arm.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

>=20, n / N (%)	9/65 (13.8)	2/68 (2.9)	NA
<20, n / N (%)	1/8 (12.5)	0/10	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function and "Poisson" distribution. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
NOTE 4: Includes SOC >=10% in any arm OR number of subjects with AE by SOC with at least 10 subjects with the respective AE and >=1% in any arm.
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

5.2.1.2 Subgruppen

5.2.1.2 .1 Interaktionstest

Number of Subjects with Treatment-Emergent Adverse Event by Grade of Severity: Treatment by Subgroup Interaction: 217-PPD-201B - Safety population

Page: 5 of 6

Grade >=3

Subgroup Subgroup Category	Placebo (N=73)	Zuranolone (N=78)	p-value for Treatment by Subgroup Interaction Test
Number of subjects with >=1 TEAE, n(%)	3 (4.1)	3 (3.8)	
Age Group (years)			
18 - 24, n / N (%)	1/25 (4.0)	1/17 (5.9)	NA
25 - 45, n / N (%)	2/48 (4.2)	2/61 (3.3)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	1/21 (4.8)	1/31 (3.2)	NA
>=28, n / N (%)	2/52 (3.8)	2/47 (4.3)	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	2/32 (6.3)	2/31 (6.5)	NA
White, n / N (%)	1/39 (2.6)	1/45 (2.2)	
Antidepressant Use at Baseline			
Yes, n / N (%)	2/13 (15.4)	1/16 (6.3)	NA
No, n / N (%)	1/60 (1.7)	2/62 (3.2)	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.

Number of subjects with >=1 TEAE, n(%)	0	1 (1.3)	
Age Group (years)			
18 - 24, n / N (%)	0/25	0/17	NA
25 - 45, n / N (%)	0/48	1/61 (1.6)	
Baseline HAMD-17 Total Score Category, by median of baseline HAMD-17 total score			
<28, n / N (%)	0/21	1/31 (3.2)	NA
>=28, n / N (%)	0/52	0/47	
Race Group (Black or African American, White)			
Black or African American, n / N (%)	0/32	0/31	NA
White, n / N (%)	0/39	1/45 (2.2)	
Antidepressant Use at Baseline			
Yes, n / N (%)	0/13	1/16 (6.3)	NA
No, n / N (%)	0/60	0/62	

NOTE 1: AEs were coded using MedDRA version 24.0.
NOTE 2: If there is no event for at least one category in treatment*subgroup combination, p-value is based on relative risk normal approximation after adding 0.5 to all counts of each treatment*subgroup combination. Otherwise, p-value is based on the generalized estimating equation (GEE) for binary response model, with factors for antidepressant use at baseline, treatment, subgroup, and subgroup-by-treatment interaction with "Log" link function. NA indicates criteria not met for subgroup/interaction analysis.
NOTE 3: n / N (%) = number of subjects with the AE specified in the subgroup / number of subjects in the subgroup and (n / N *100%).
(a), (b), and (c) represent p-values from interaction tests comparing BMI groups: <=24.9 vs 25-29.9, <=24.9 vs >=30, and 25-29.9 vs >=30 respectively.
