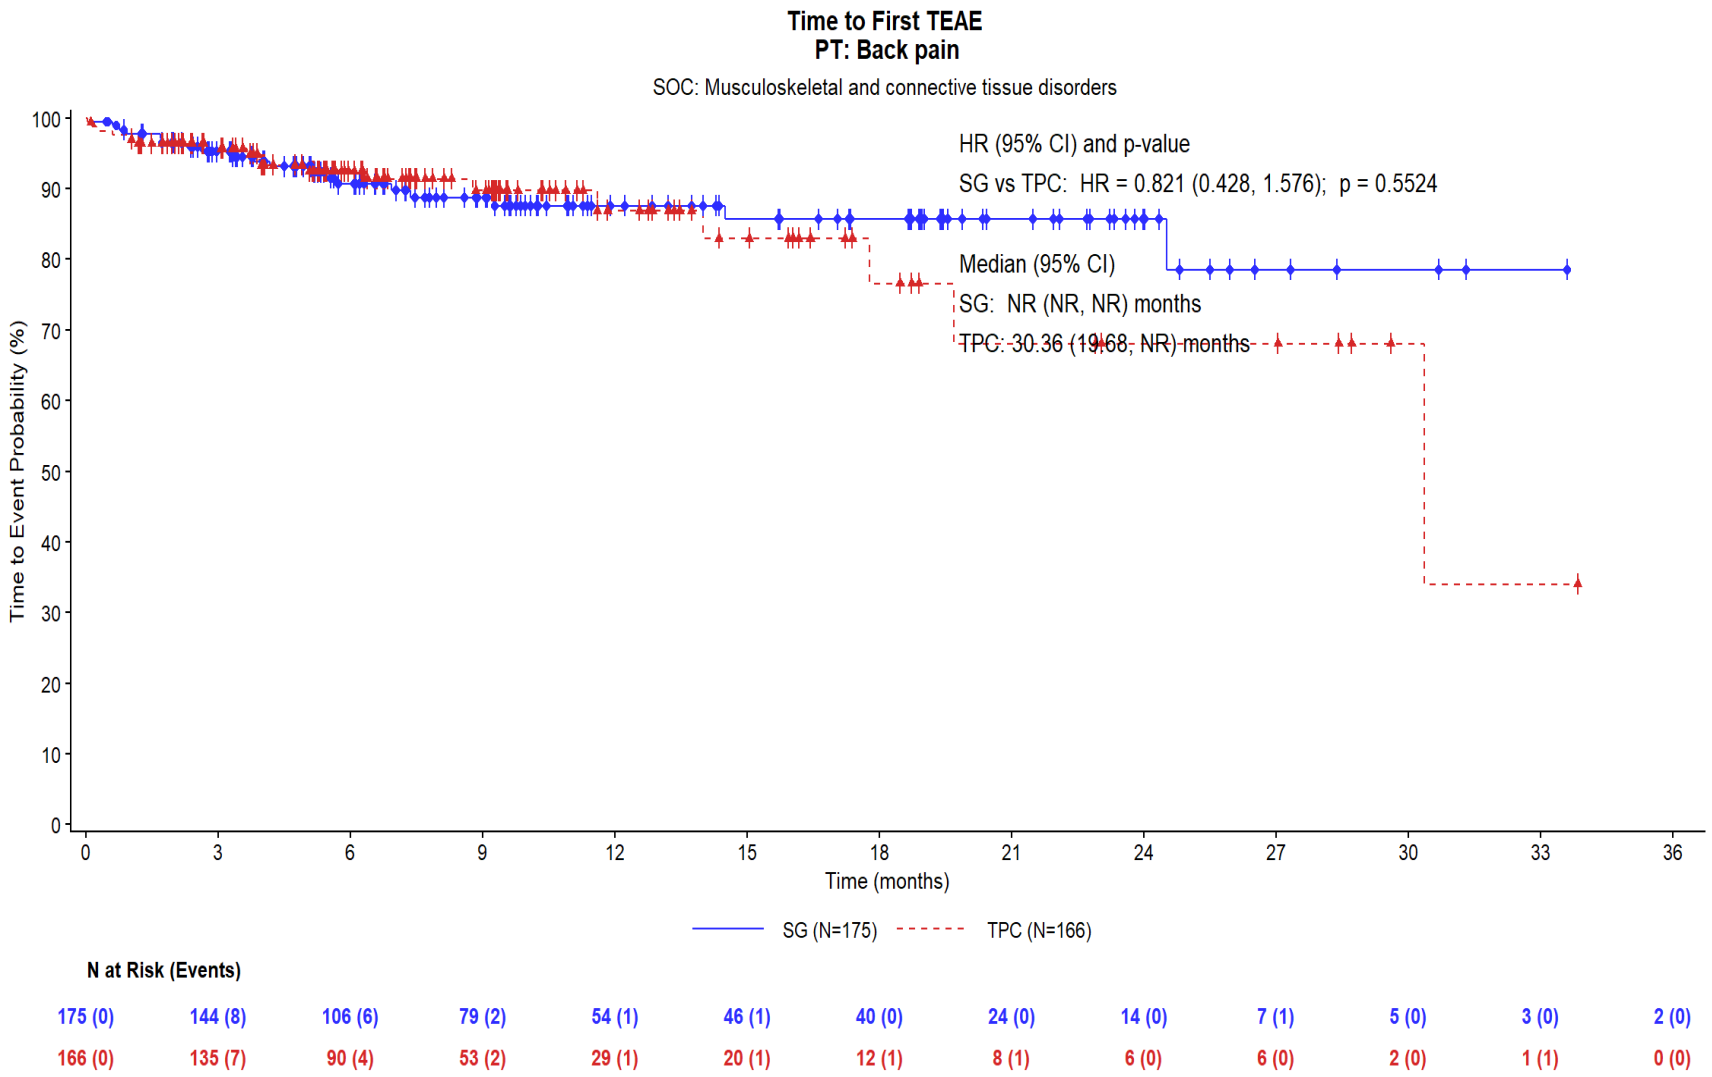
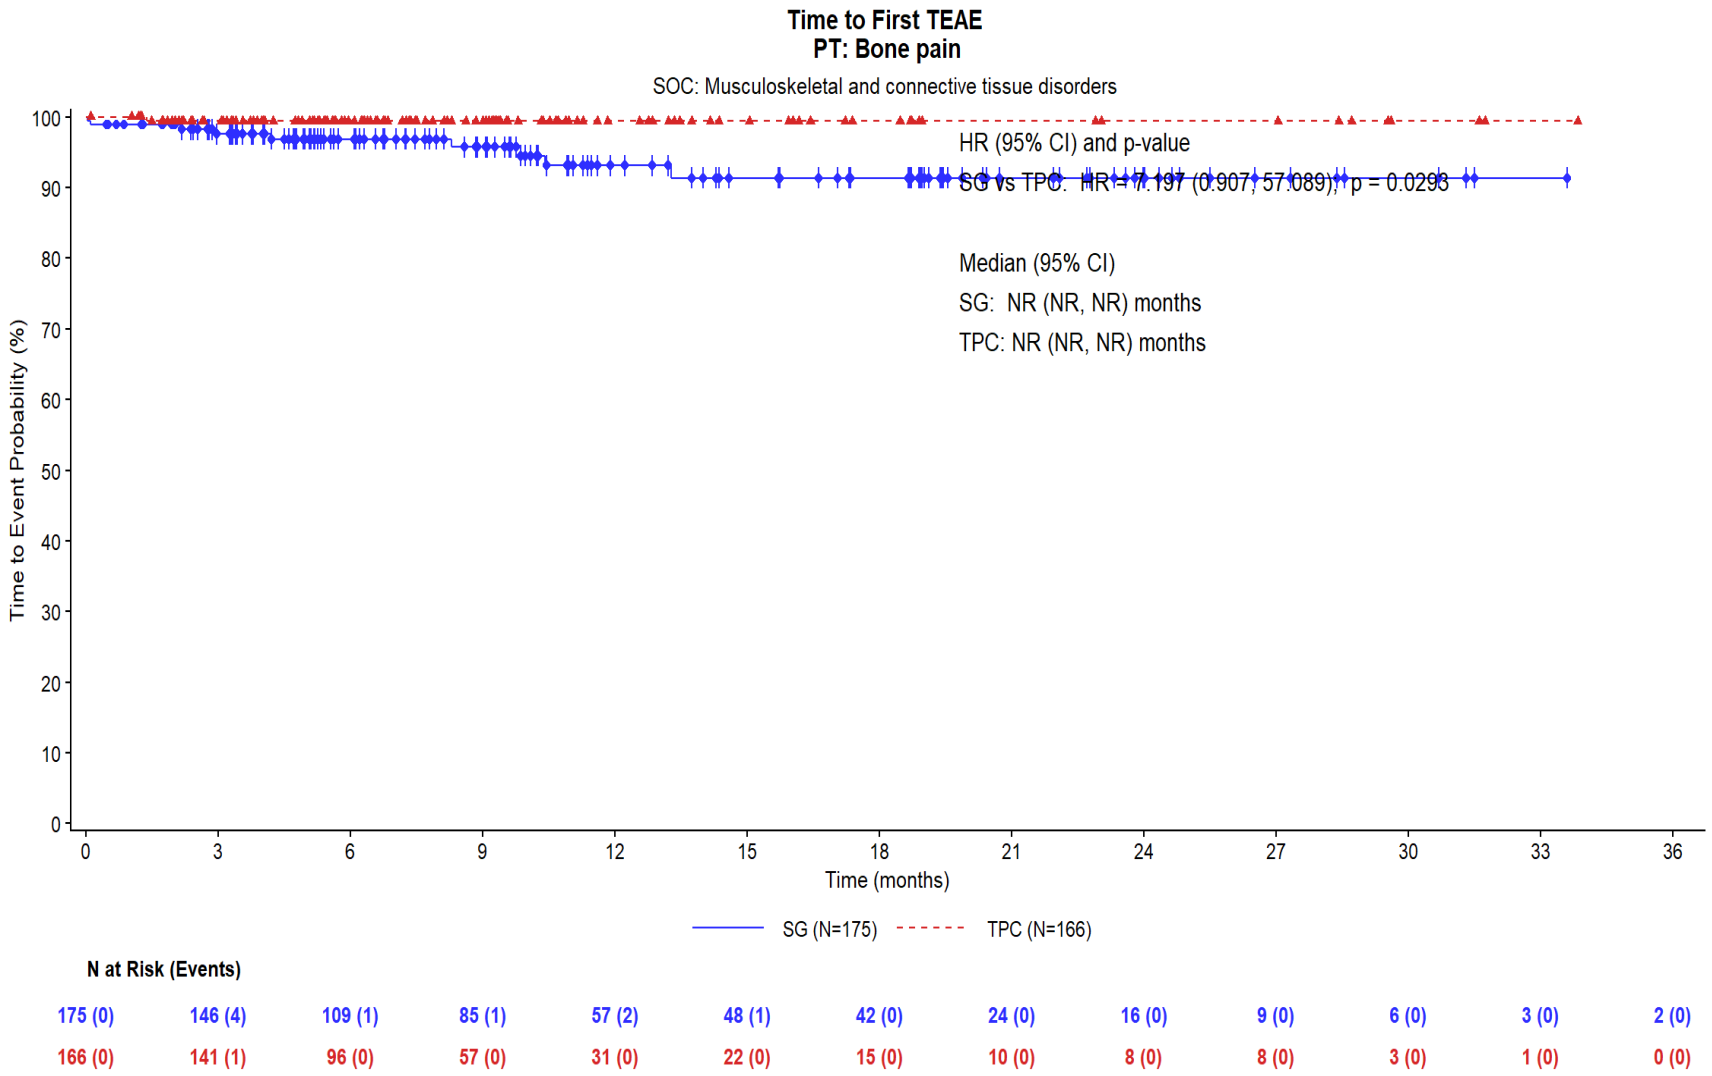
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.85. Figure 1.1.84: Kaplan Meier Plot of Time to First TEAE by PT Hyponatraemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



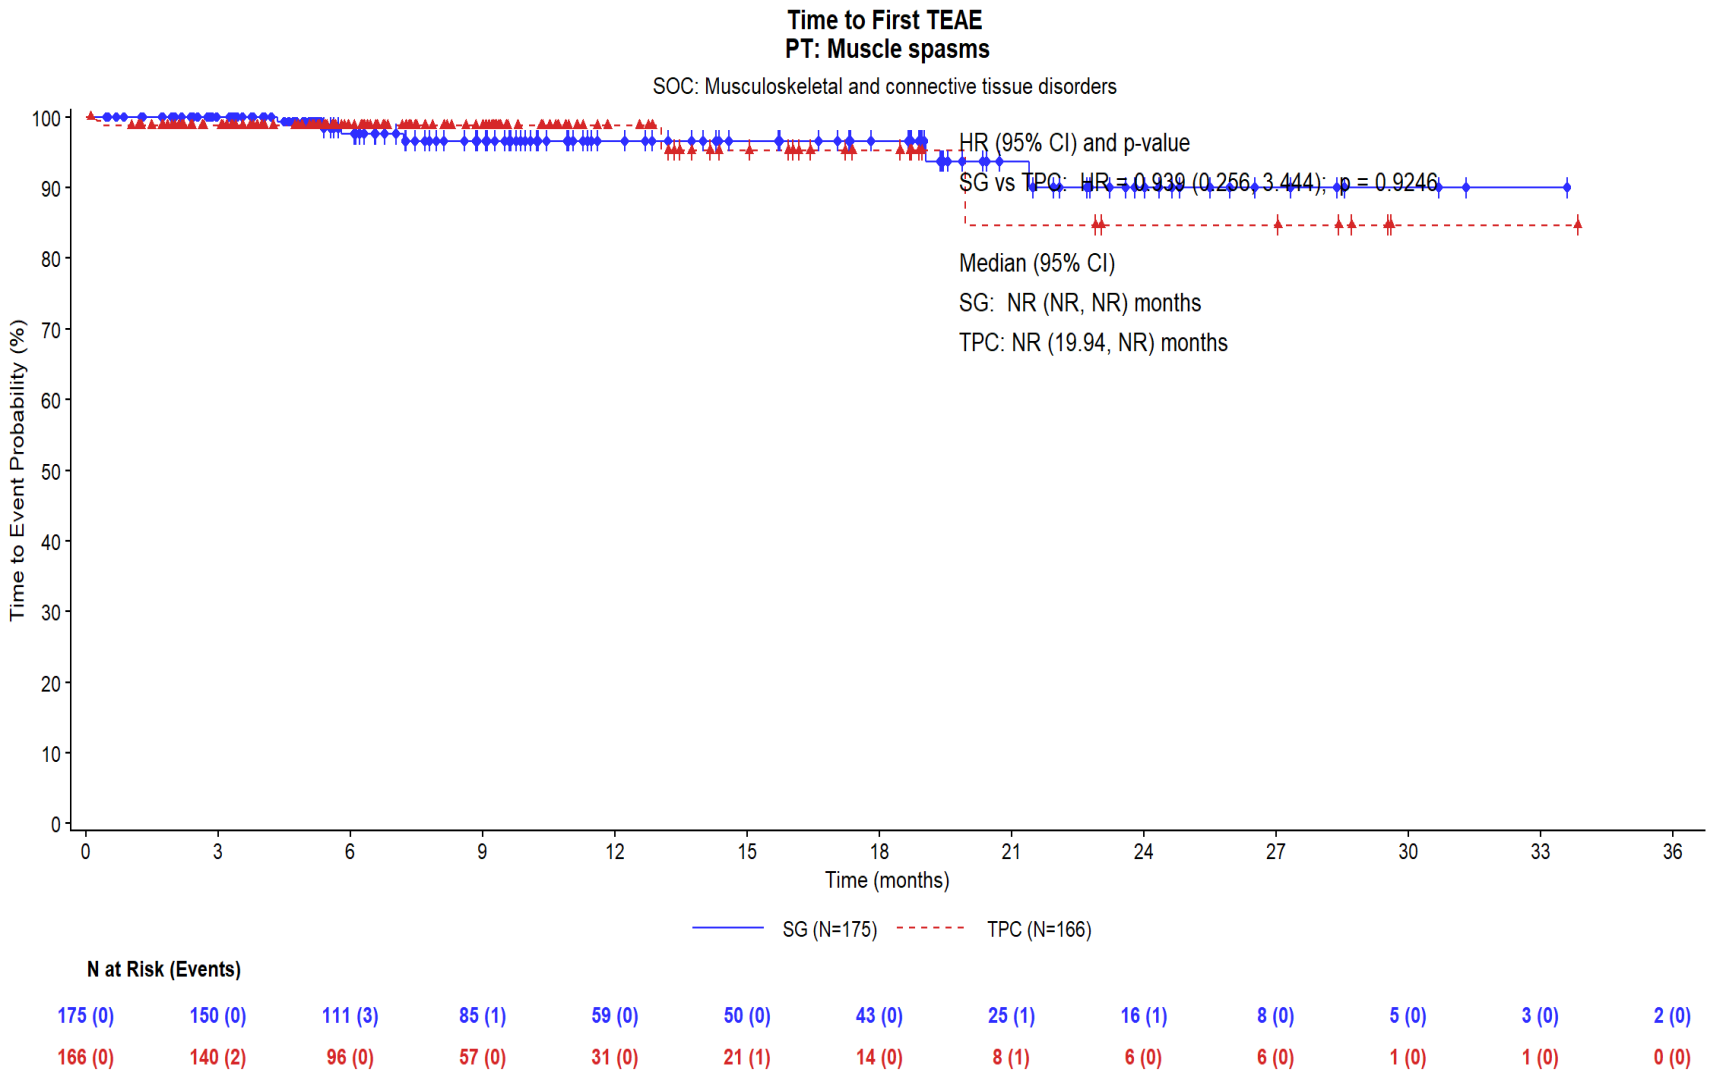
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.86. Figure 1.1.85: Kaplan Meier Plot of Time to First TEAE by PT Arthralgia — mSAF — Excluding patients preselected to receive nab-paclitaxel



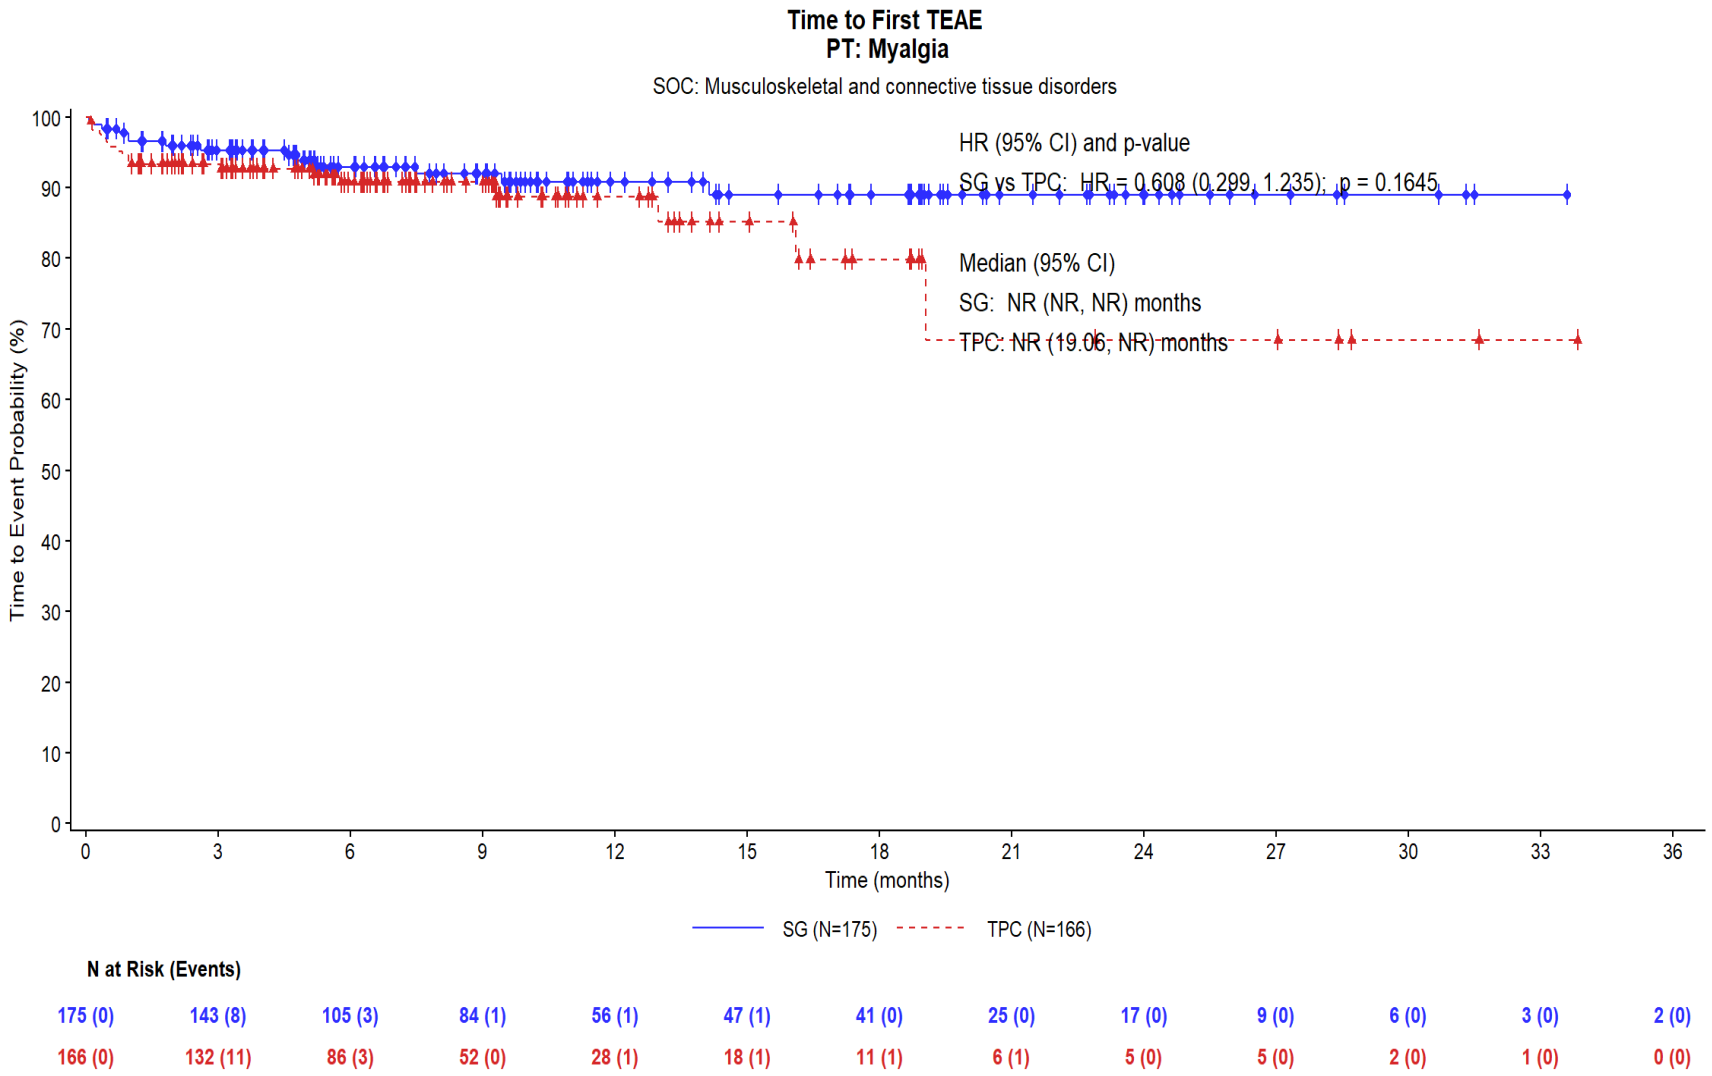
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.87. Figure 1.1.86: Kaplan Meier Plot of Time to First TEAE by PT Back pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



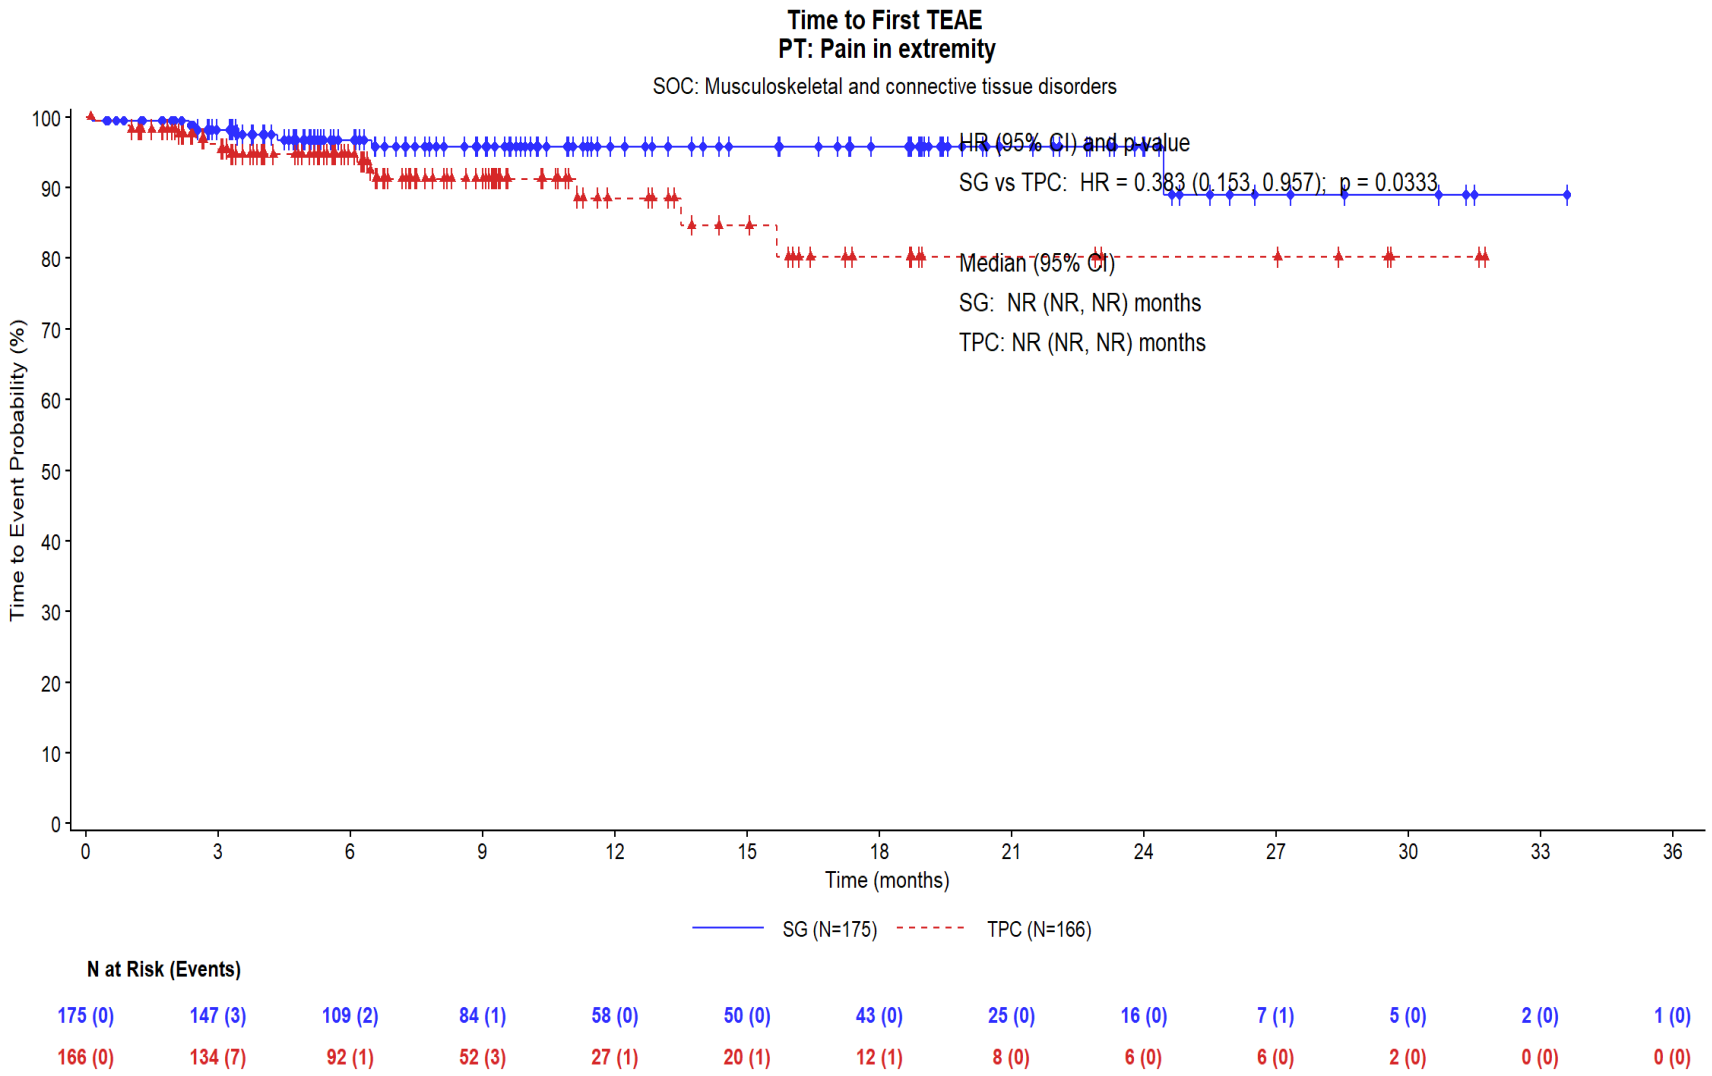
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.88. Figure 1.1.87: Kaplan Meier Plot of Time to First TEAE by PT Bone pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



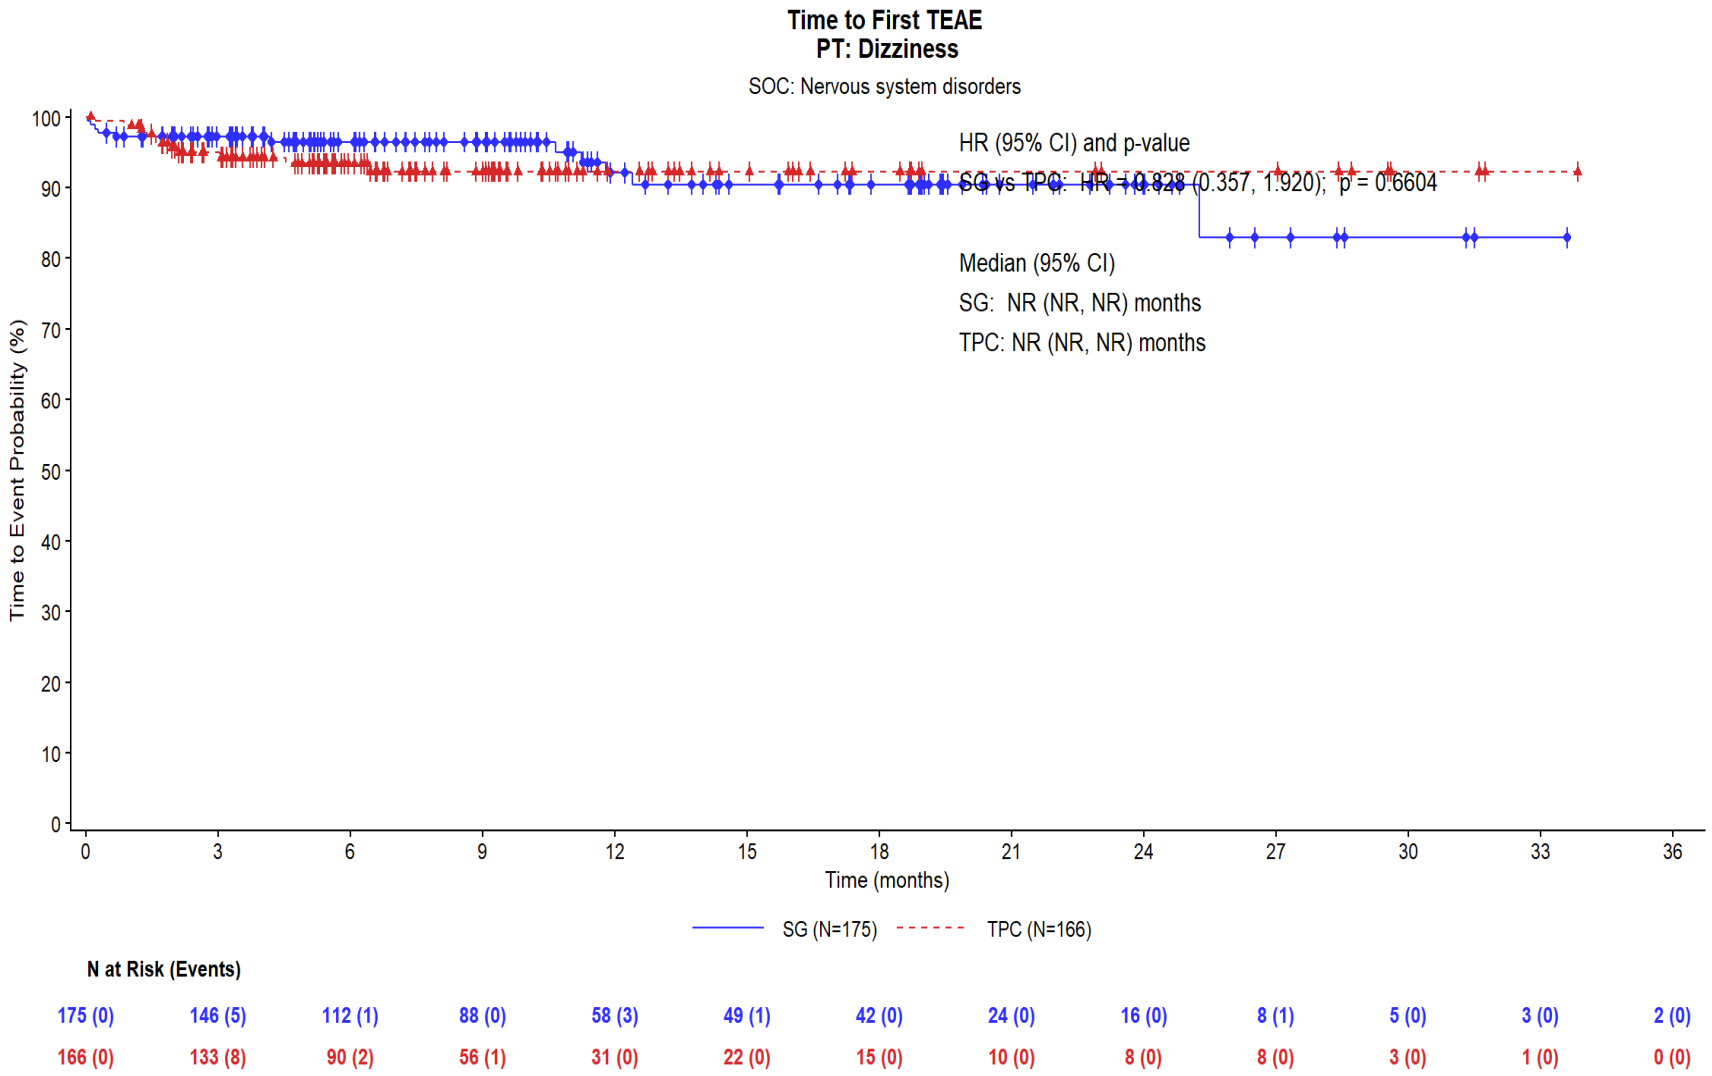
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.89. Figure 1.1.88: Kaplan Meier Plot of Time to First TEAE by PT Muscle spasms — mSAF — Excluding patients preselected to receive nab-paclitaxel



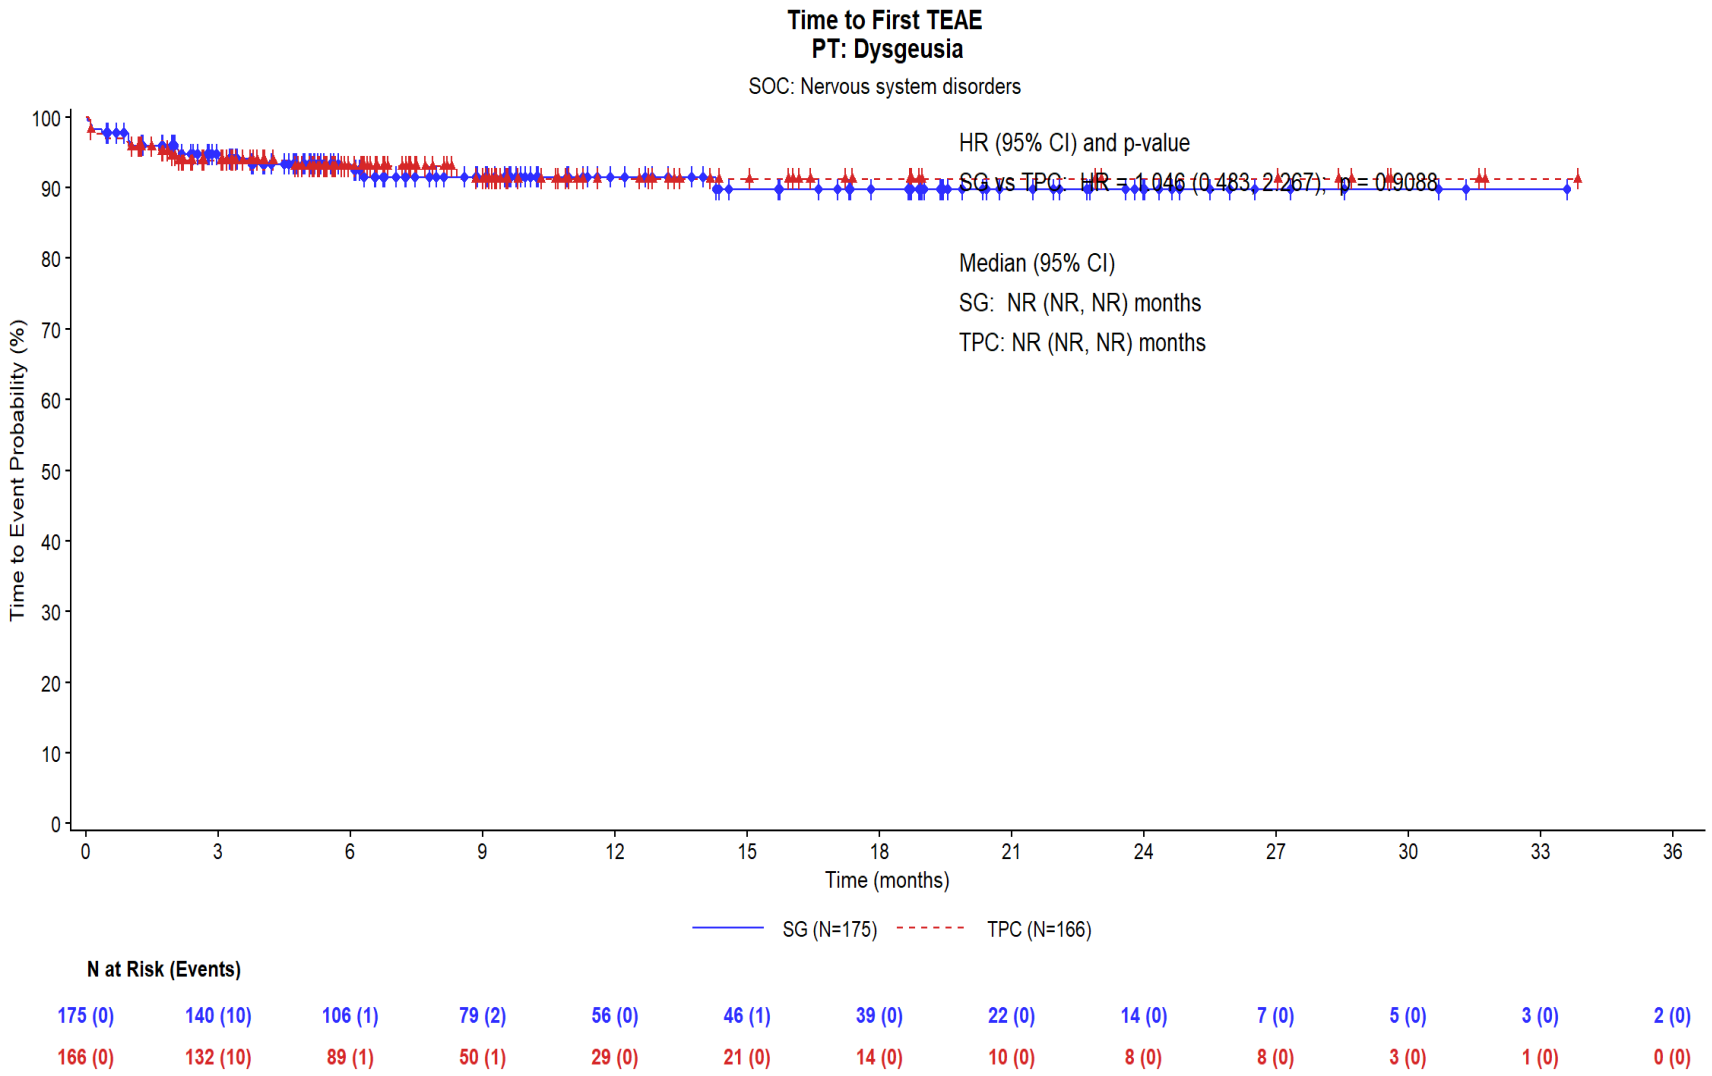
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.90. Figure 1.1.89: Kaplan Meier Plot of Time to First TEAE by PT Myalgia — mSAF — Excluding patients preselected to receive nab-paclitaxel



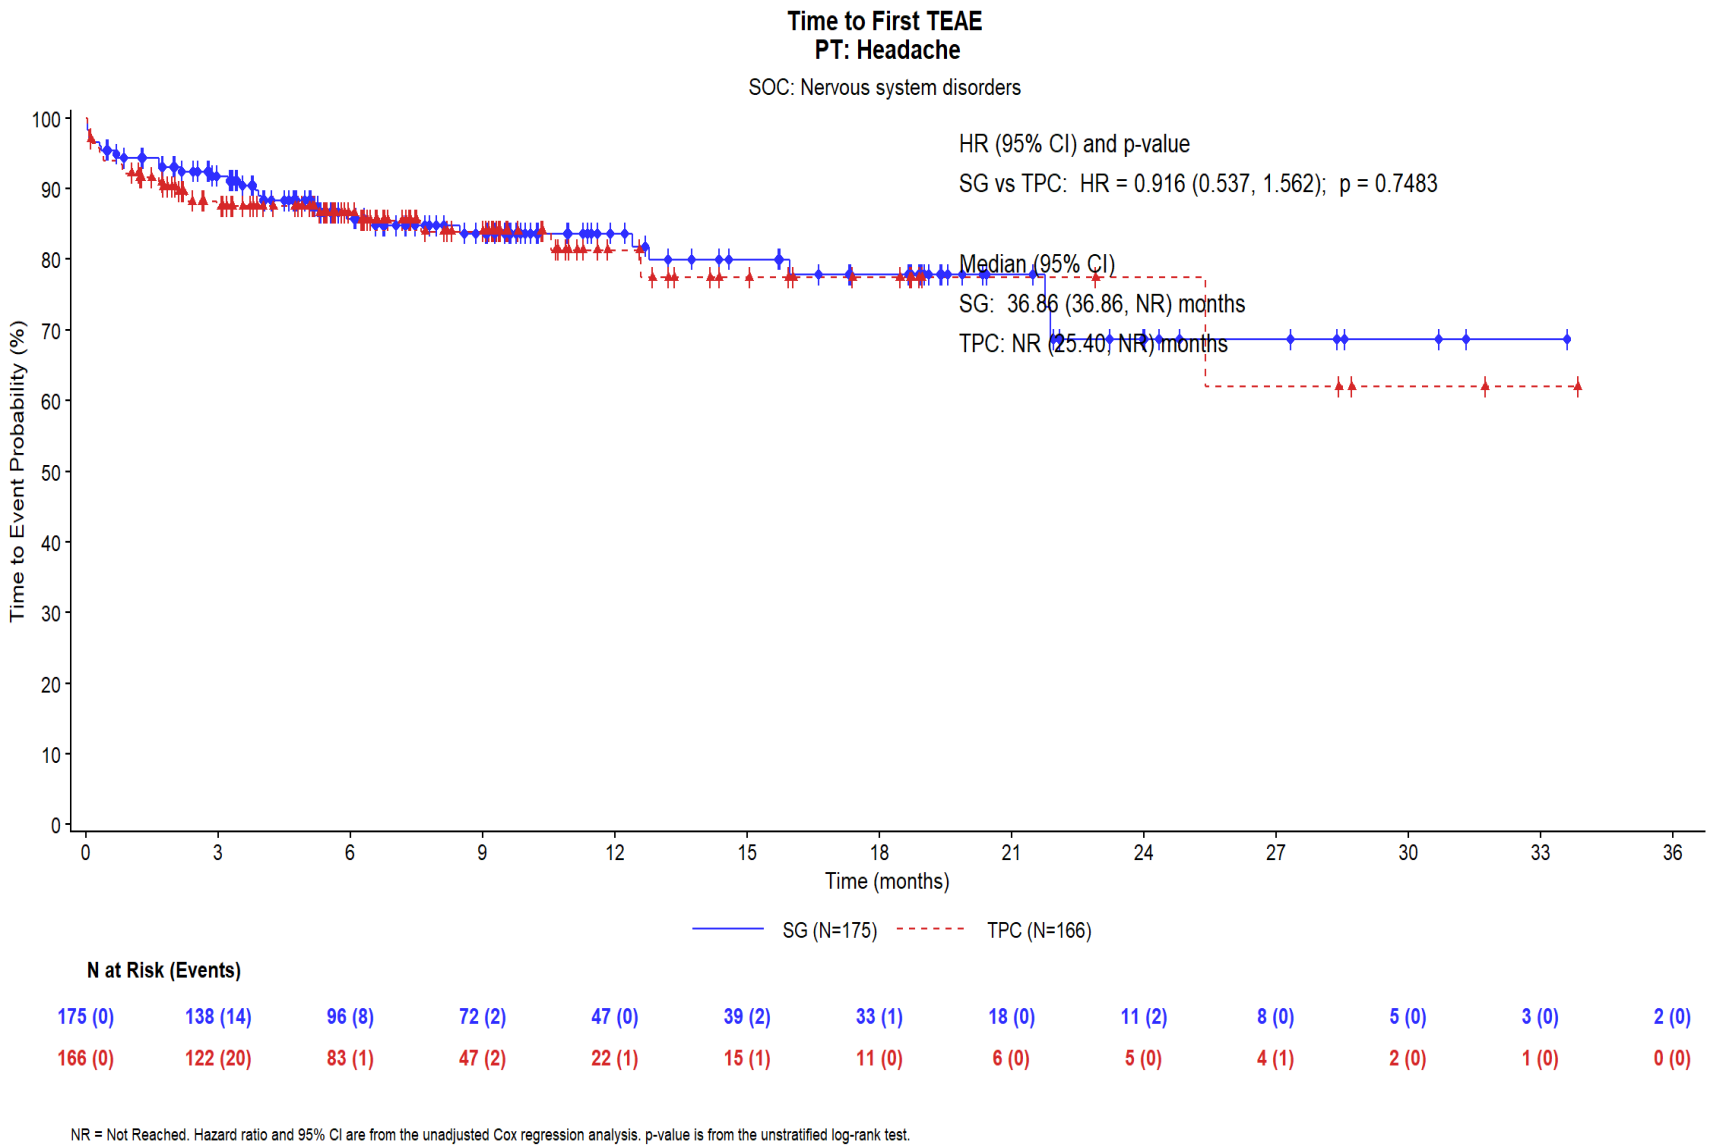
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.91. Figure 1.1.90: Kaplan Meier Plot of Time to First TEAE by PT Pain in extremity — mSAF — Excluding patients preselected to receive nab-paclitaxel



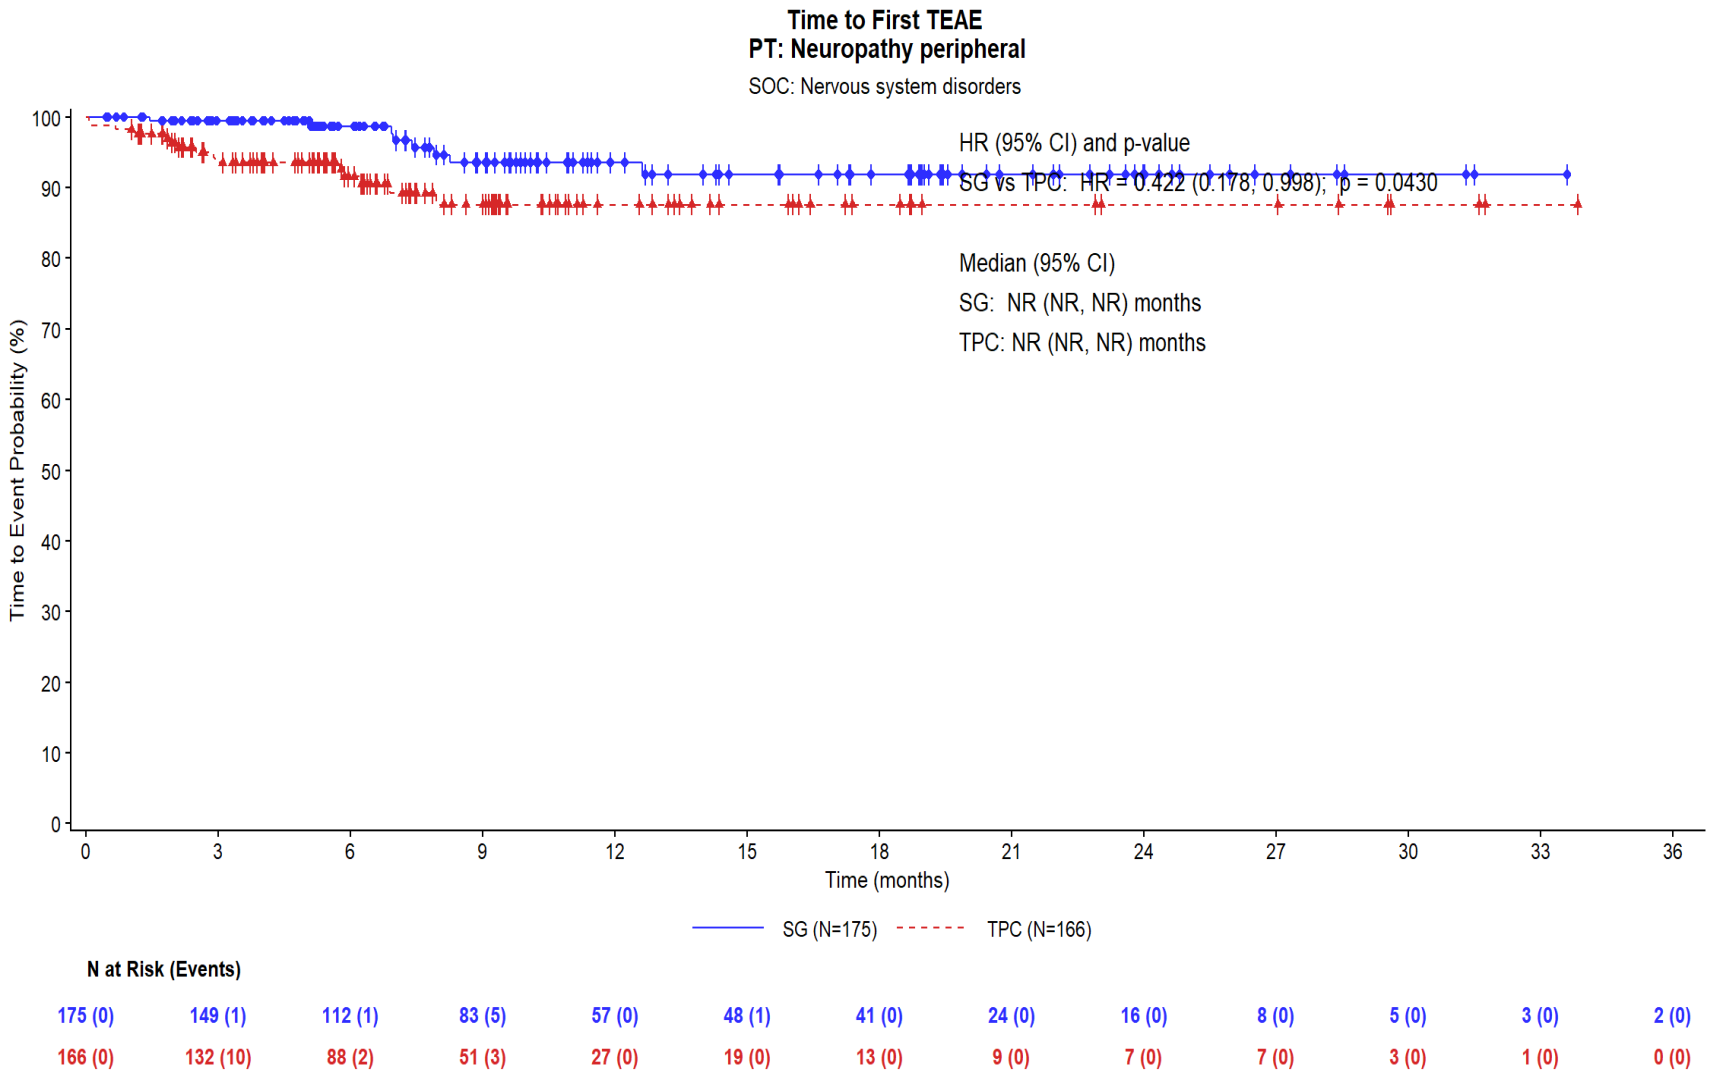
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.92. Figure 1.1.91: Kaplan Meier Plot of Time to First TEAE by PT Dizziness — mSAF — Excluding patients preselected to receive nab-paclitaxel



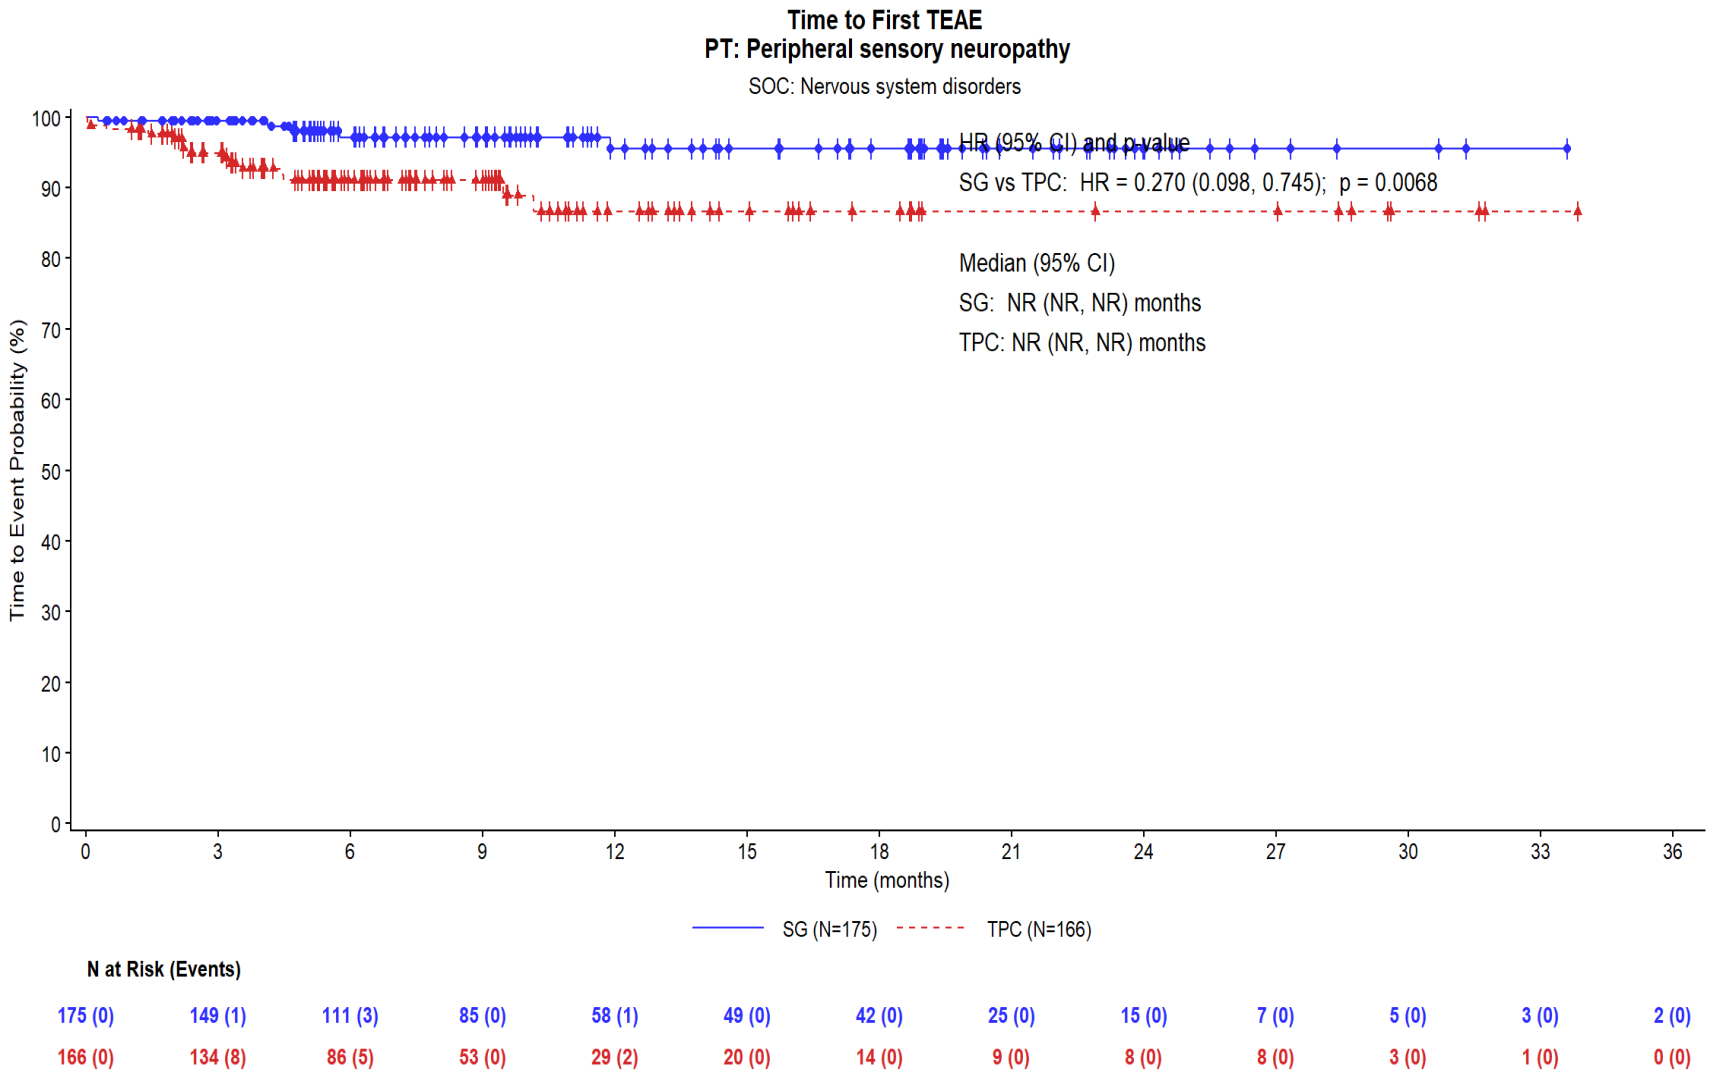
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.93. Figure 1.1.92: Kaplan Meier Plot of Time to First TEAE by PT Dysgeusia — mSAF — Excluding patients preselected to receive nab-paclitaxel



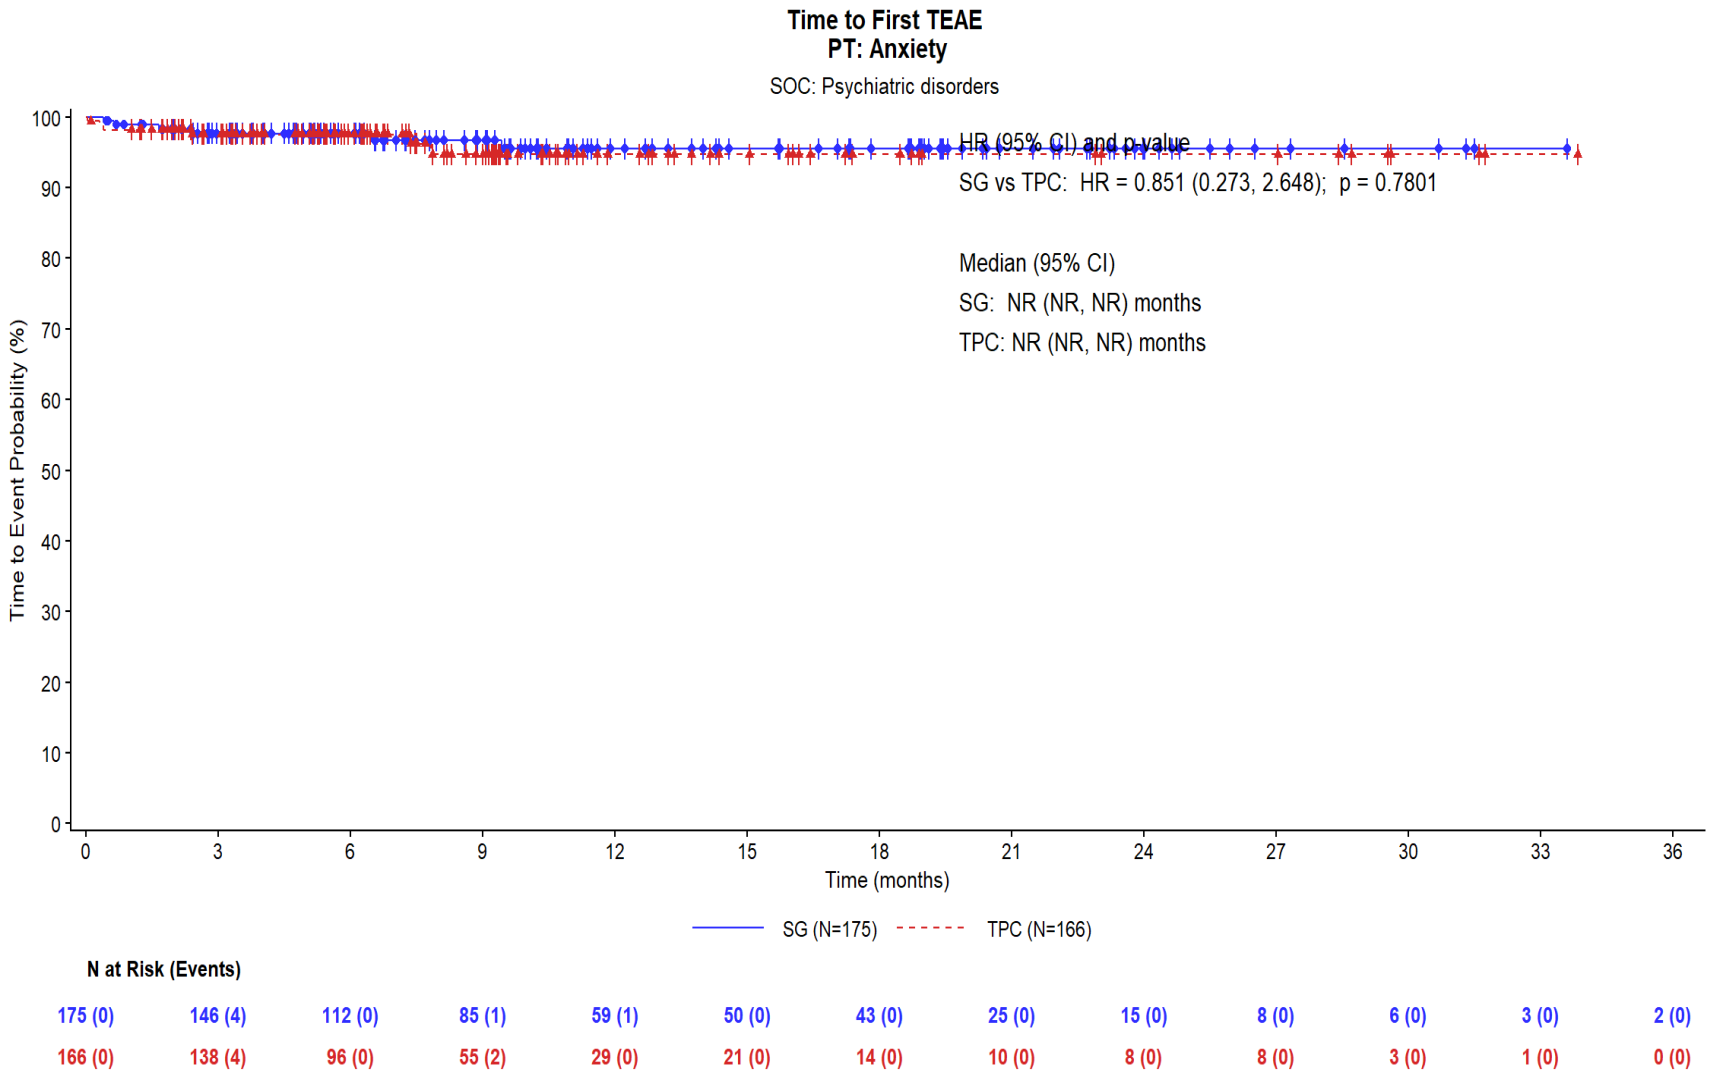
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.94. Figure 1.1.93: Kaplan Meier Plot of Time to First TEAE by PT Headache — mSAF — Excluding patients preselected to receive nab-paclitaxel



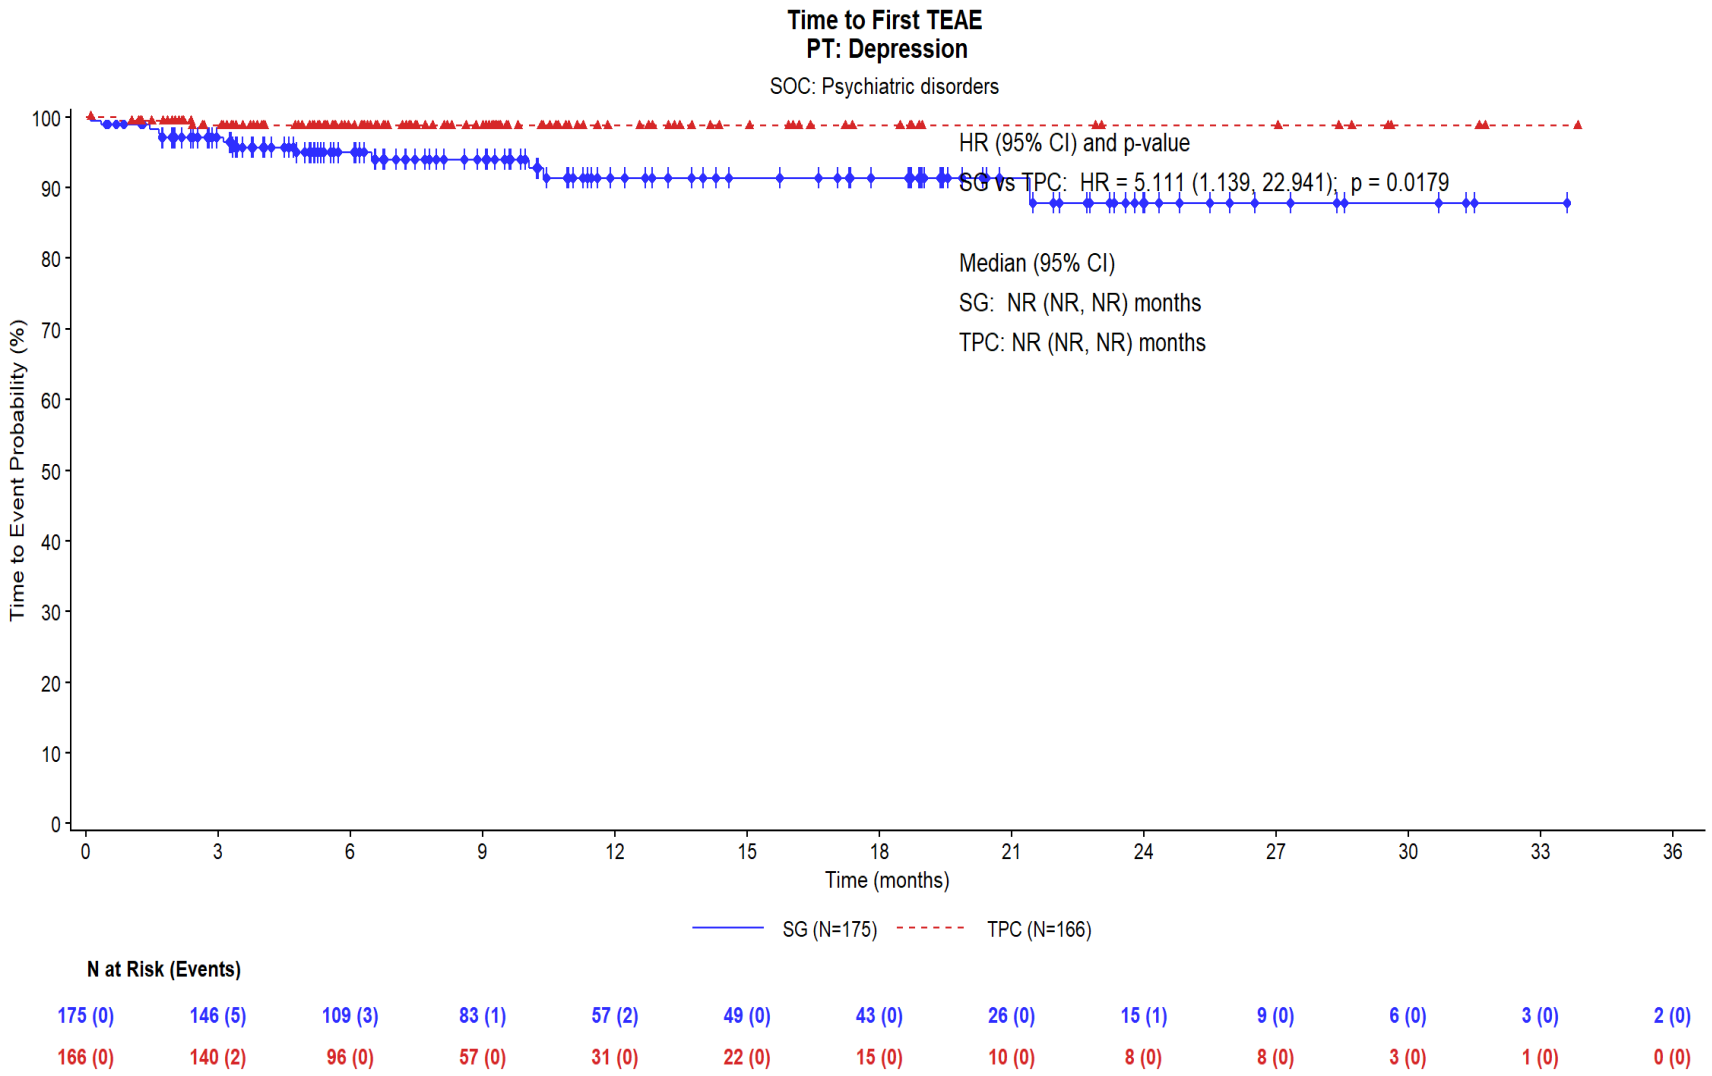
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.95. Figure 1.1.94: Kaplan Meier Plot of Time to First TEAE by PT Neuropathy peripheral — mSAF — Excluding patients preselected to receive nab-paclitaxel



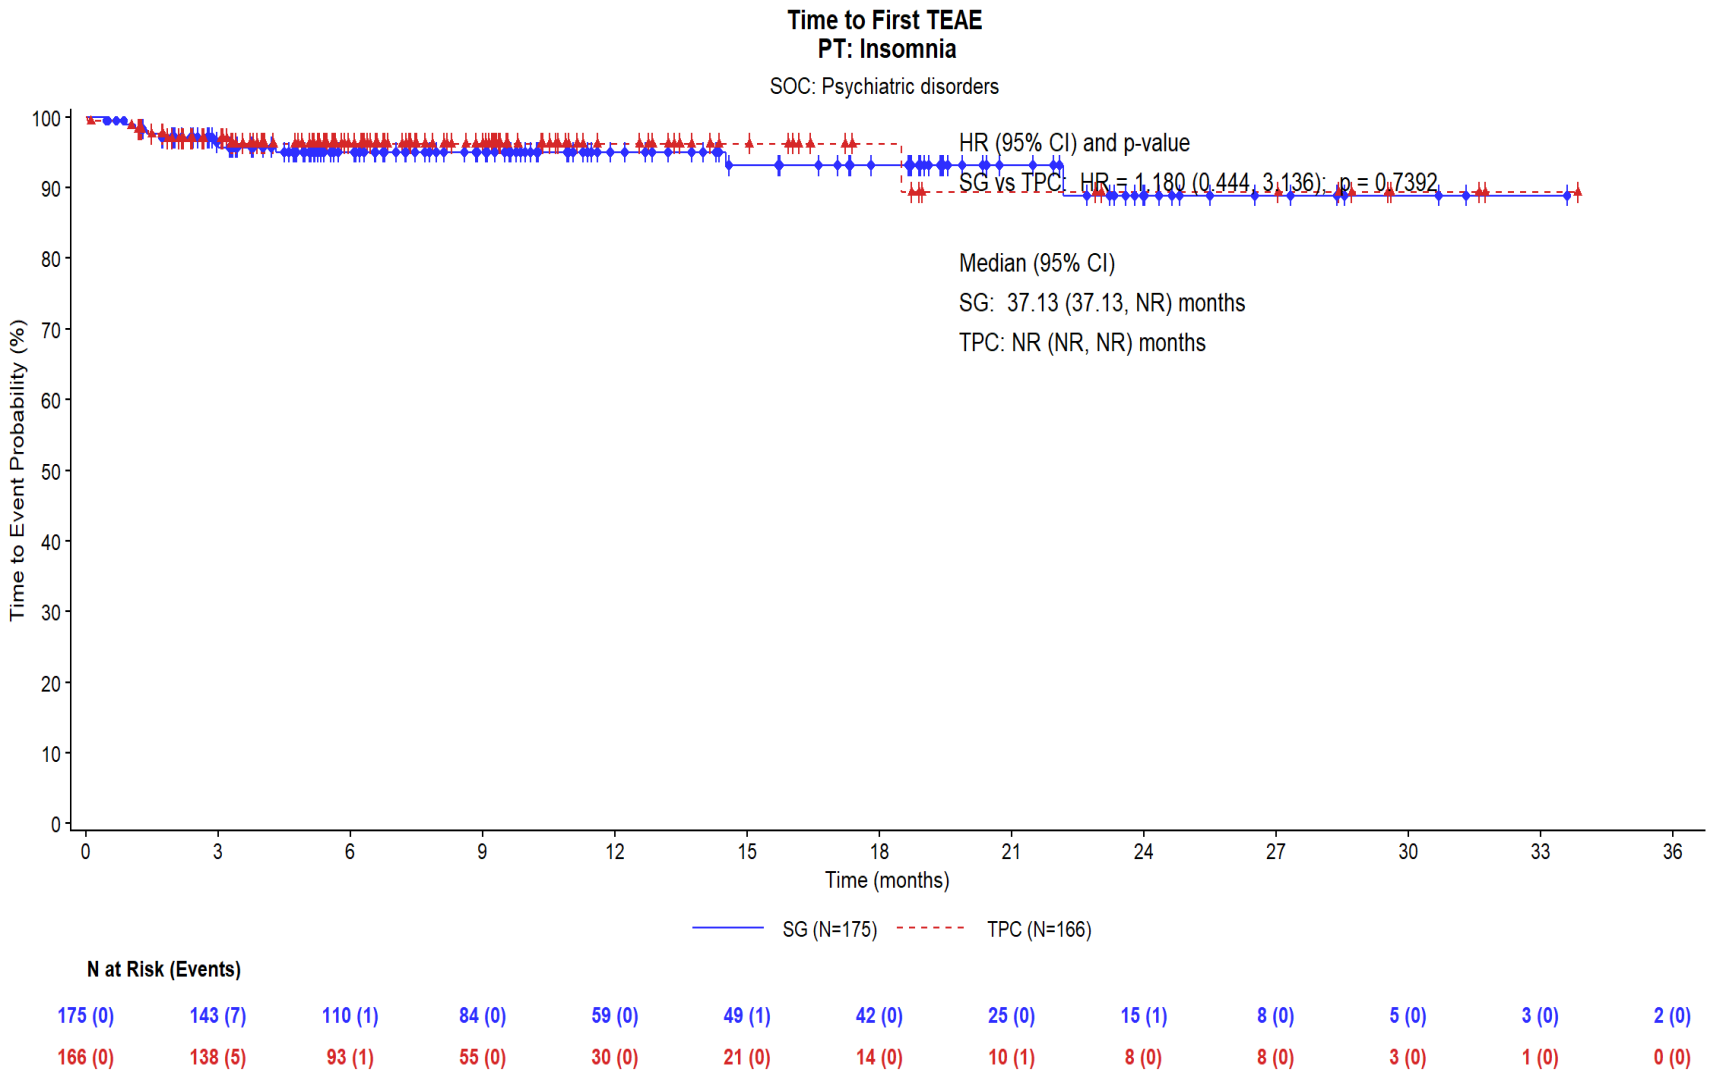
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.96. Figure 1.1.95: Kaplan Meier Plot of Time to First TEAE by PT Peripheral sensory neuropathy — mSAF — Excluding patients preselected to receive nab-paclitaxel



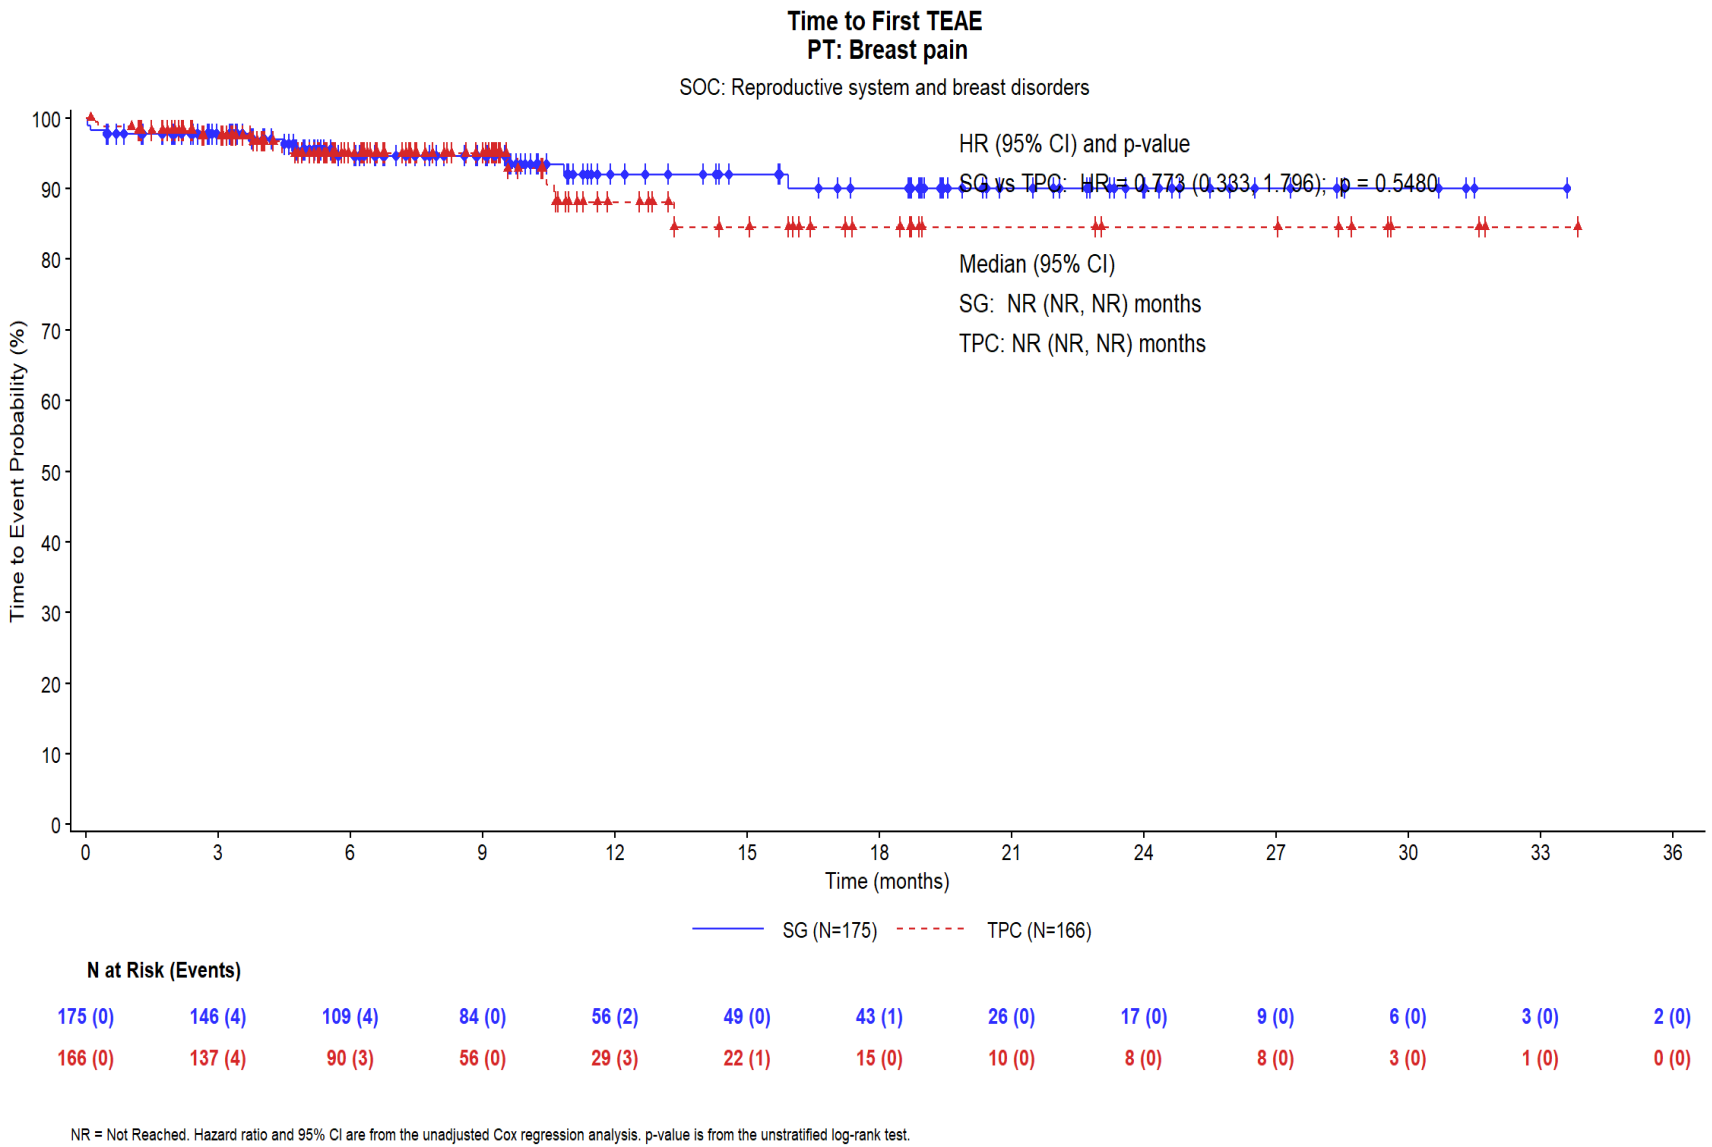
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.97. Figure 1.1.96: Kaplan Meier Plot of Time to First TEAE by PT Anxiety — mSAF — Excluding patients preselected to receive nab-paclitaxel



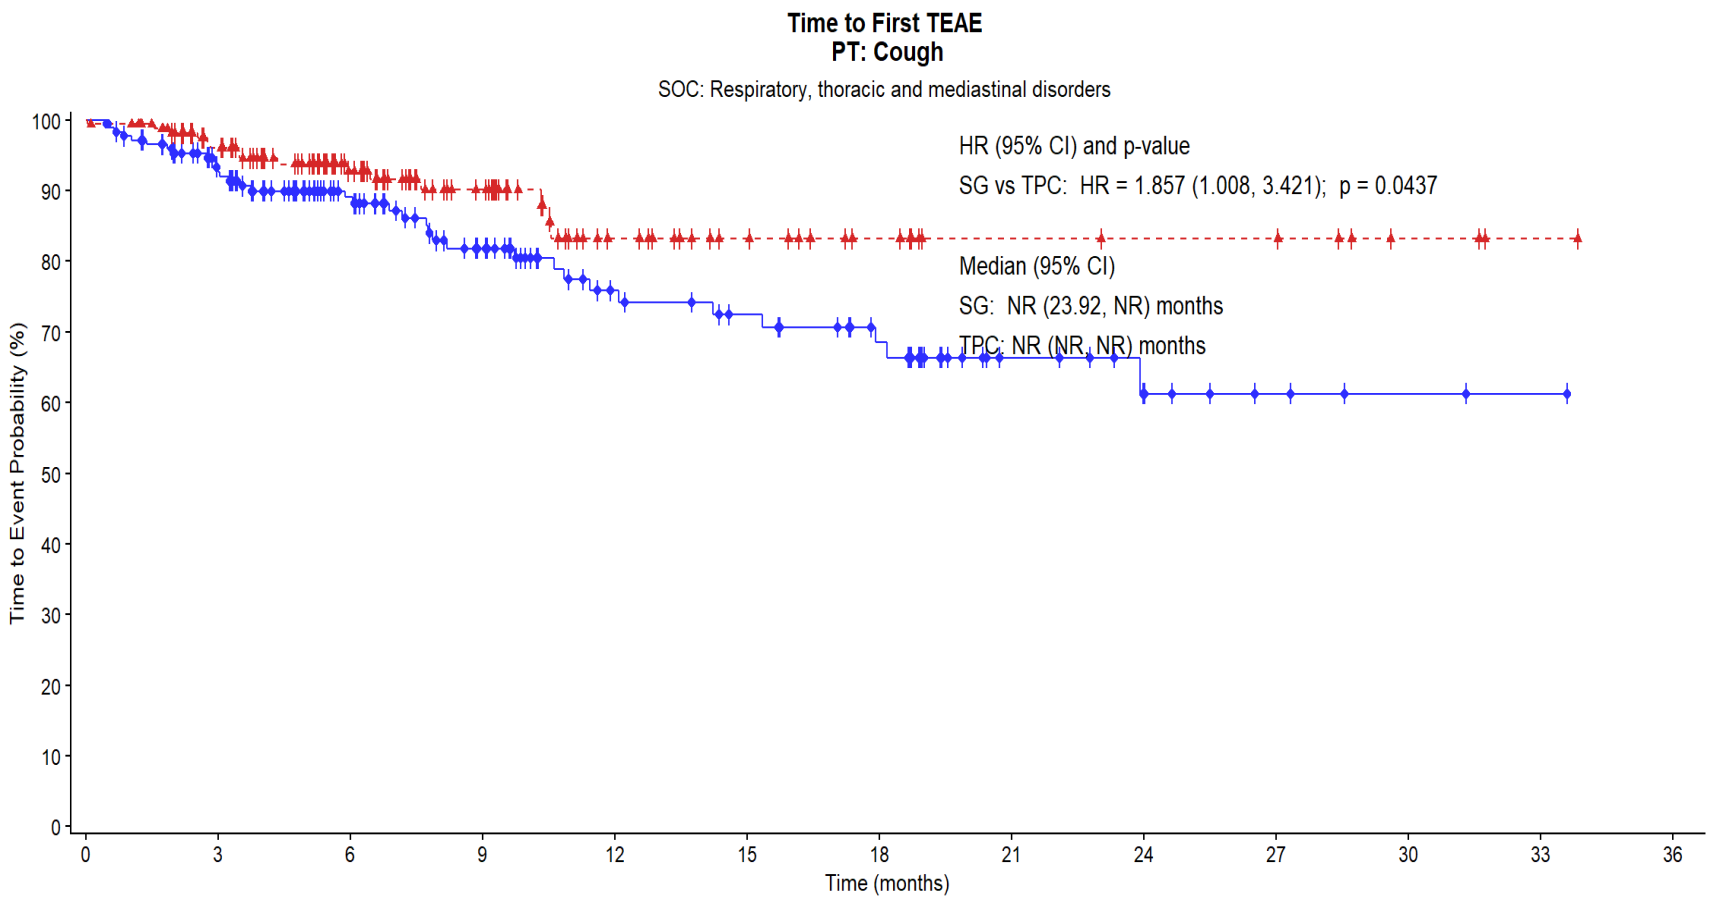
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.98. Figure 1.1.97: Kaplan Meier Plot of Time to First TEAE by PT Depression — mSAF — Excluding patients preselected to receive nab-paclitaxel



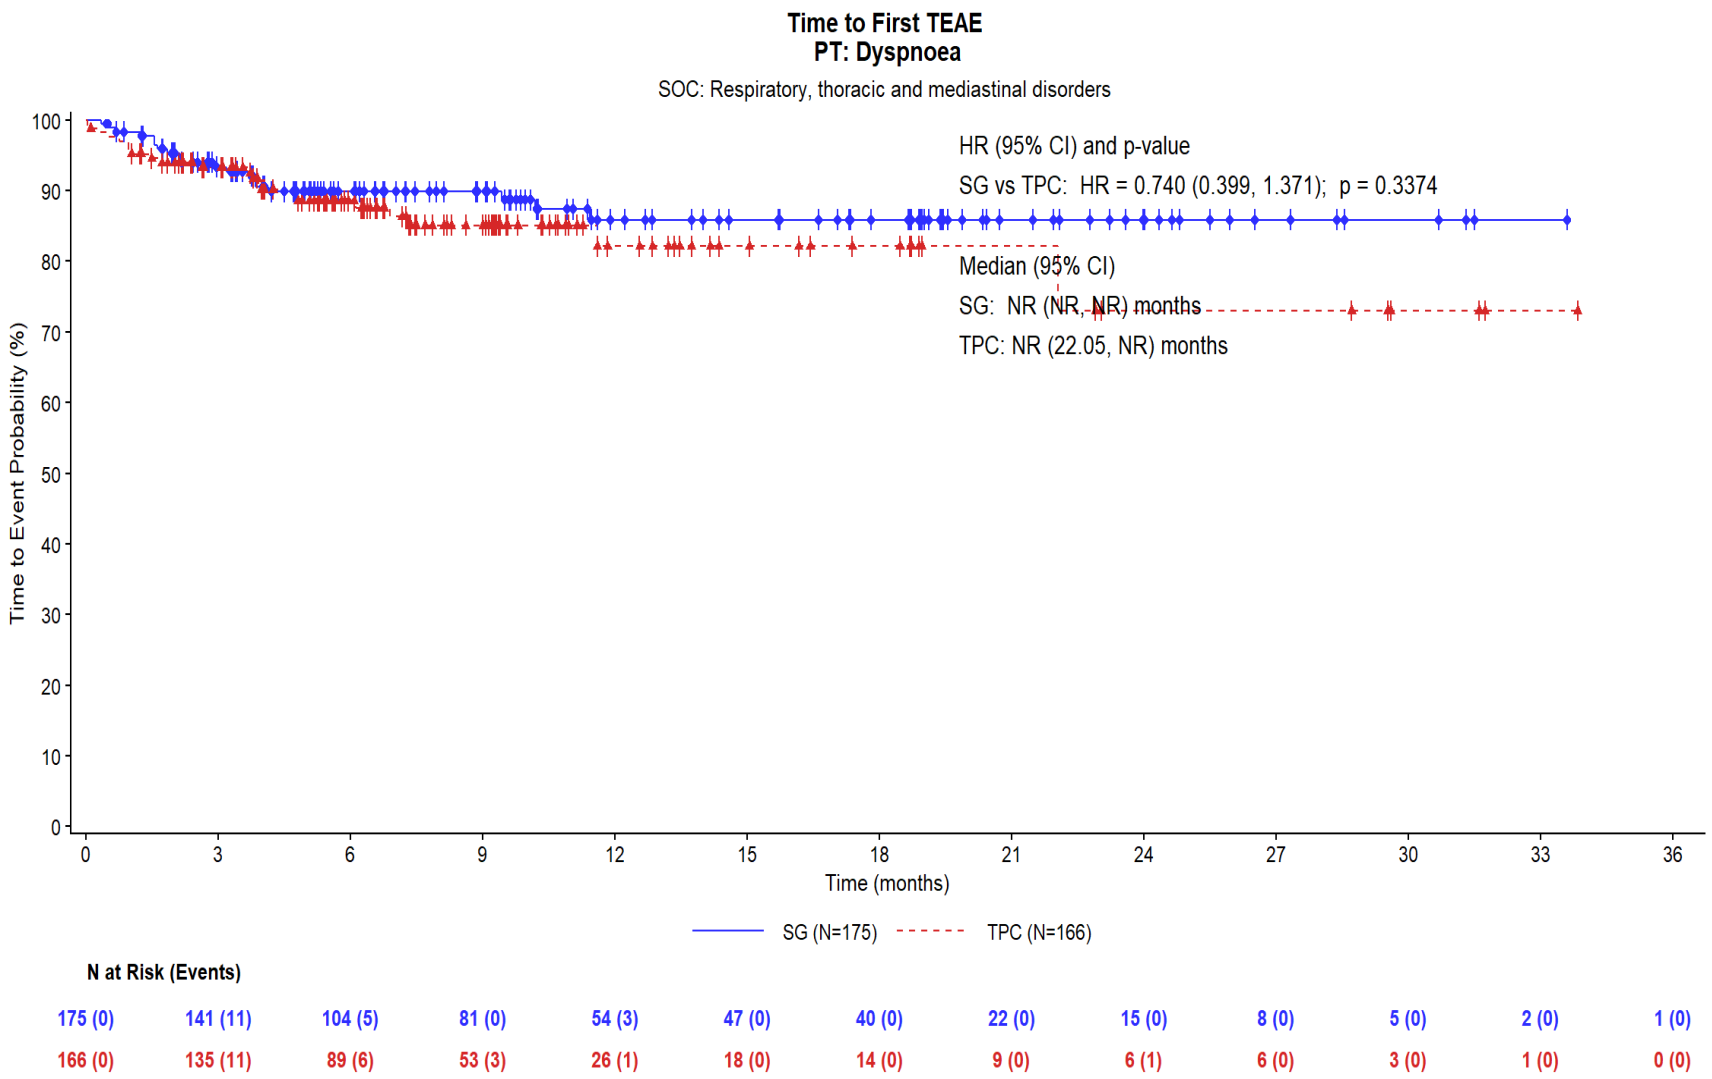
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.99. Figure 1.1.98: Kaplan Meier Plot of Time to First TEAE by PT Insomnia — mSAF — Excluding patients preselected to receive nab-paclitaxel



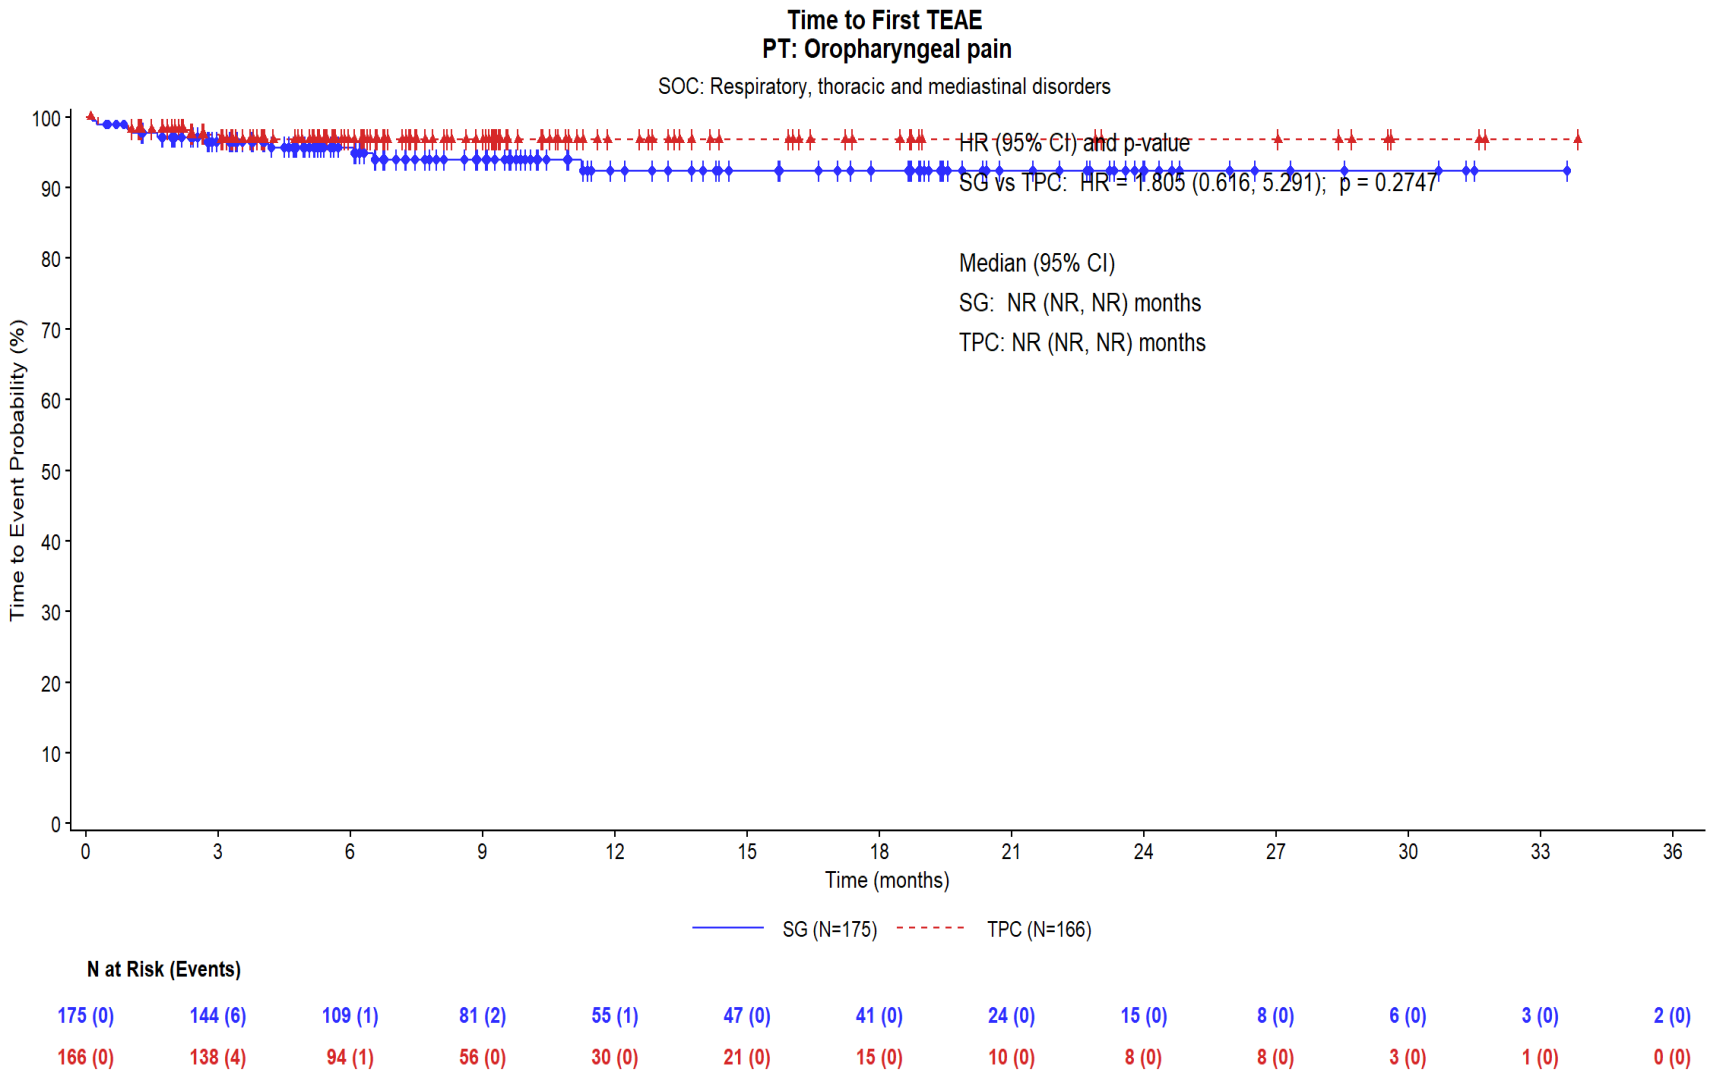
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.100. Figure 1.1.99: Kaplan Meier Plot of Time to First TEAE by PT Breast pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



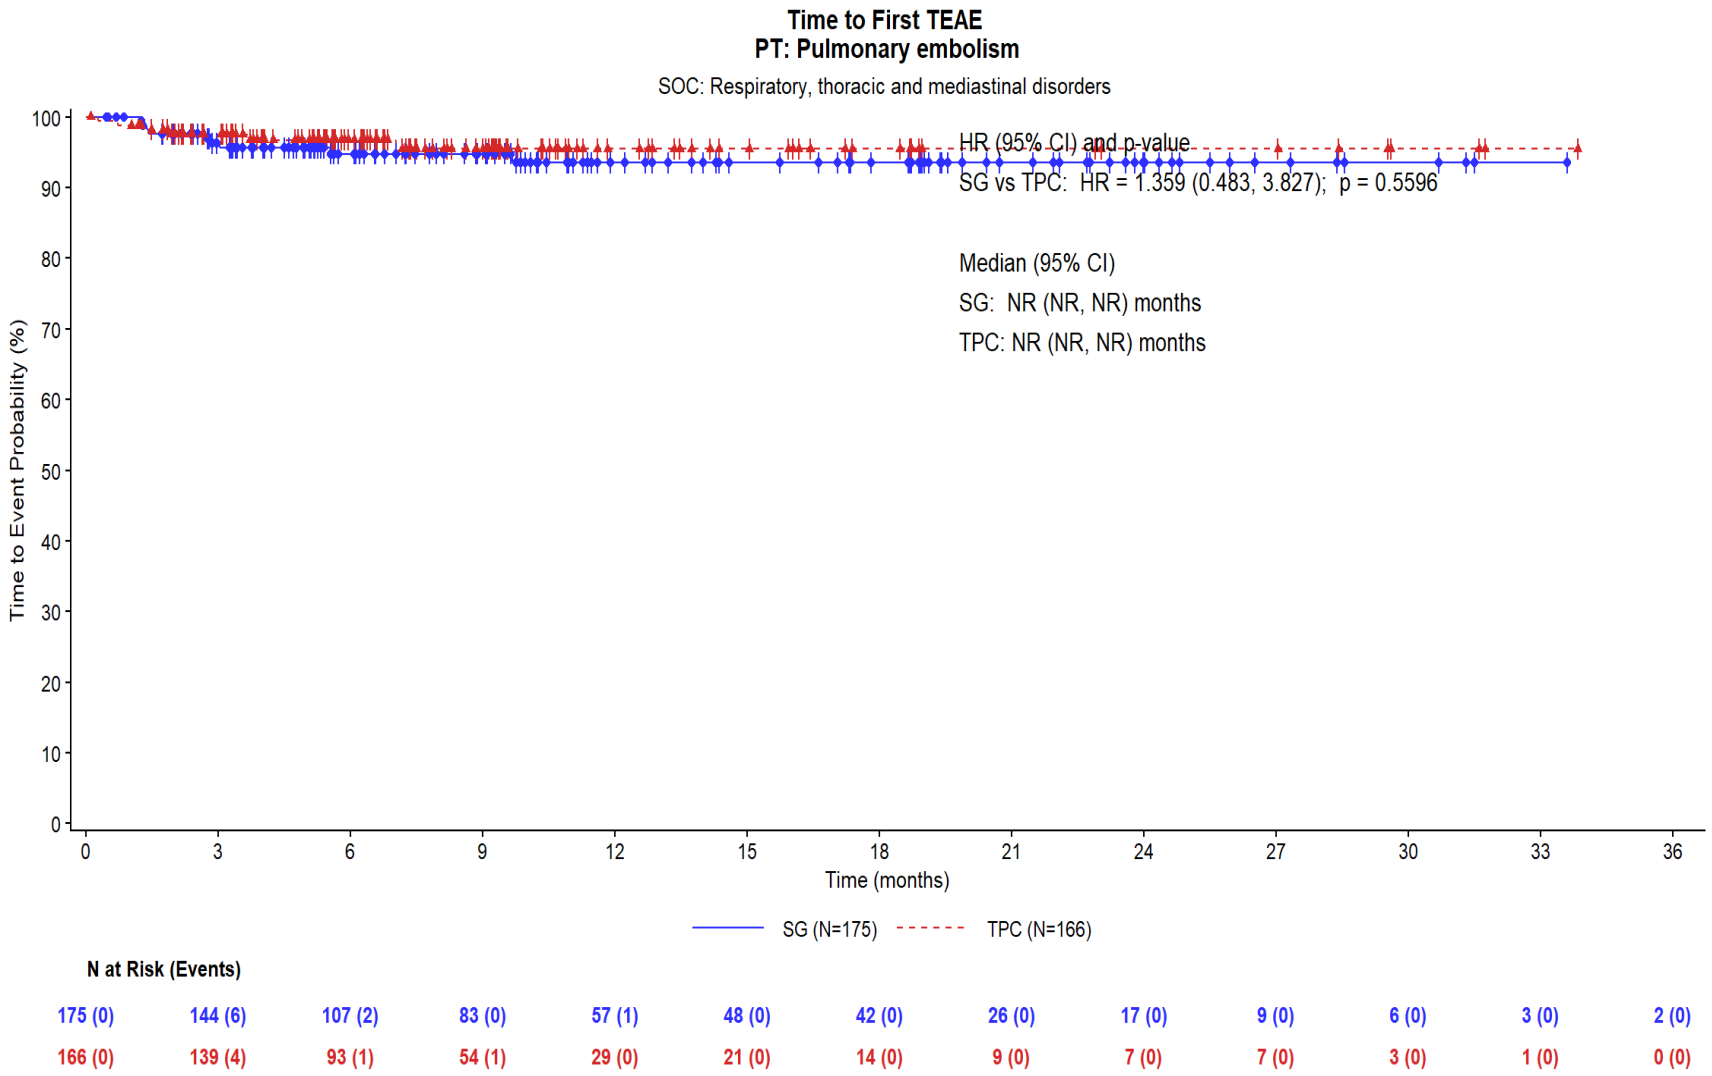
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.101. Figure 1.1.100: Kaplan Meier Plot of Time to First TEAE by PT Cough — mSAF — Excluding patients preselected to receive nab-paclitaxel



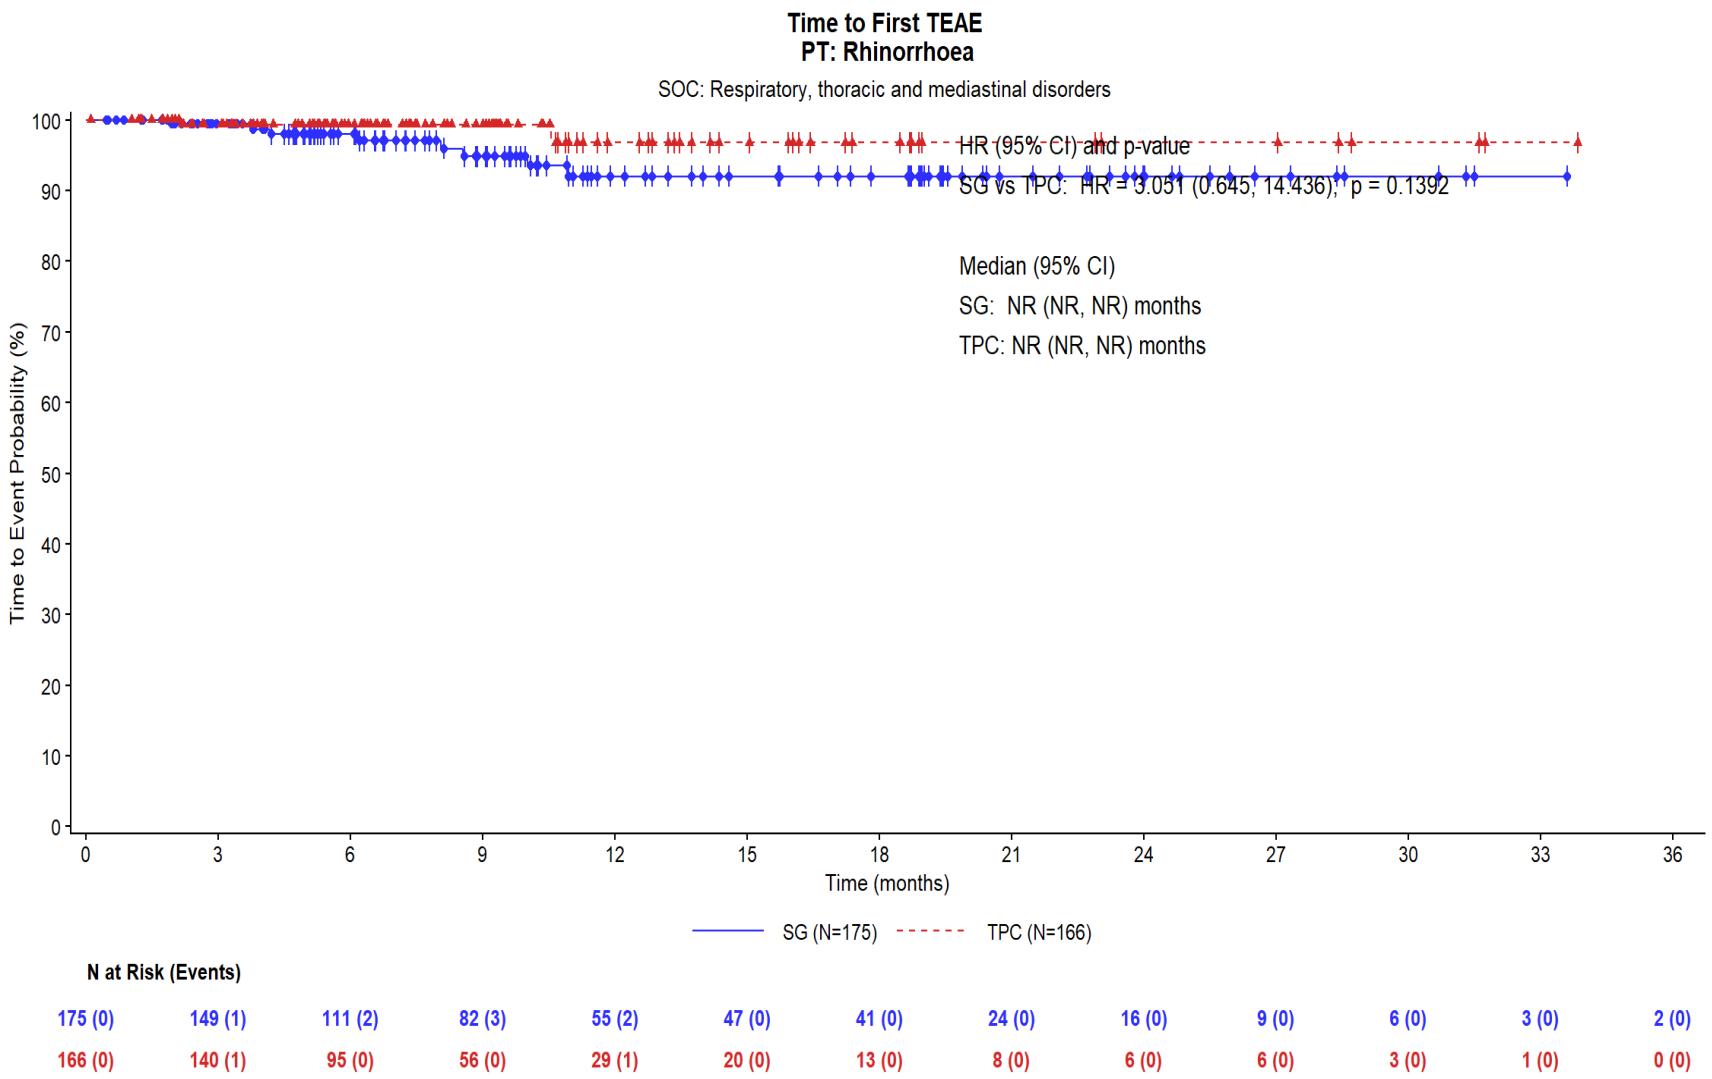
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.102. Figure 1.1.101: Kaplan Meier Plot of Time to First TEAE by PT Dyspnoea — mSAF — Excluding patients preselected to receive nab-paclitaxel



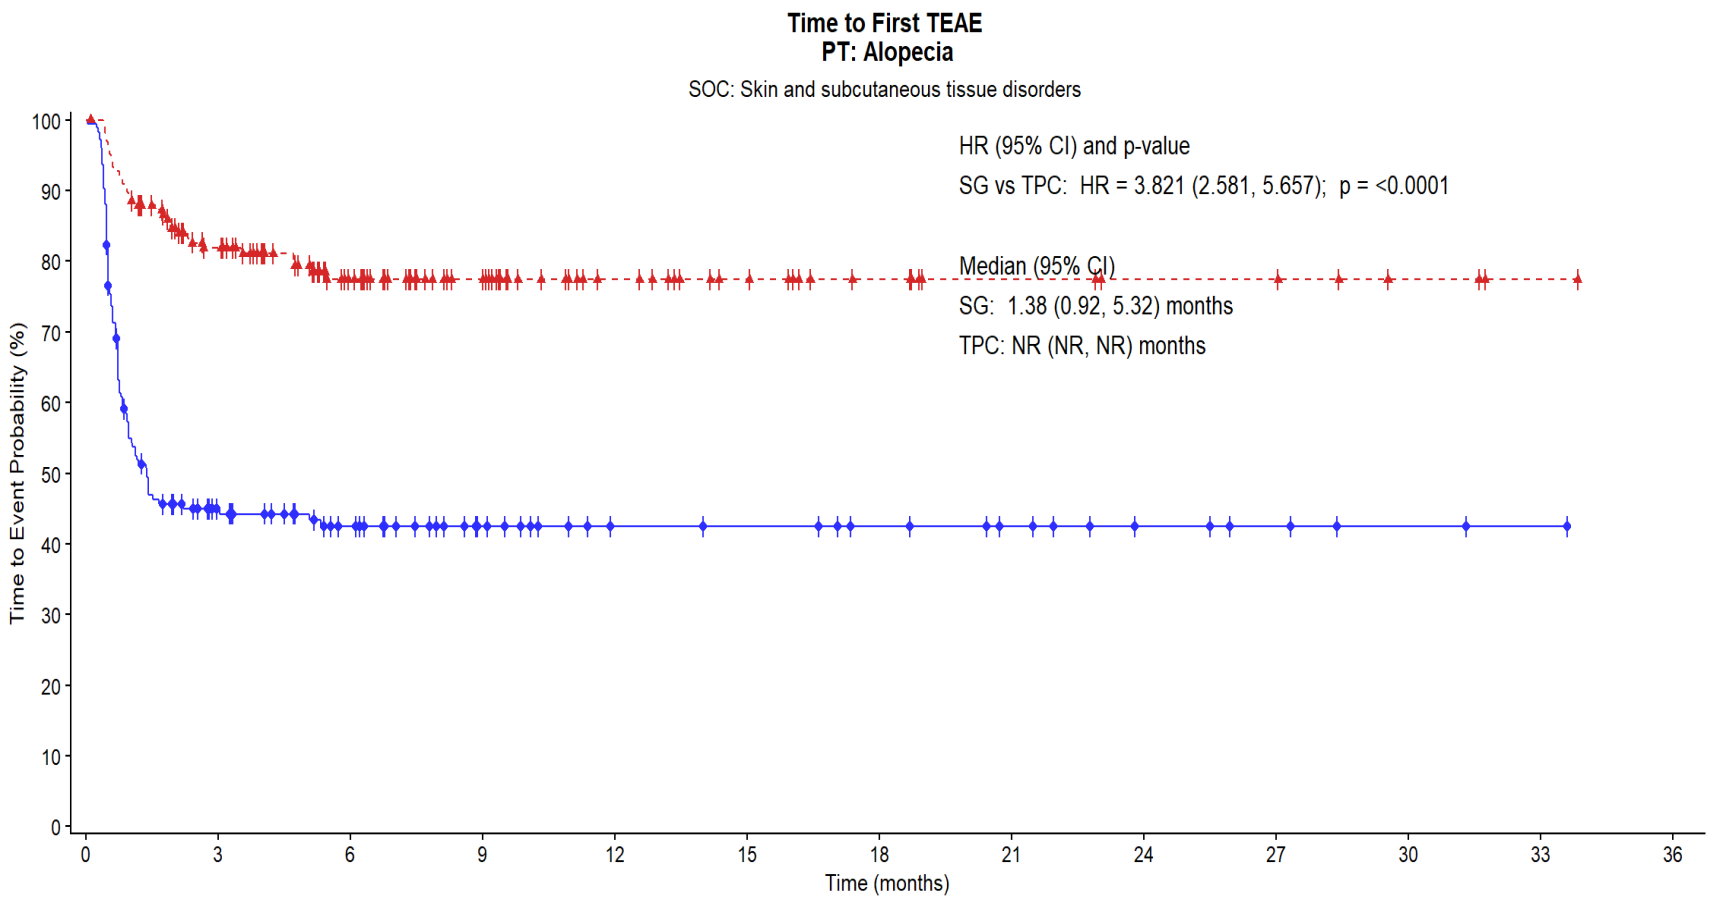
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.103. Figure 1.1.102: Kaplan Meier Plot of Time to First TEAE by PT Oropharyngeal pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



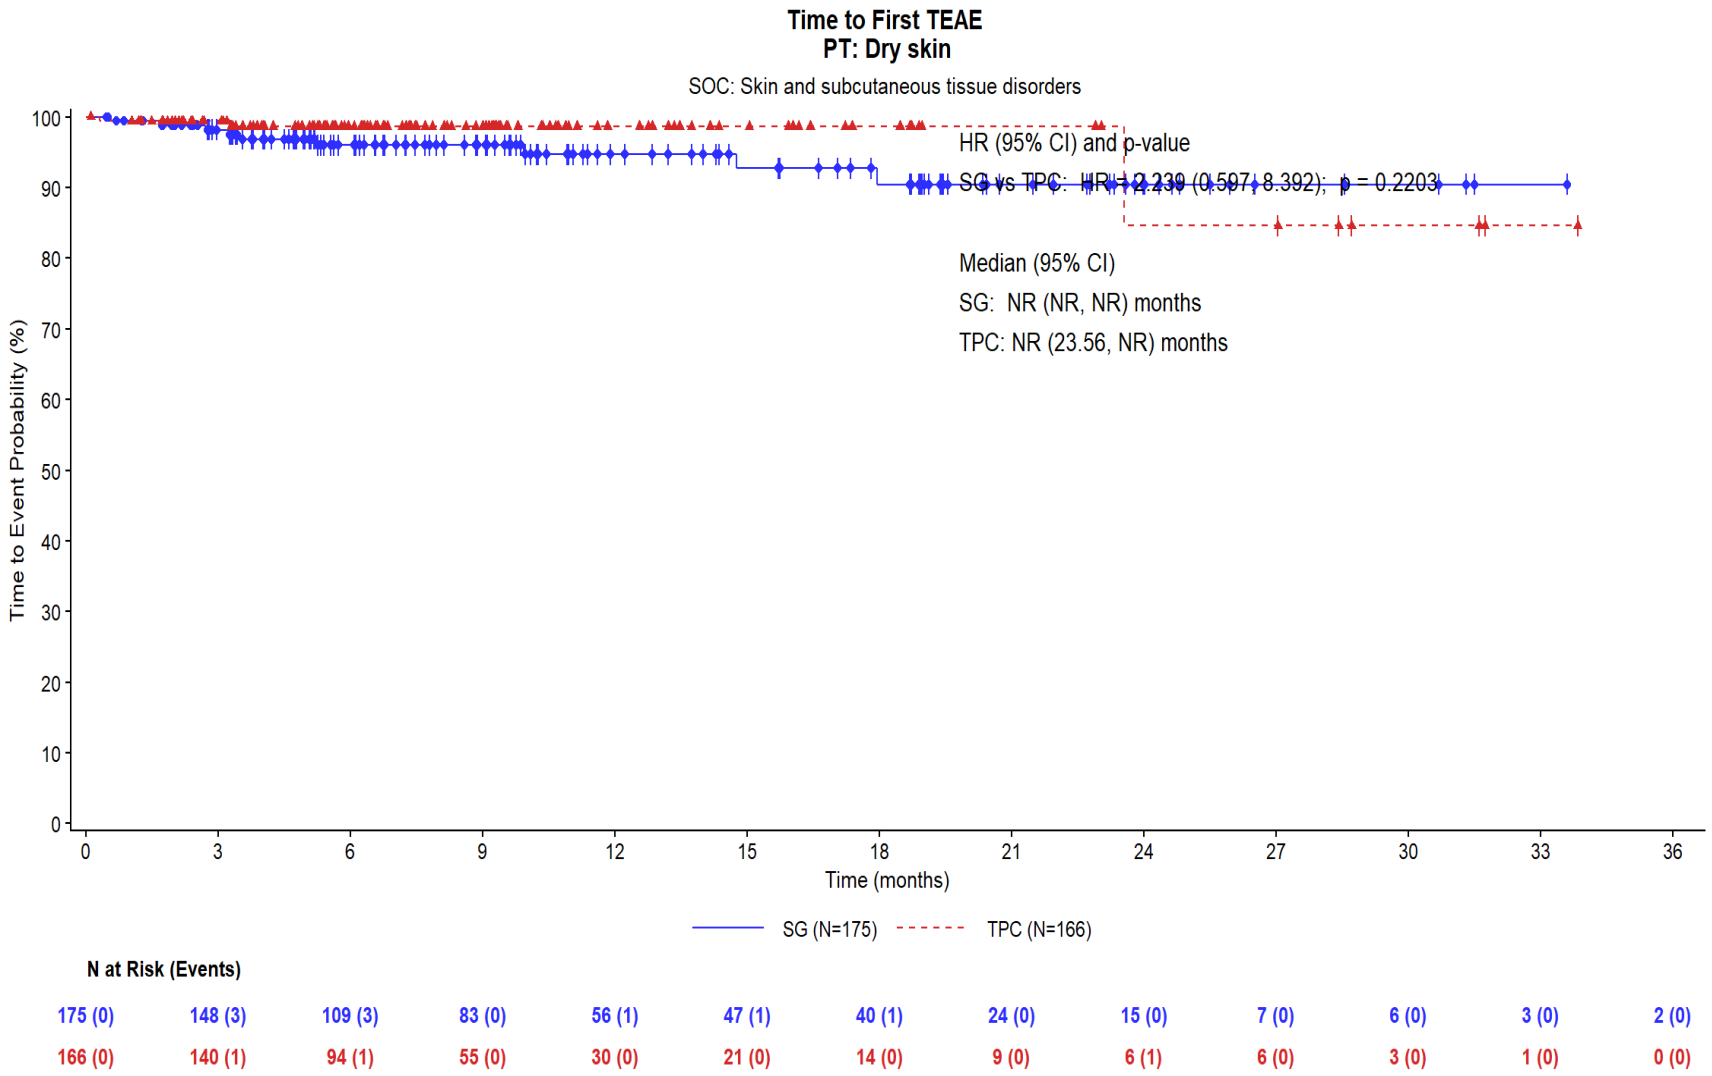
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.104. Figure 1.1.103: Kaplan Meier Plot of Time to First TEAE by PT Pulmonary embolism — mSAF — Excluding patients preselected to receive nab-paclitaxel



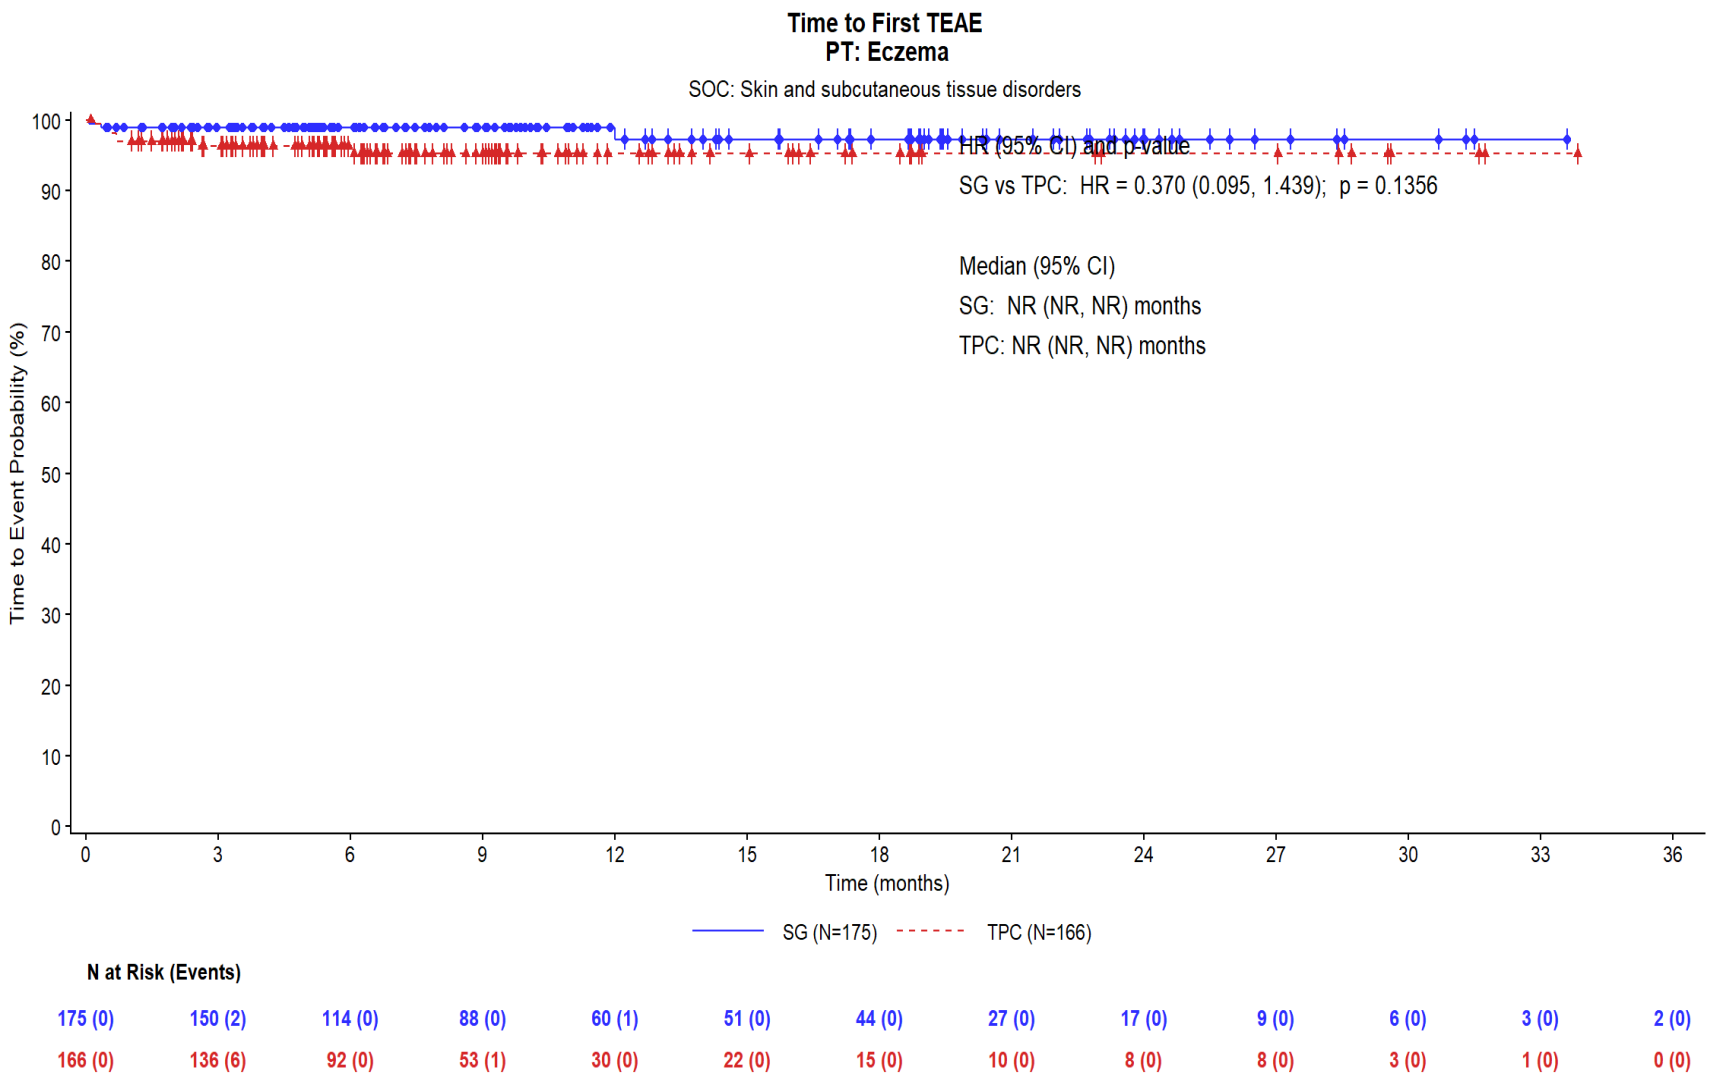
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.105. Figure 1.1.104: Kaplan Meier Plot of Time to First TEAE by PT Rhinorrhoea — mSAF — Excluding patients preselected to receive nab-paclitaxel



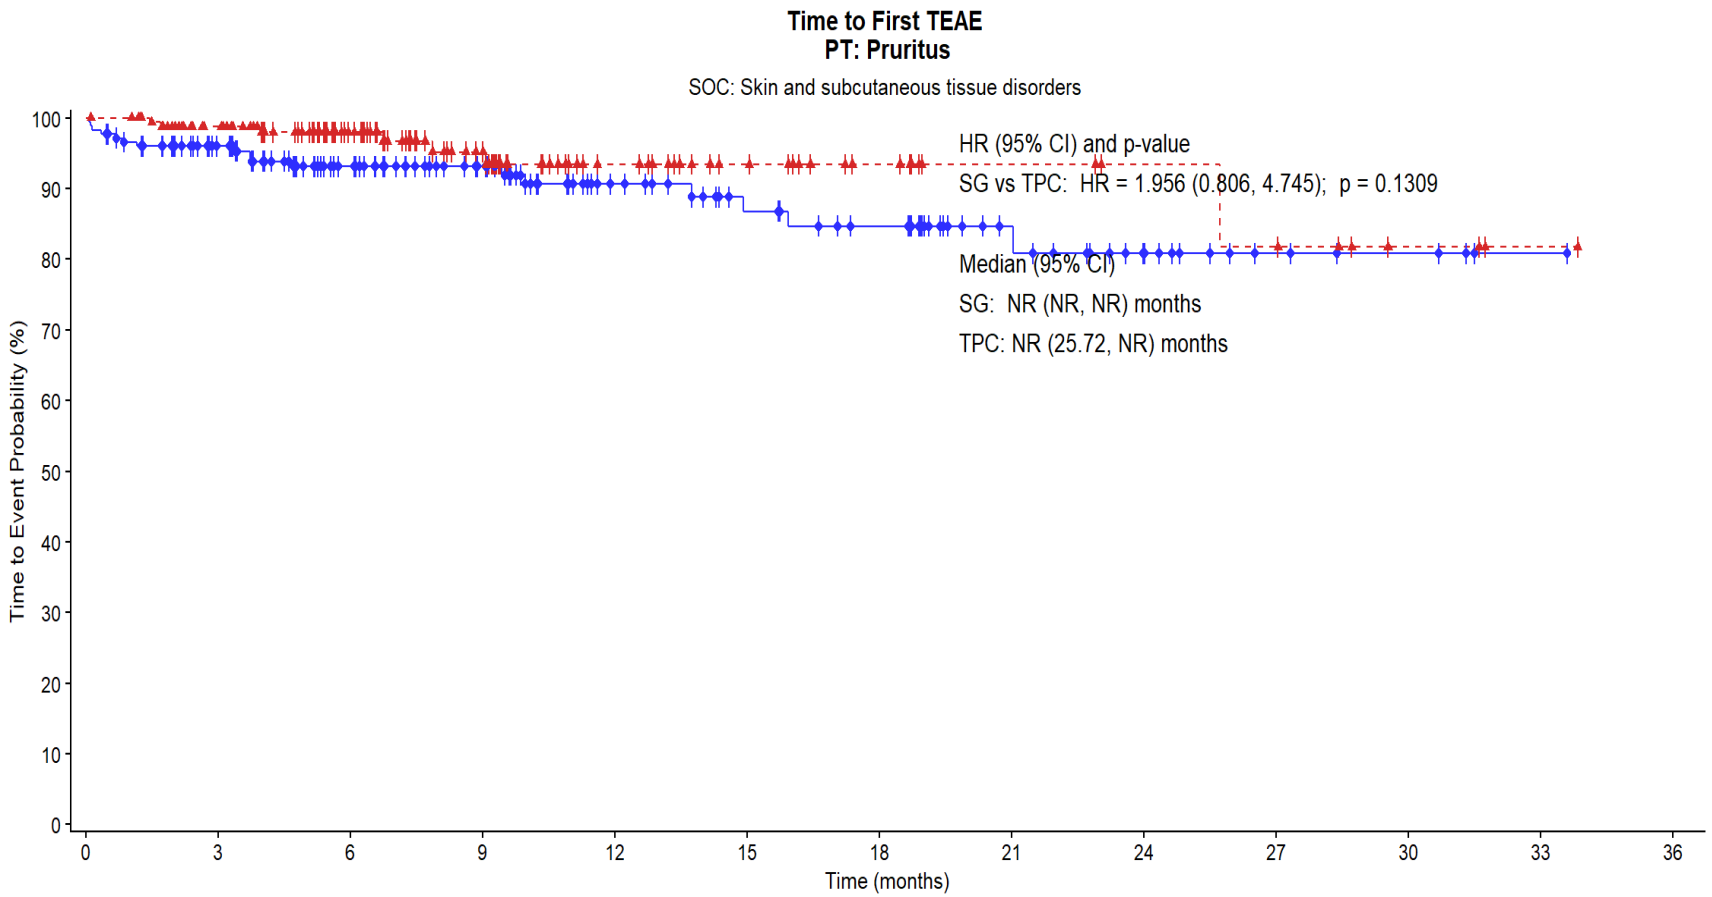
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.106. Figure 1.1.105: Kaplan Meier Plot of Time to First TEAE by PT Alopecia — mSAF — Excluding patients preselected to receive nab-paclitaxel



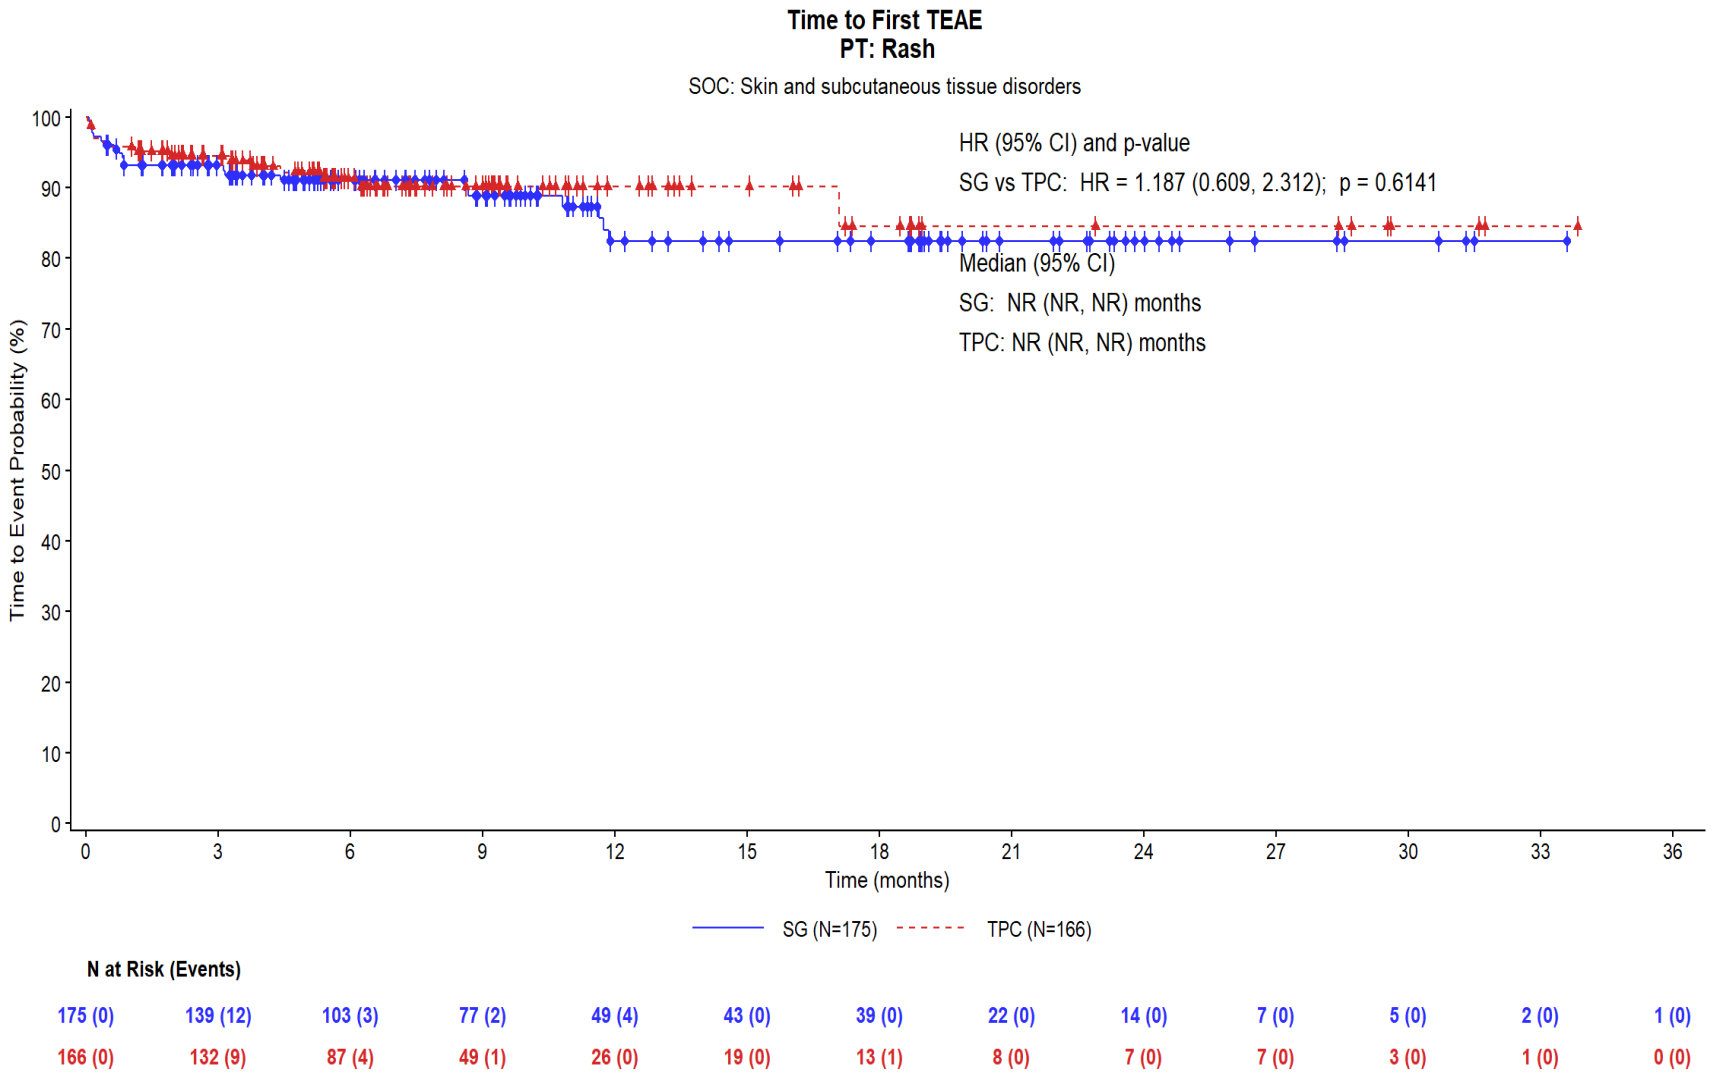
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.107. Figure 1.1.106: Kaplan Meier Plot of Time to First TEAE by PT Dry skin — mSAF — Excluding patients preselected to receive nab-paclitaxel



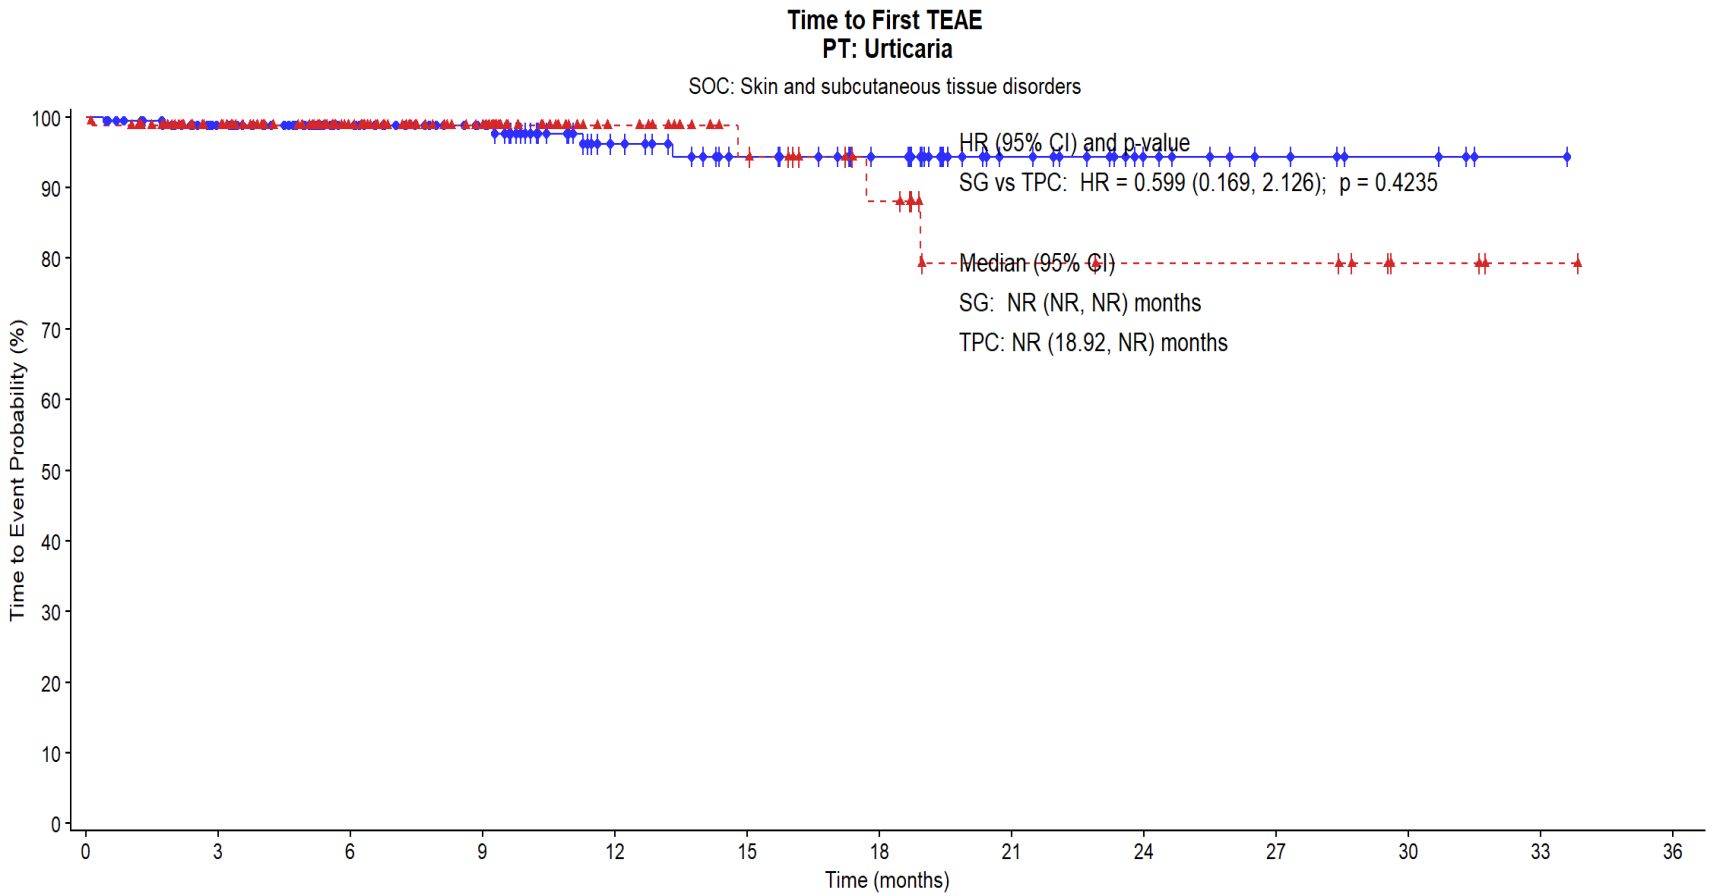
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.108. Figure 1.1.107: Kaplan Meier Plot of Time to First TEAE by PT Eczema — mSAF — Excluding patients preselected to receive nab-paclitaxel



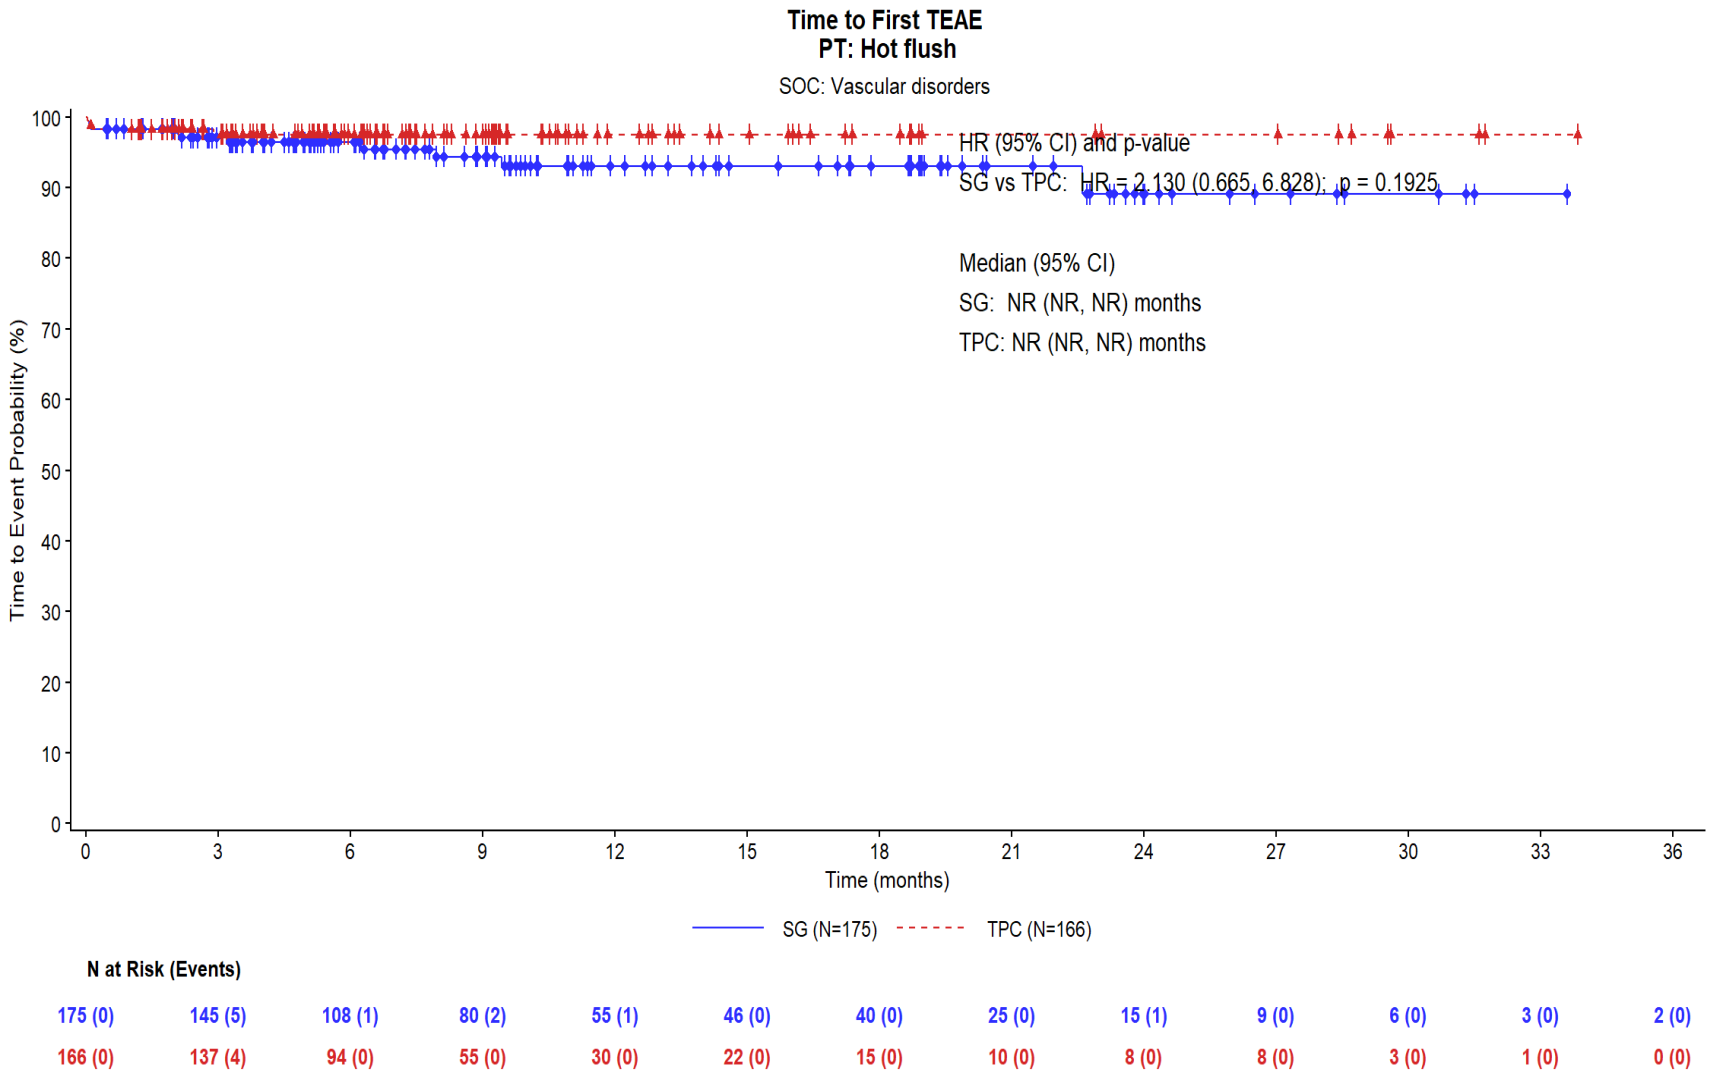
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.109. Figure 1.1.108: Kaplan Meier Plot of Time to First TEAE by PT Pruritus — mSAF — Excluding patients preselected to receive nab-paclitaxel



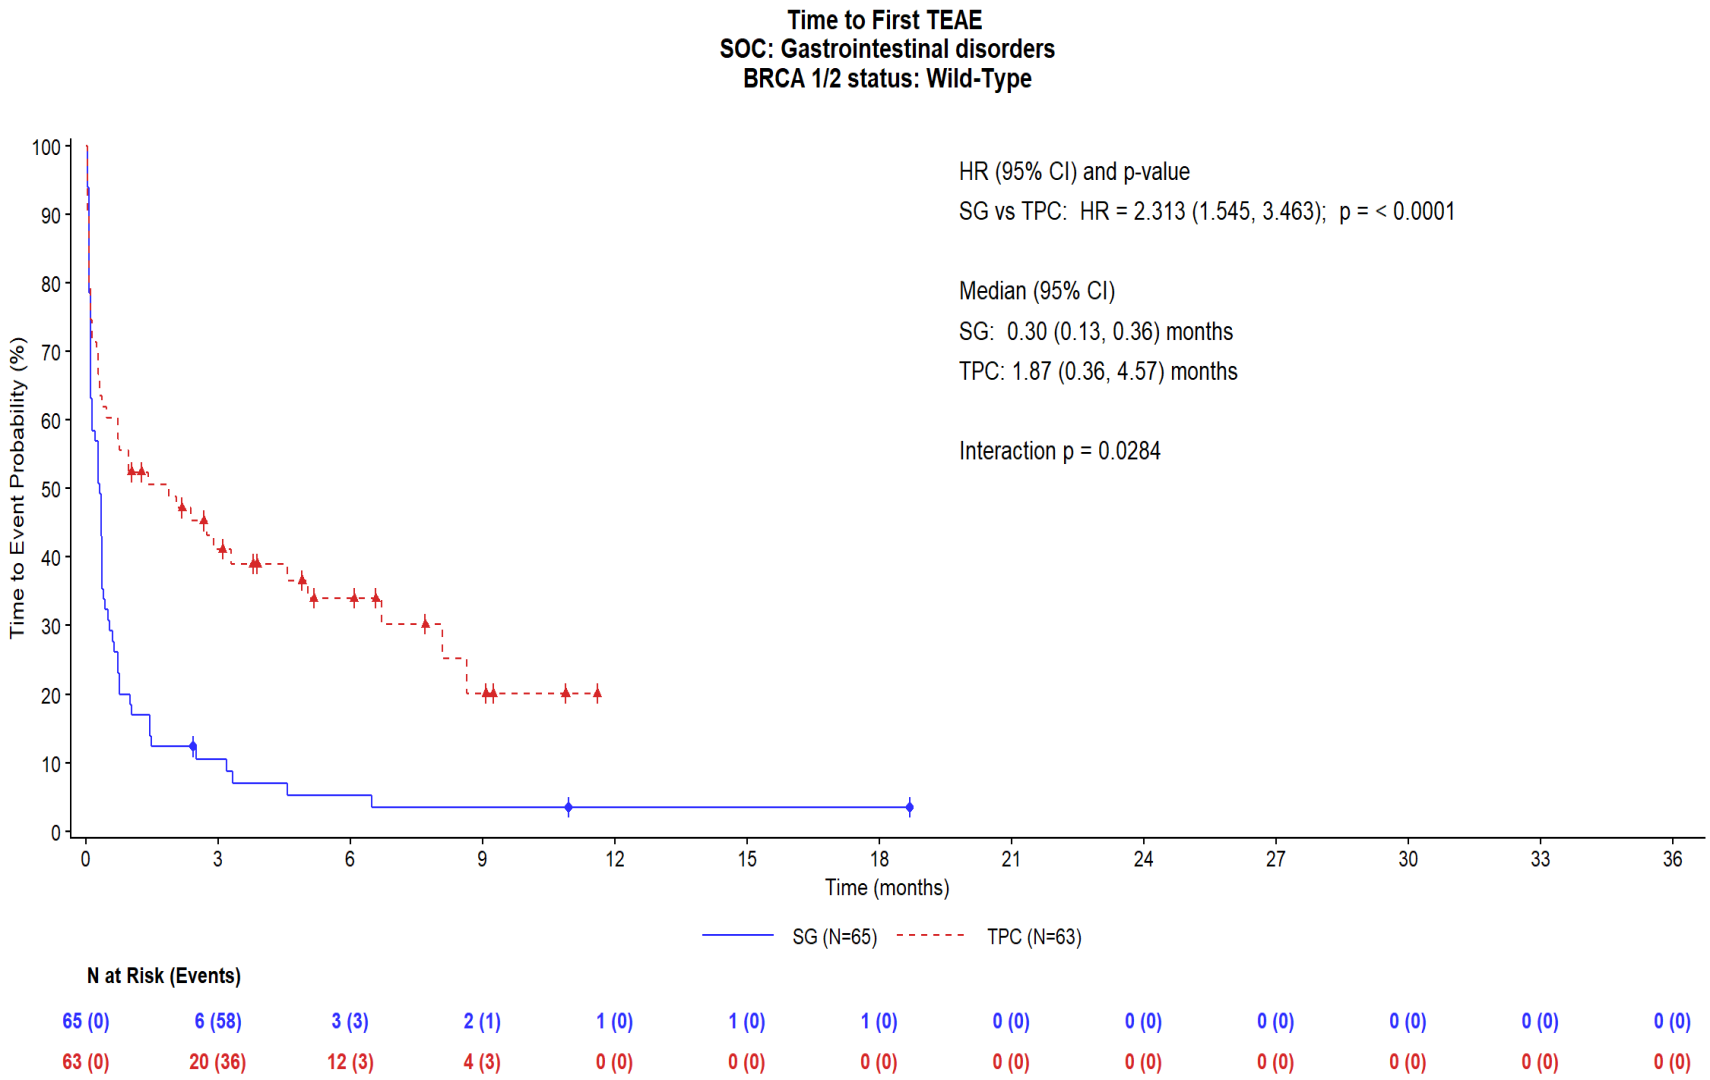
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.110. Figure 1.1.109: Kaplan Meier Plot of Time to First TEAE by PT Rash — mSAF — Excluding patients preselected to receive nab-paclitaxel



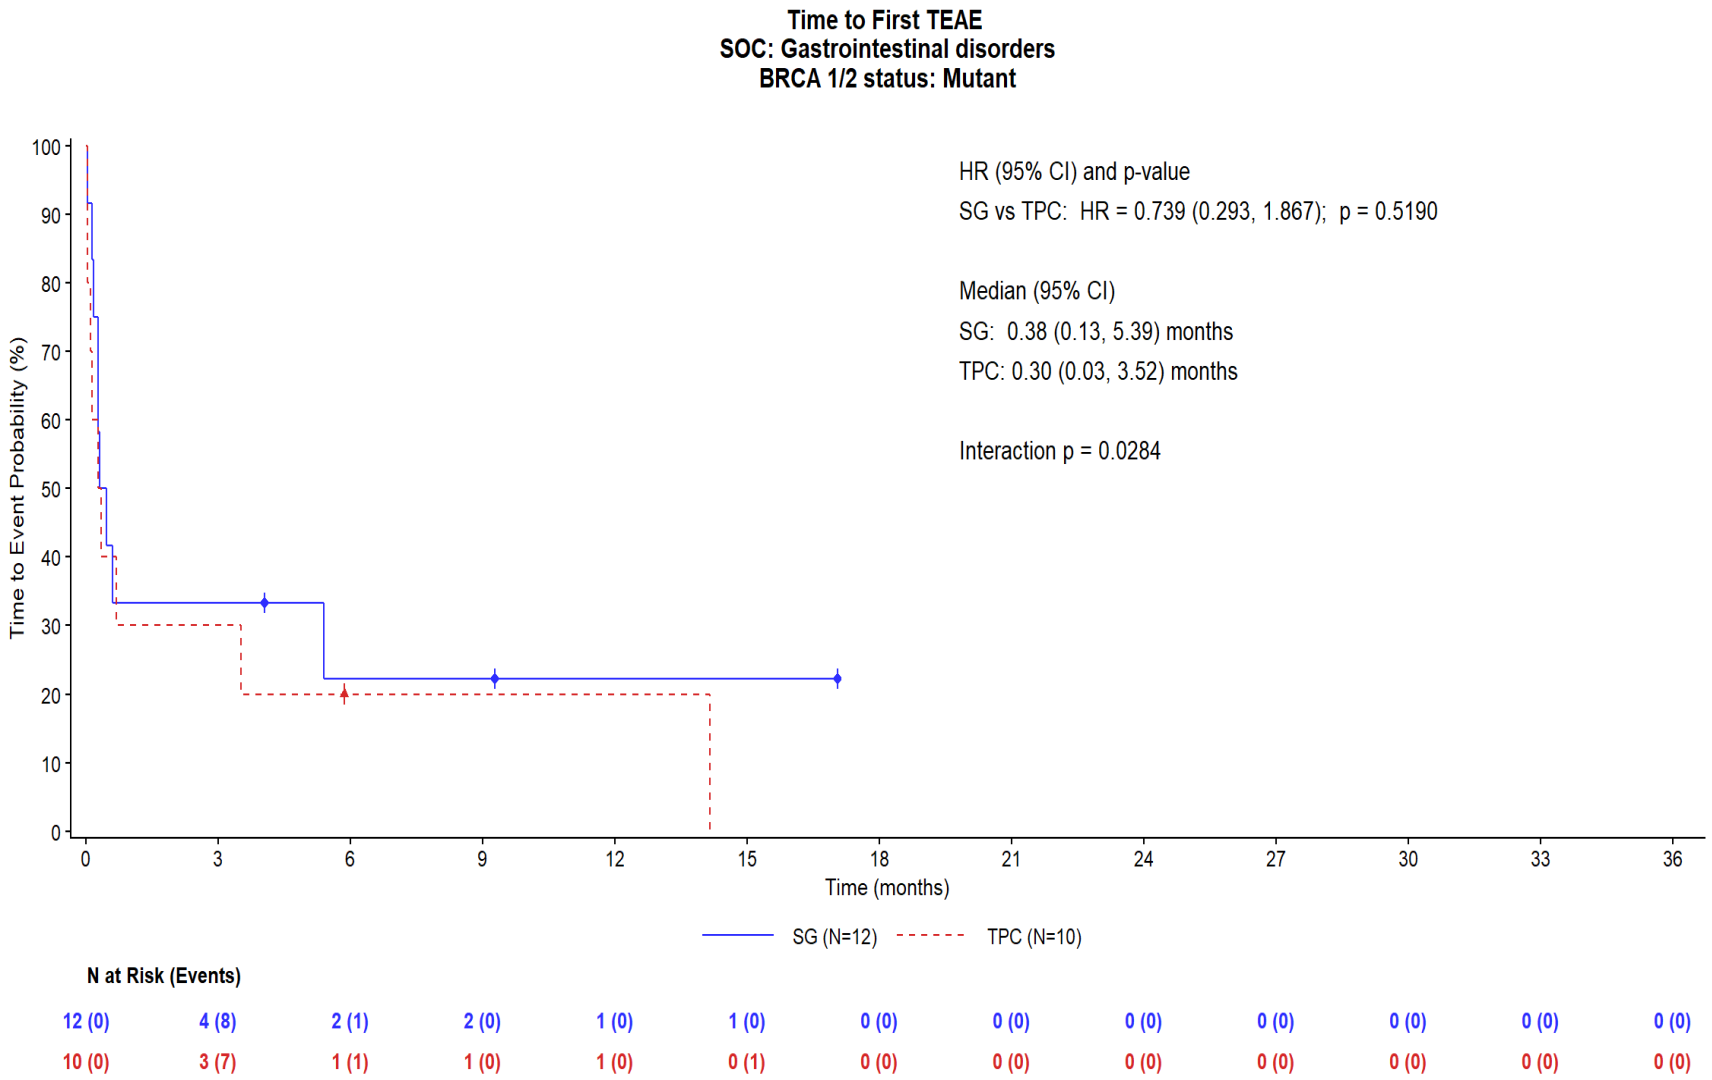
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.111. Figure 1.1.110: Kaplan Meier Plot of Time to First TEAE by PT Urticaria — mSAF — Excluding patients preselected to receive nab-paclitaxel



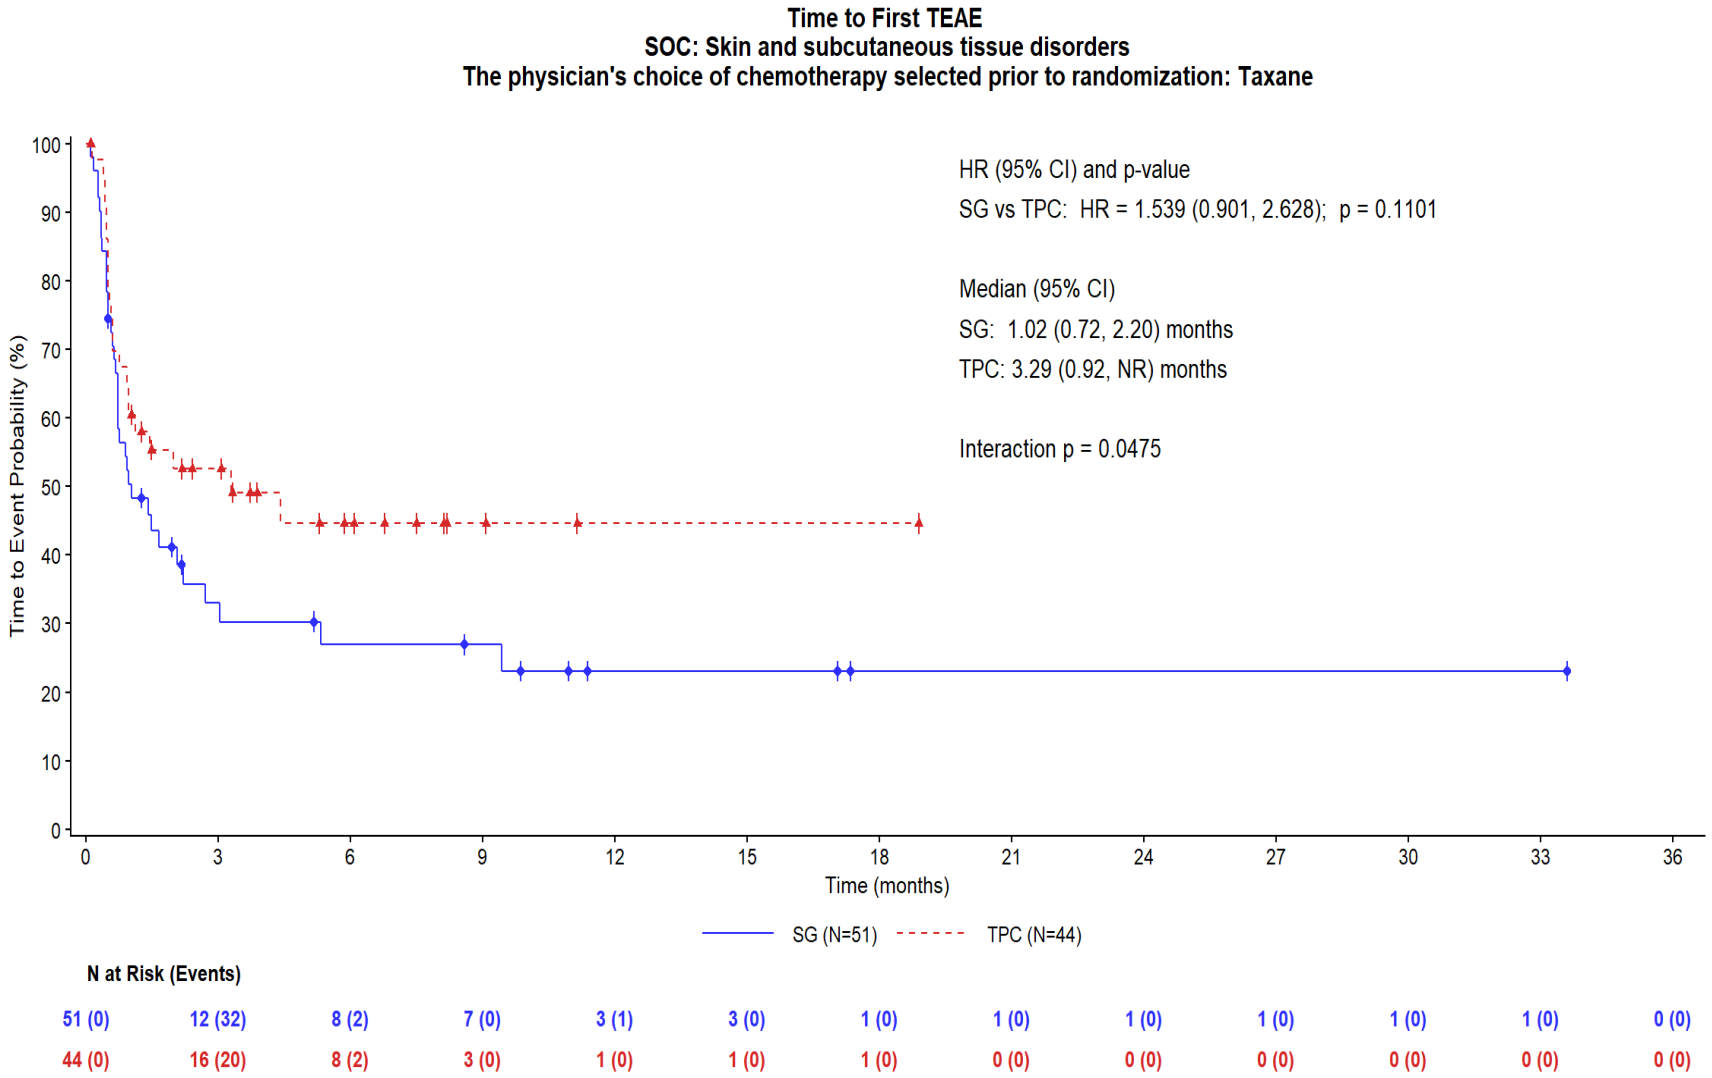
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.112. Figure 1.1.111: Kaplan Meier Plot of Time to First TEAE by PT Hot flush — mSAF — Excluding patients preselected to receive nab-paclitaxel



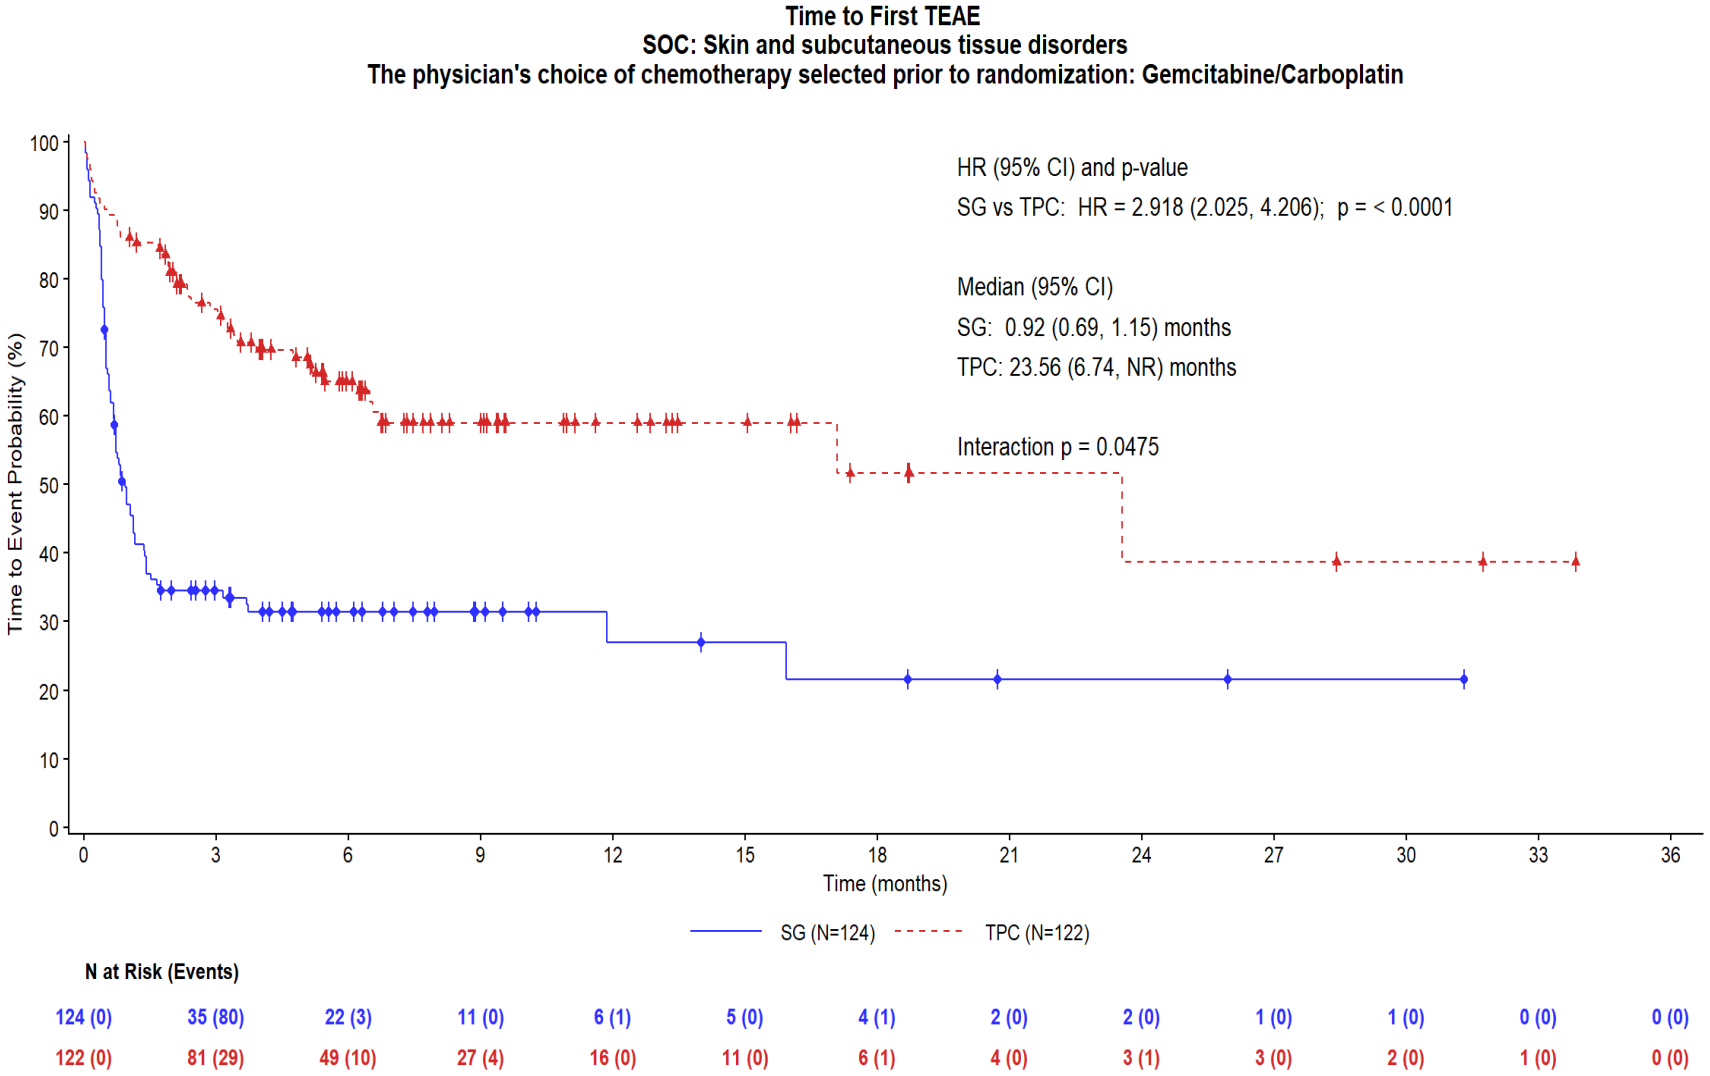
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.113. Figure 1.1.112: Kaplan Meier Plot of Time to First TEAE by SOC Gastrointestinal disorders BRCA 1 2 status Wild Type — mSAF — Excluding patients preselected to receive nab-paclitaxel



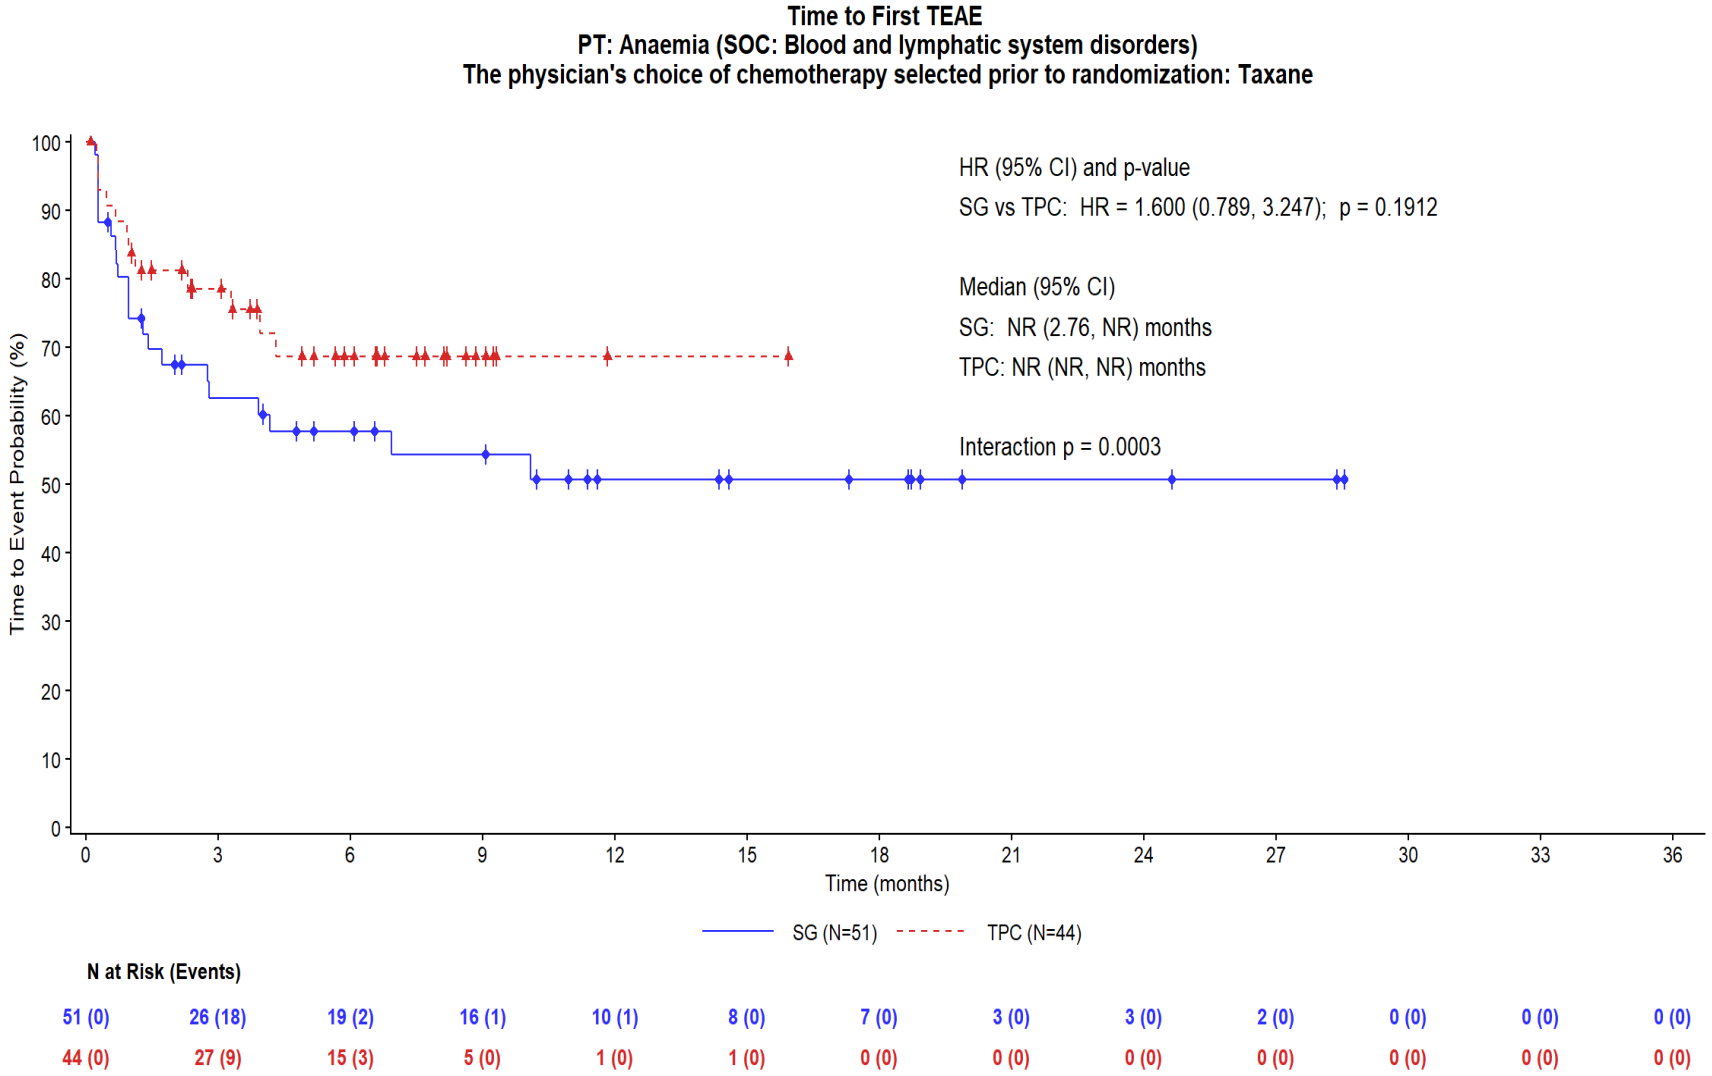
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.114. Figure 1.1.113: Kaplan Meier Plot of Time to First TEAE by SOC Gastrointestinal disorders BRCA 1 2 status Mutant — mSAF — Excluding patients preselected to receive nab-paclitaxel



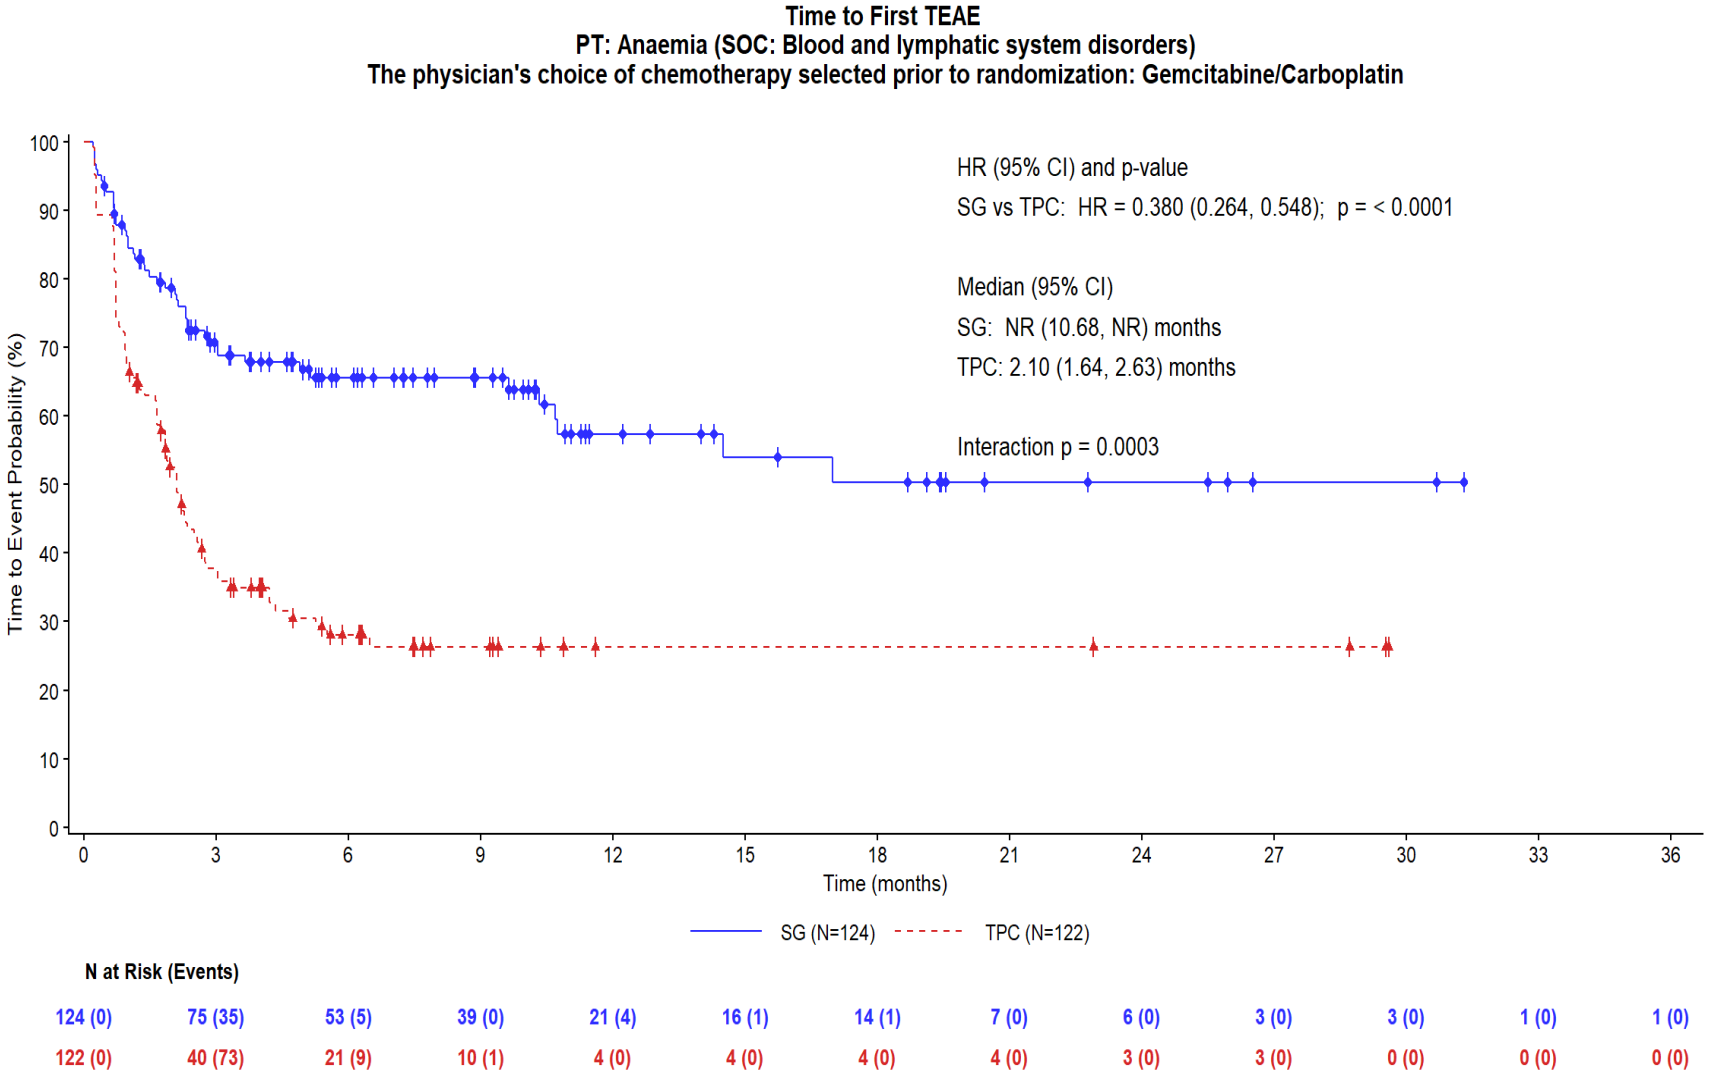
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.115. Figure 1.1.114: Kaplan Meier Plot of Time to First TEAE by SOC Skin and subcutaneous tissue disorders The physician s choice of chemotherapy selected prior to randomization Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



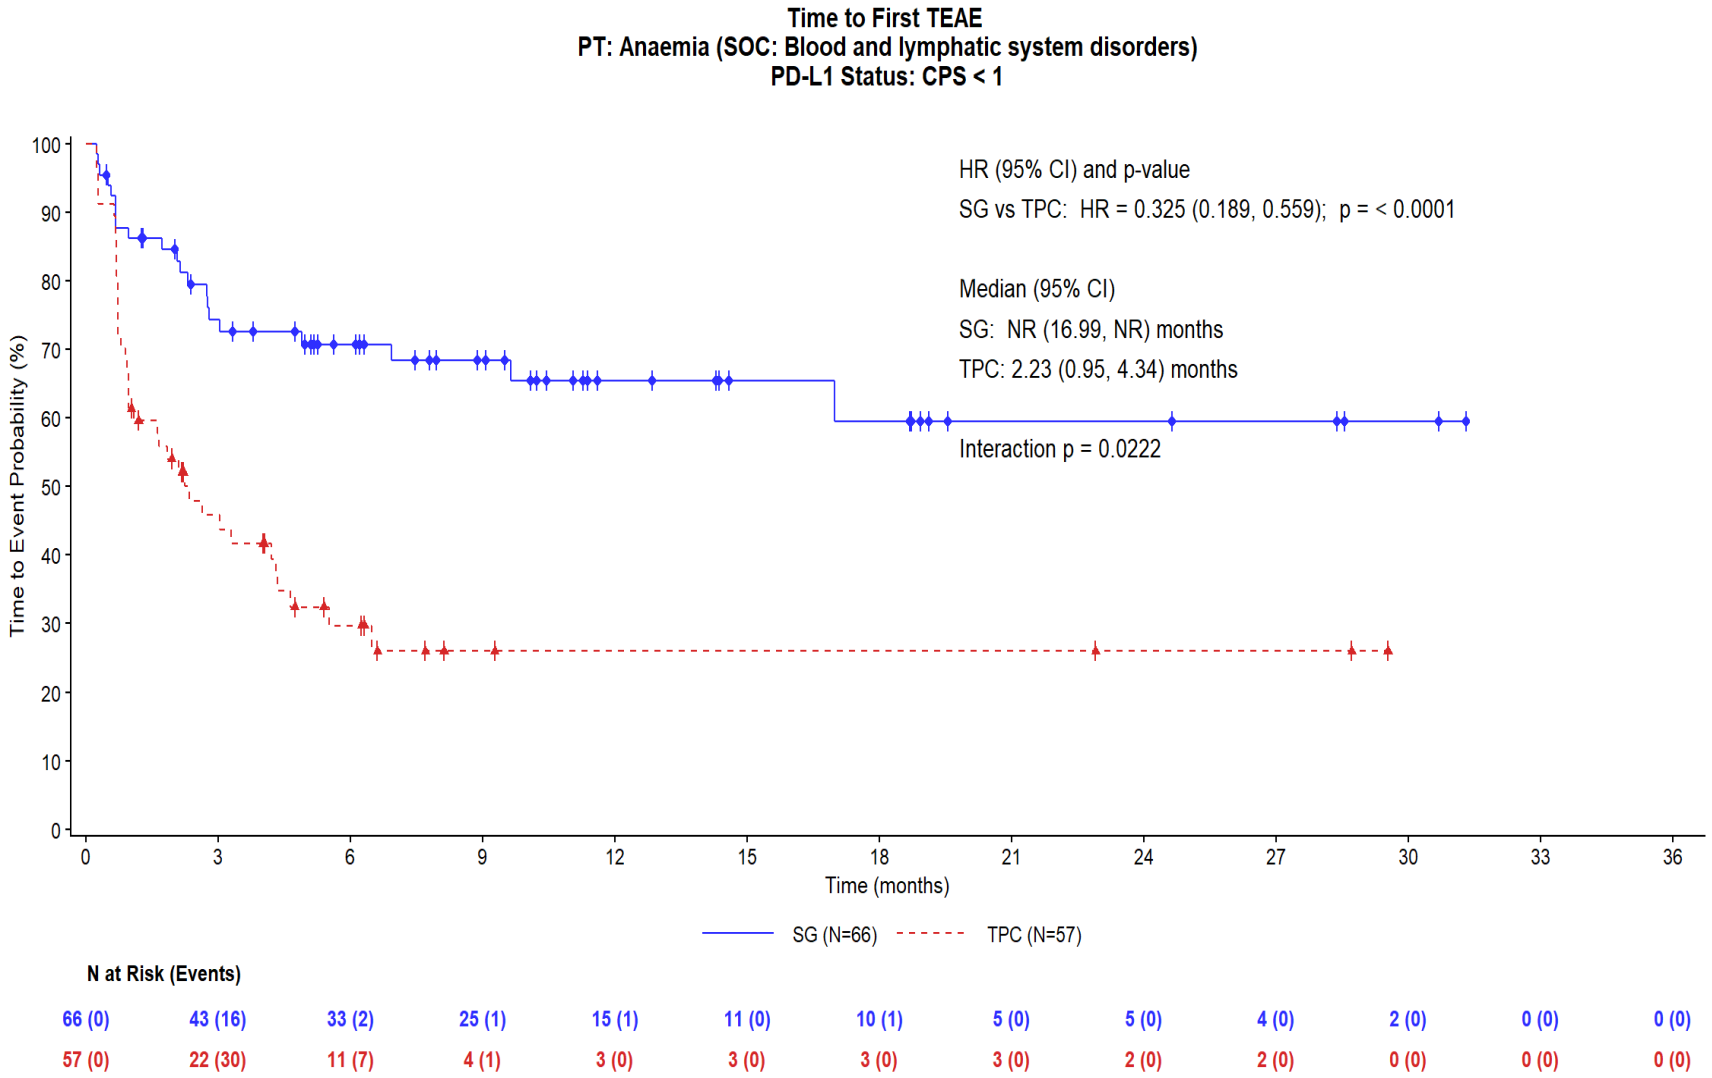
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.116. Figure 1.1.115: Kaplan Meier Plot of Time to First TEAE by SOC Skin and subcutaneous tissue disorders The physician s choice of chemotherapy selected prior to randomization Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



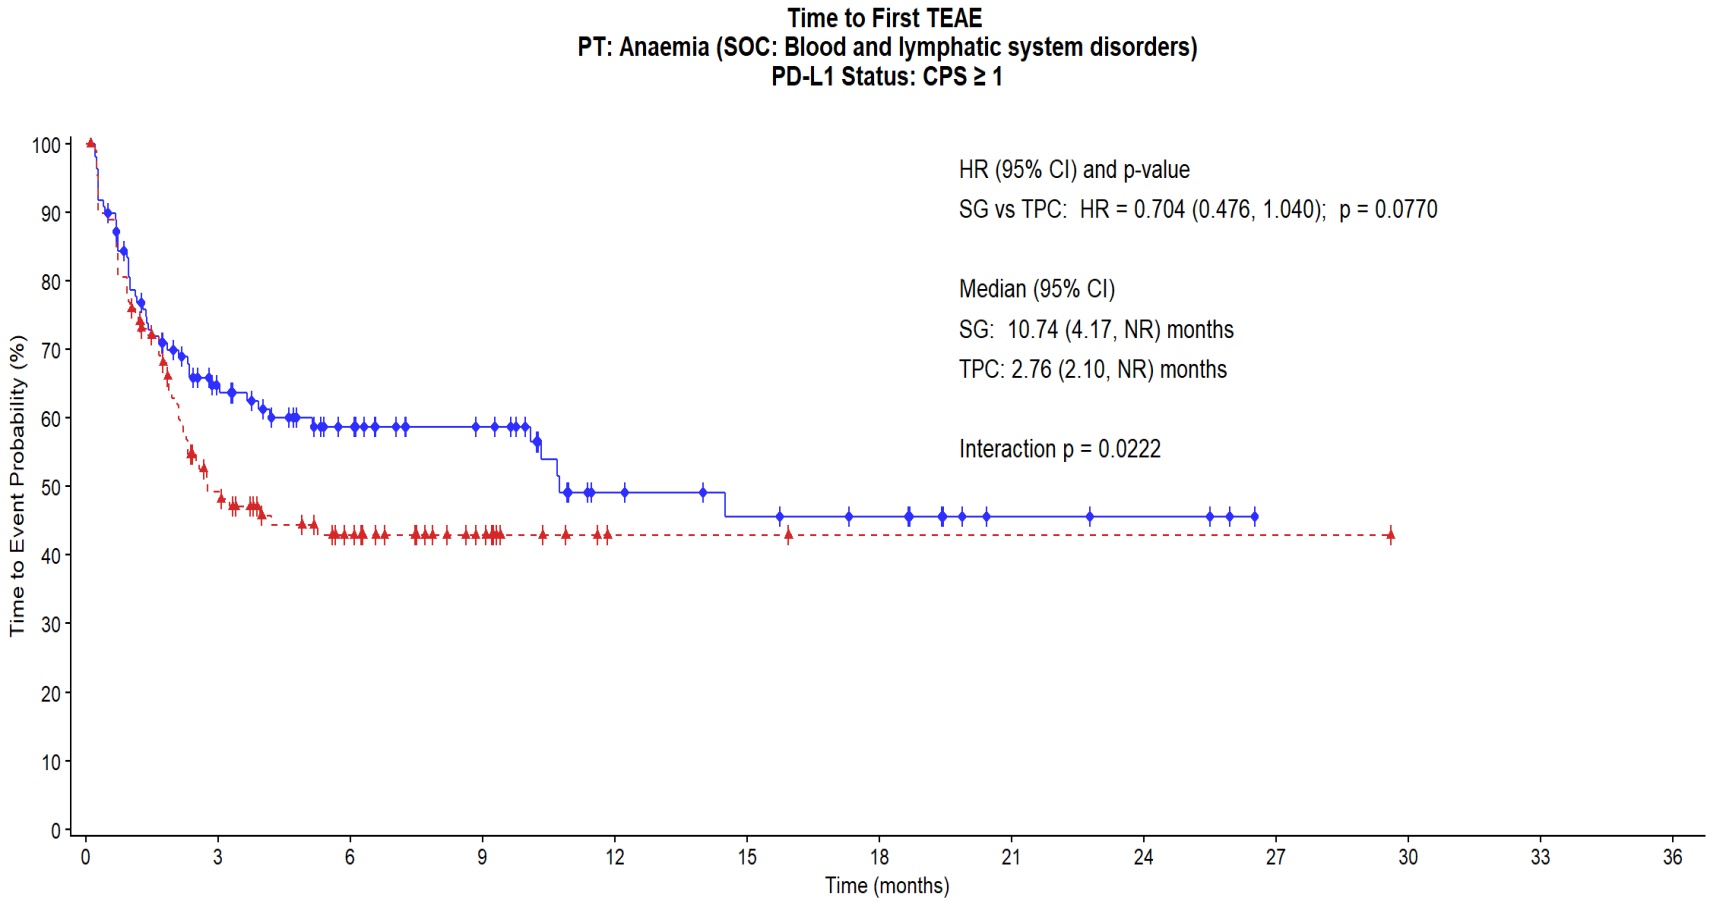
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.117. Figure 1.1.116: Kaplan Meier Plot of Time to First TEAE by PT Anaemia (SOC Blood and lymphatic system disorders) The physician s choice of chemotherapy selected prior to randomization Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



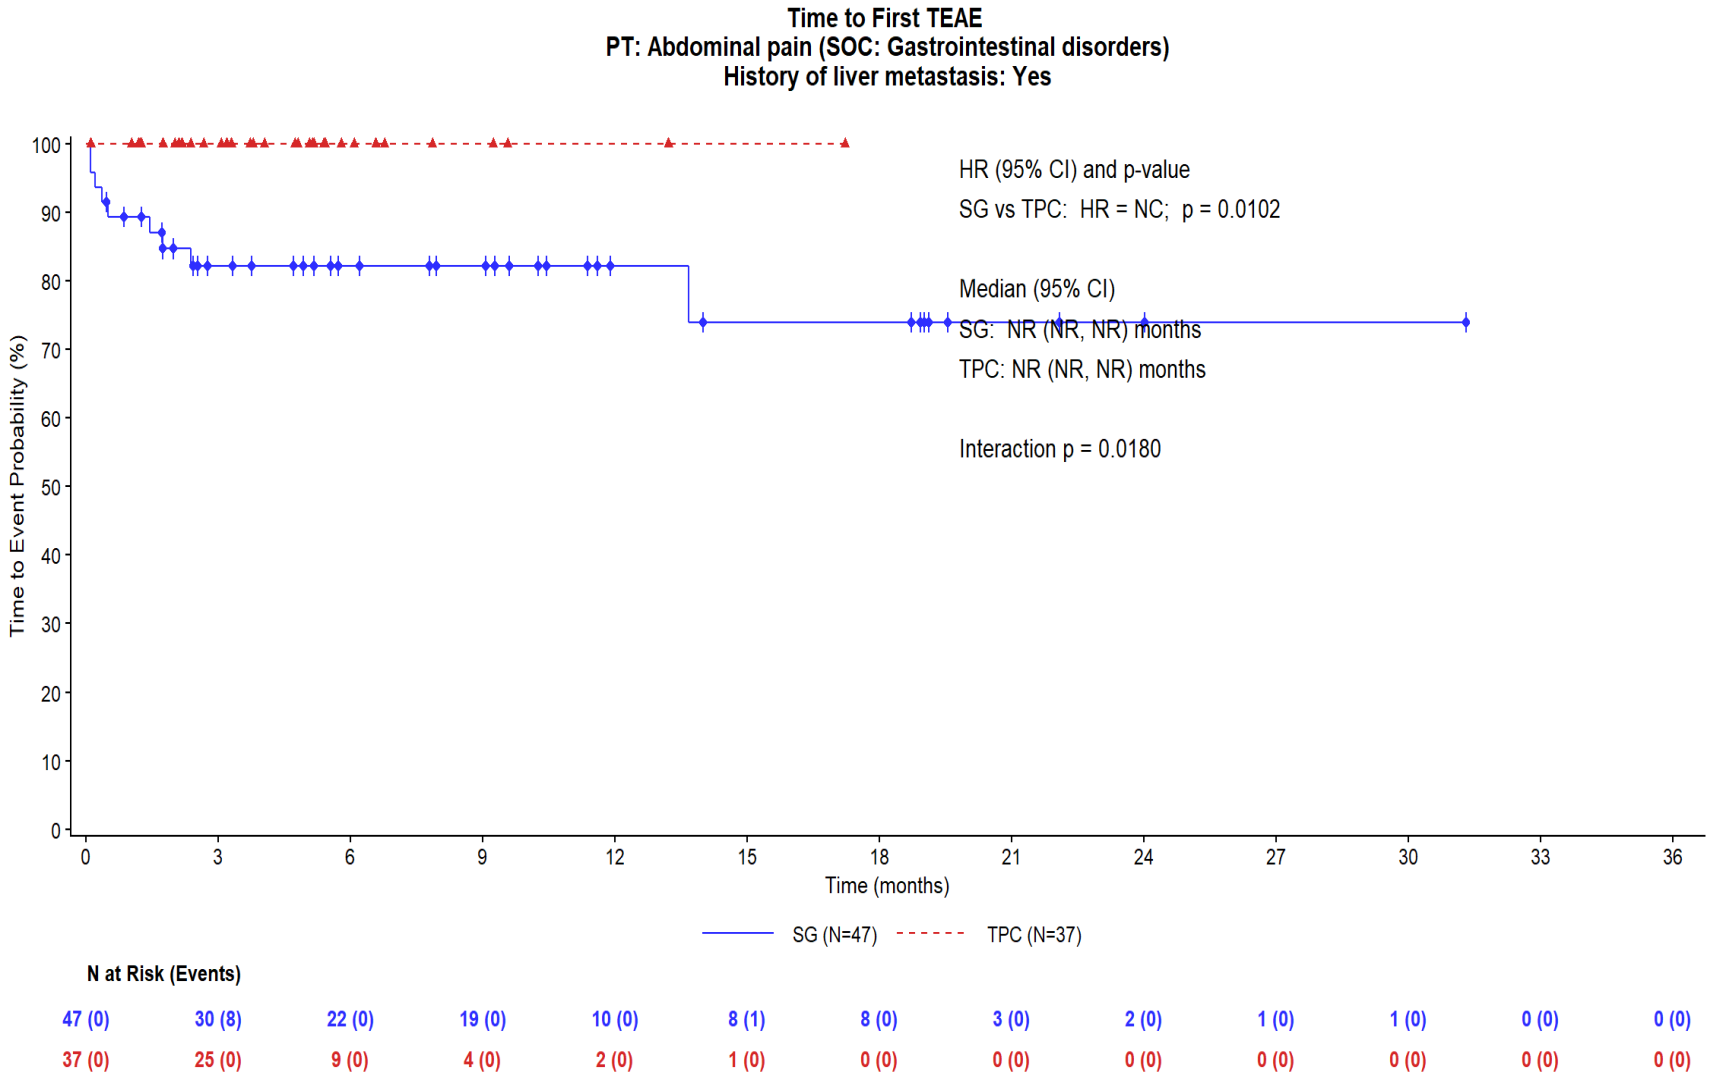
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.118. Figure 1.1.117: Kaplan Meier Plot of Time to First TEAE by PT Anaemia (SOC Blood and lymphatic system disorders) The physician s choice of chemotherapy selected prior to randomization Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



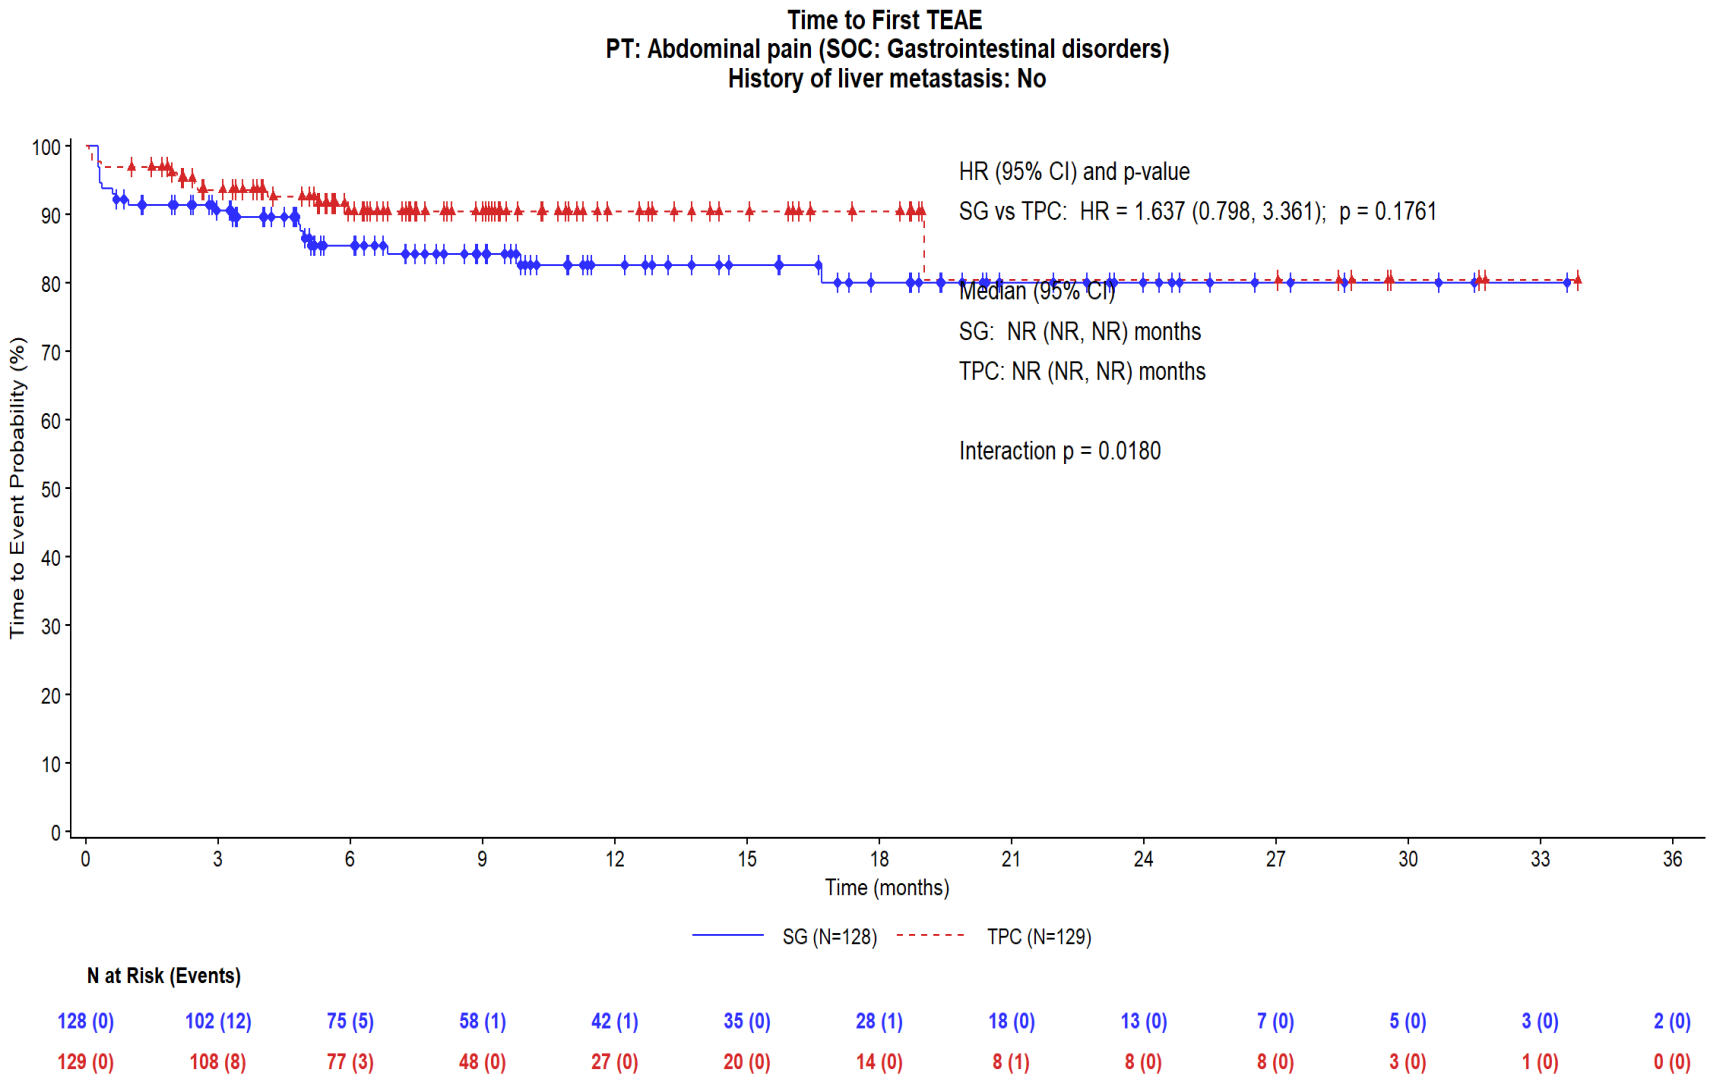
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.119. Figure 1.1.118: Kaplan Meier Plot of Time to First TEAE by PT Anaemia (SOC Blood and lymphatic system disorders) PD L1 Status CPS less than 1 — mSAF — Excluding patients preselected to receive nab-paclitaxel



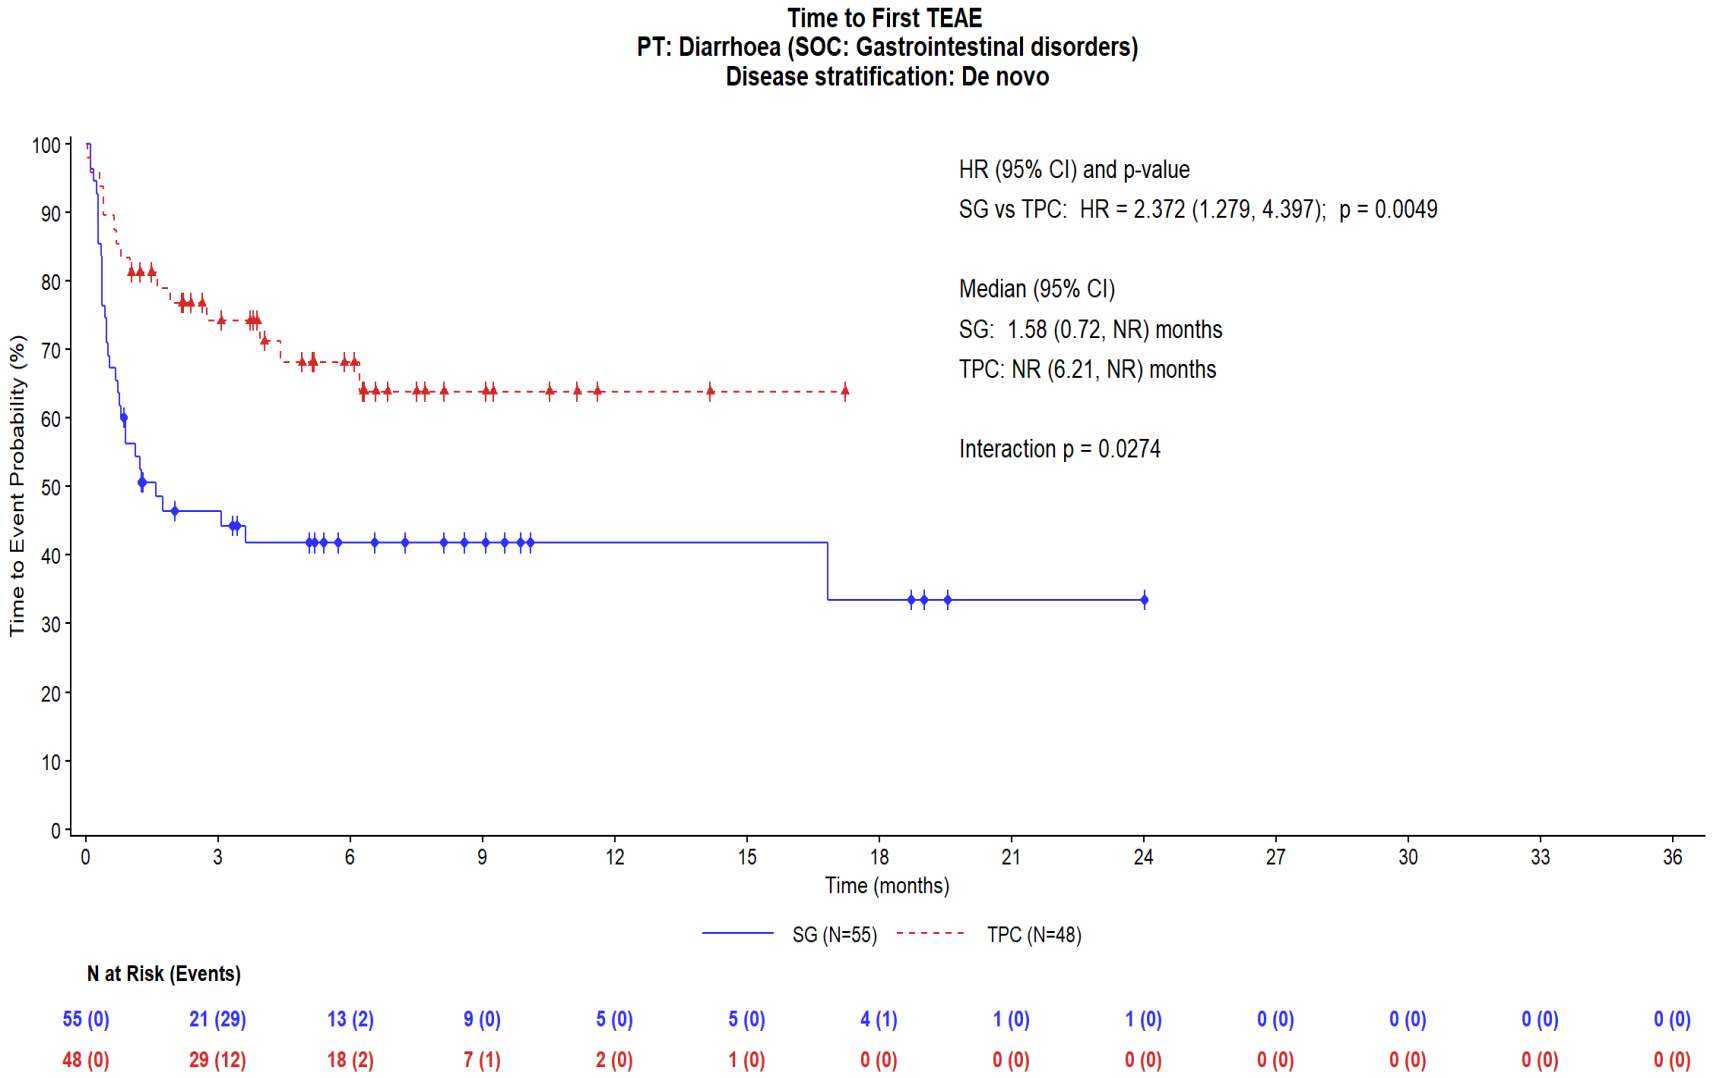
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.120. Figure 1.1.119: Kaplan Meier Plot of Time to First TEAE by PT Anaemia (SOC Blood and lymphatic system disorders) PD L1 Status CPS 1 — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.121. Figure 1.1.120: Kaplan Meier Plot of Time to First TEAE by PT Abdominal pain (SOC Gastrointestinal disorders) History of liver metastasis Yes — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

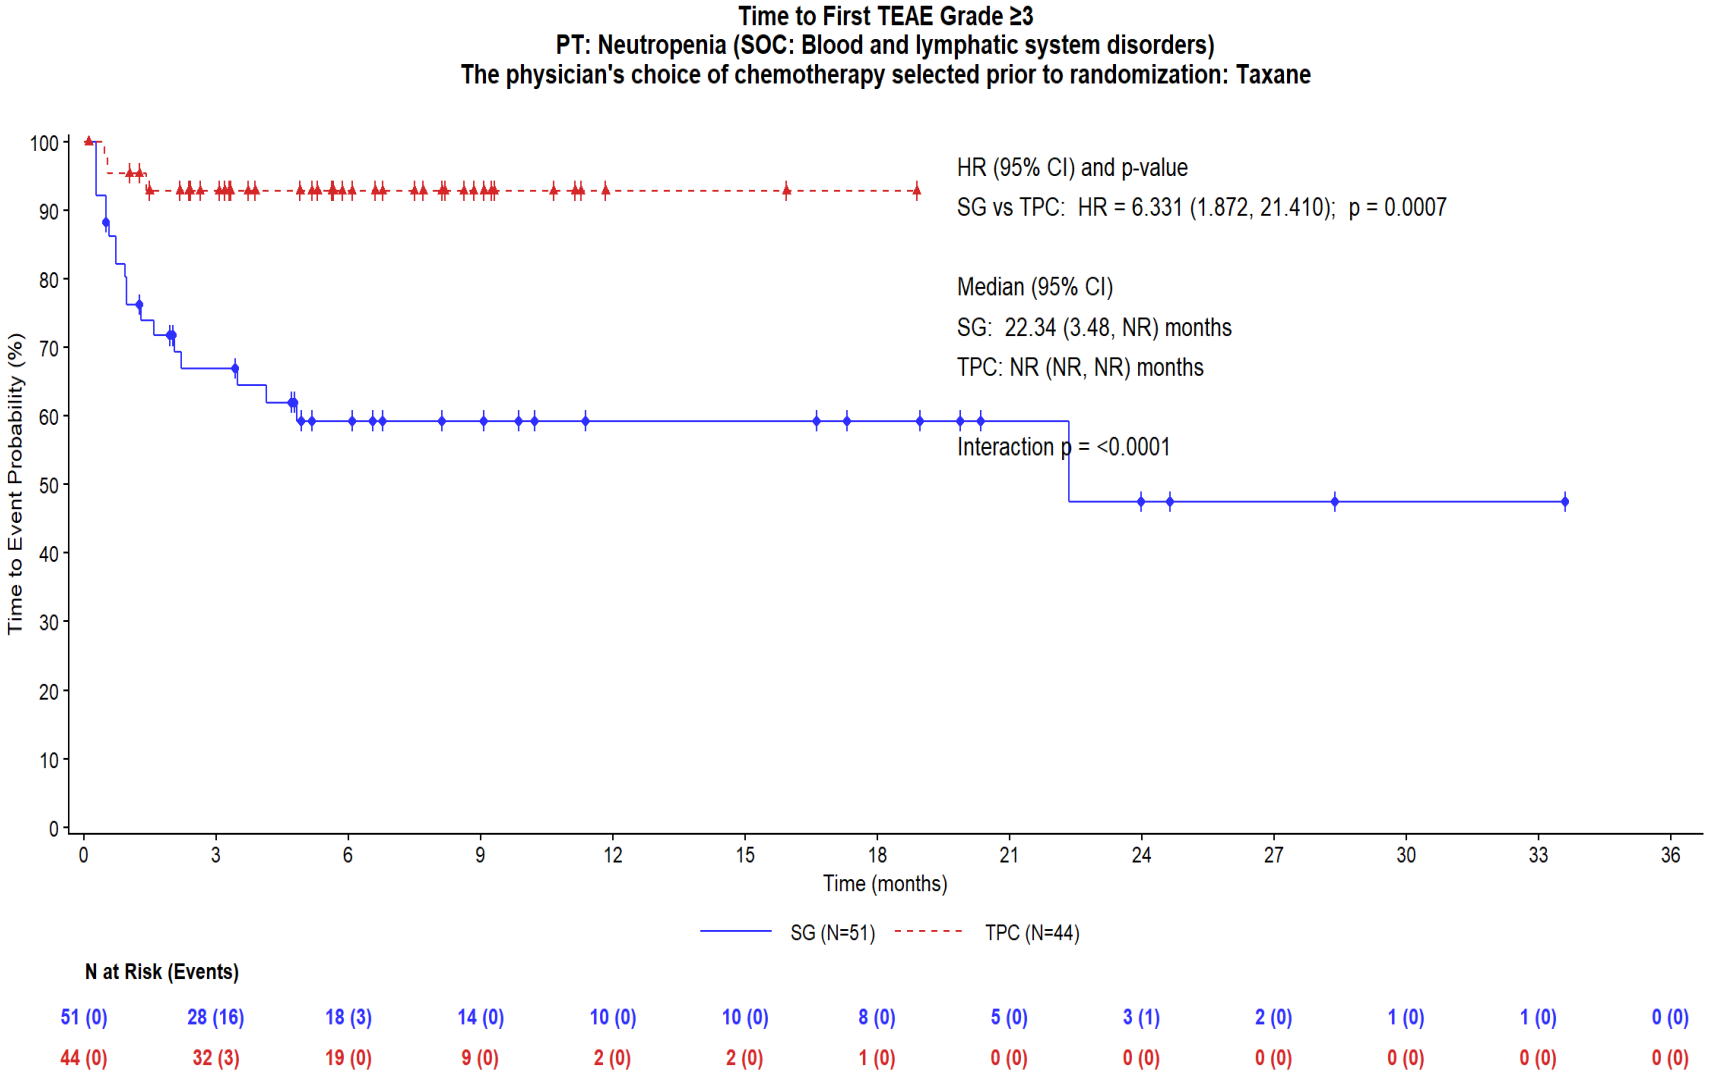
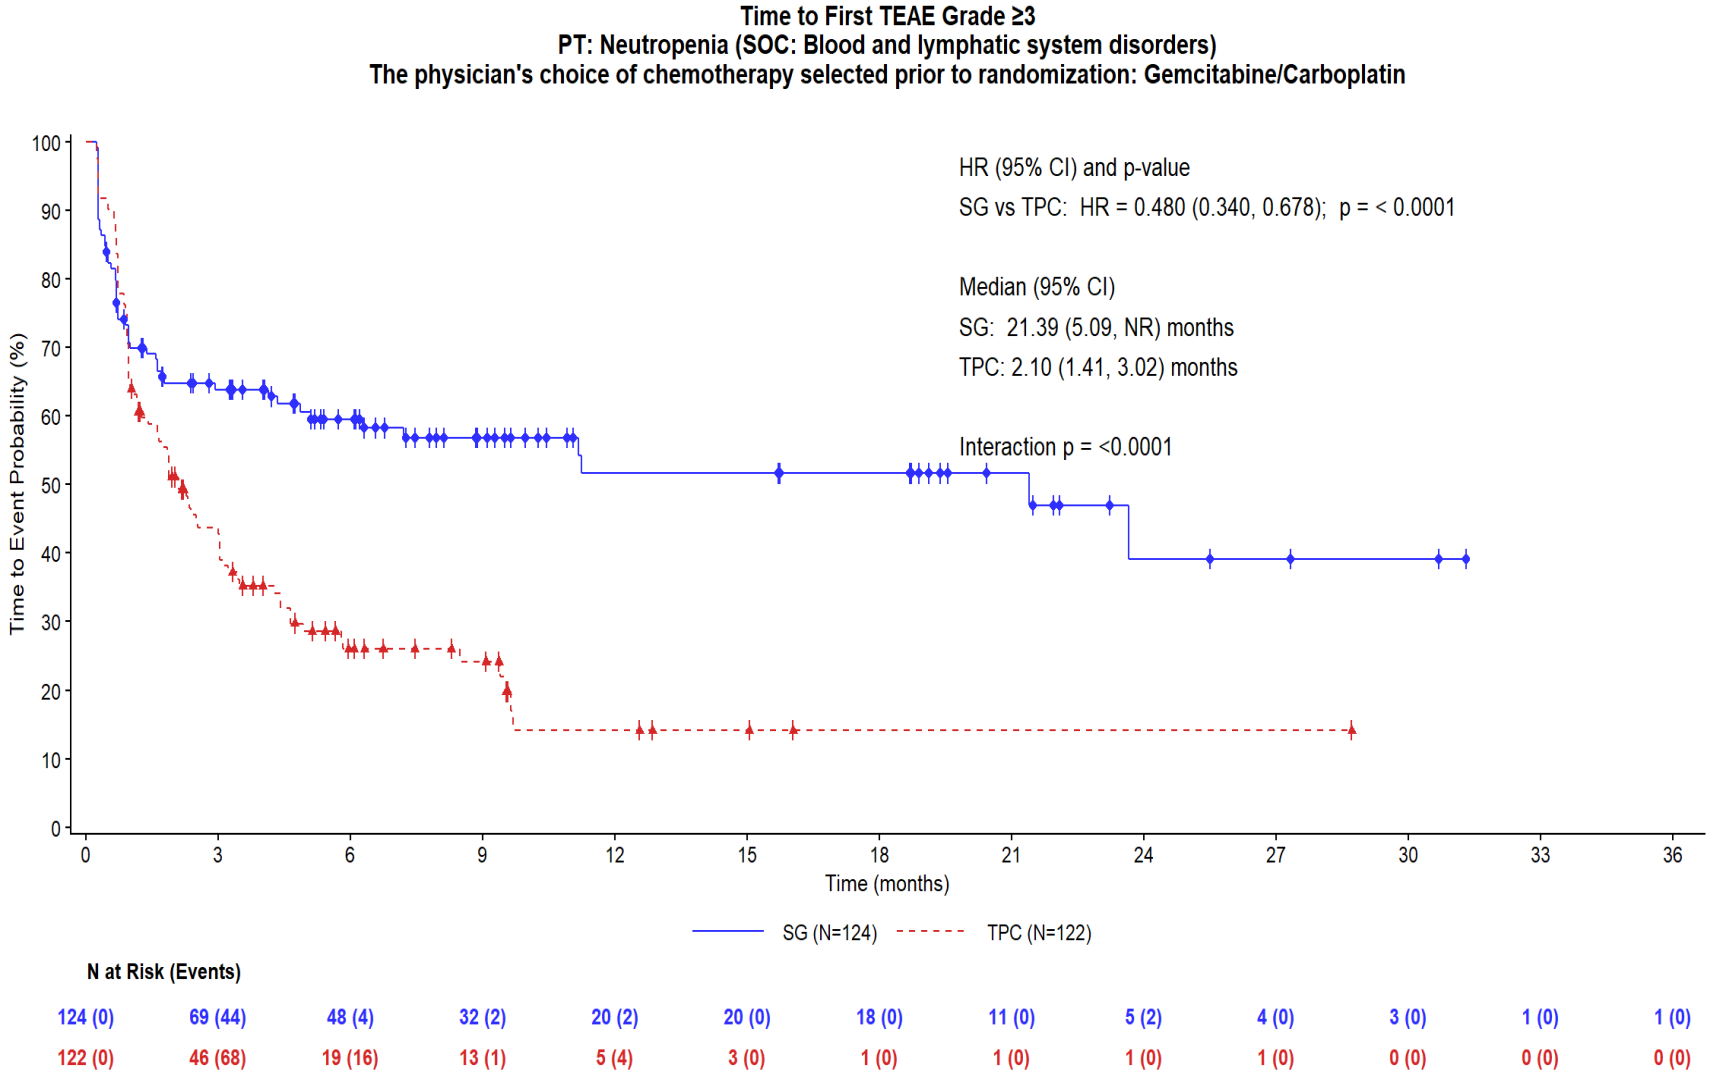
8.160. Figure 1.1.159: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Race Asian — mSAF — Excluding patients preselected to receive nab-paclitaxel



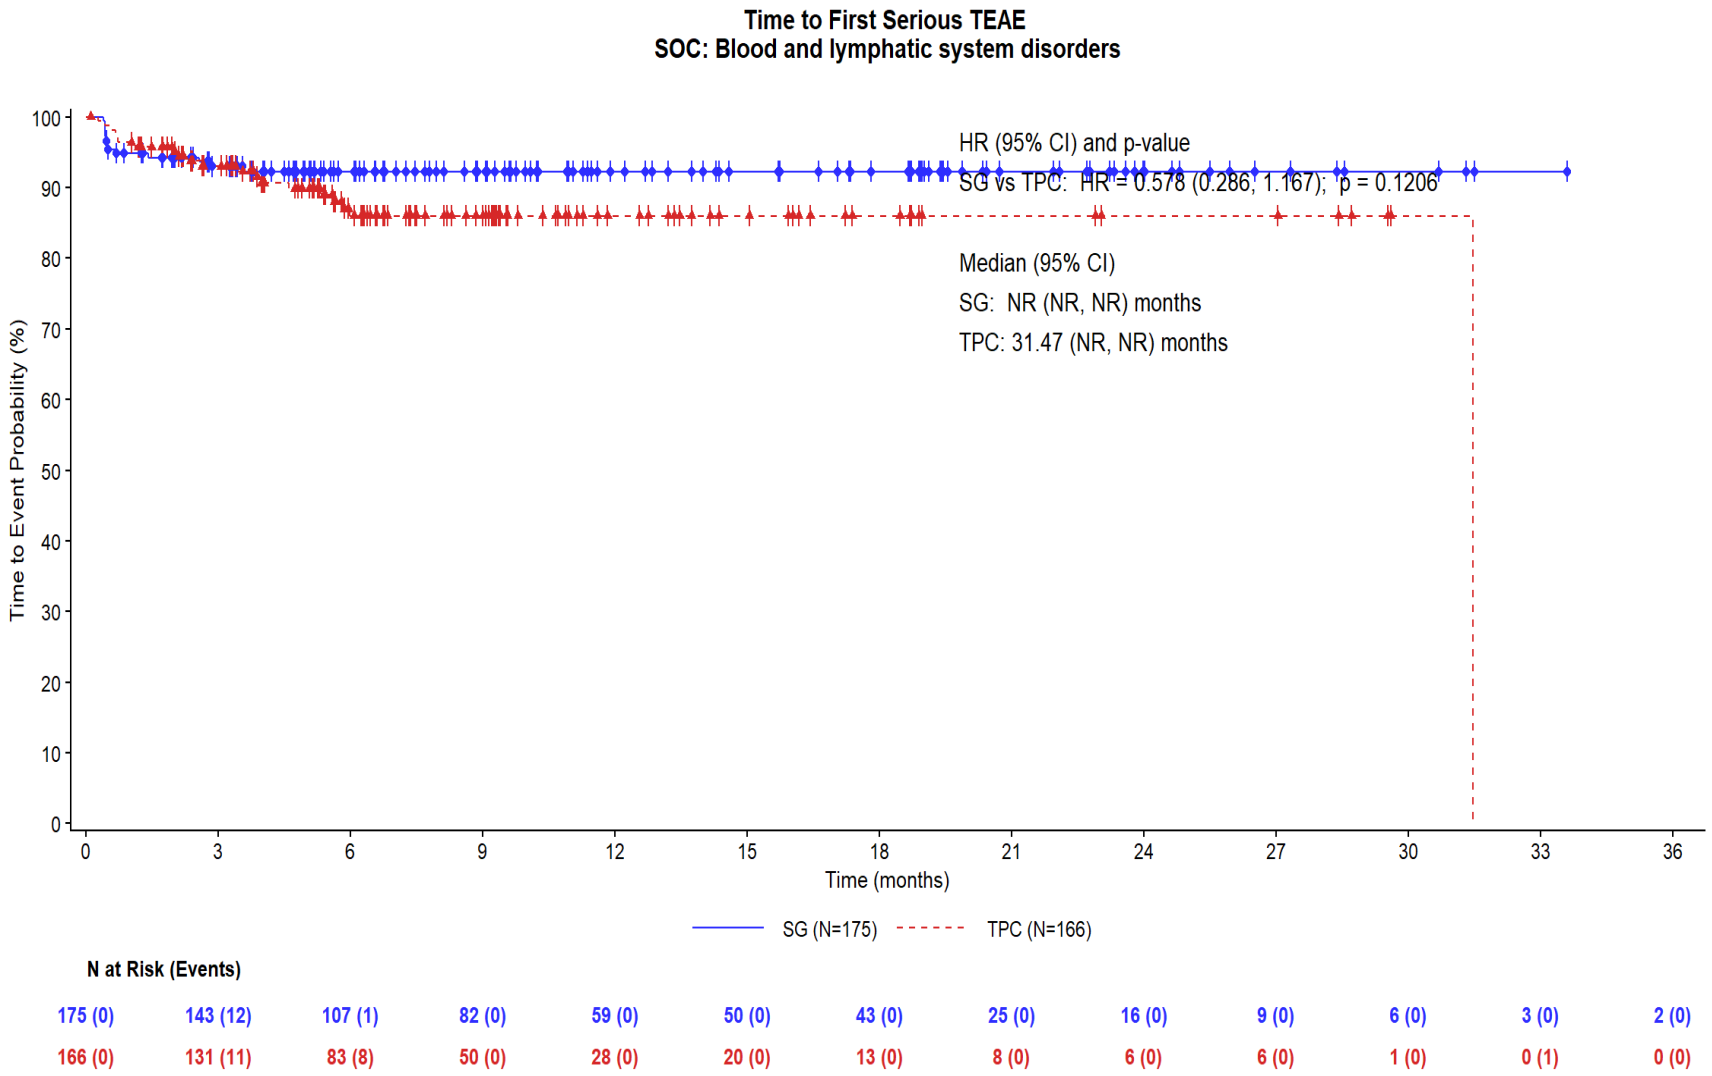
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.161. Figure 1.1.160: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Race Other — mSAF — Excluding patients preselected to receive nab-paclitaxel



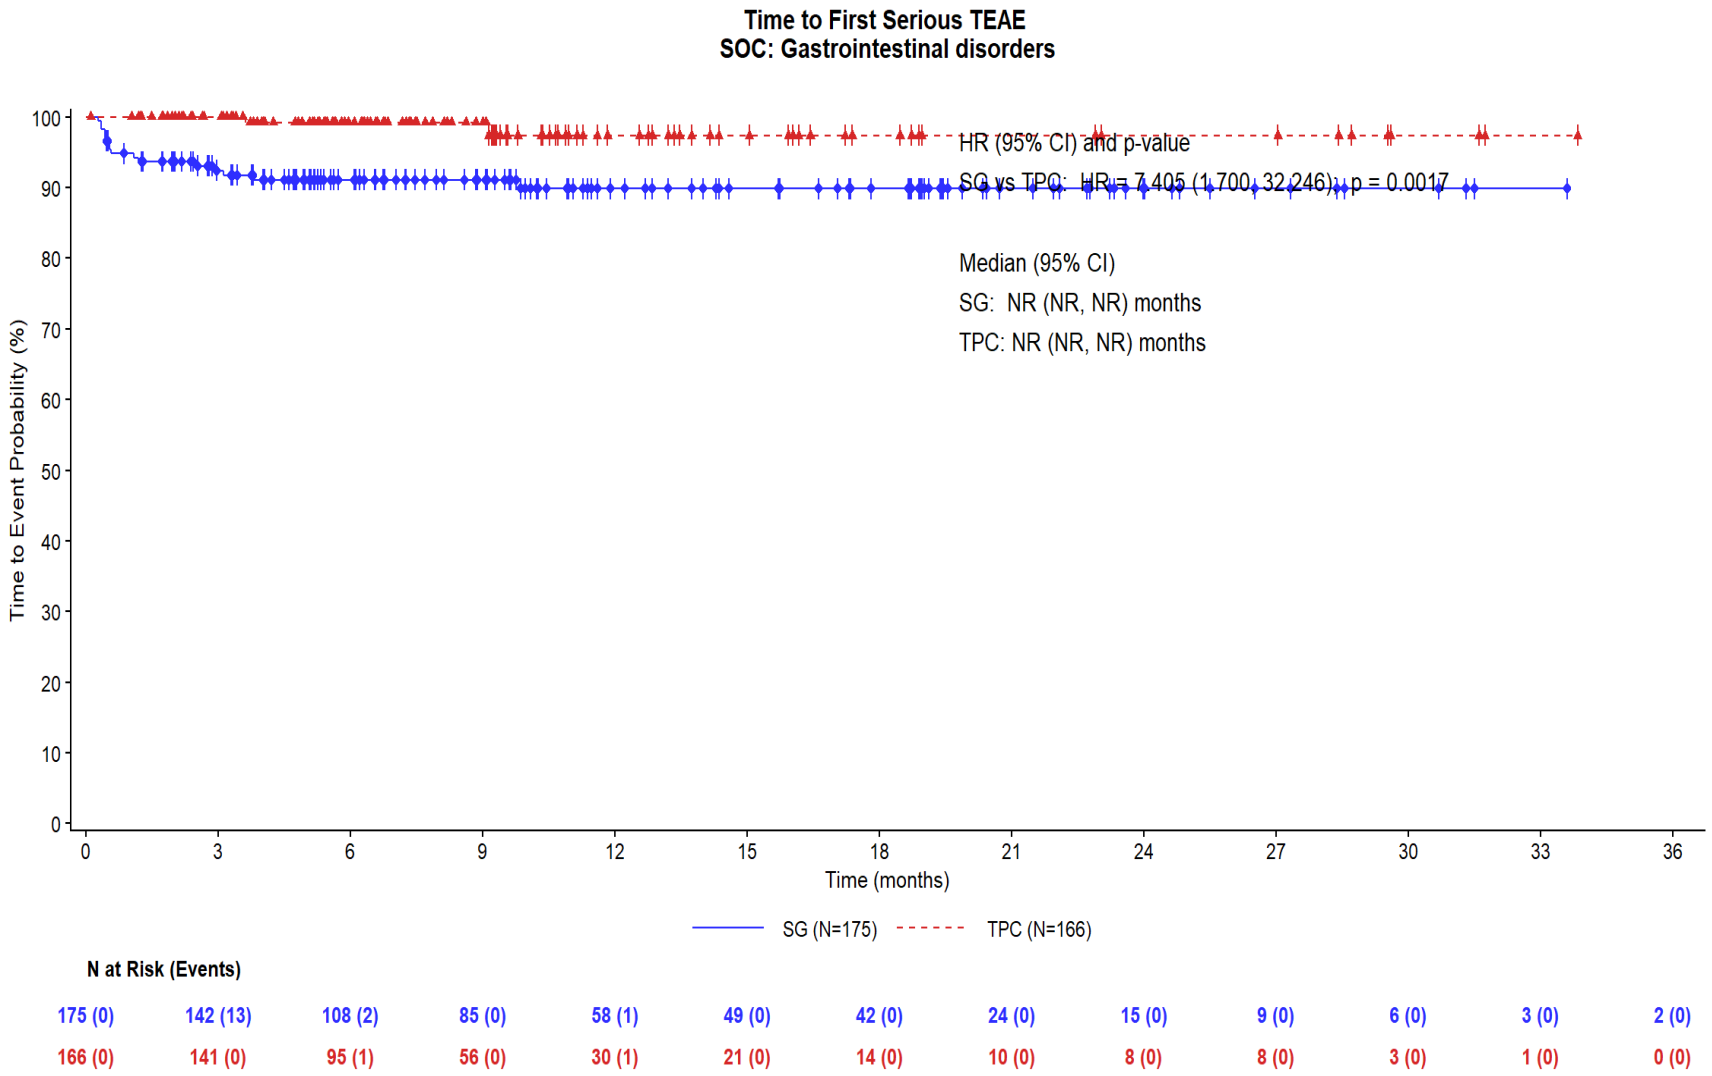
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.162. Figure 1.1.161: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Physician s chemotherapy choice Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



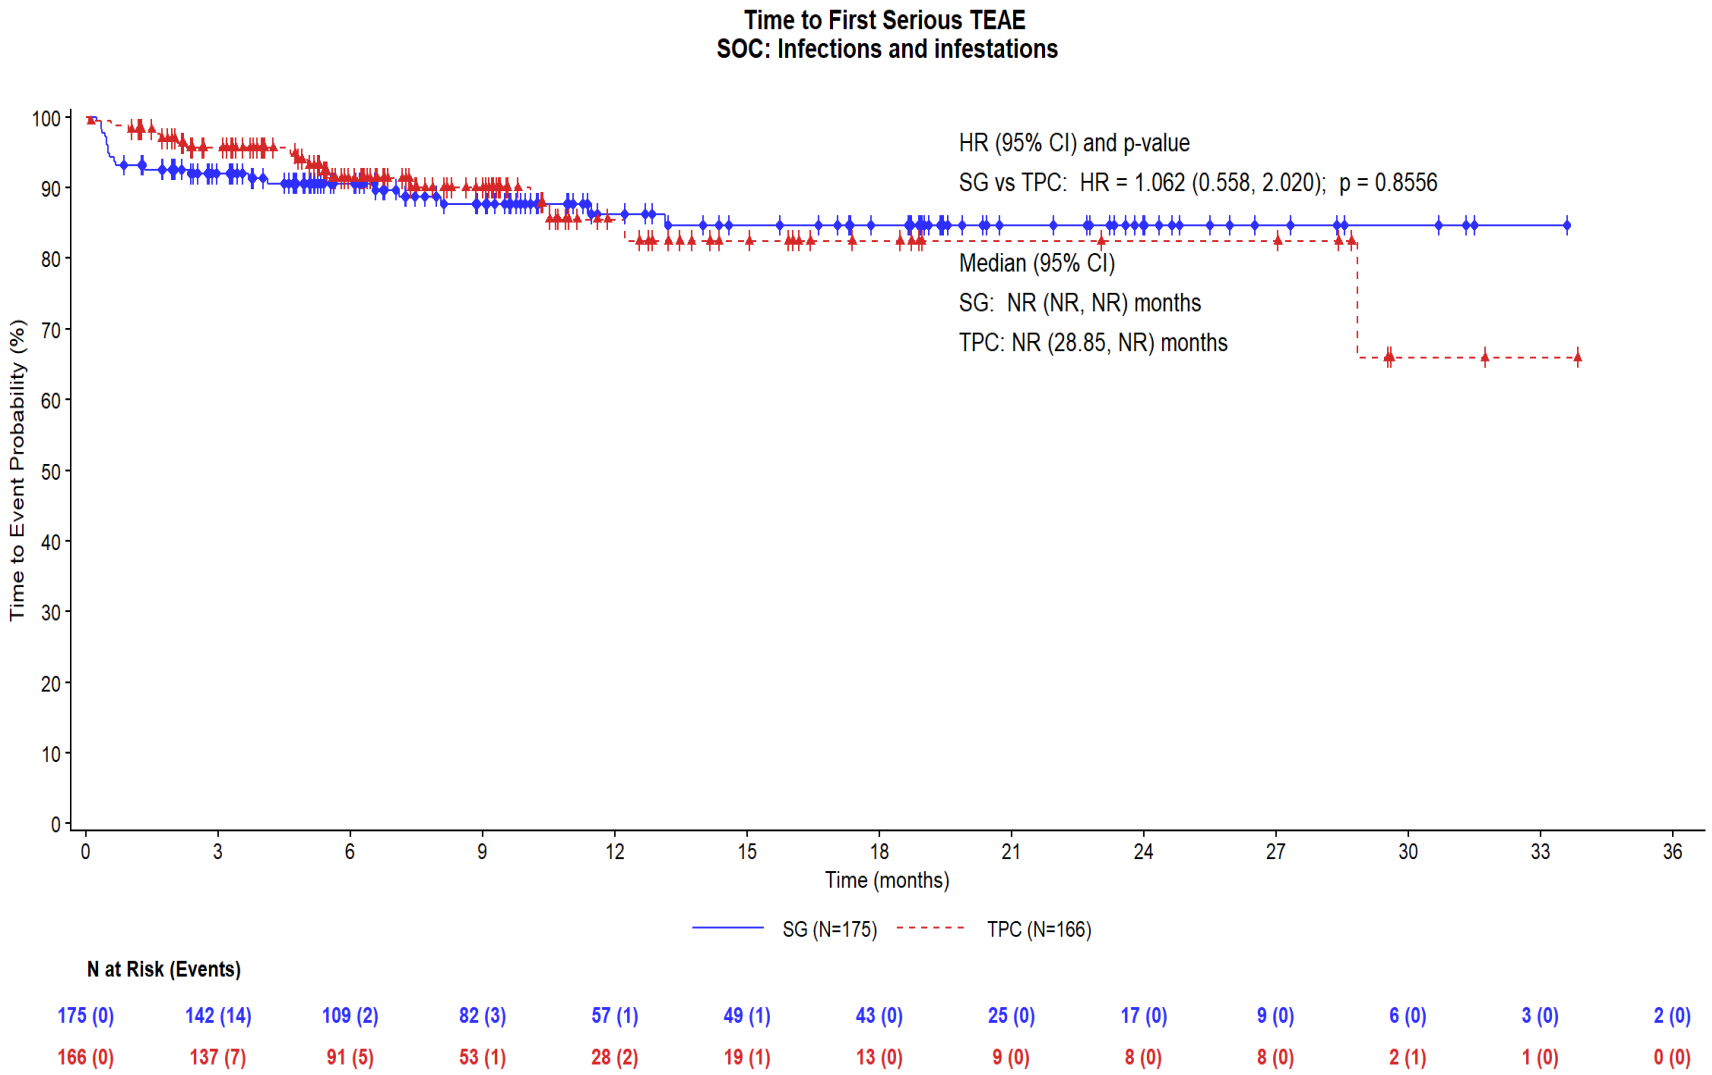
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.163. Figure 1.1.162: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Physician s chemotherapy choice Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



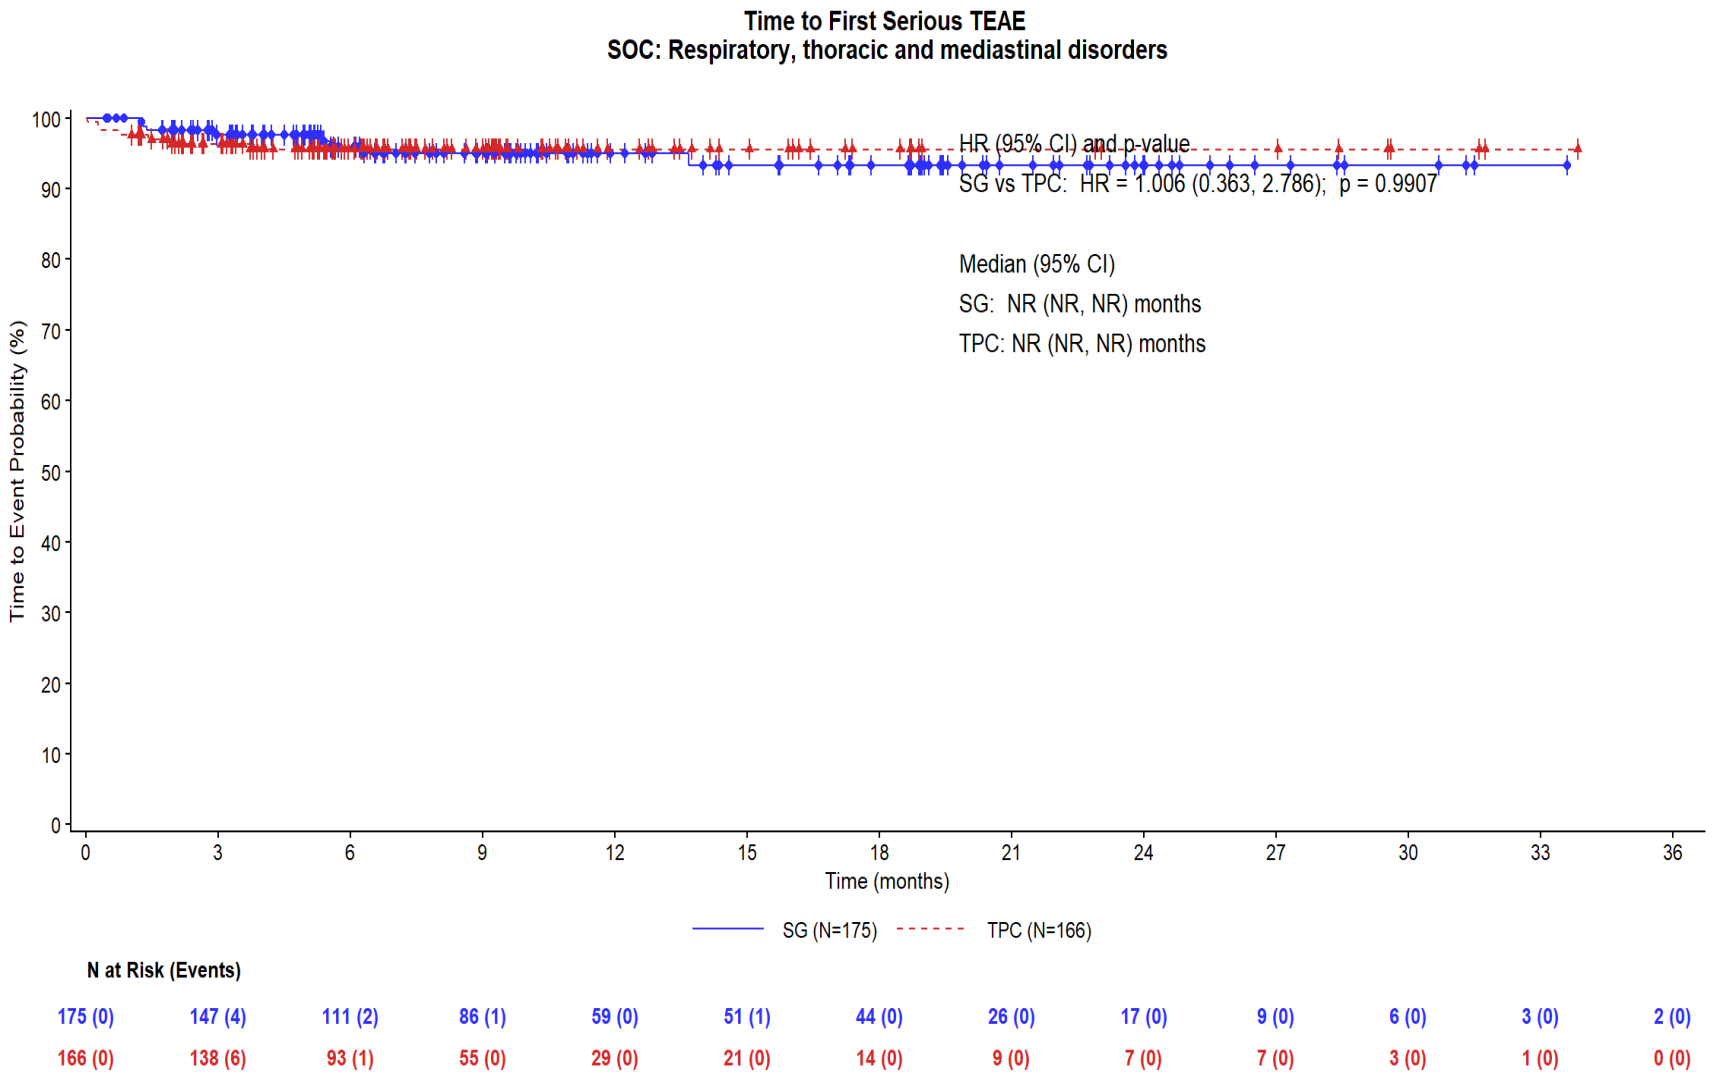
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.164. Figure 1.1.163: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Blood and lymphatic system disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



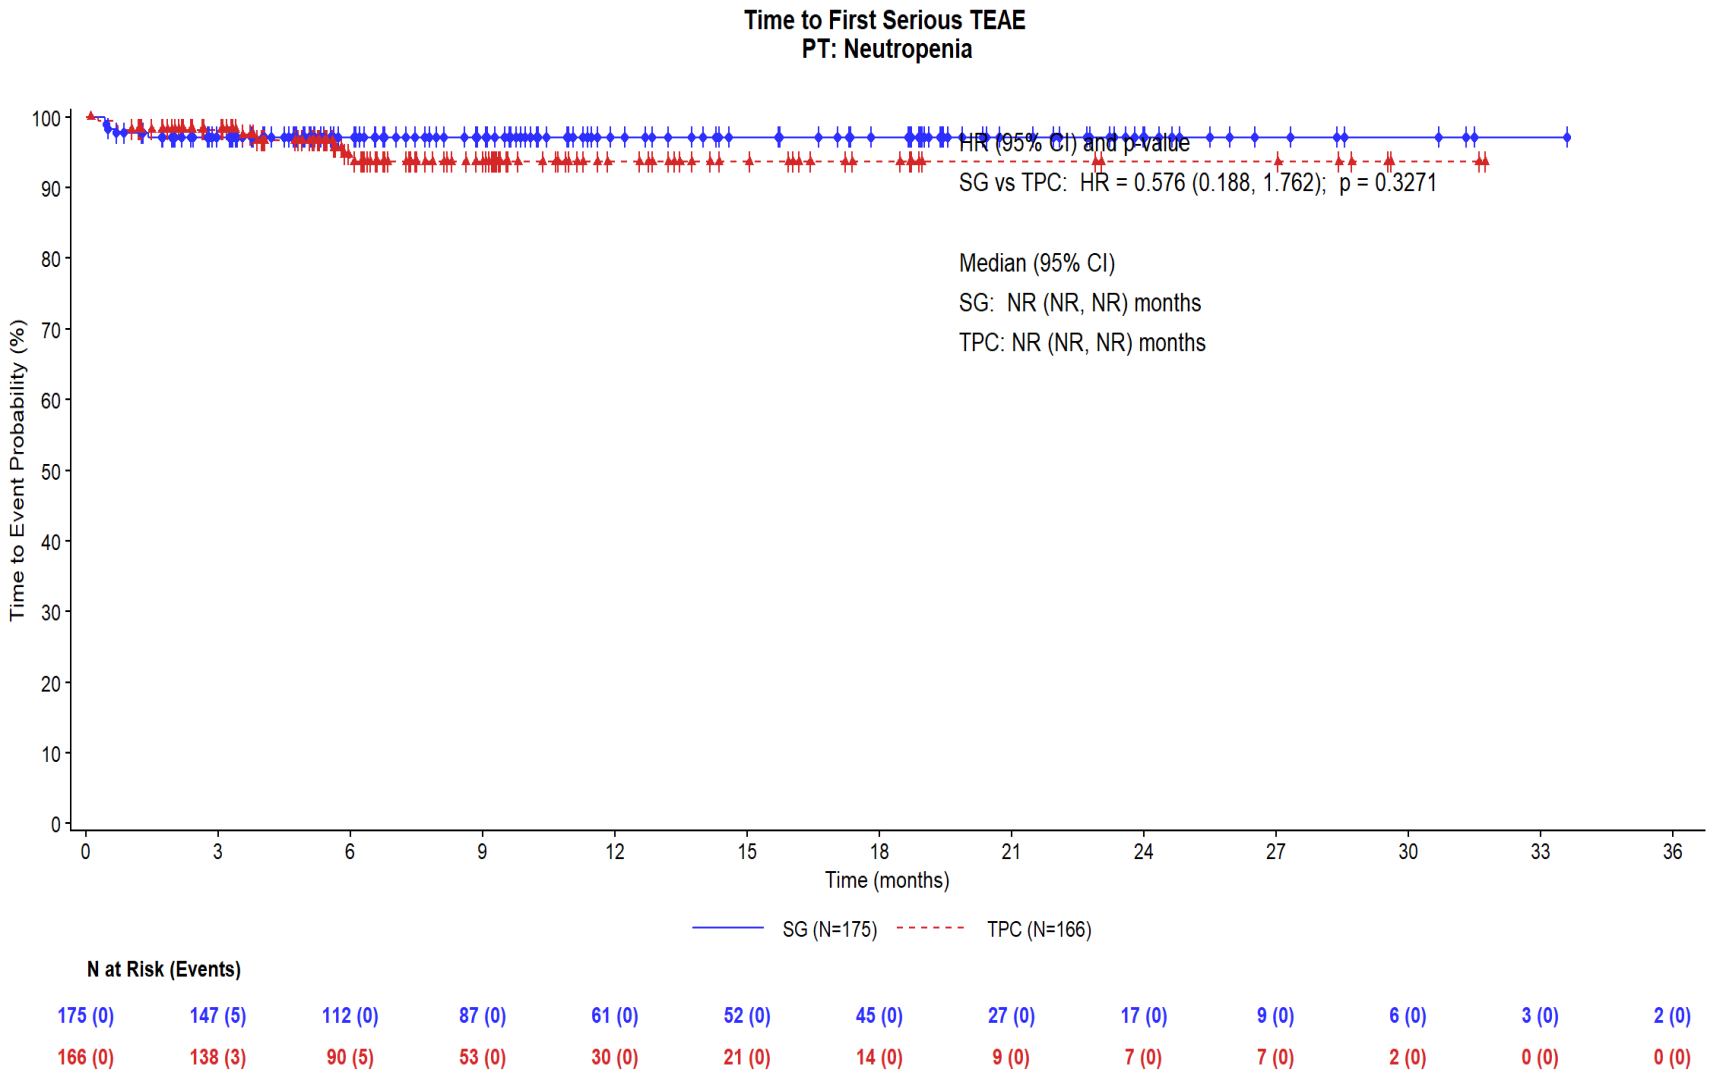
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.165. Figure 1.1.164: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Gastrointestinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



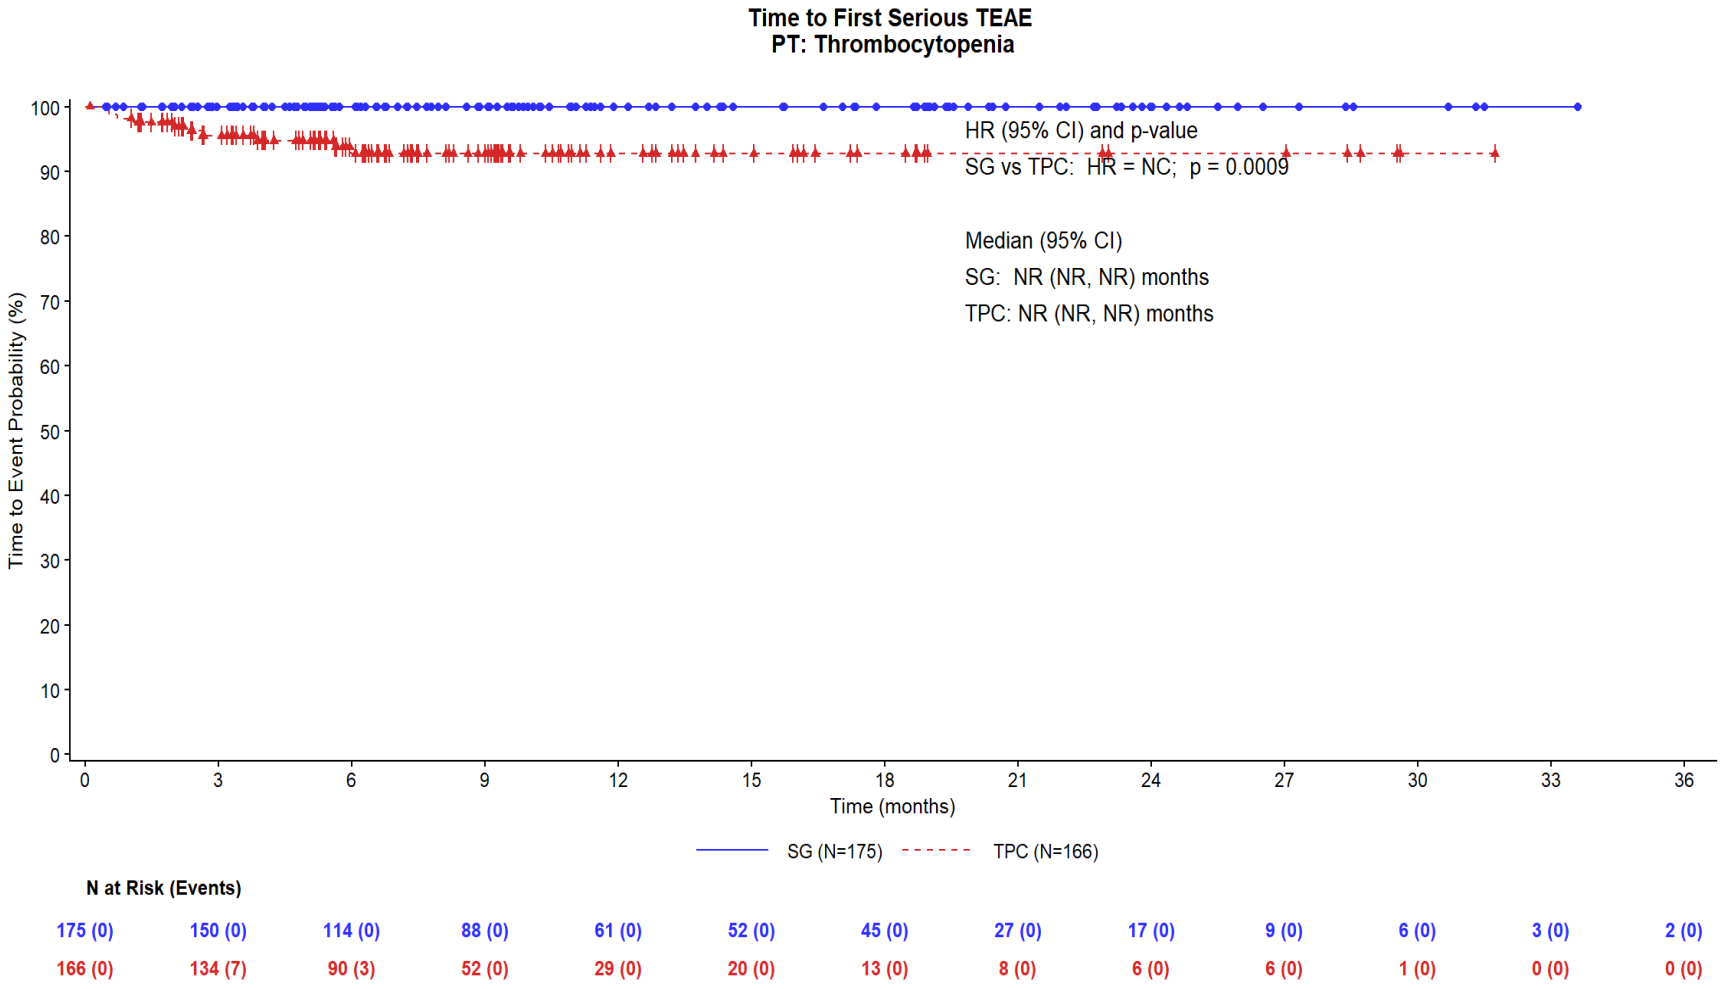
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.166. Figure 1.1.165: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Infections and infestations — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.167. Figure 1.1.166: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Respiratory thoracic and mediastinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.168. Figure 1.1.167: Kaplan Meier Plot of Time to First TEAE (SAE) by PT Neutropenia — mSAF — Excluding patients preselected to receive nab-paclitaxel

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.169. Figure 1.1.168: Kaplan Meier Plot of Time to First TEAE (SAE) by PT Thrombocytopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

Table. Recurrence of diarrhoea TEAE — mSAF1: Excluding patients preselected to nab-paclitaxel

	SG (N=175)			TPC (N=166)		
Incidence of diarrhoea TEAE	**1 event**	**2 events**	**>2 events**	**1 event**	**2 events**	**>2 events**
Grade 1	46 (26.3%)	16 (9.1%)	18 (10.3%)	28 (16.9%)	2 (1.2%)	4 (2.4%)
Grade 2	36 (20.6%)	10 (5.7%)	5 (2.9%)	11 (6.6%)	2 (1.2%)	1 (0.6%)
Grade ≥3	17 (9.7%)	1 (0.6%)	0	3 (1.8%)	0	0
Grade 3	18 (10.3%)	0	0	3 (1.8%)	0	0
Grade 4	1 (0.6%)	0	0	0	0	0
Grade 5	0	0	0	0	0	0

n = number of events per patient;

GS-US-592-6238-20788-92106 (SG): 2 diarrhoea episodes at Grade≥3 (1×Grade 3 + 1×Grade 4)

Data cut off:- 22 APR 2026

Descriptive Analysis of G-CSF Use Prior to First Febrile Neutropenia AE

	Febrile Neutropenia CTCAE Grade ≥3[1]			Febrile Neutropenia Serious Adverse Event (SAE)[2]		
Parameter	**SG (N=175)**	**TPC (N=166)**	**Overall (N=341)**	**SG (N=175)**	**TPC (N=166)**	**Overall (N=341)**
Total Patients in Safety Analysis Set	**175**	**166**	**341**	**175**	**166**	**341**
Patients with Febrile Neutropenia, n (%)	**8 (4.6%)**	**3 (1.8%)**	**11 (3.2%)**	**6 (3.4%)**	**2 (1.2%)**	**8 (2.3%)**
G-CSF Prophylaxis Prior to AE						
Yes	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)
No	8 (100.0%)	3 (100.0%)	11 (100.0%)	6 (100.0%)	2 (100.0%)	8 (100.0%)
Patients Without Febrile Neutropenia, n (%)	**167 (95.4%)**	**163 (98.2%)**	**330 (96.8%)**	**169 (96.6%)**	**164 (98.8%)**	**333 (97.7%)**

n (%) = number of subjects and percentage of the relevant denominator.
Denominator for Total Patients, Patients with Febrile Neutropenia, and Patients without Febrile Neutropenia rows = total number of patients in each treatment arm (or overall) in the Safety Analysis Set.
Denominator for G-CSF Prophylaxis Yes/No rows = number of patients who experienced a febrile neutropenia event in the respective treatment arm or overall.
[a] Observation period is the time from first dose until the earliest of: the data cut-off (DCO) date; the date of study treatment discontinuation plus 30 days; or death; whichever occurs first and stops the collection of endpoint data. The same observation period applies to any adverse event and any serious adverse event, so the adverse-event and serious-adverse-event windows coincide. Only febrile neutropenia events with an onset date within this period are counted.
Adverse events were coded using the Medical Dictionary for Regulatory Activities (MedDRA) Version 28.1.

[1] Febrile neutropenia with CTCAE Grade ≥3: includes only febrile neutropenia events with a toxicity grade of 3 or higher and an onset date within the adverse-event observation period defined in footnote [a]. [2] Febrile neutropenia classified as a Serious Adverse Event (SAE): includes only febrile neutropenia events that met at least one seriousness criterion and had an onset date within the serious-adverse-event observation period defined in footnote [a].

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
Screened Population: Participants who have signed an informed consent and participated in the screening procedures at site to assess eligibility.
Safety Analysis Set includes randomized participants who have received at least one dose of any study drug.
Denominator of percentages is the number of participants in each treatment group.
Randomized Phase excludes crossover phase when participants in TPC arm started to receive SG.
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
Denominator of percentages is the number of participants in each treatment group.
Age (in years) was collected on the date of first study drug administration (Day 1) if dosed, or randomization if not dosed.
Not Permitted = local regulators did not allow collection of race or ethnicity information or participant refused to provide information.
*Body Mass Index (BMI) (kg/m^2) = [Weight (kg) / Height (cm)^2]*10,000*
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
Denominator of percentages for other baseline characteristics is the number of participants in each treatment group.
[a] Mutant denotes participant is either BRCA1 or BRCA2 mutant, or both mutant. Wild type denotes participant is both BRCA1 and BRCA2 wild type. Unknown denotes participant is BRCA1 unknown and BRCA2 wild type or unknown, or participant is BRCA1 wild type or unknown and BRCA2 unknown.
PD-L1 CPS (combined positive score) and TNBC status were collected centrally.
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
Denominator of percentages is the number of participants in each treatment group.
Medical history was coded according to MedDRA Version 27.1.
Participants may report >=1 medical history per system organ class or preferred term. At each level of summarization, a participant was counted once if the participant reported 1 or more medical history.
SOCs were presented alphabetically and PTs within SOC were presented by descending order of the total frequencies.
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
The denominator of percentages is the number of participants in each treatment group.
Medications are mapped using WHODRUG dictionary version BMAR24.
Participants are counted only once for each category and preferred drug name.
The preferred drug name "Sacituzumab Govitecan" includes both commercial use and crossover to SG on study.
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
The denominator of percentages is the number of participants in each treatment group.
Medications are mapped using WHODRUG dictionary version BMAR24.
Participants are counted only once for each category and preferred drug name. Participants may be counted in more than one drug category if they received multiple drugs as part of their first subsequent anti-cancer therapy. The total number of participants with any subsequent anti-cancer therapy differs by 1 from the first subsequent therapy count because one patient in the TPC arm has a missing first subsequent therapy record but has two entries recorded for the fourth subsequent therapy. This patient is therefore counted in "Participants with any subsequent anti-cancer therapy" but not in "First subsequent anti-cancer therapy"
The preferred drug name "Sacituzumab Govitecan" includes both commercial use and crossover to SG on study.
Data Cut Date: 27 October 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice; NR = Not Reached; IWRS = Interactive Web Response System.
[a] Ongoing participants are those who have not discontinued participation in the study by the data cutoff date.
[b] OS (months) = (date of death or censoring − date of randomisation + 1) / 30.4375. Based on Kaplan-Meier estimates with 95% CI using the log-log transformation.
[c] The two-sided p-value is from stratified log-rank test, adjusted for randomization stratification factors (IWRS).
[d] Hazard ratio and 95% CIs are calculated using the Cox proportional hazards model, adjusted for randomization stratification factors (IWRS).

Parameter	SG (N=177)	TPC (N=169)

[e] Duration of OS follow-up (months) = (date of death or censoring - date of randomization + 1) / 30.4375.
Data Cut Date: 27 OCT 2025.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
OS (months) = (date of death or censoring − date of randomisation + 1) / 30.4375. Median OS from Kaplan-Meier estimate. 95% CI based on log-log transformation.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
Log-rank test is unstratified.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Participants with unknown BRCA 1/2 status were excluded from that subgroup.
Disease stratification and geographic region are collected from IWRS.
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
[1] Interaction p-value: likelihood ratio test from Cox model with treatment + subgroup + treatment×subgroup interaction terms; shown once per subgroup variable at first category level.
Data Cut Date: 27 OCT 2025.

5.4. Table 1.1.6: Follow-up Duration (Months) for PFS and Tumor Response by BICR — mITT — Excluding patients preselected to receive nab-paclitaxel

At 12 Months	0.415 (0.336, 0.493)	0.253 (0.181, 0.331)
At 18 Months	0.277 (0.203, 0.356)	0.111 (0.059, 0.180)
Treatment Comparison		
Stratified Log-rank p-value of SG vs TPC [d]	0.0016	
Stratified Hazard Ratio of SG vs TPC (95% CI) [e]	0.651 (0.498, 0.851)	

SG = sacituzumab govitecan; TPC = treatment of physician's choice; IWRS = Interactive Web Response System; NR = Not Reached.
[a] Censoring due to no baseline or no postbaseline evaluable assessment does not include death events before the second scheduled postbaseline visit.
[b] PFS (months) = (date of event or censoring − date of randomisation + 1) / 30.4375. The 95% CI is based on the log-log transformation.

Parameter	SG (N=177)	TPC (N=169)

[c] PFS rate is the proportion of participants alive without progressive disease (PD). The 95% CI is based on the log-log transformation.
[d] The two-sided p-value is from stratified log-rank test.
[e] Hazard ratio with 95% CIs are calculated using Cox proportional hazards model, stratified for randomization stratification factors (IWRS).
Data Cut Date: 27 OCT 2025.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Intent-to-treat (ITT) Analysis Set includes all participants who were randomised in the study.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
PFS (months) = (date of events or censoring − date of randomisation + 1) / 30.4375. 95% CI based on log-log transformation. Median PFS from Kaplan-Meier estimate.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
[a] Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 27 OCT 2025.

Stratified Hazard Ratio of SG vs TPC (95% CI) [d]	0.688 (0.530, 0.894)	

Parameter	SG (N=177)	TPC (N=169)

SG = sacituzumab govitecan; TPC = treatment of physician's choice; IWRS = Interactive Web Response System; NR = Not Reached.
PFS2 is defined as the time from date of randomization to the first documented progression on next-line therapy based on investigator assessment of PD or death due to any cause, whichever occurs first. Next line therapy is defined as the first new systemic anti-cancer therapy (including crossover treatment) initiated after discontinuation of study treatment regardless of end of treatment reason.
[a] Quantile of PFS2 is from Kaplan-Meier estimate. The 95% CI is based on log-log transformation.
[b] PFS2 rate is the proportion of participants alive without progression at the next line of therapy. The 95% CI is based on the log-log transformation.
[c] The two-sided p-value is from stratified log-rank test.
[d] Hazard ratio with 95% CIs are calculated using Cox proportional hazards model, adjusted for randomization stratification factors (IWRS).
Data Cut Date: 27 OCT 2025.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
PFS2 is defined as the time from date of randomization to the first documented progression on next-line therapy based on investigator assessment of PD or death due to any cause, whichever occurs first.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
PFS2 rate is the proportion of participants alive without progression at the next line of therapy. The 95% CI is based on the log-log transformation.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from an unstratified log-rank test.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
[1] Interaction p-value: likelihood ratio test from Cox model with treatment + subgroup + treatment×subgroup interaction terms; shown once per subgroup variable at first category level.
Data Cut Date: 27 OCT 2025.

At 18 Months	0.311 (0.243, 0.381)	0.161 (0.109, 0.221)
At 24 Months	0.162 (0.102, 0.234)	0.119 (0.073, 0.177)
Treatment Comparison		
Log-rank p-value of SG vs TPC [c]	0.0004	
Hazard Ratio of SG vs TPC (95% CI) [d]	0.650 (0.511, 0.826)	

SG = sacituzumab govitecan; TPC = treatment of physician's choice; IWRS = Interactive Web Response System; NR = Not Reached.
Time to first subsequent therapy is defined as the time from randomization to the start date of the first subsequent anti-cancer therapy after discontinuation of randomized treatment, or death due to any cause.
[a] Quantile of TFST is from Kaplan-Meier estimate. The 95% CI is based on log-log transformation.
[b] TFST rate is the proportion of participants alive without any subsequent therapy. The 95% CI is based on the log-log transformation.
[c] The two-sided p-value is from stratified log-rank test.
[d] Hazard ratio with 95% CIs are calculated using Cox proportional hazards model, adjusted for randomization stratification factors from Interactive Web Response System (IWRS).
Data Cut Date: 27 OCT 2025.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Time to first subsequent therapy is defined as the time from randomisation to the start date of the first subsequent anti-cancer therapy after discontinuation of randomised treatment, or death due to any cause.
TFST rate is the proportion of participants alive without any subsequent therapy.
Hazard ratio and 95% CIs calculated using unstratified Cox proportional hazards model. Efron method used to handle ties. Reference arm = TPC.
Log-rank p-value is from an unstratified log-rank test.
[1] Interaction p-value: likelihood ratio test from Cox model with treatment + subgroup + treatment×subgroup interaction terms; shown once per subgroup variable at first category level.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Data Cut Date: 27 OCT 2025.

SG = sacituzumab govitecan, TPC = treatment of physician's choice, Gem = gemcitabine, Carbo = carboplatin.
Safety Analysis Set includes randomized participants who have received at least one dose of any study drug. Taxane includes participants who have received Paclitaxel. TPC column includes participants who have received any of Gem, Carbo or Paclitaxel.
Duration of exposure to study drug (months) = (last dosing date − first dosing date + 1)/30.4375.

6.2. Table 1.1.2: Observation Period (Months) for Safety — mSAF — Excluding patients preselected to receive nab-paclitaxel

	SG (N=175)	TPC (N=166)	Total (N=341)
Observation Period (months) for Safety [a]

Min, Max	0.46, 34.96	0.10, 28.71	0.10, 34.96

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
[a] Observation period is defined as the time from first dose until Data cutoff date, study treatment discontinuation +30 days for any AE and any serious AE, or death, whichever comes first and stops the collection of endpoint data.

6.3. Table 1.1.3: Analysis of Time to First Treatment-Emergent Adverse Event (TEAE) — mSAF — Excluding patients preselected to receive nab-paclitaxel

Analysis SG vs. TPC		
Hazard Ratio (95% CI)		1.246 (1.002, 1.548)
p-value		0.0424

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.

	SG (N=175)	TPC (N=166)

p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if all categories contain ≥10 patients across both arms combined.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
NC = Not Calculable: the hazard ratio and 95% CI are not estimable by the Cox model.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if all categories contain ≥10 patients across both arms combined.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.

SG = sacituzumab govitecan, TPC = treatment of physician's choice.
NR = Not Reached. NC = Not Calculable (HR is NC when one treatment arm has zero events; log-rank p-value remains valid).
Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if all categories contain ≥10 patients across both arms combined.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.

SG = sacituzumab govitecan, TPC = treatment of physician's choice, SOC = System Organ Class, PT = Preferred Term.
Rule 1 = Events occurring in ≥10% of subjects in at least one arm; Rule 2 = Events occurring in ≥10 subjects overall (SG + TPC combined) and ≥1% in at least one arm. SOC and PT meeting Rule 1 OR Rule 2 are shown.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation

	SG (N=175)	TPC (N=166)

of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

SG = sacituzumab govitecan, TPC = treatment of physician's choice, SOC = System Organ Class, PT = Preferred Term.
Rule 1 = Events occurring in ≥10% of subjects in at least one arm; Rule 2 = Events occurring in ≥10 subjects overall (SG + TPC combined) and ≥1% in at least one arm. SOC and PT meeting Rule 1 OR Rule 2 are shown.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if p-value from the Cox model is <0.05 and subgroups with ≥10 events (excluding censored) in at least one category of the subgroup over both arms.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

Hazard Ratio (95% CI)		2.131 (1.002, 4.532)	
p-value		0.0445	

SG = sacituzumab govitecan, TPC = treatment of physician's choice, SOC = System Organ Class, PT = Preferred Term.
Rule 1 = Events occurring in ≥10% of subjects in at least one arm; Rule 2 = Events occurring in ≥10 subjects overall (SG + TPC combined) and ≥1% in at least one arm. SOC and PT meeting Rule 1 OR Rule 2 are shown.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if p-value from the Cox model is <0.05 and subgroups with ≥10 events (excluding censored) in at least one category of the subgroup over both arms.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

SG = sacituzumab govitecan, TPC = treatment of physician's choice, SOC = System Organ Class, PT = Preferred Term.
Rule 1 = Events occurring in ≥10% of subjects in at least one arm; Rule 2 = Events occurring in ≥10 subjects overall (SG + TPC combined) and ≥1% in at least one arm. SOC and PT meeting Rule 1 OR Rule 2 are shown.
NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.
Subgroup presented only if p-value from the Cox model is <0.05 and subgroups with ≥10 events (excluding censored) in at least one category of the subgroup over both arms.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.

	SG (N=175)	TPC (N=166)	Interaction p-value[1]

p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

[1]Interaction p-value from likelihood ratio test: Cox model with treatment + subgroup + treatment×subgroup interaction vs treatment + subgroup only.

	SG (N=175)	TPC (N=166)	Interaction p-value[1]

Subgroup presented only if p-value from the Cox model is <0.05 and subgroups with ≥10 events (excluding censored) in at least one category of the subgroup over both arms.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

SG = sacituzumab govitecan, TPC = treatment of physician's choice, SOC = System Organ Class, PT = Preferred Term.
Rule 1 = Events occurring in ≥5% of subjects in at least one arm; Rule 2 = Events occurring in ≥10 subjects overall (SG + TPC combined) and ≥1% in at least one arm. SOC and PT meeting Rule 1 OR Rule 2 are shown.

	SG (N=175)	TPC (N=166)

NR = Not Reached. Duration (months) = (date of event/censoring − date of first dose + 1)/30.4375.
Median Time-to-Event is from Kaplan-Meier estimate. 95% CI is computed using the Brookmeyer-Crowley method.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
p-value from unstratified log-rank test.
Denominator of percentages is the number of participants in each treatment arm.
Adverse events were coded according to MedDRA Version 28.1.
Treatment-emergent adverse event (AE) defined as any AE occurring on or after the first dose date of study drug, and up to and including 30 days after last dose date of study drug or the day prior to initiation of subsequent anticancer therapy (including crossover treatment), whichever occurs first.
The following terms are mapped: Neutrophil count decreased → Neutropenia, White blood cell count decreased → Leukopenia, Lymphocyte count decreased → Lymphopenia, Haemoglobin decreased → Anaemia, Red blood cell count decreased → Anaemia, Platelet count decreased → Thrombocytopenia, Asthenia → Fatigue, Typhlitis → Neutropenic colitis, Dyspnoea exertional → Dyspnoea.

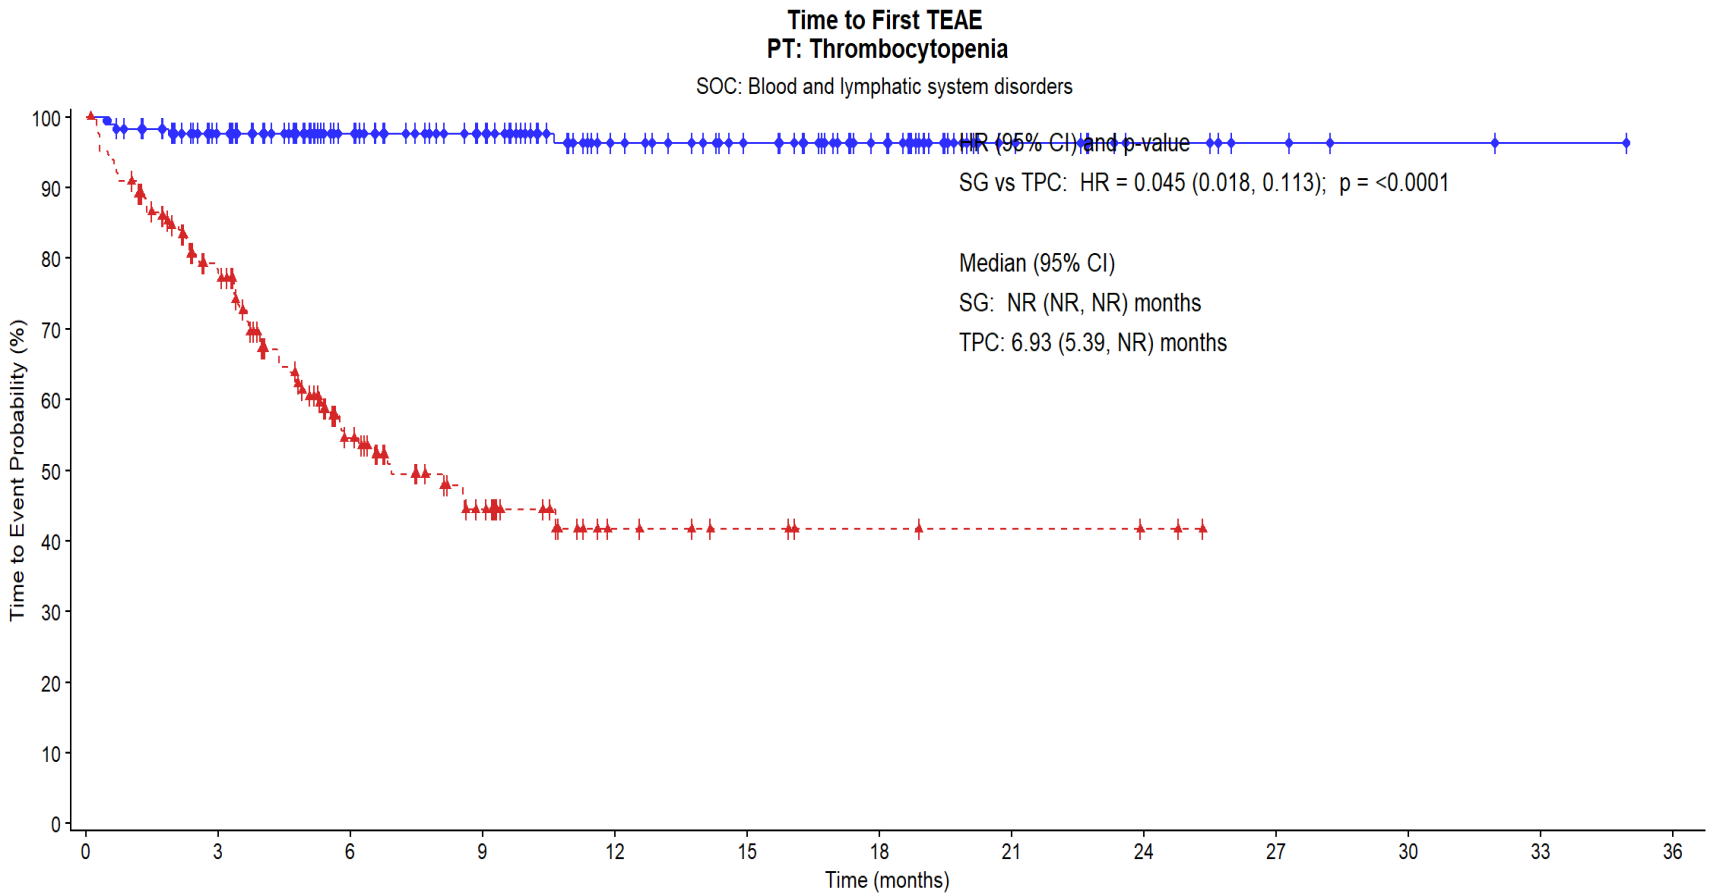
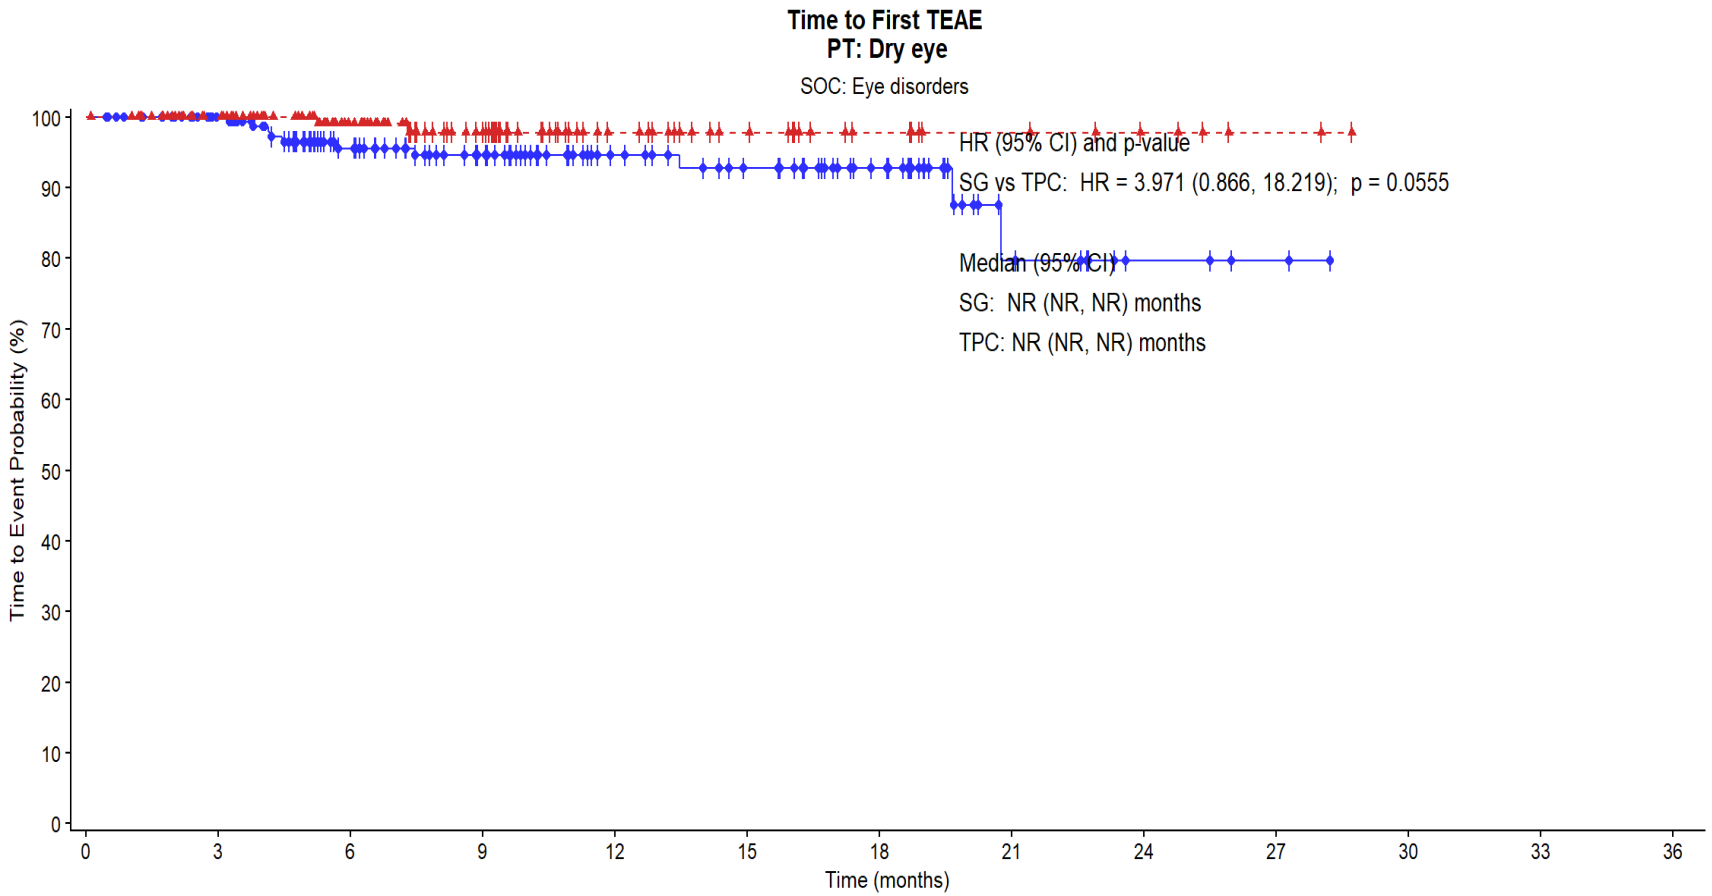
8.42. Figure 1.1.43: Kaplan Meier Plot of Time to First TEAE by PT Lymphopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



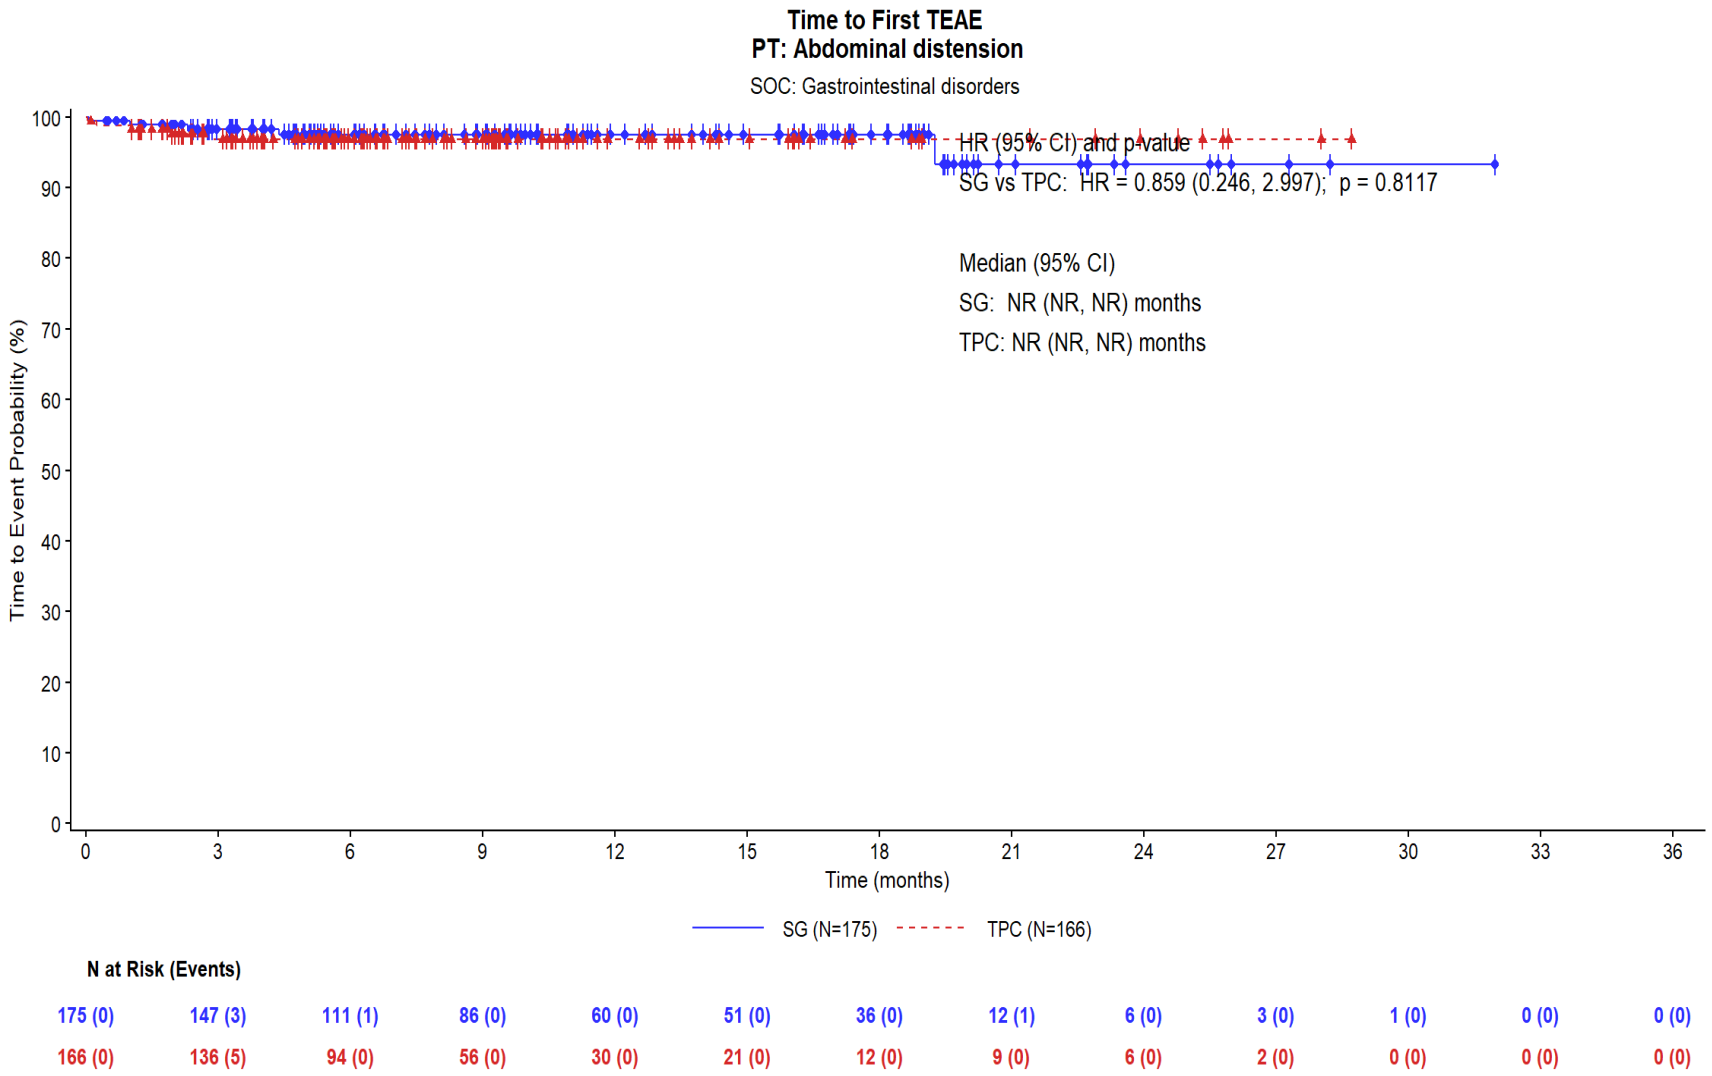
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.43. Figure 1.1.44: Kaplan Meier Plot of Time to First TEAE by PT Neutropenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



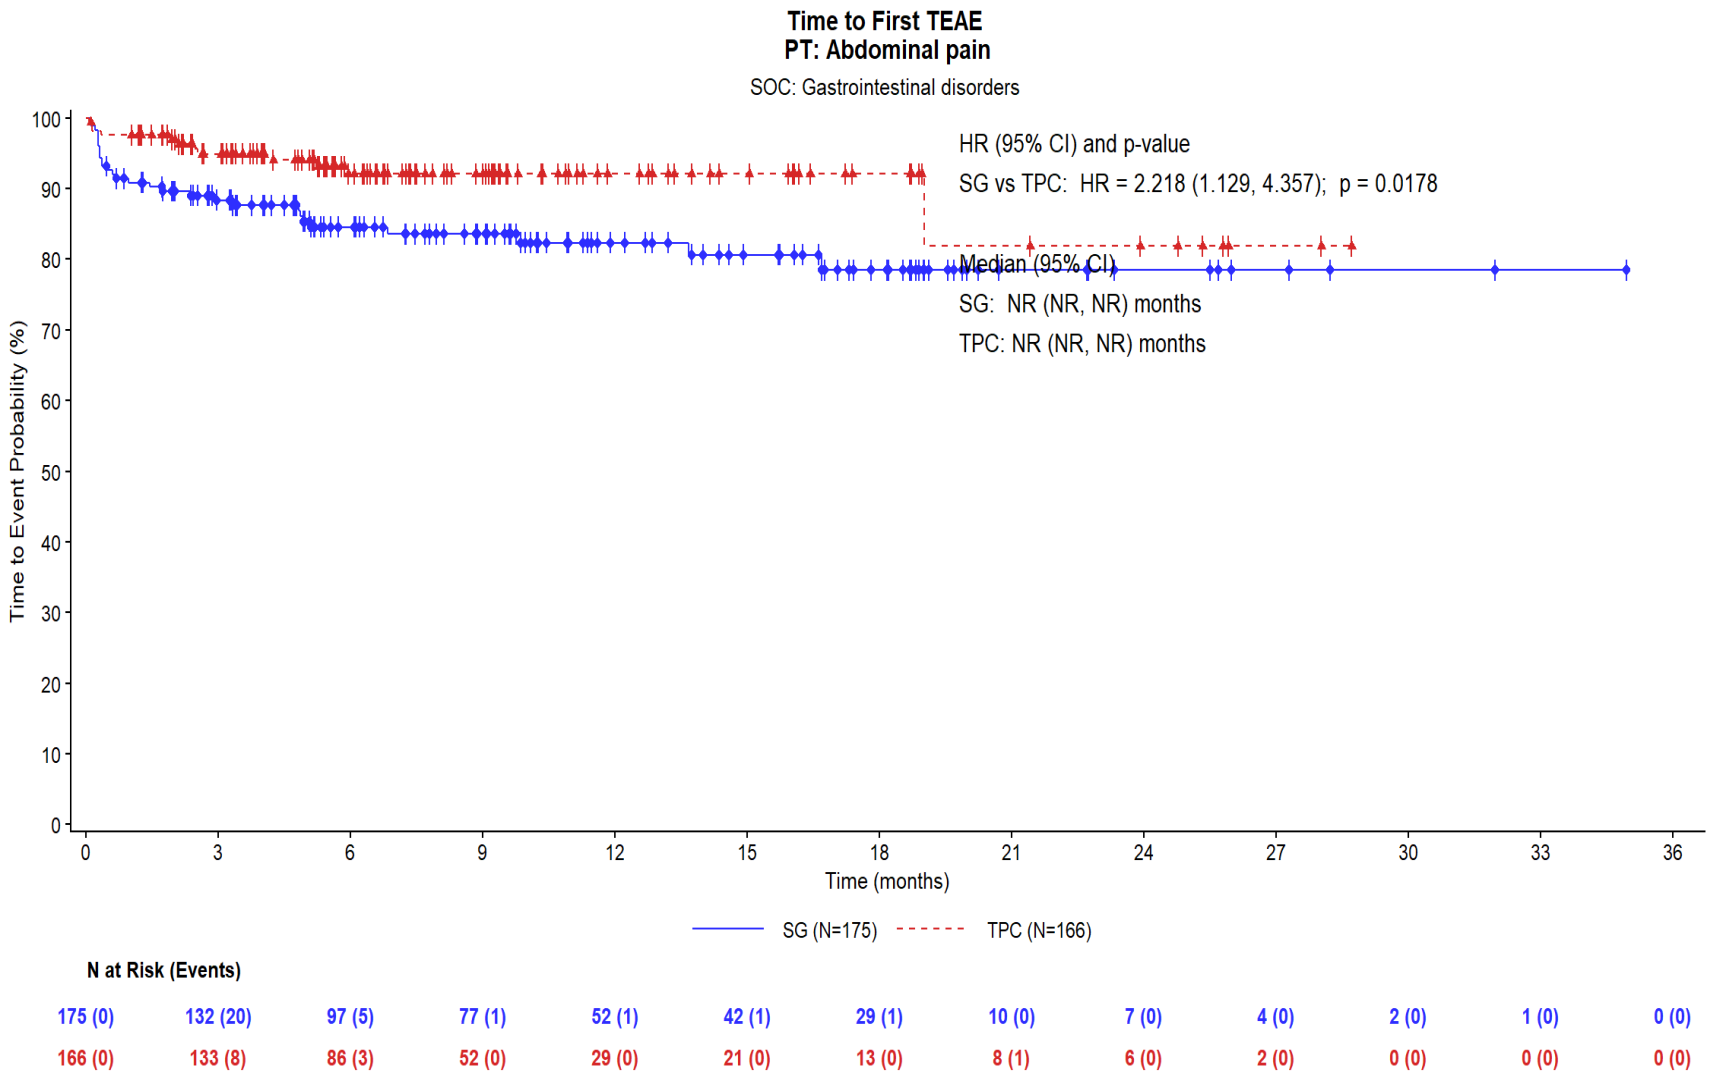
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.44. Figure 1.1.45: Kaplan Meier Plot of Time to First TEAE by PT Thrombocytopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



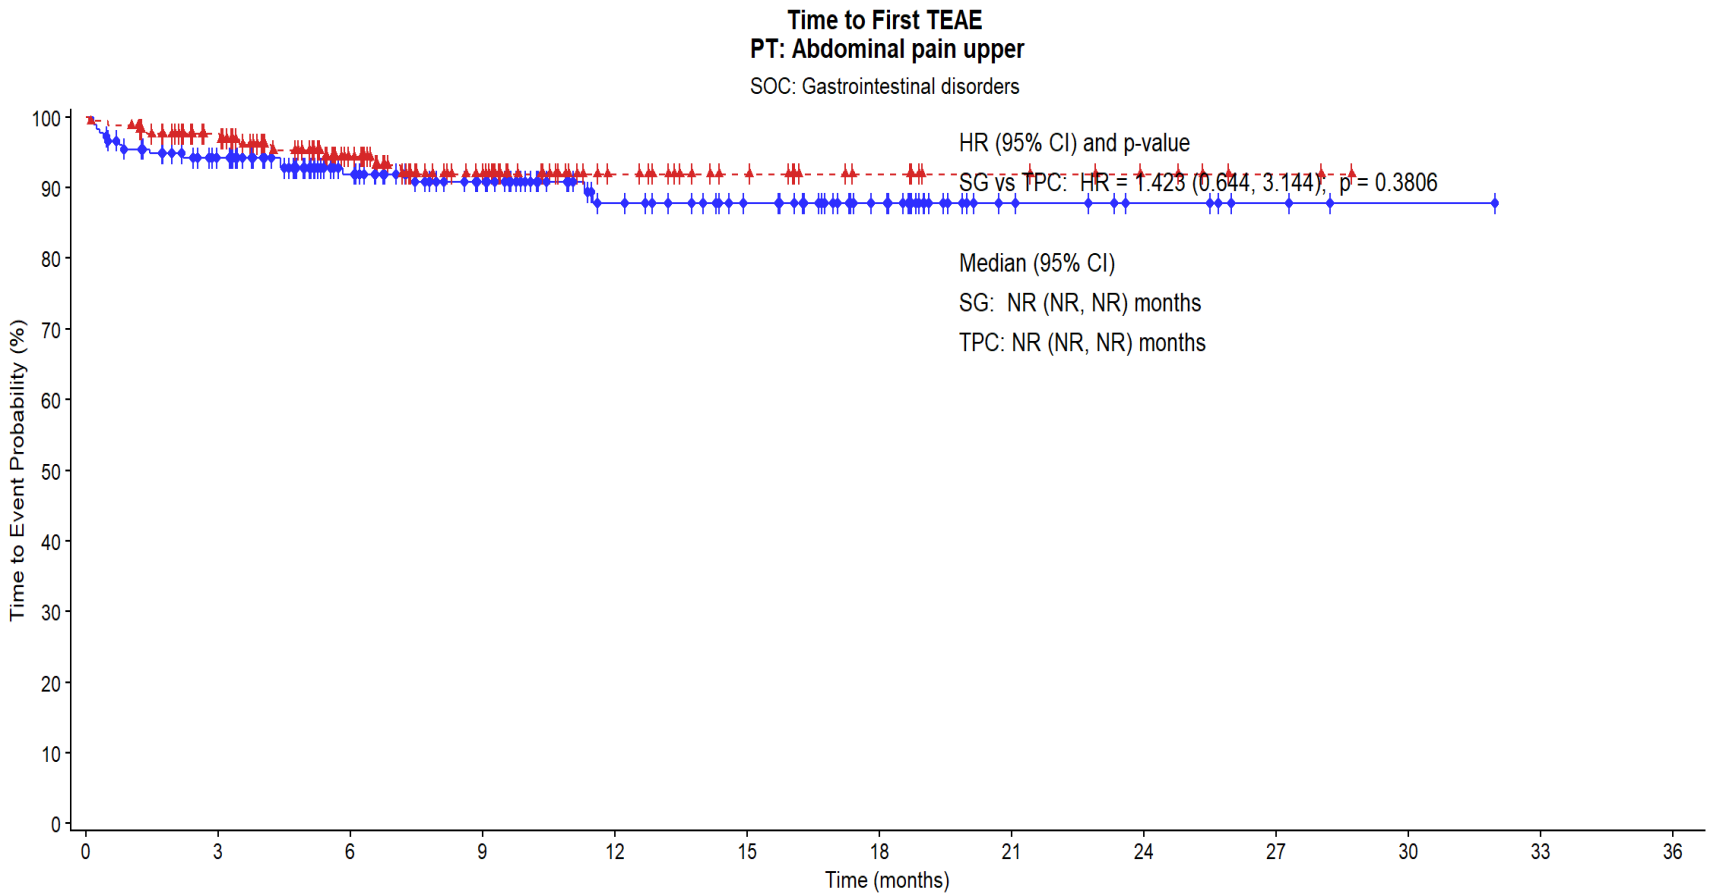
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.45. Figure 1.1.46: Kaplan Meier Plot of Time to First TEAE by PT Dry eye — mSAF — Excluding patients preselected to receive nab-paclitaxel



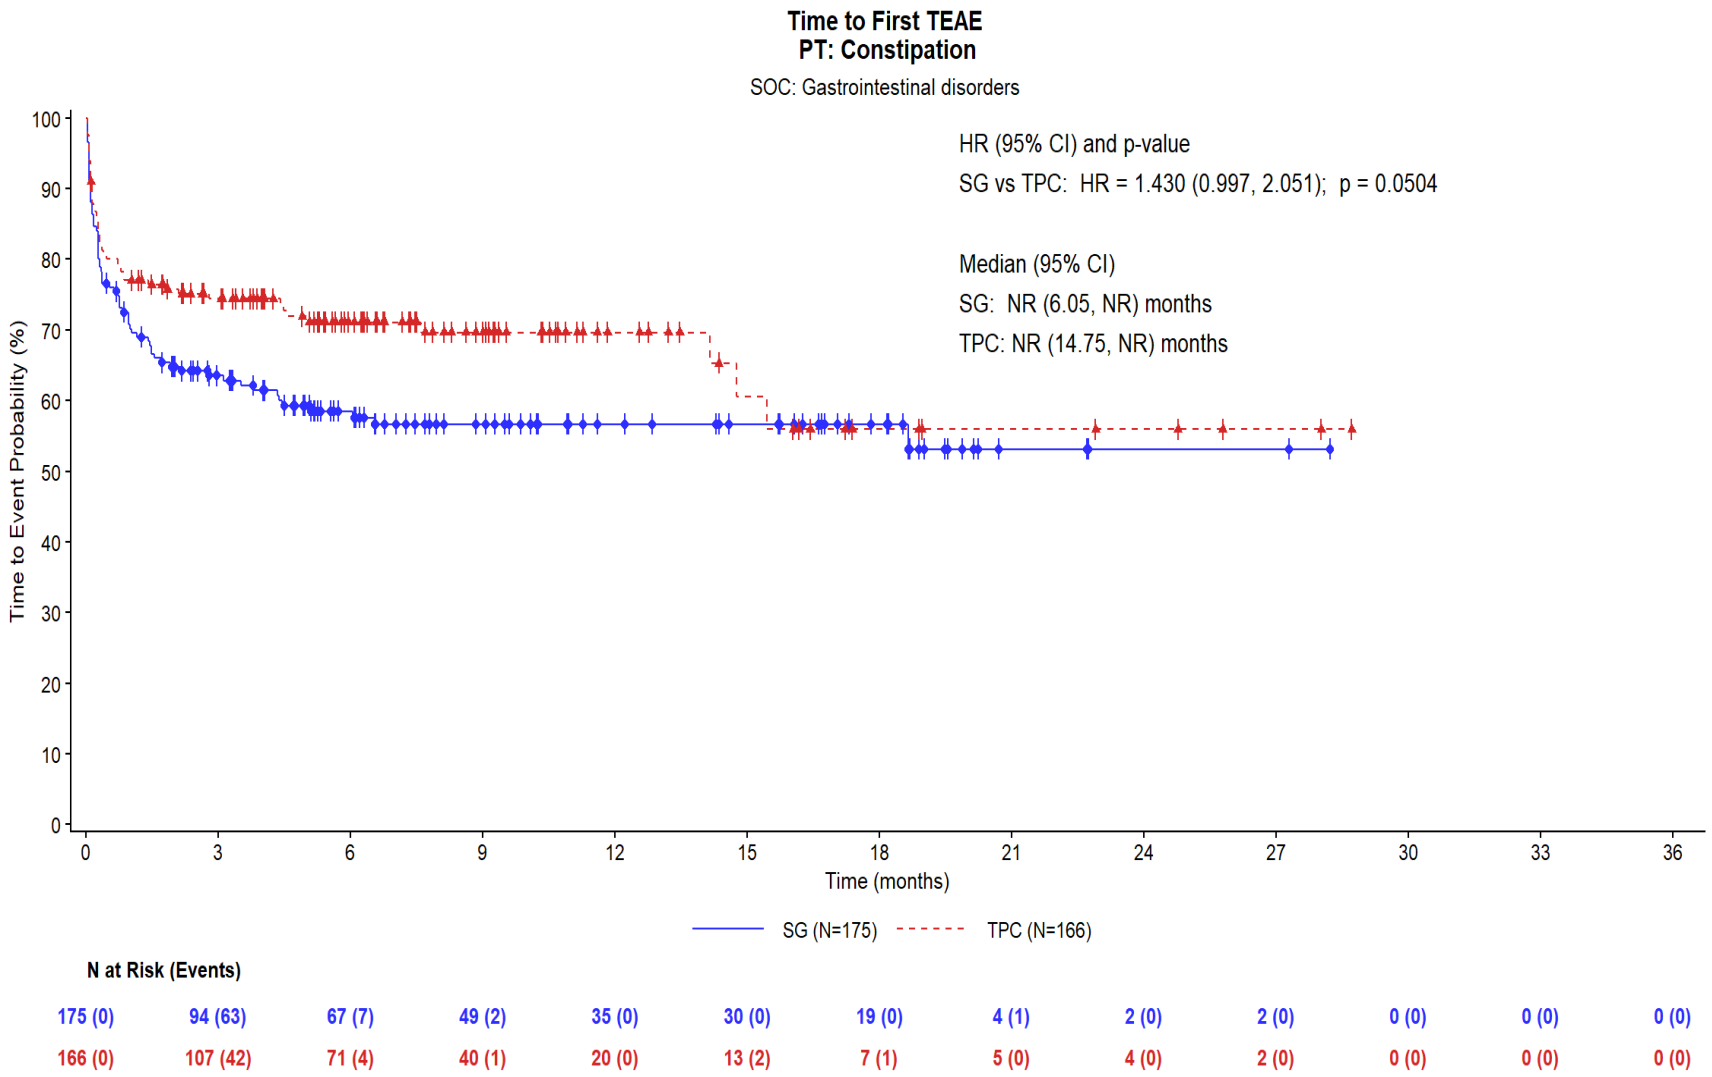
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.46. Figure 1.1.47: Kaplan Meier Plot of Time to First TEAE by PT Abdominal distension — mSAF — Excluding patients preselected to receive nab-paclitaxel



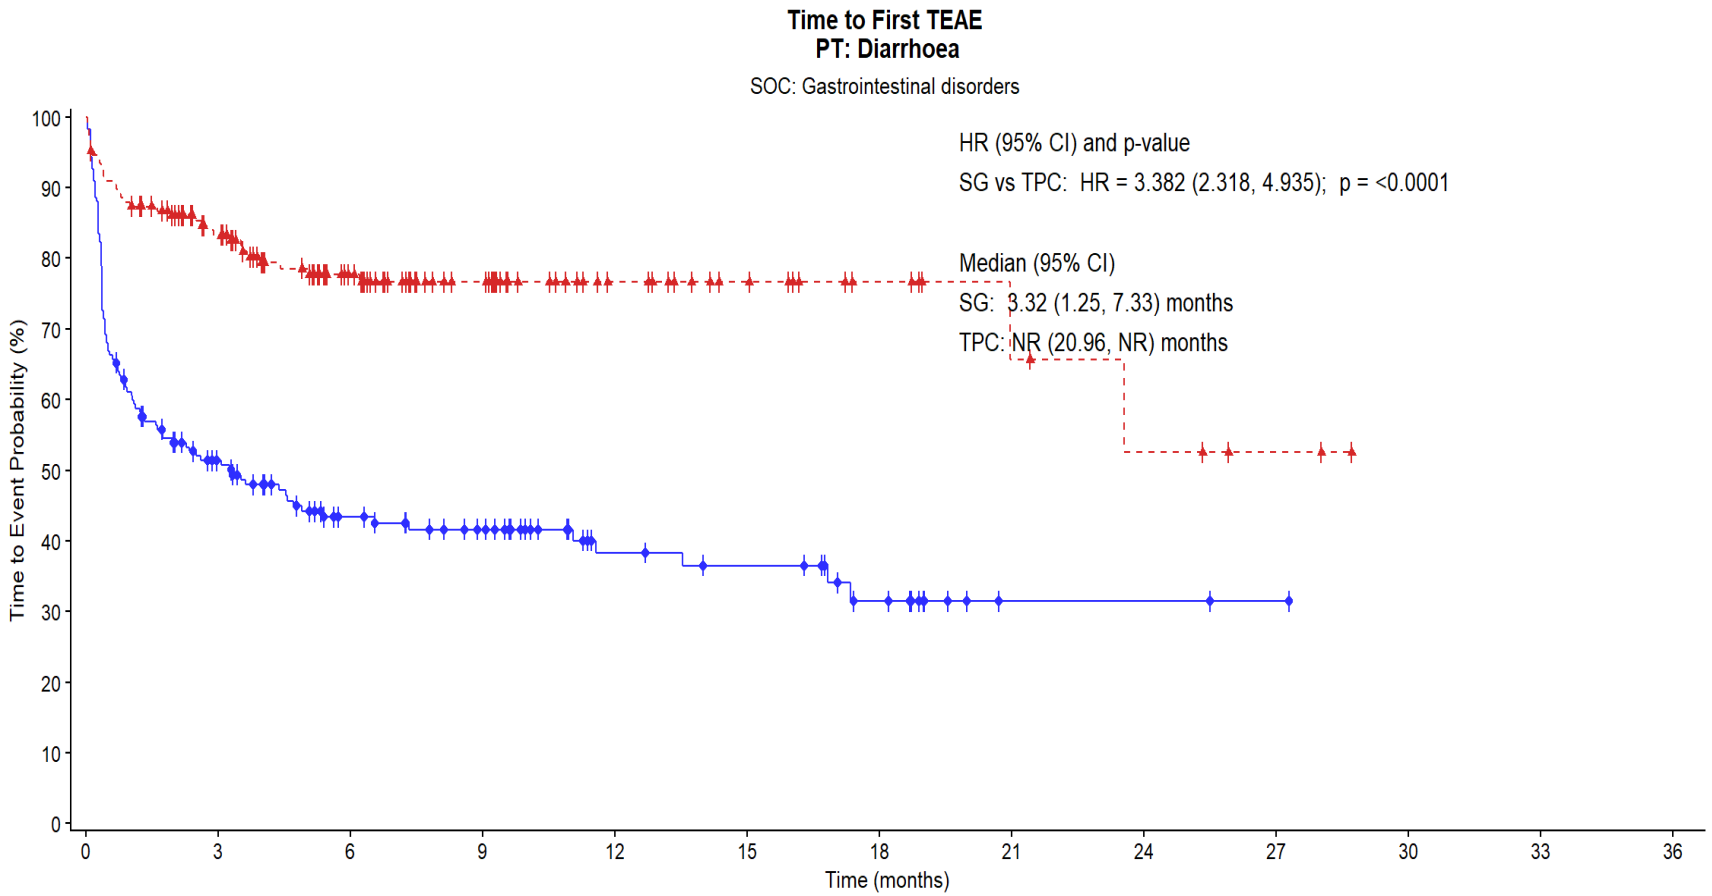
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.47. Figure 1.1.48: Kaplan Meier Plot of Time to First TEAE by PT Abdominal pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



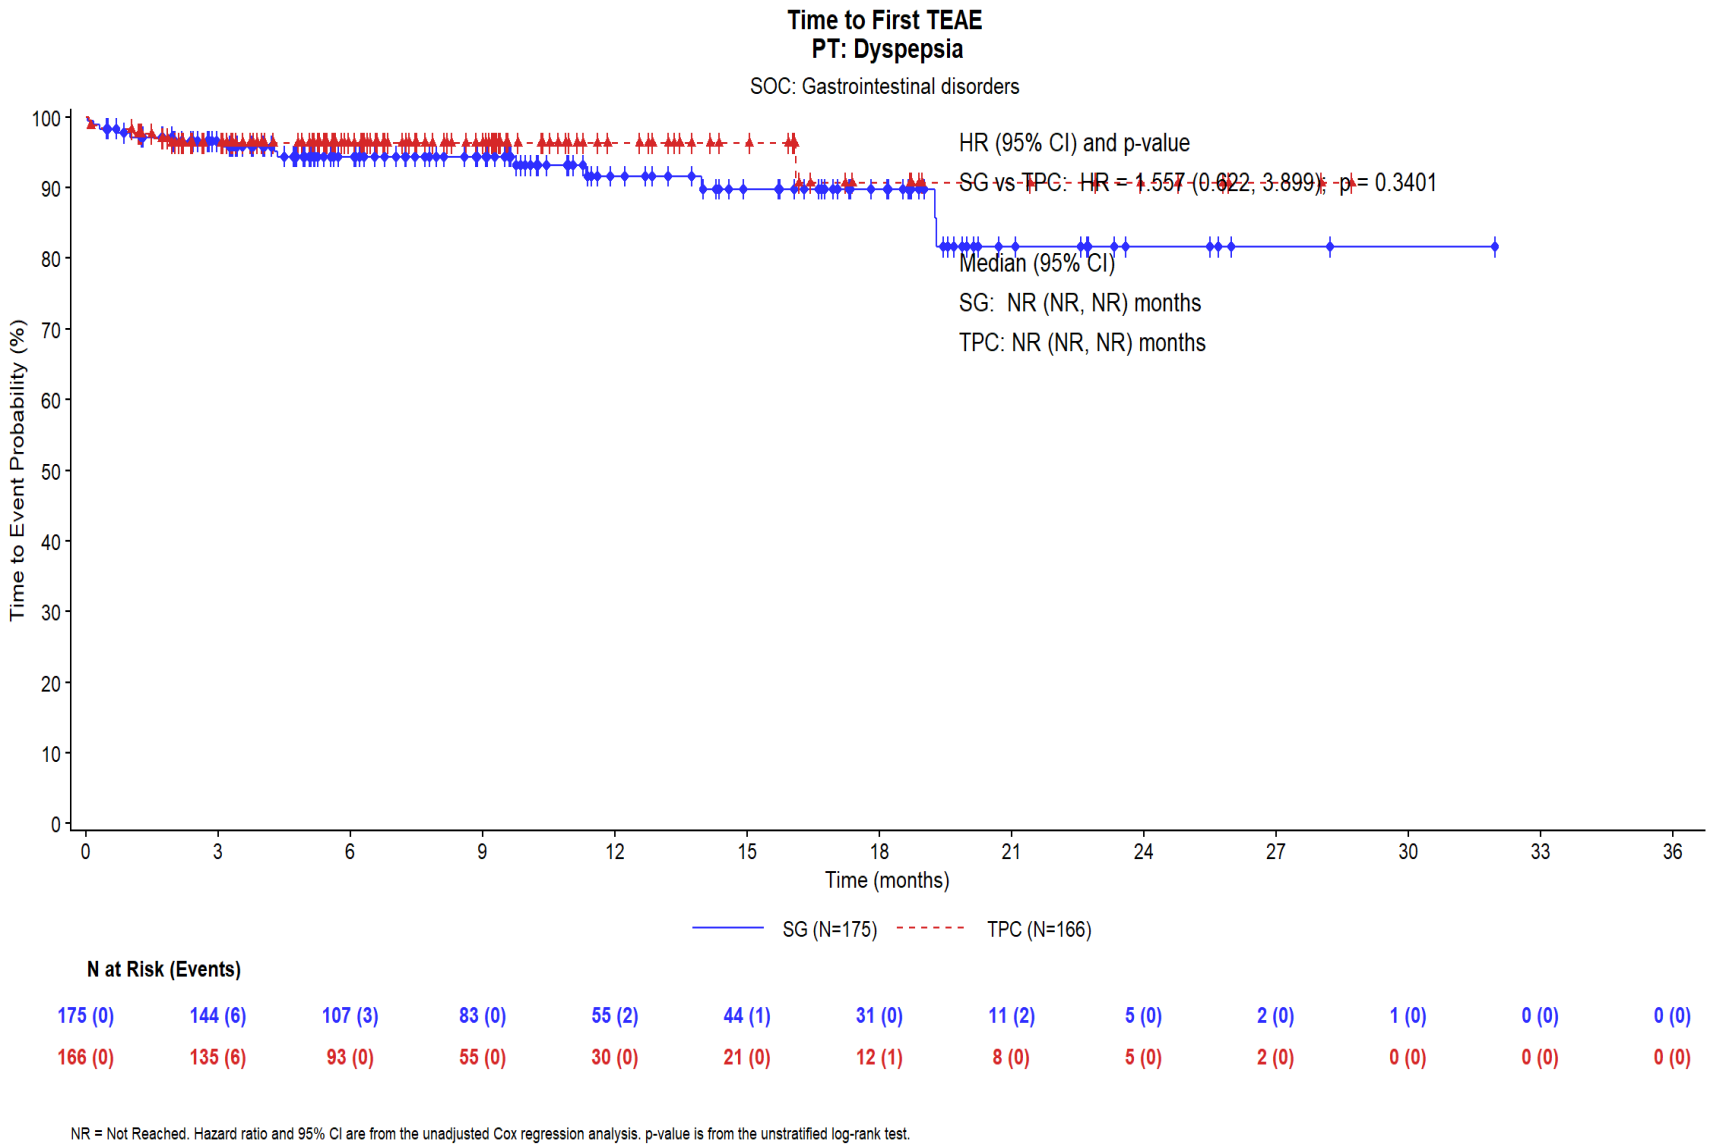
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.48. Figure 1.1.49: Kaplan Meier Plot of Time to First TEAE by PT Abdominal pain upper — mSAF — Excluding patients preselected to receive nab-paclitaxel



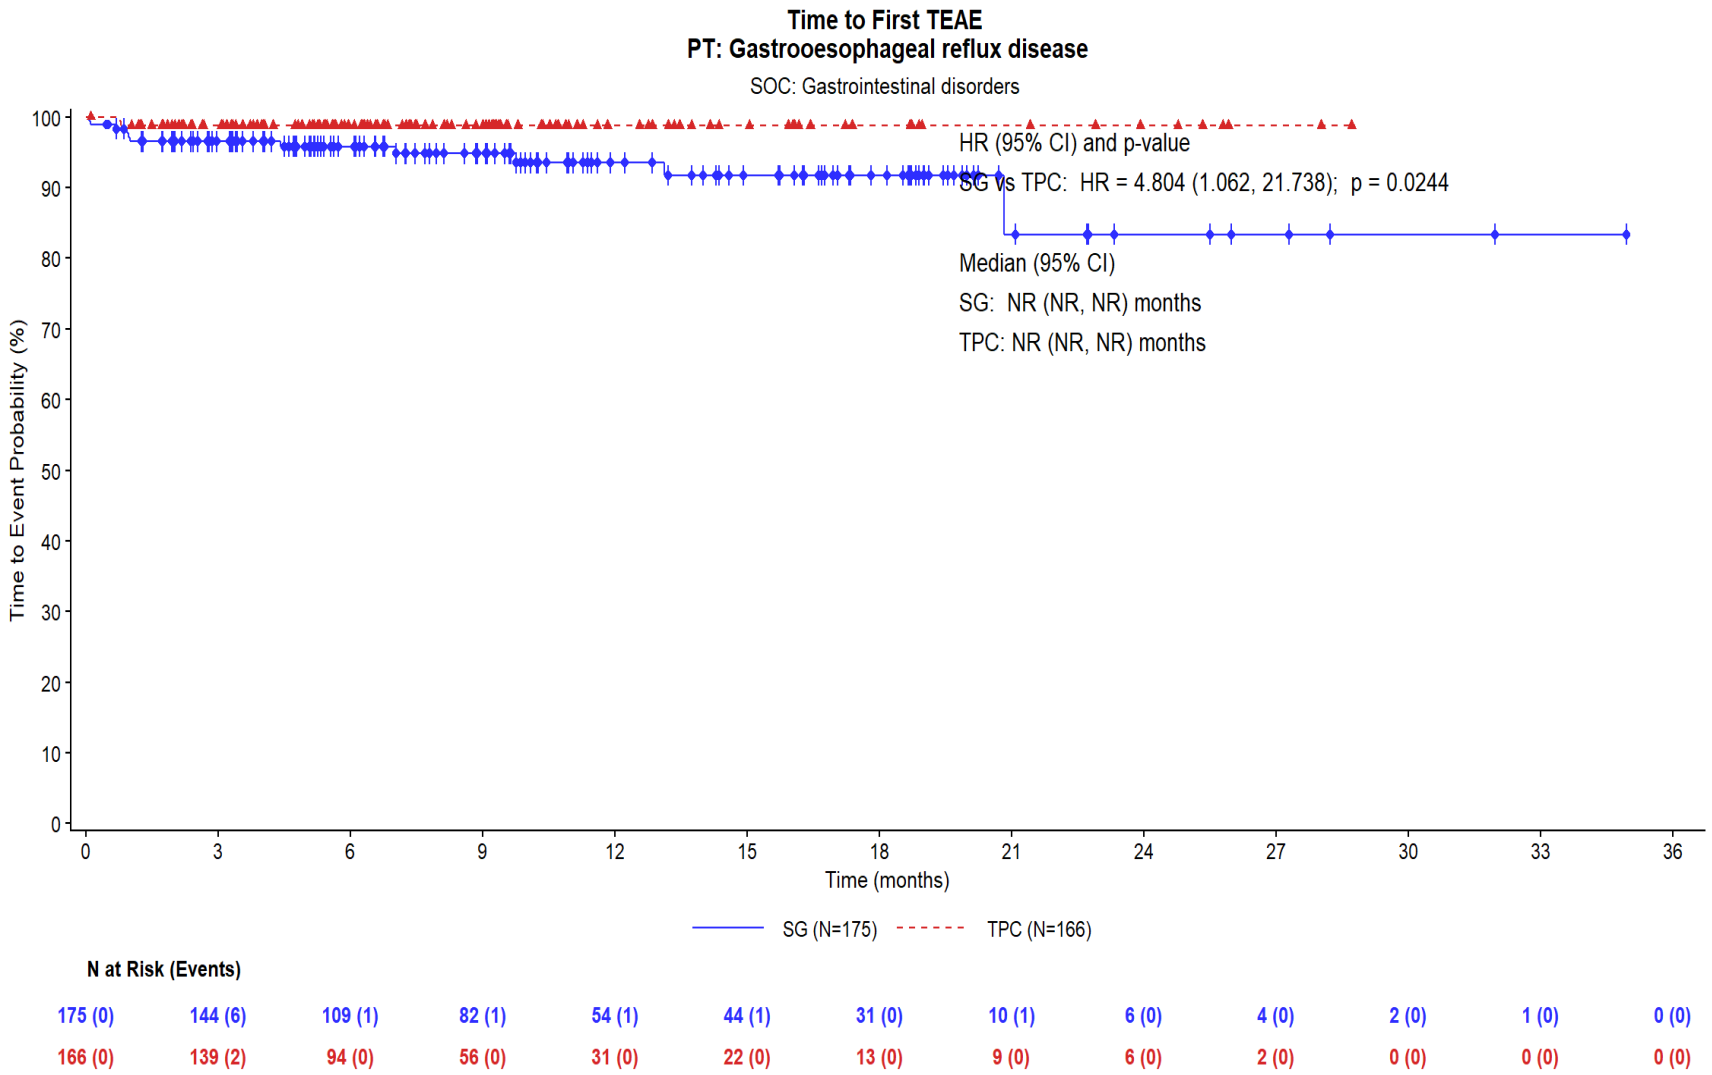
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.49. Figure 1.1.50: Kaplan Meier Plot of Time to First TEAE by PT Constipation — mSAF — Excluding patients preselected to receive nab-paclitaxel



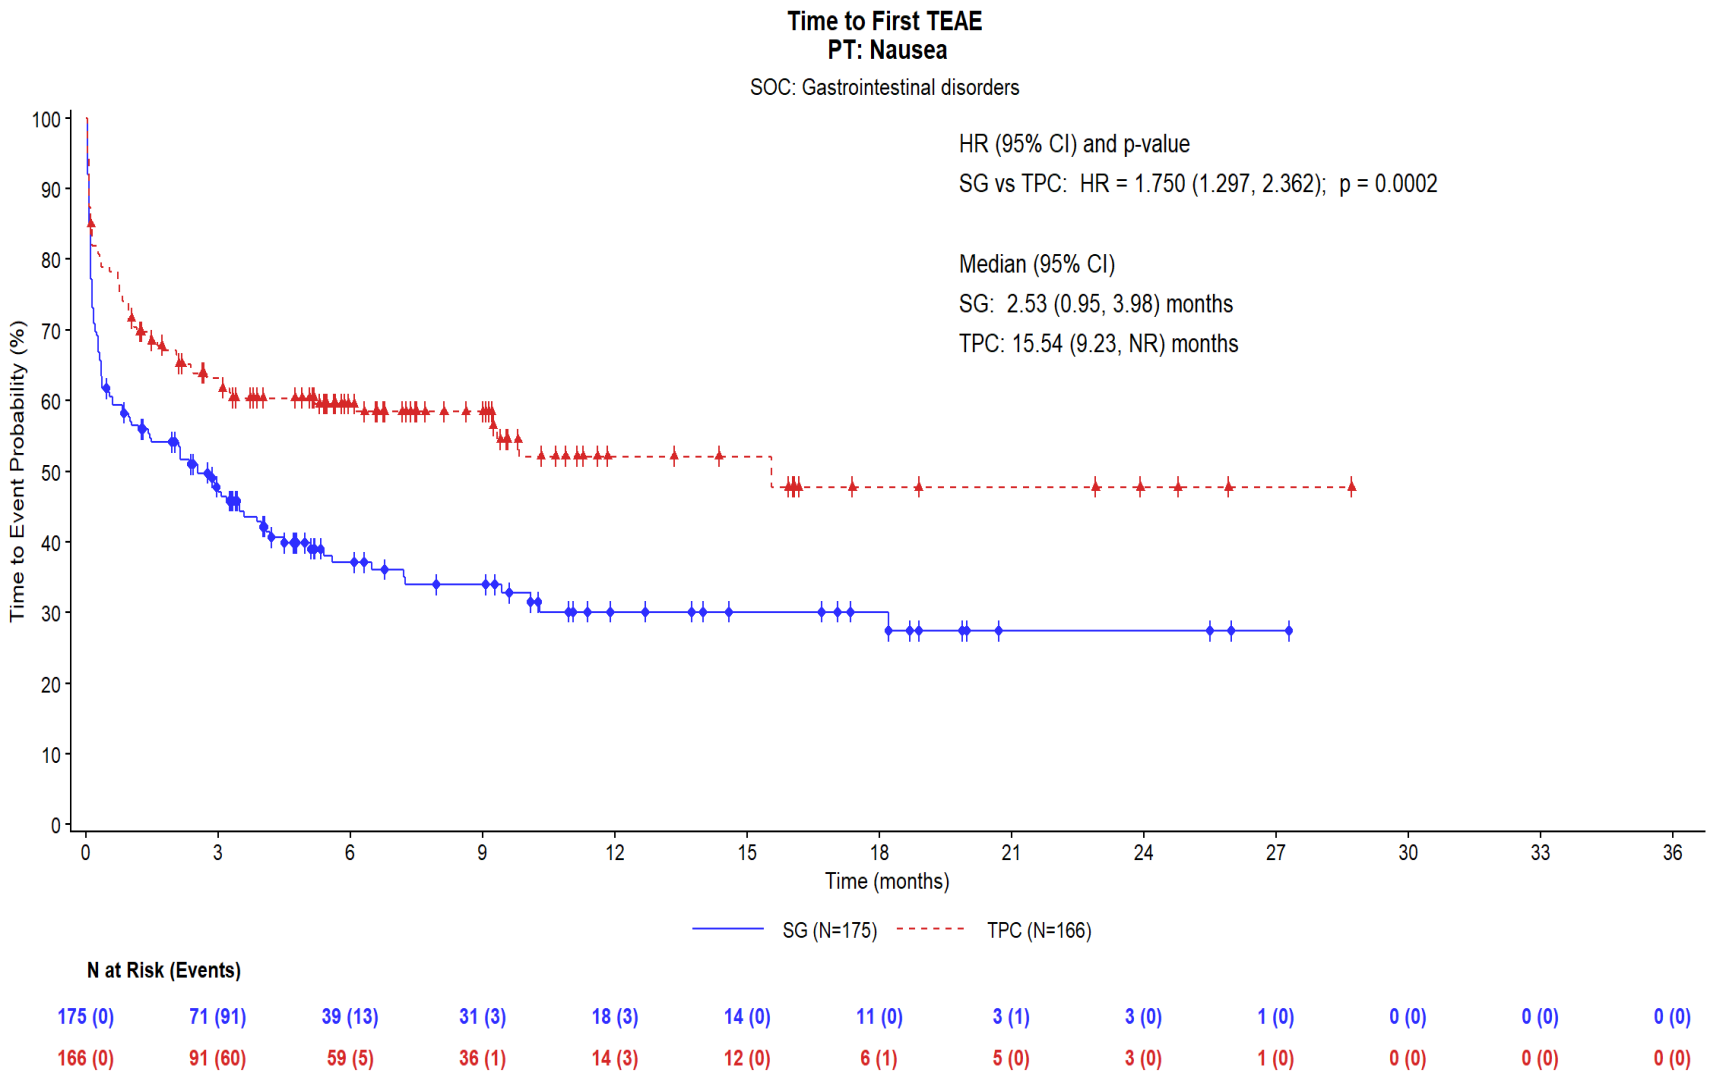
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.50. Figure 1.1.51: Kaplan Meier Plot of Time to First TEAE by PT Diarrhoea — mSAF — Excluding patients preselected to receive nab-paclitaxel



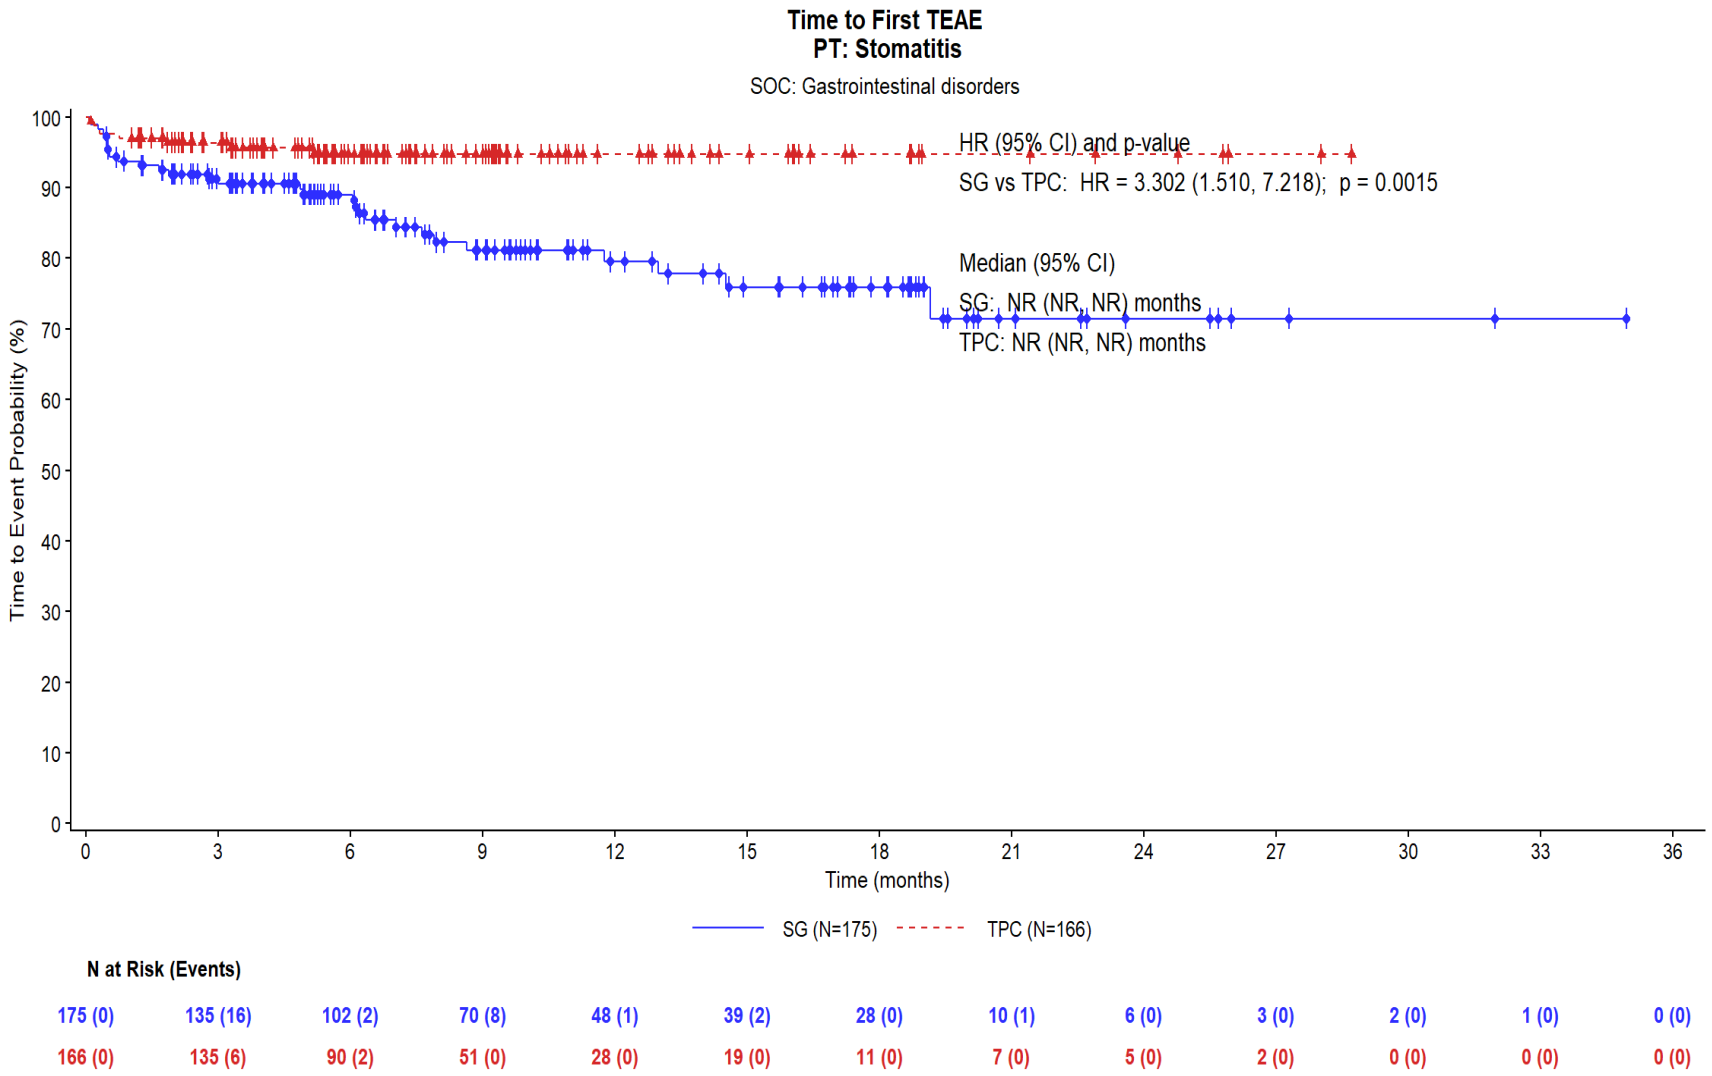
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.51. Figure 1.1.52: Kaplan Meier Plot of Time to First TEAE by PT Dyspepsia — mSAF — Excluding patients preselected to receive nab-paclitaxel



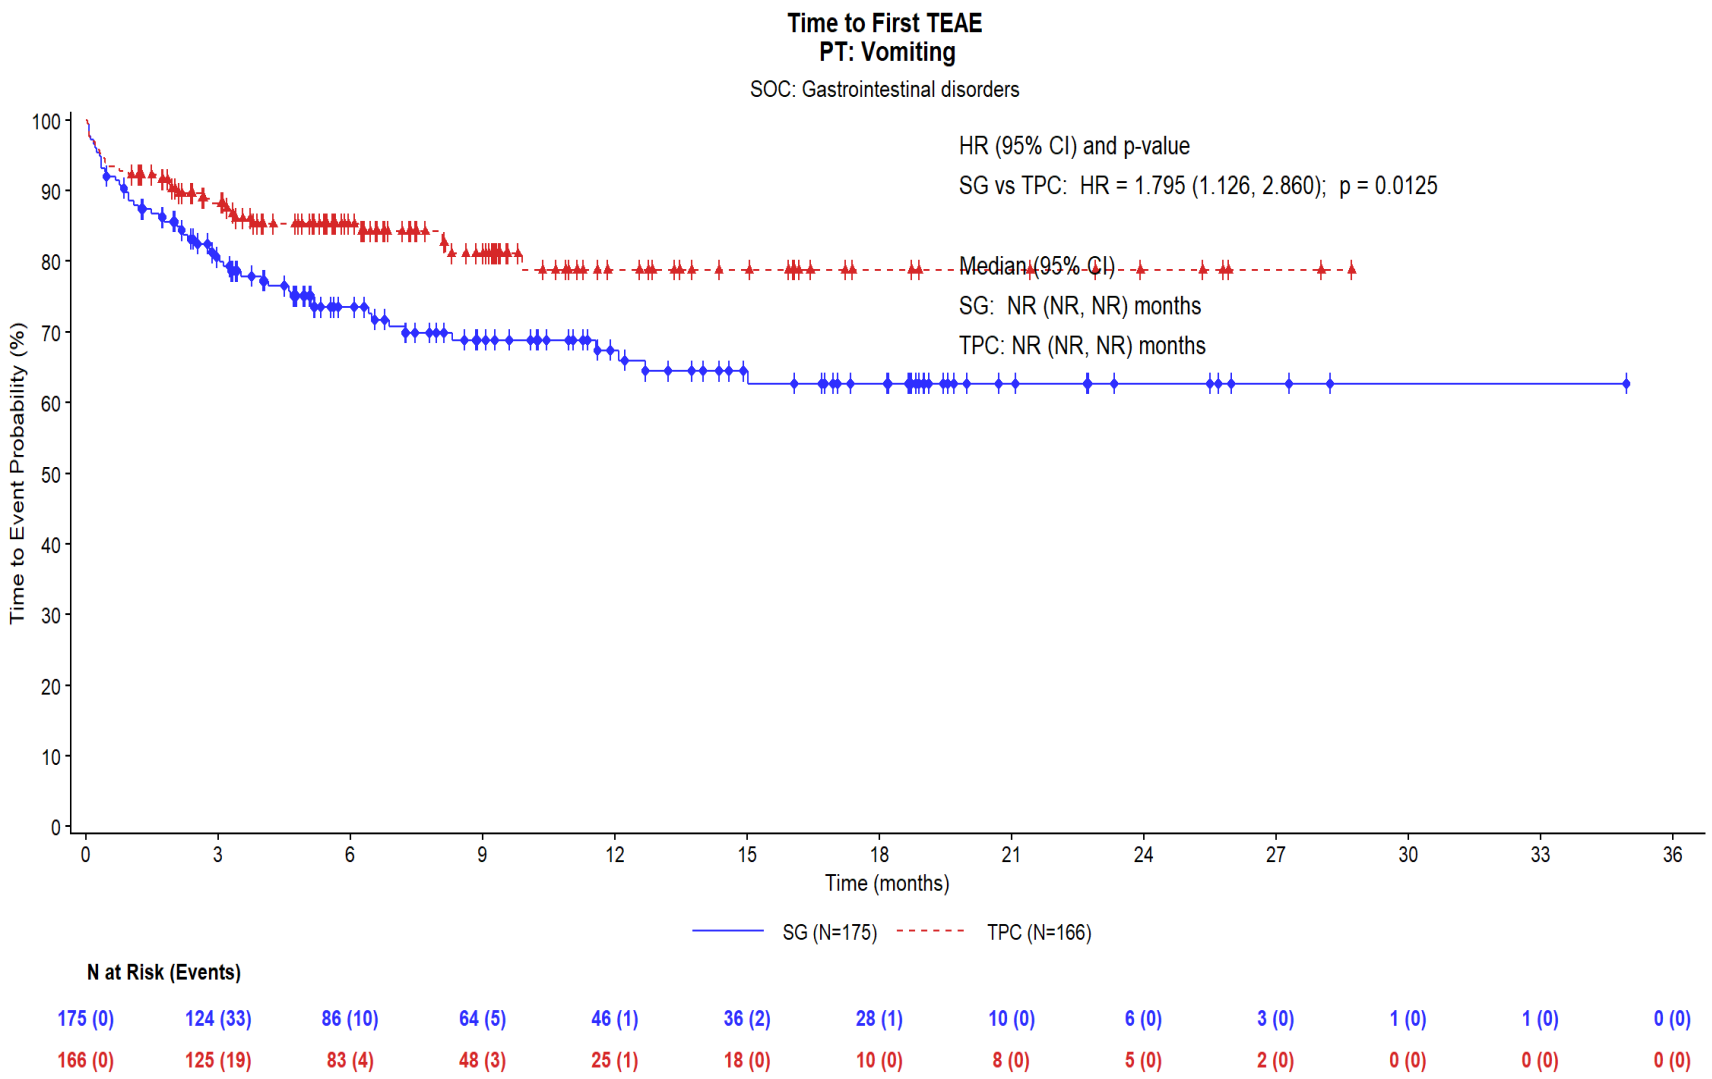
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.52. Figure 1.1.53: Kaplan Meier Plot of Time to First TEAE by PT Gastrooesophageal reflux disease — mSAF — Excluding patients preselected to receive nab-paclitaxel



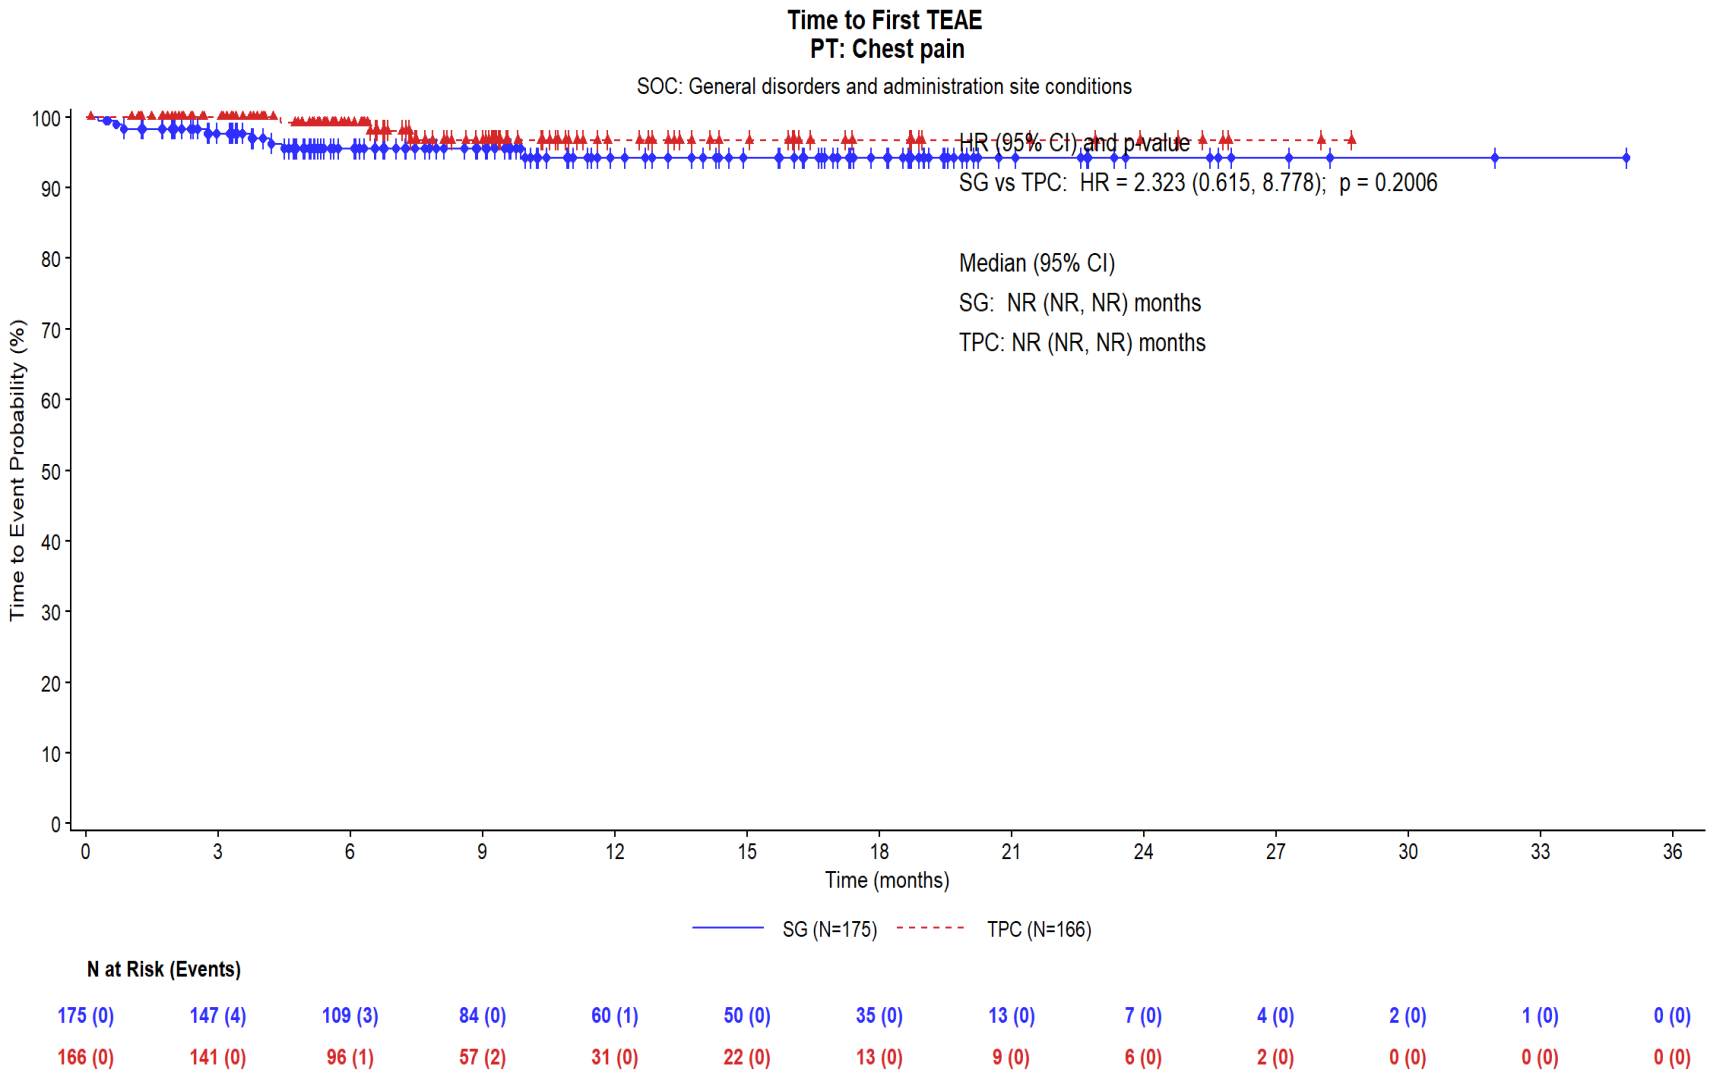
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.53. Figure 1.1.54: Kaplan Meier Plot of Time to First TEAE by PT Nausea — mSAF — Excluding patients preselected to receive nab-paclitaxel



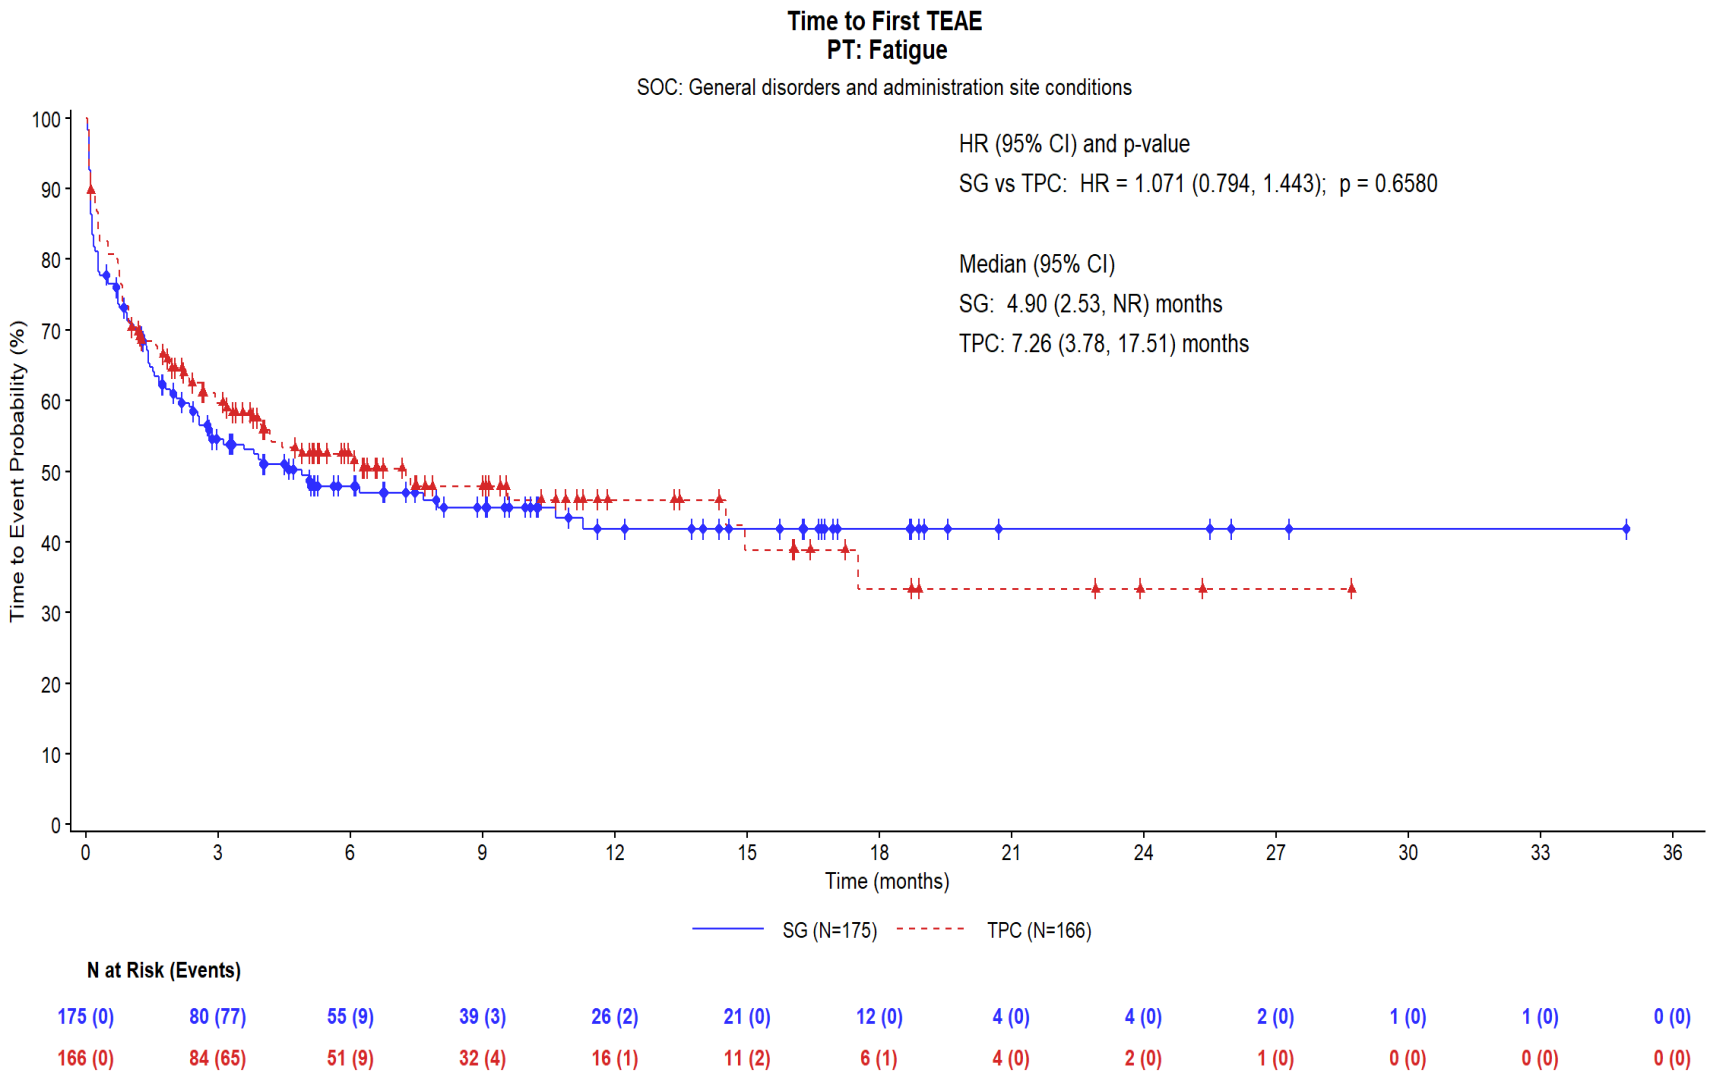
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.54. Figure 1.1.55: Kaplan Meier Plot of Time to First TEAE by PT Stomatitis — mSAF — Excluding patients preselected to receive nab-paclitaxel



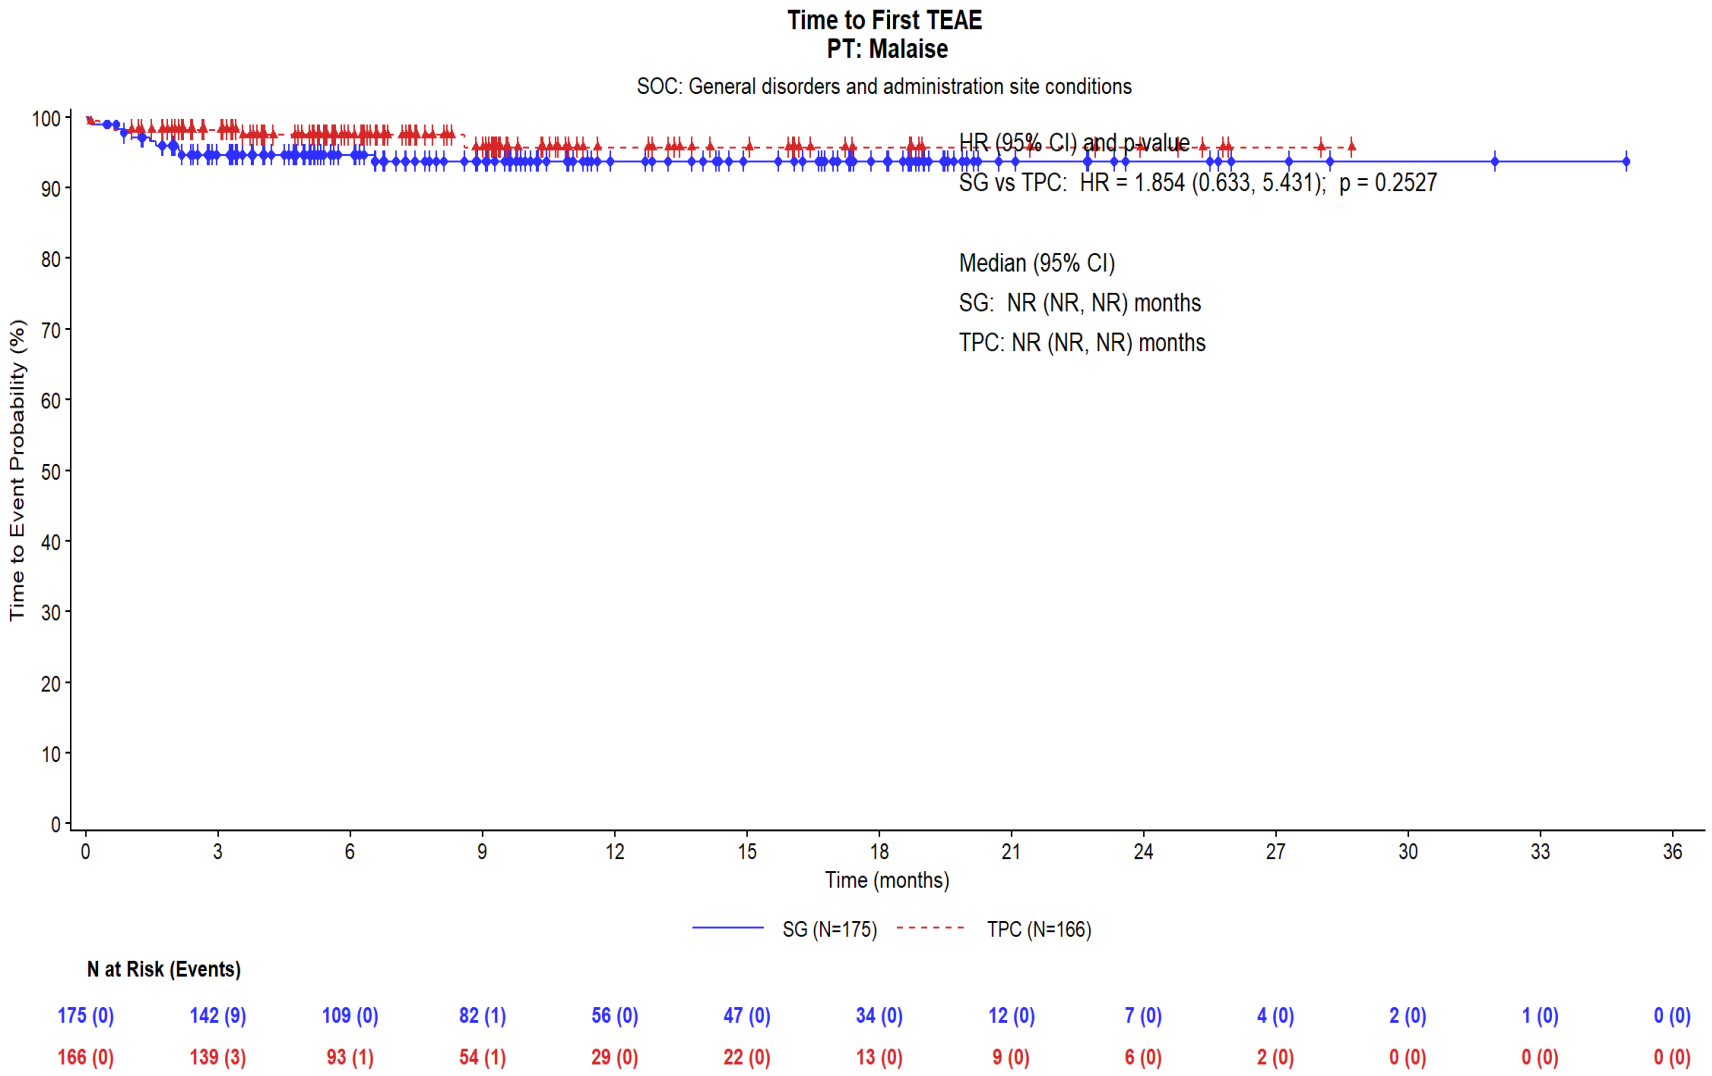
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.55. Figure 1.1.56: Kaplan Meier Plot of Time to First TEAE by PT Vomiting — mSAF — Excluding patients preselected to receive nab-paclitaxel



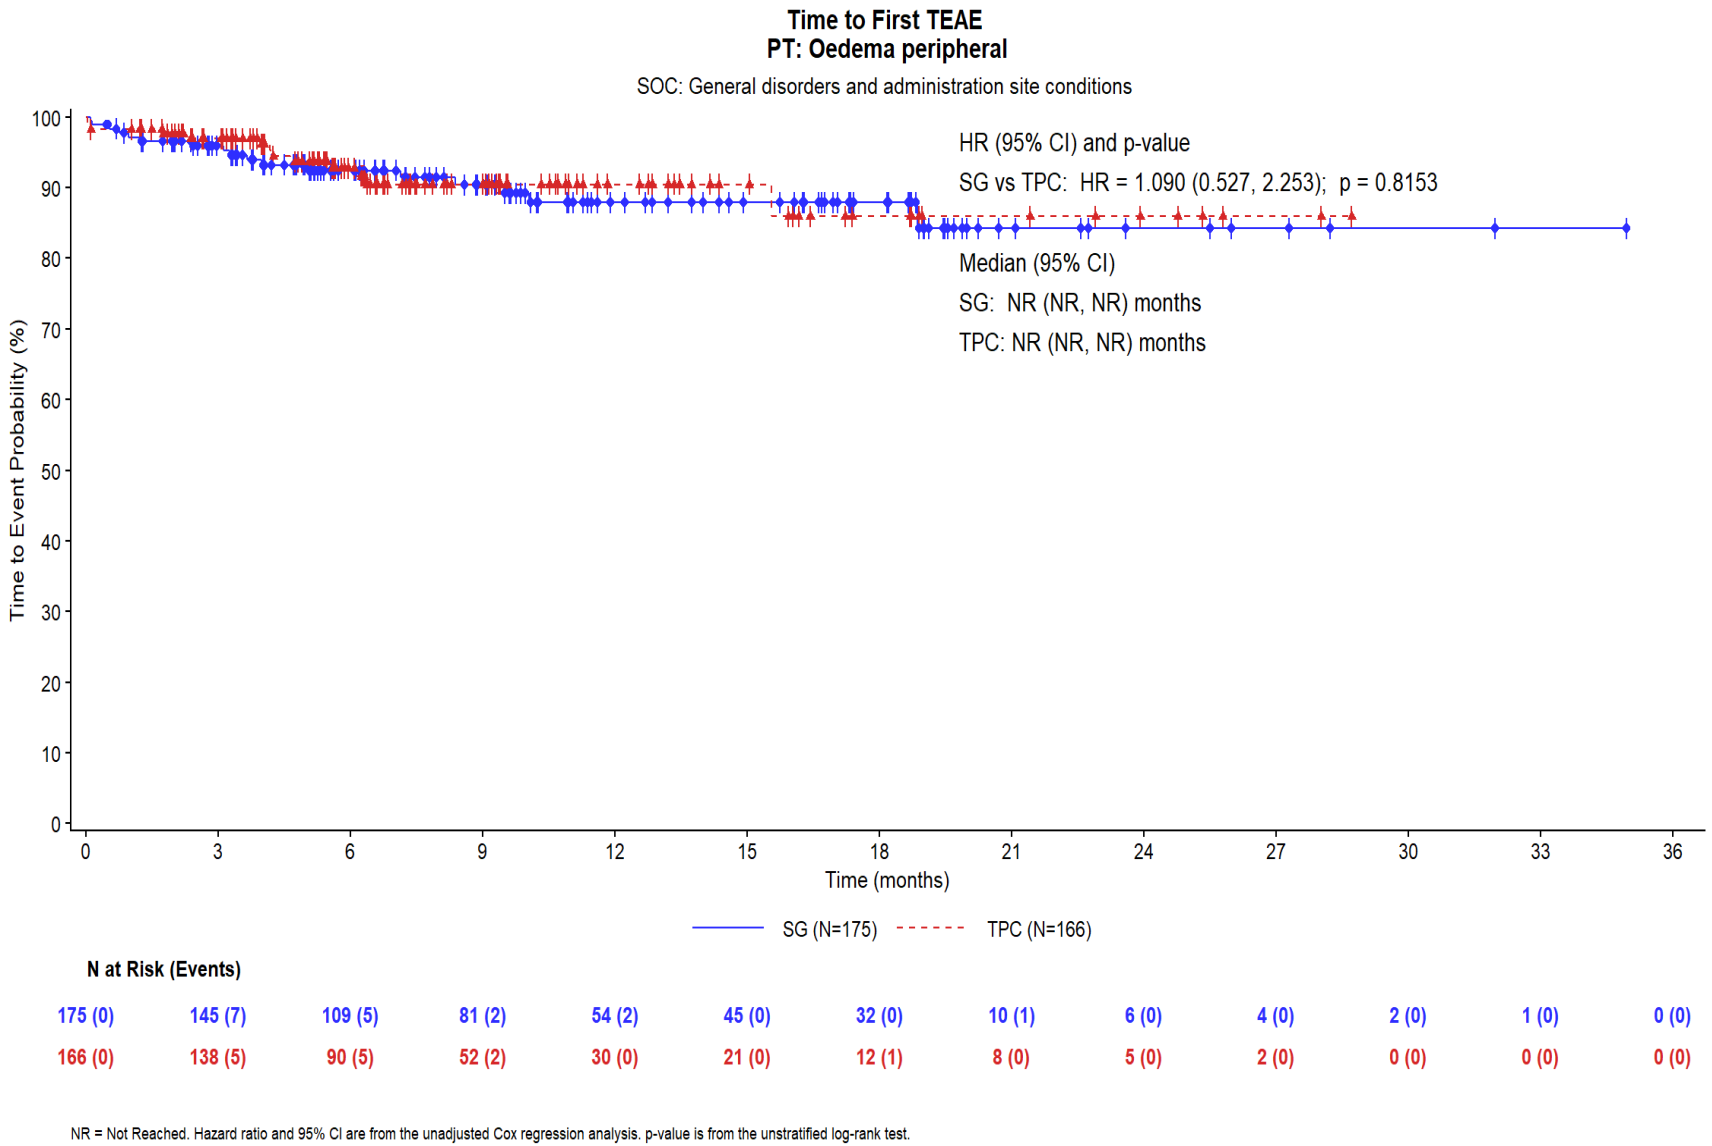
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.56. Figure 1.1.57: Kaplan Meier Plot of Time to First TEAE by PT Chest pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



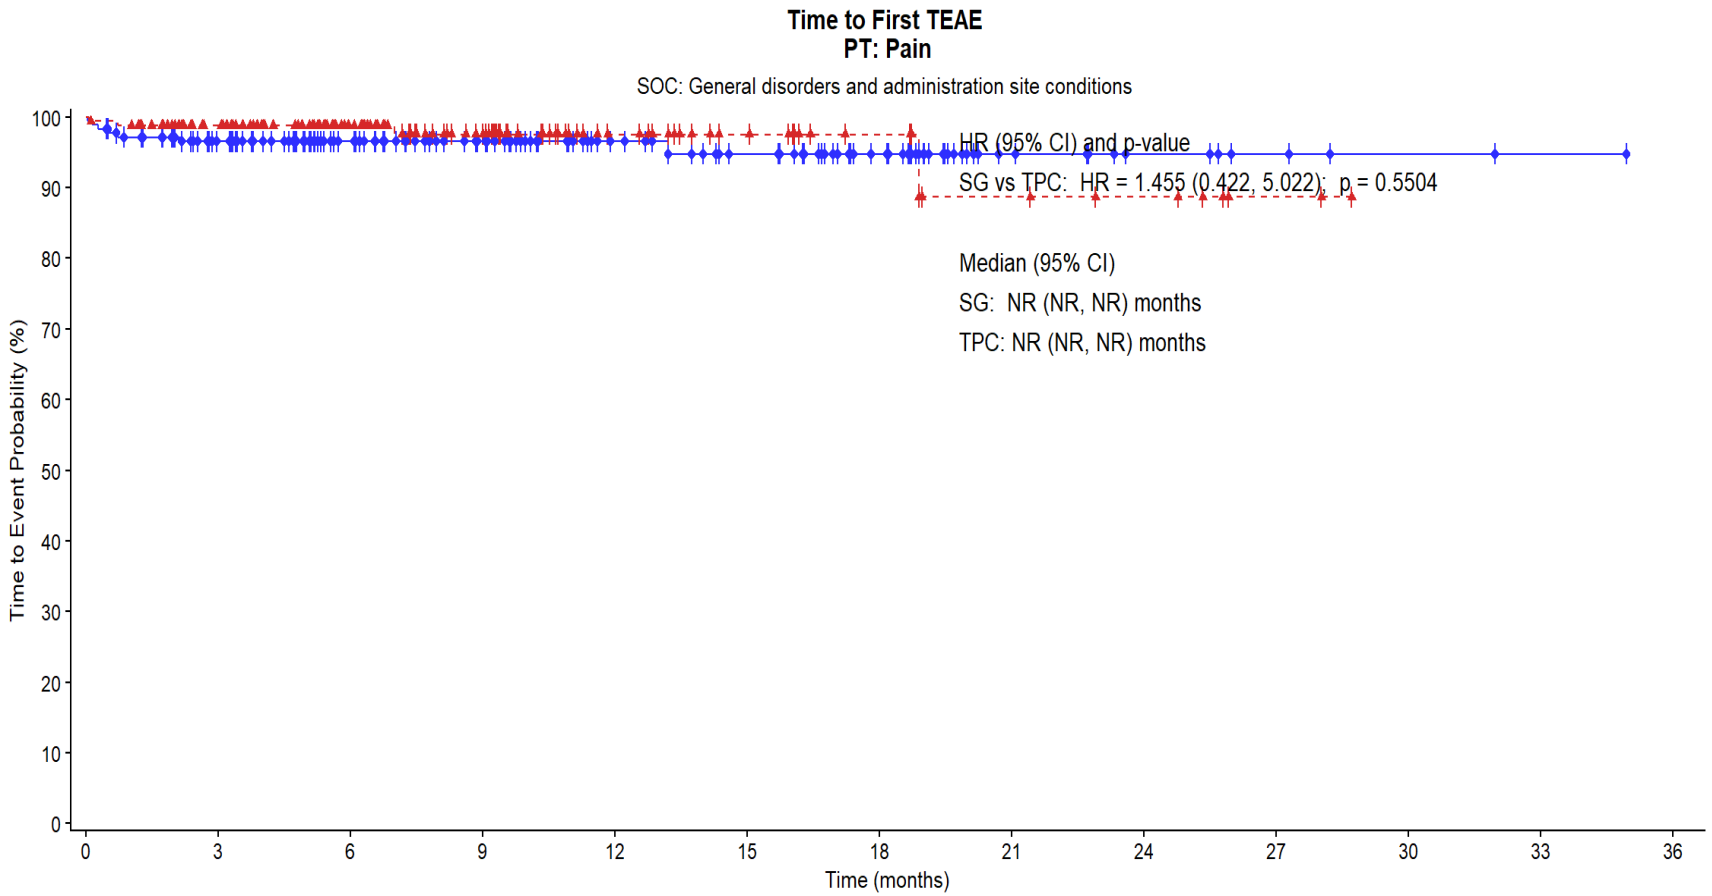
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.57. Figure 1.1.58: Kaplan Meier Plot of Time to First TEAE by PT Fatigue — mSAF — Excluding patients preselected to receive nab-paclitaxel



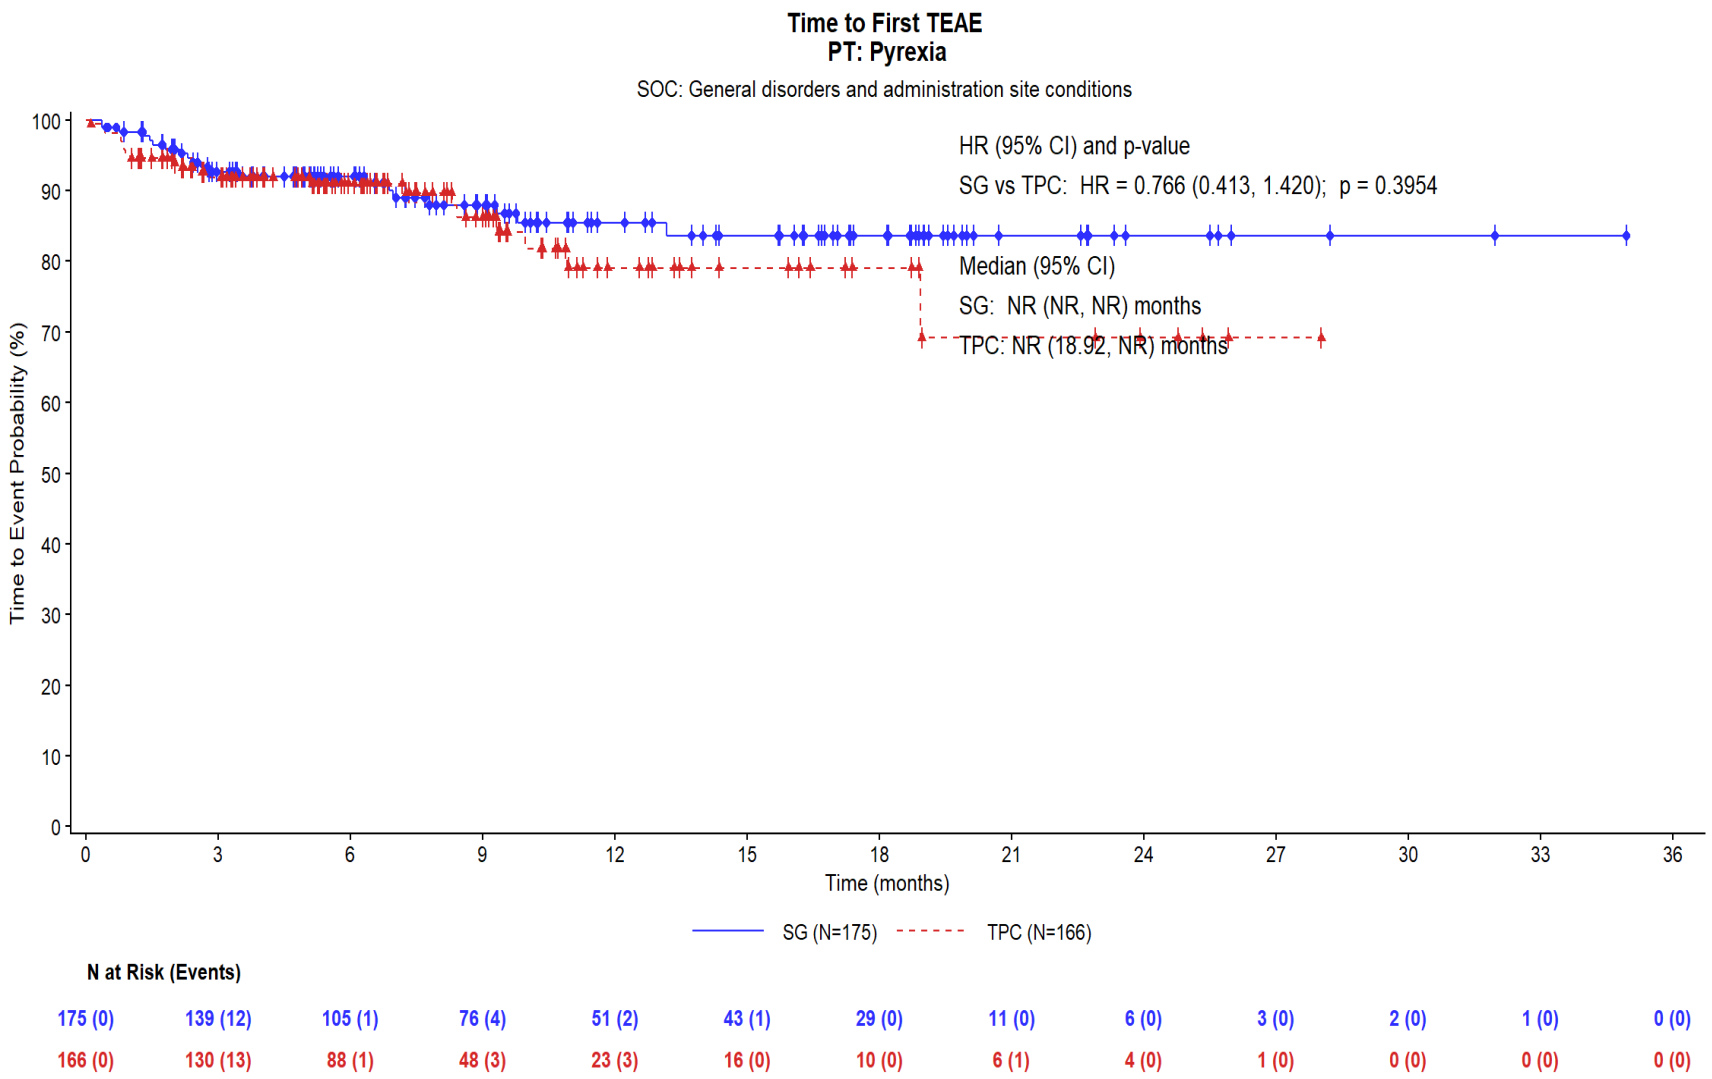
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.58. Figure 1.1.59: Kaplan Meier Plot of Time to First TEAE by PT Malaise — mSAF — Excluding patients preselected to receive nab-paclitaxel



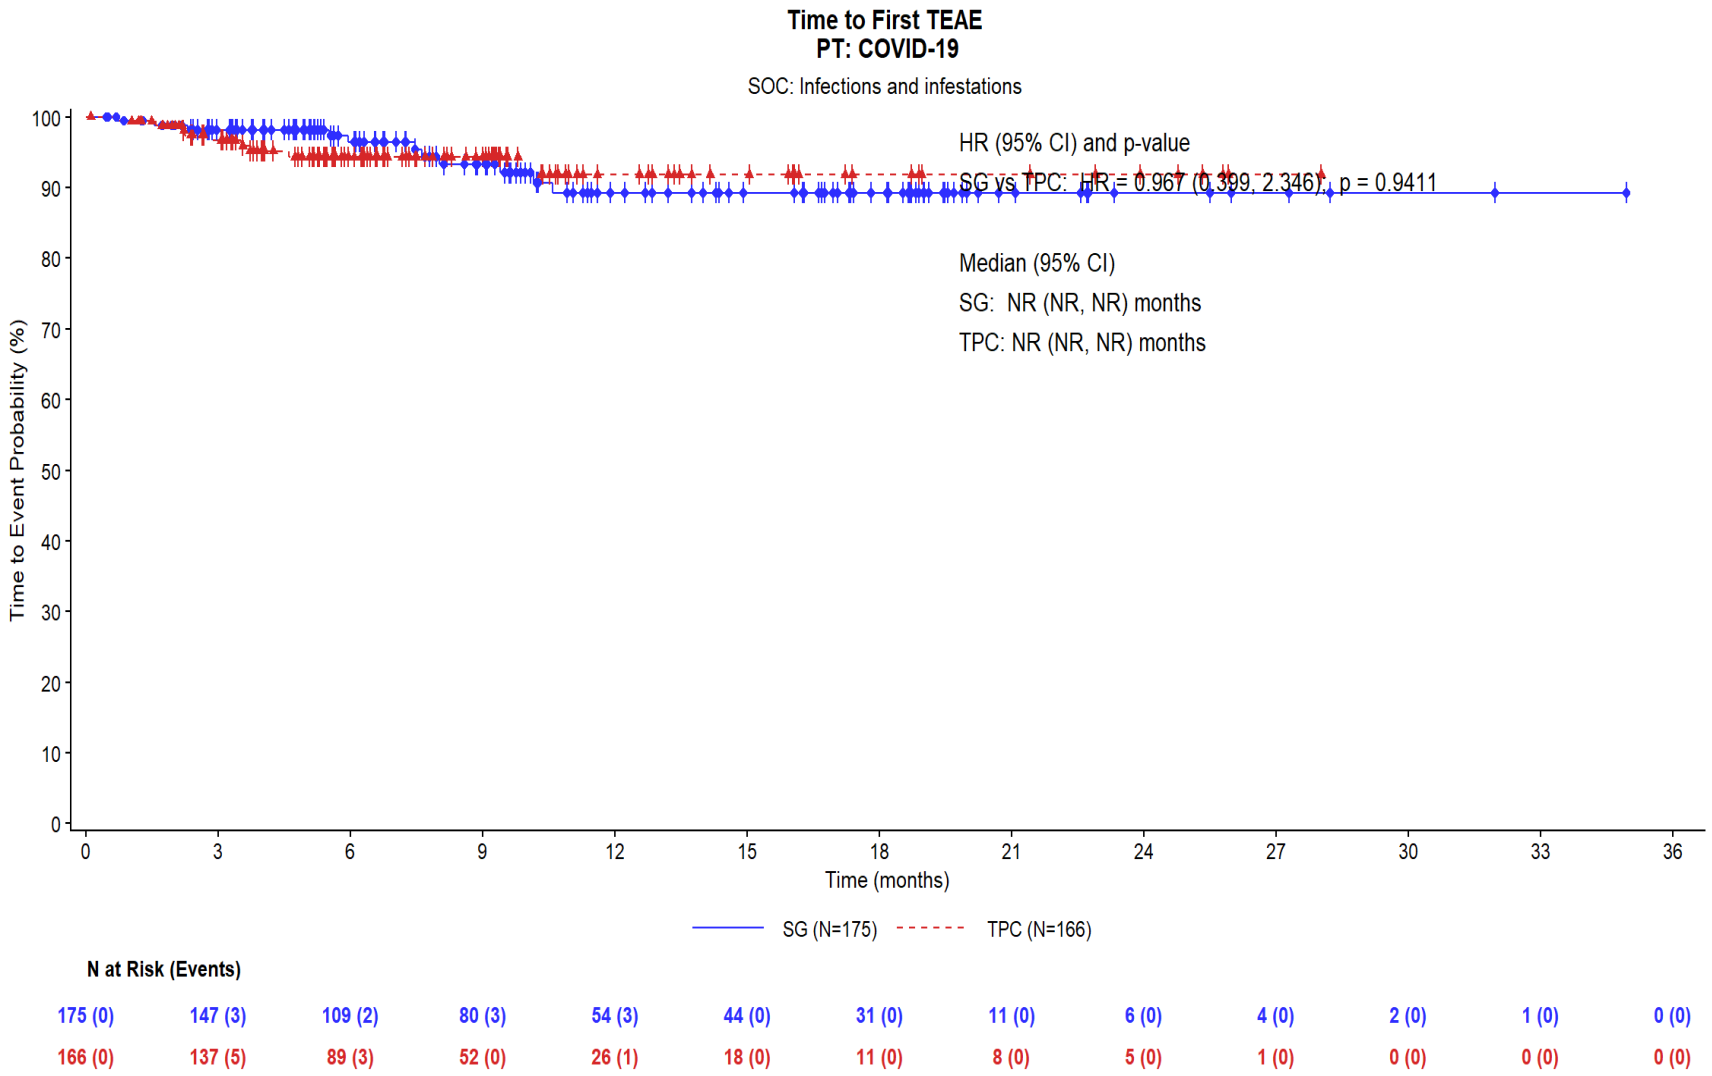
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.59. Figure 1.1.60: Kaplan Meier Plot of Time to First TEAE by PT Oedema peripheral — mSAF — Excluding patients preselected to receive nab-paclitaxel



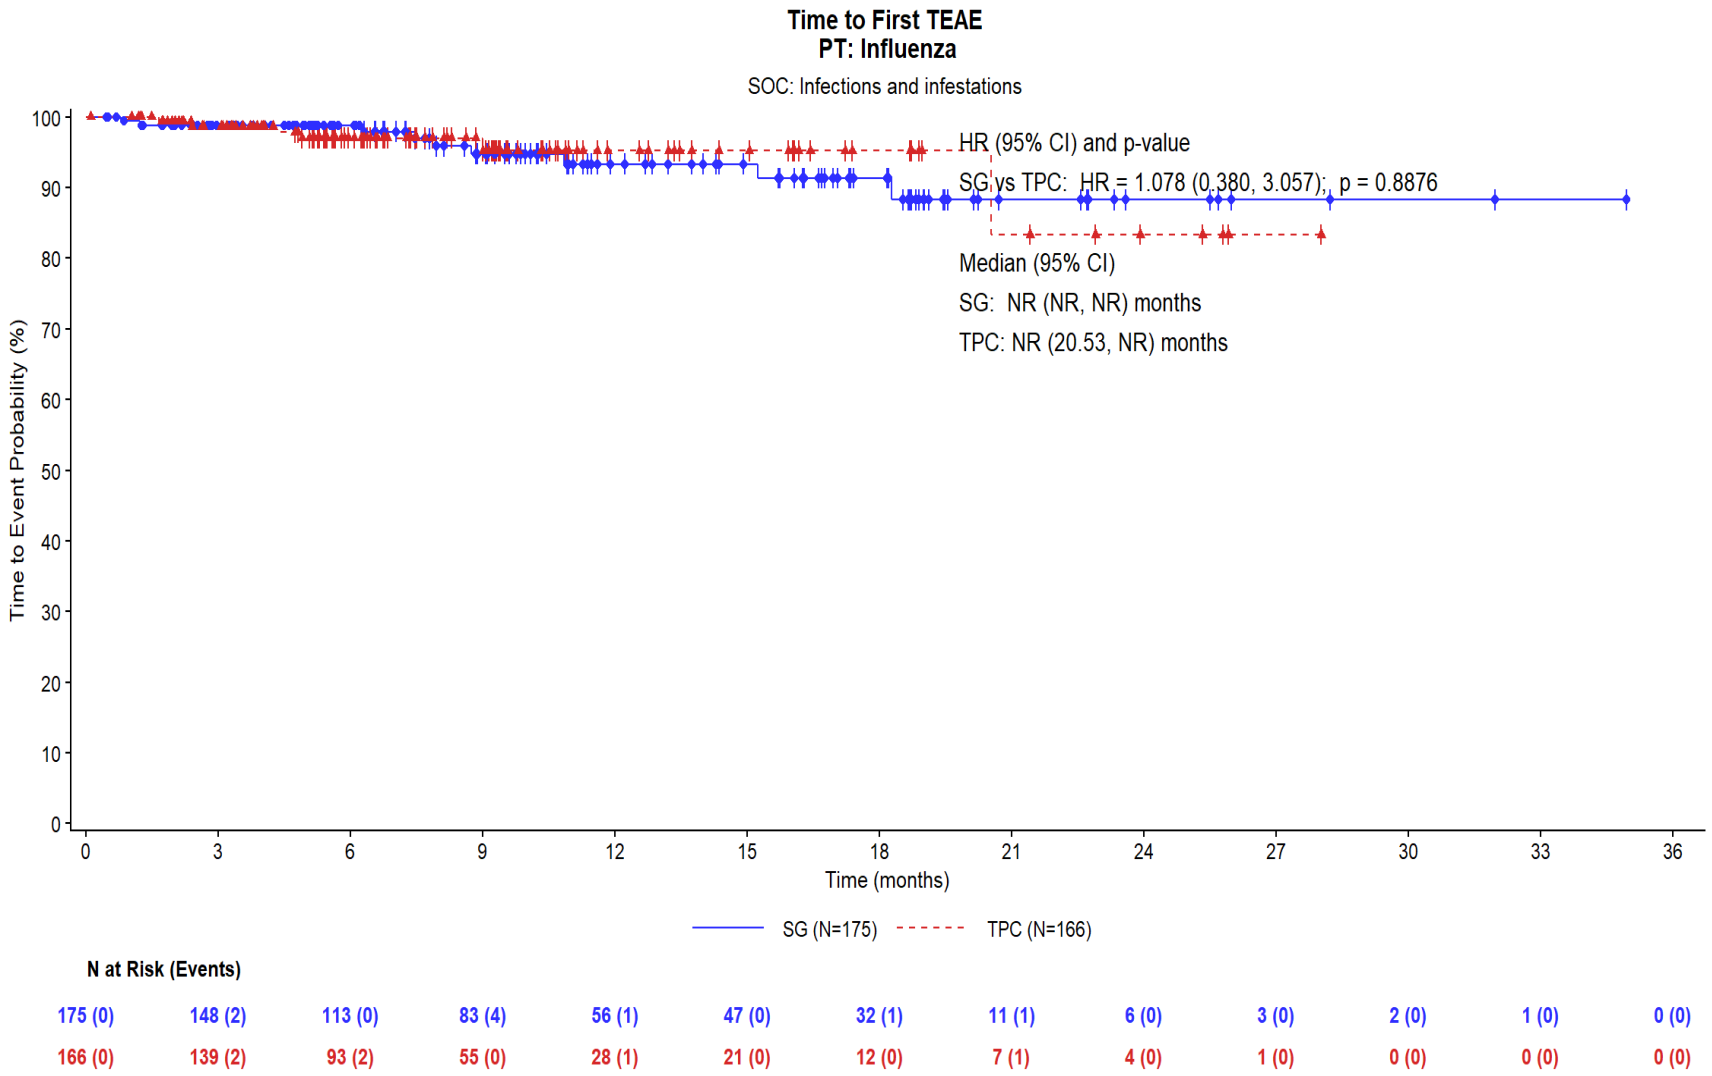
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.60. Figure 1.1.61: Kaplan Meier Plot of Time to First TEAE by PT Pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



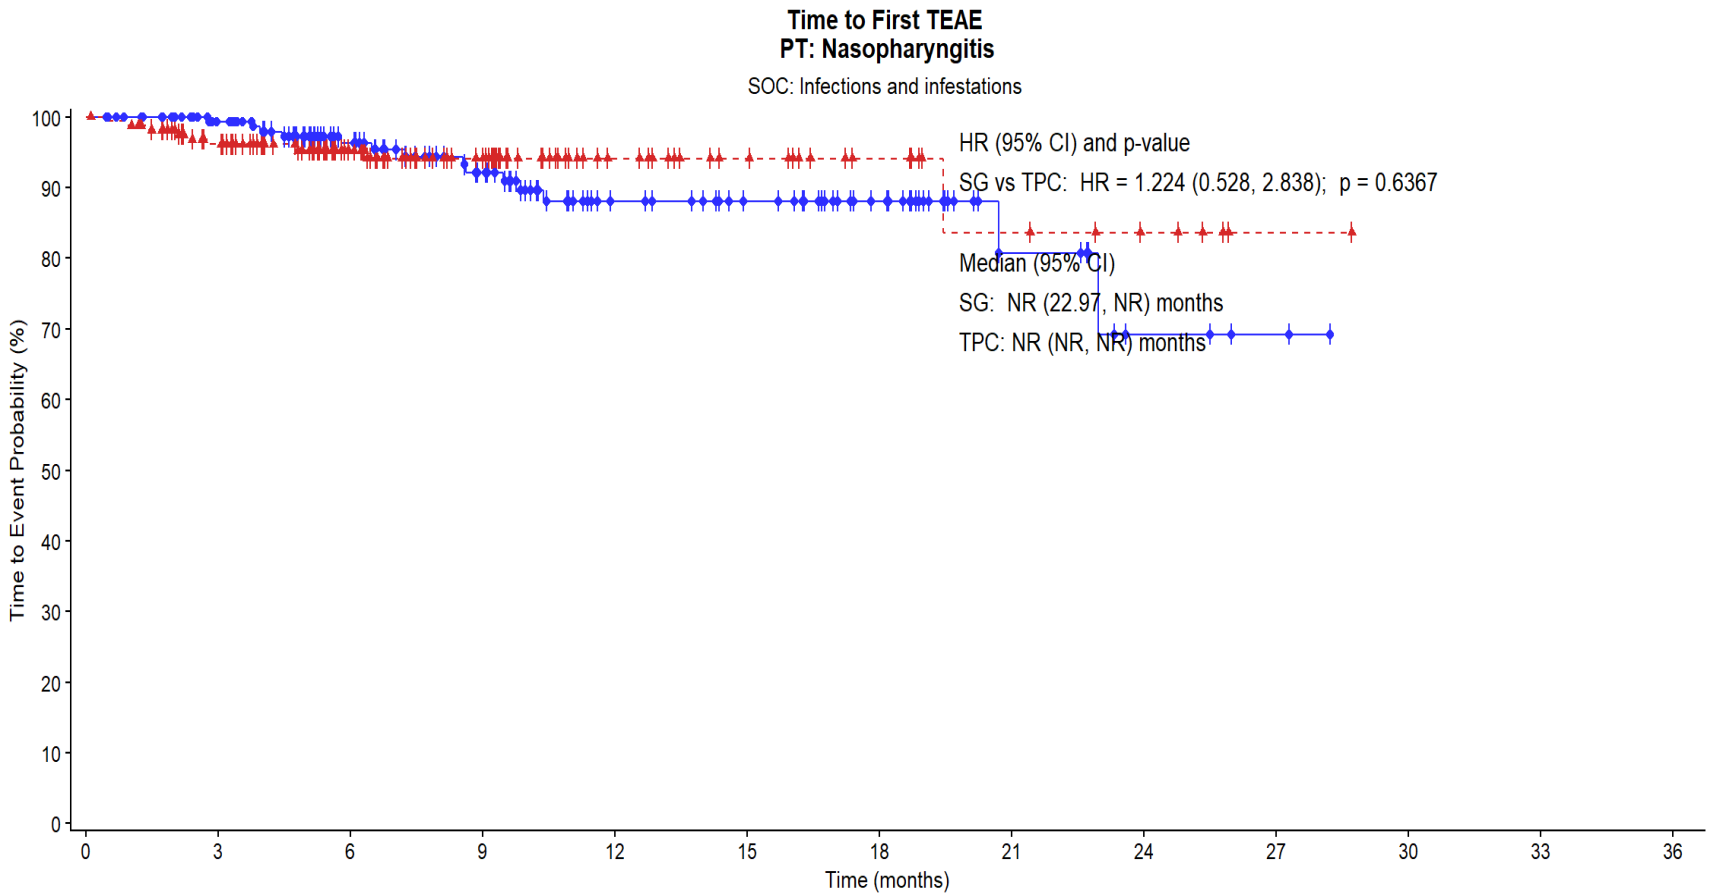
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.61. Figure 1.1.62: Kaplan Meier Plot of Time to First TEAE by PT Pyrexia — mSAF — Excluding patients preselected to receive nab-paclitaxel



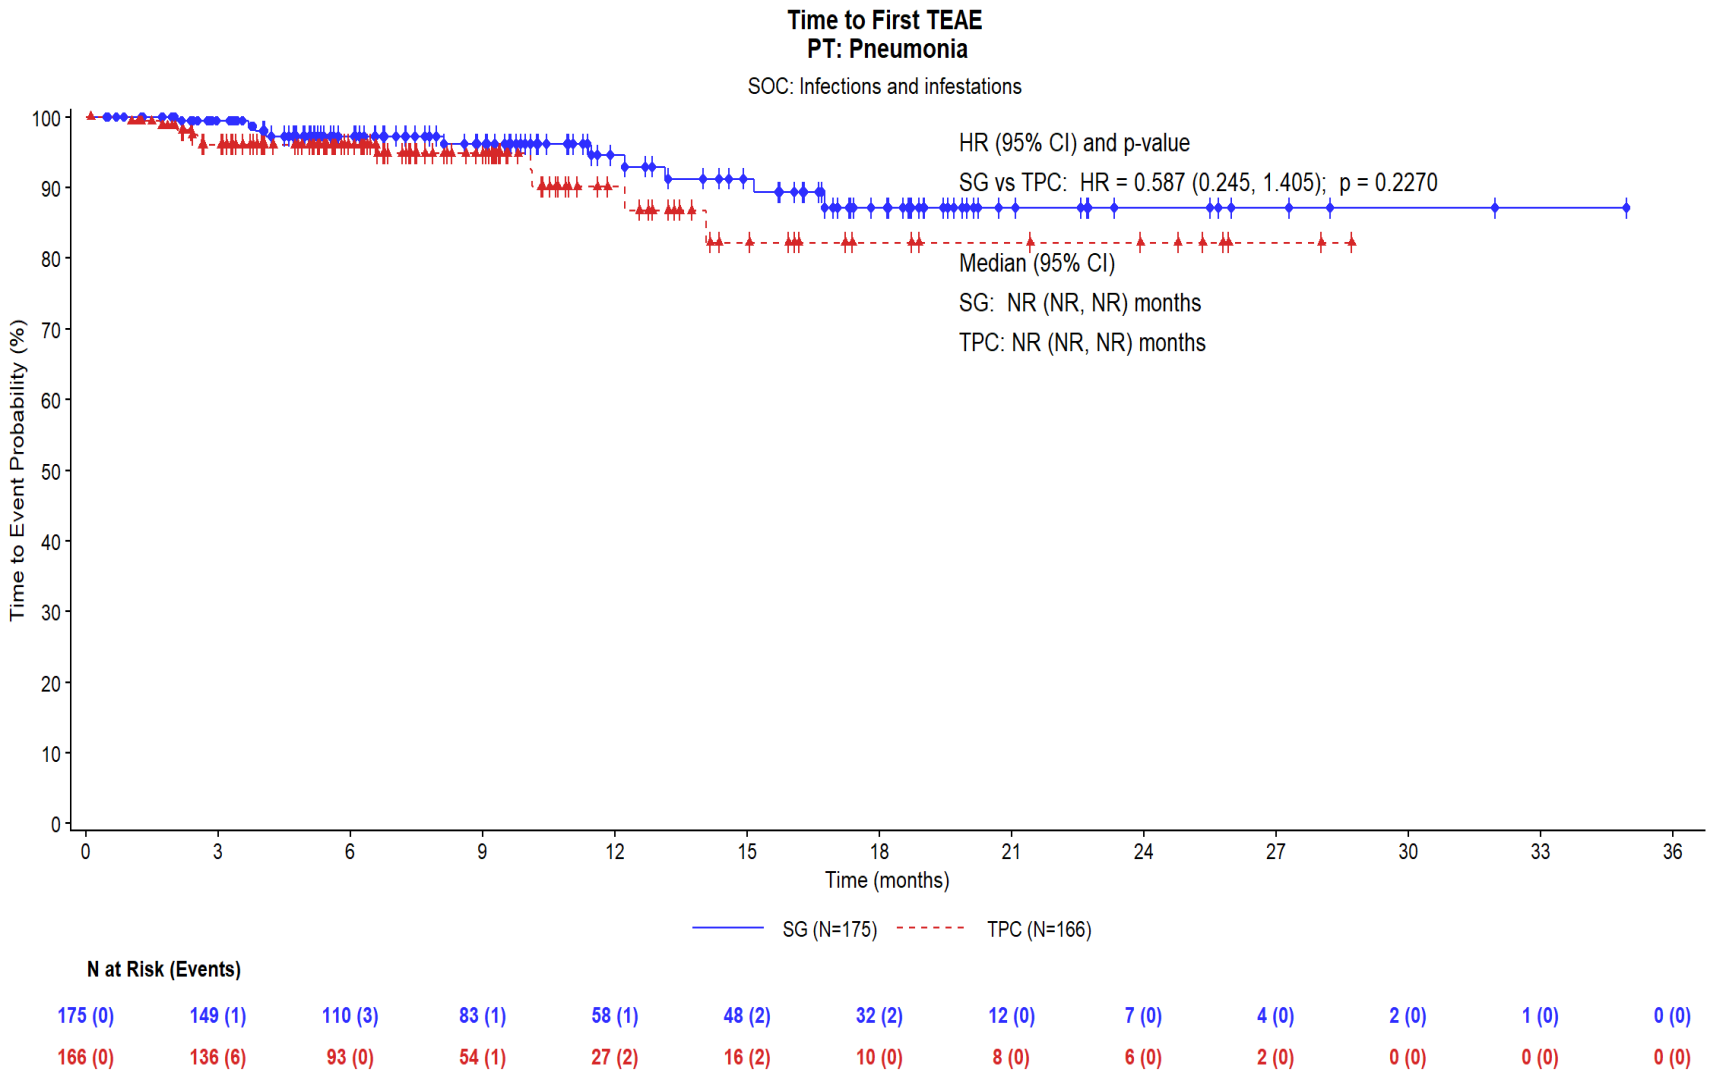
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.62. Figure 1.1.63: Kaplan Meier Plot of Time to First TEAE by PT COVID 19 — mSAF — Excluding patients preselected to receive nab-paclitaxel



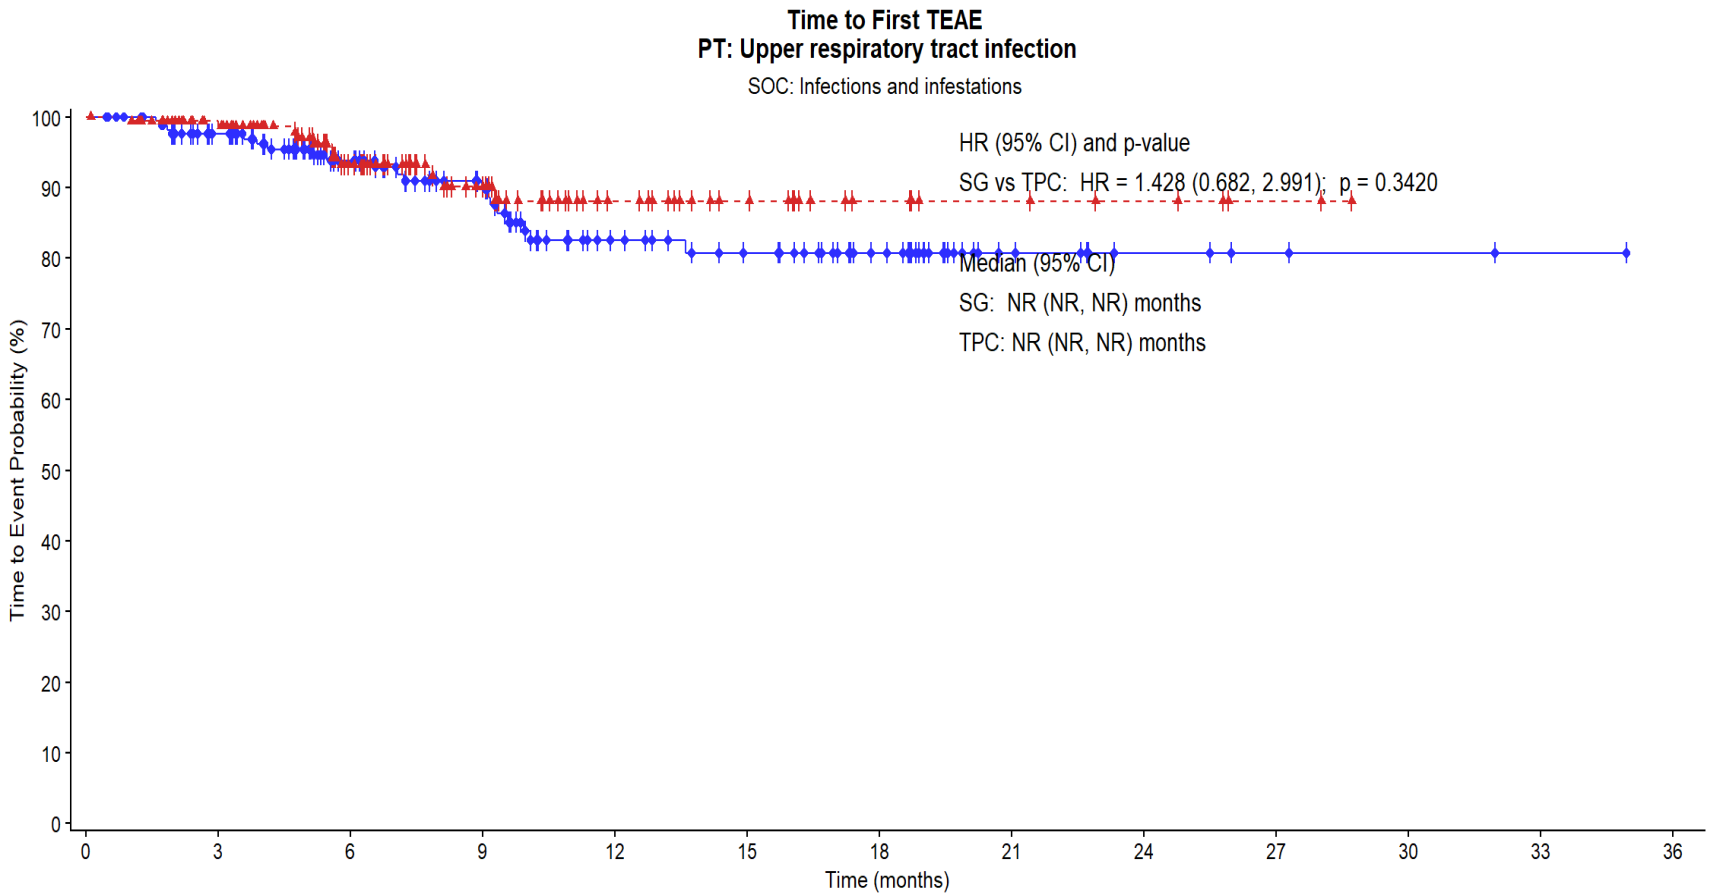
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.63. Figure 1.1.64: Kaplan Meier Plot of Time to First TEAE by PT Influenza — mSAF — Excluding patients preselected to receive nab-paclitaxel



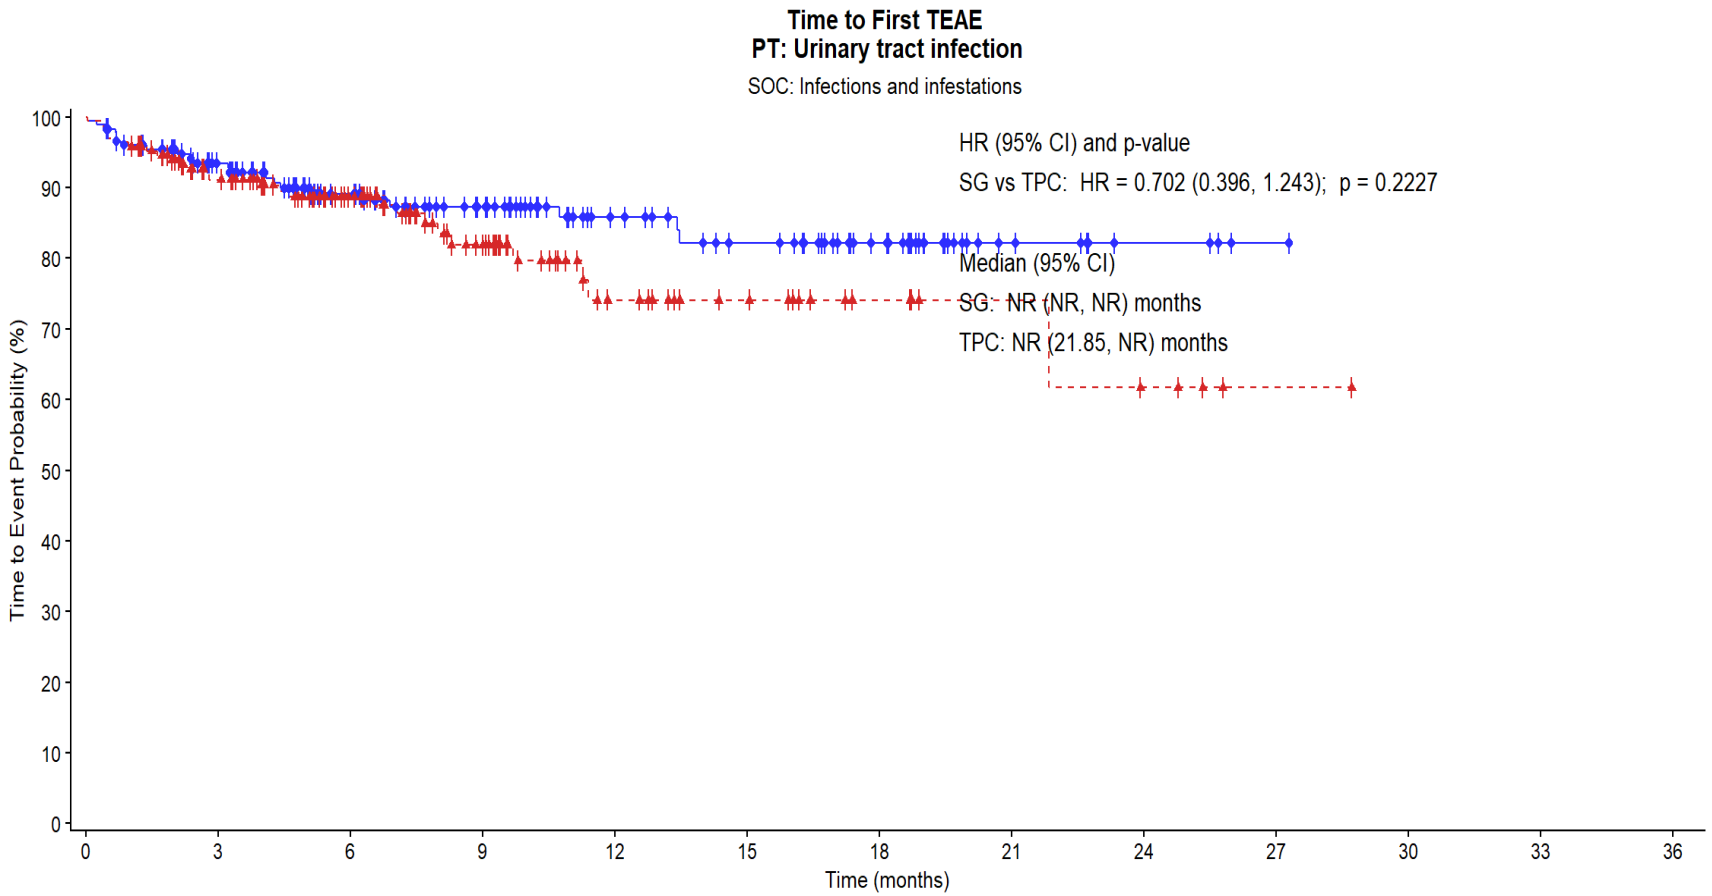
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.64. Figure 1.1.65: Kaplan Meier Plot of Time to First TEAE by PT Nasopharyngitis — mSAF — Excluding patients preselected to receive nab-paclitaxel



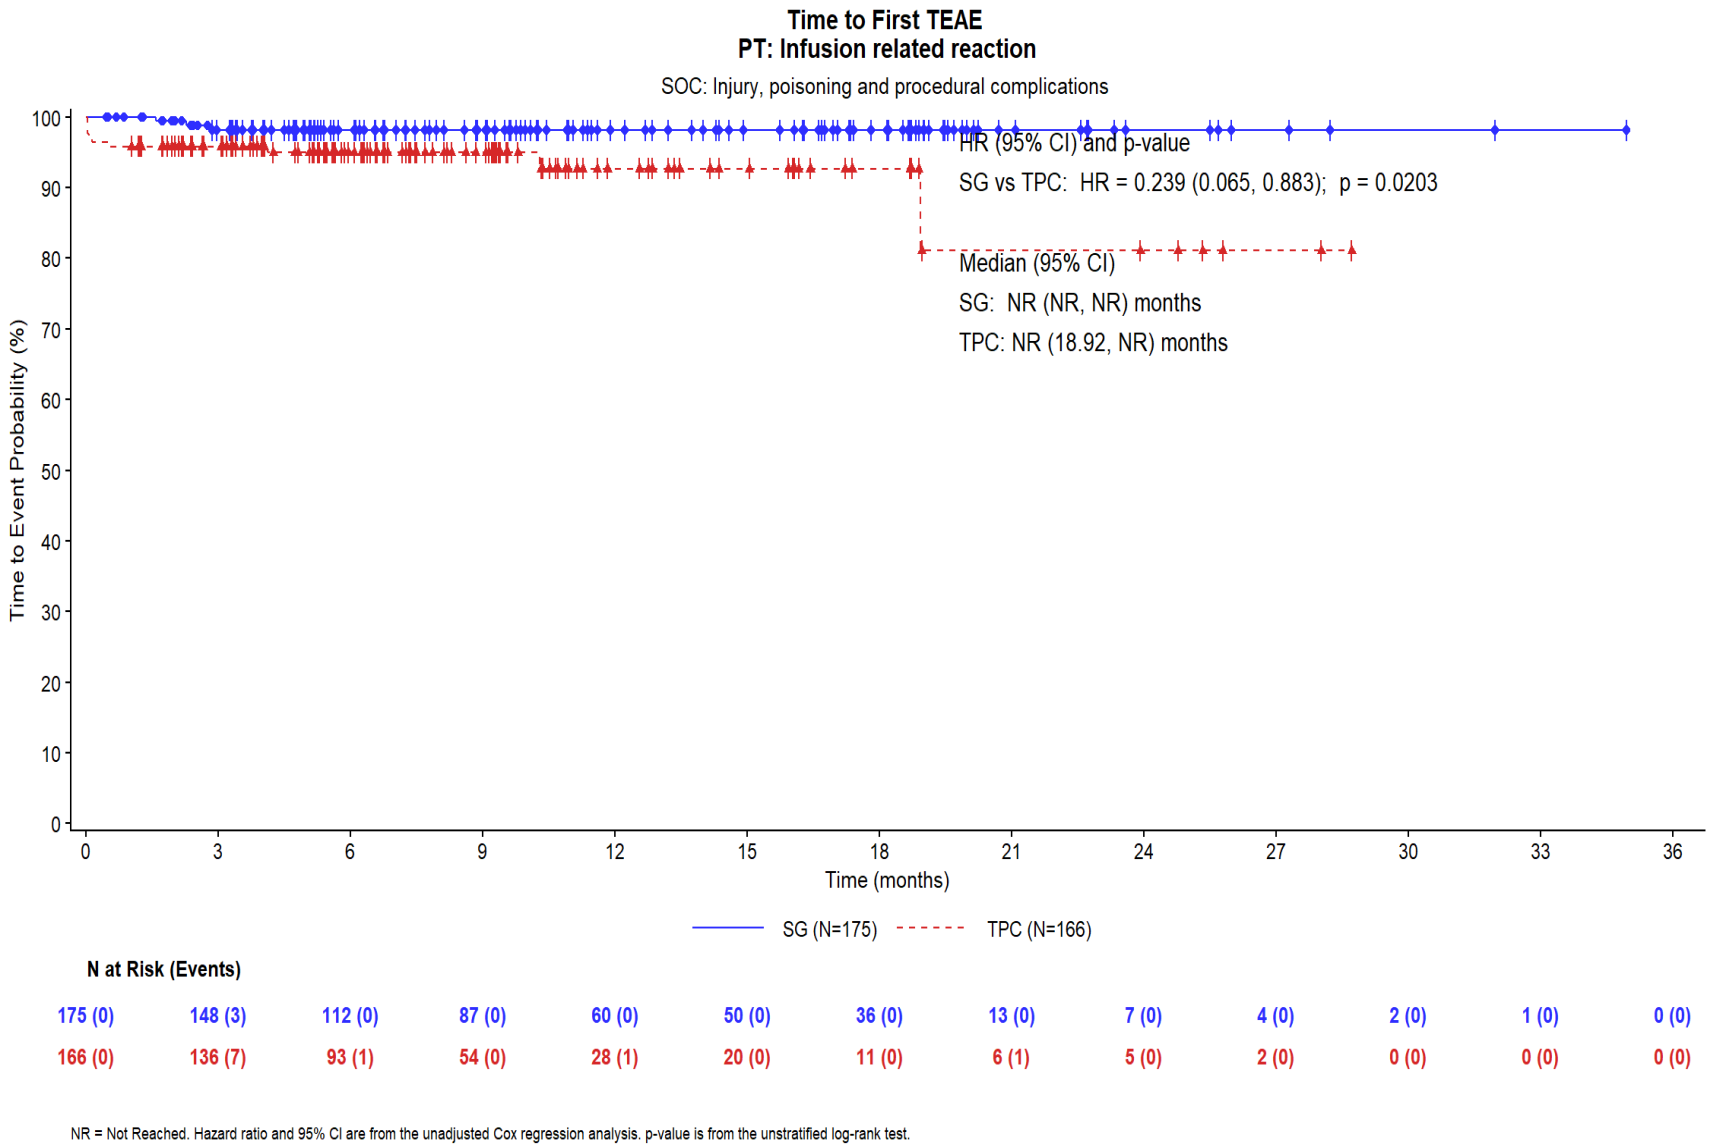
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.65. Figure 1.1.66: Kaplan Meier Plot of Time to First TEAE by PT Pneumonia — mSAF — Excluding patients preselected to receive nab-paclitaxel



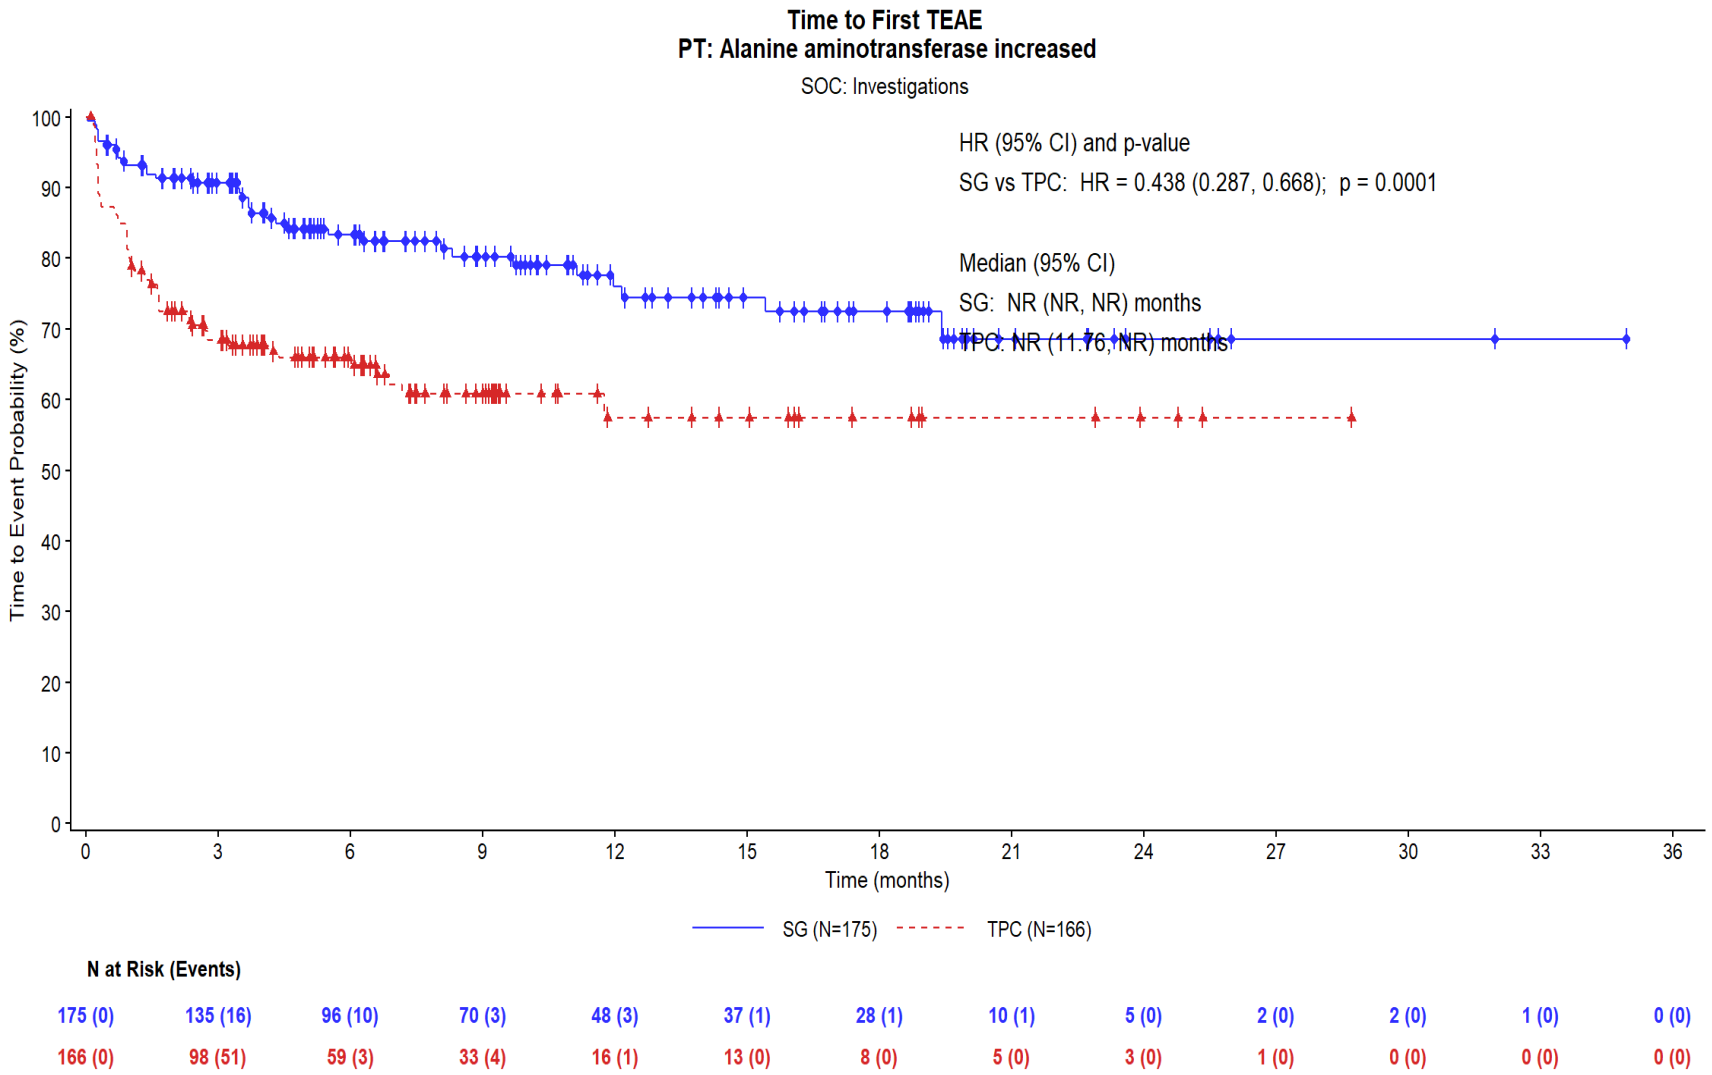
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.66. Figure 1.1.67: Kaplan Meier Plot of Time to First TEAE by PT Upper respiratory tract infection — mSAF — Excluding patients preselected to receive nab-paclitaxel



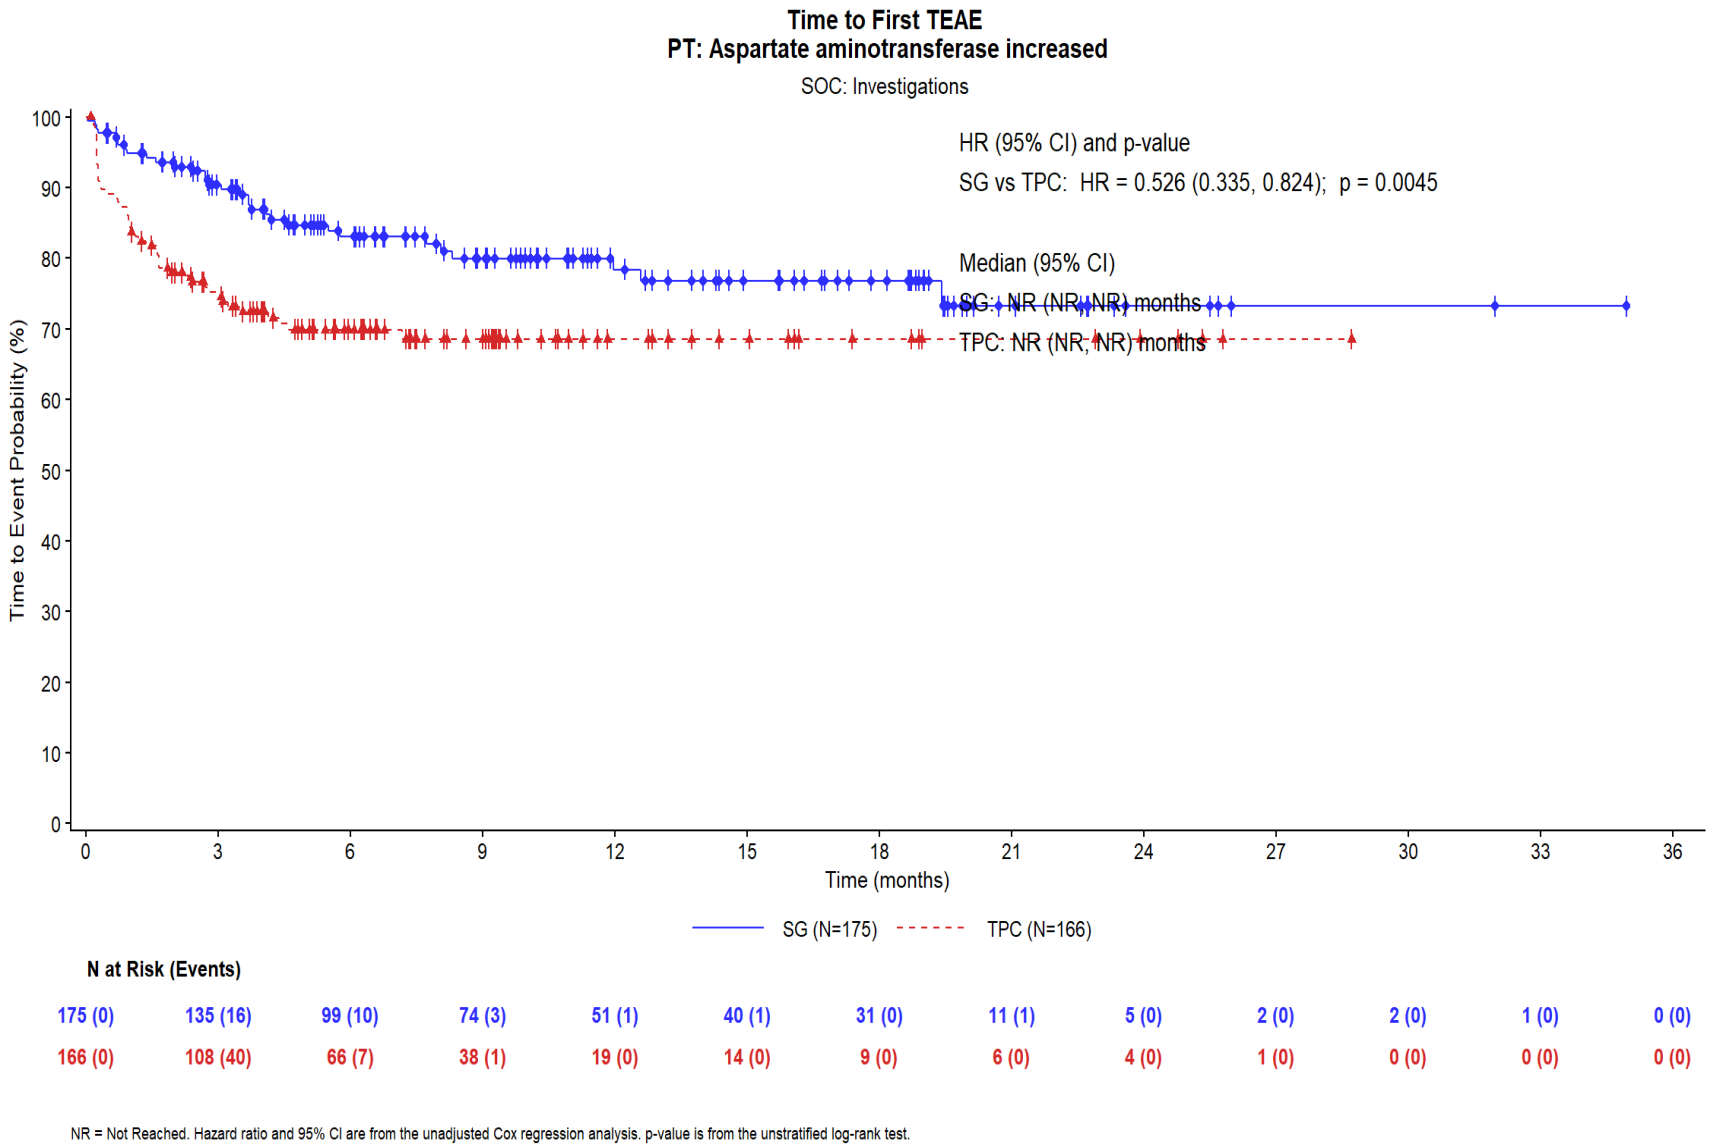
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.67. Figure 1.1.68: Kaplan Meier Plot of Time to First TEAE by PT Urinary tract infection — mSAF — Excluding patients preselected to receive nab-paclitaxel



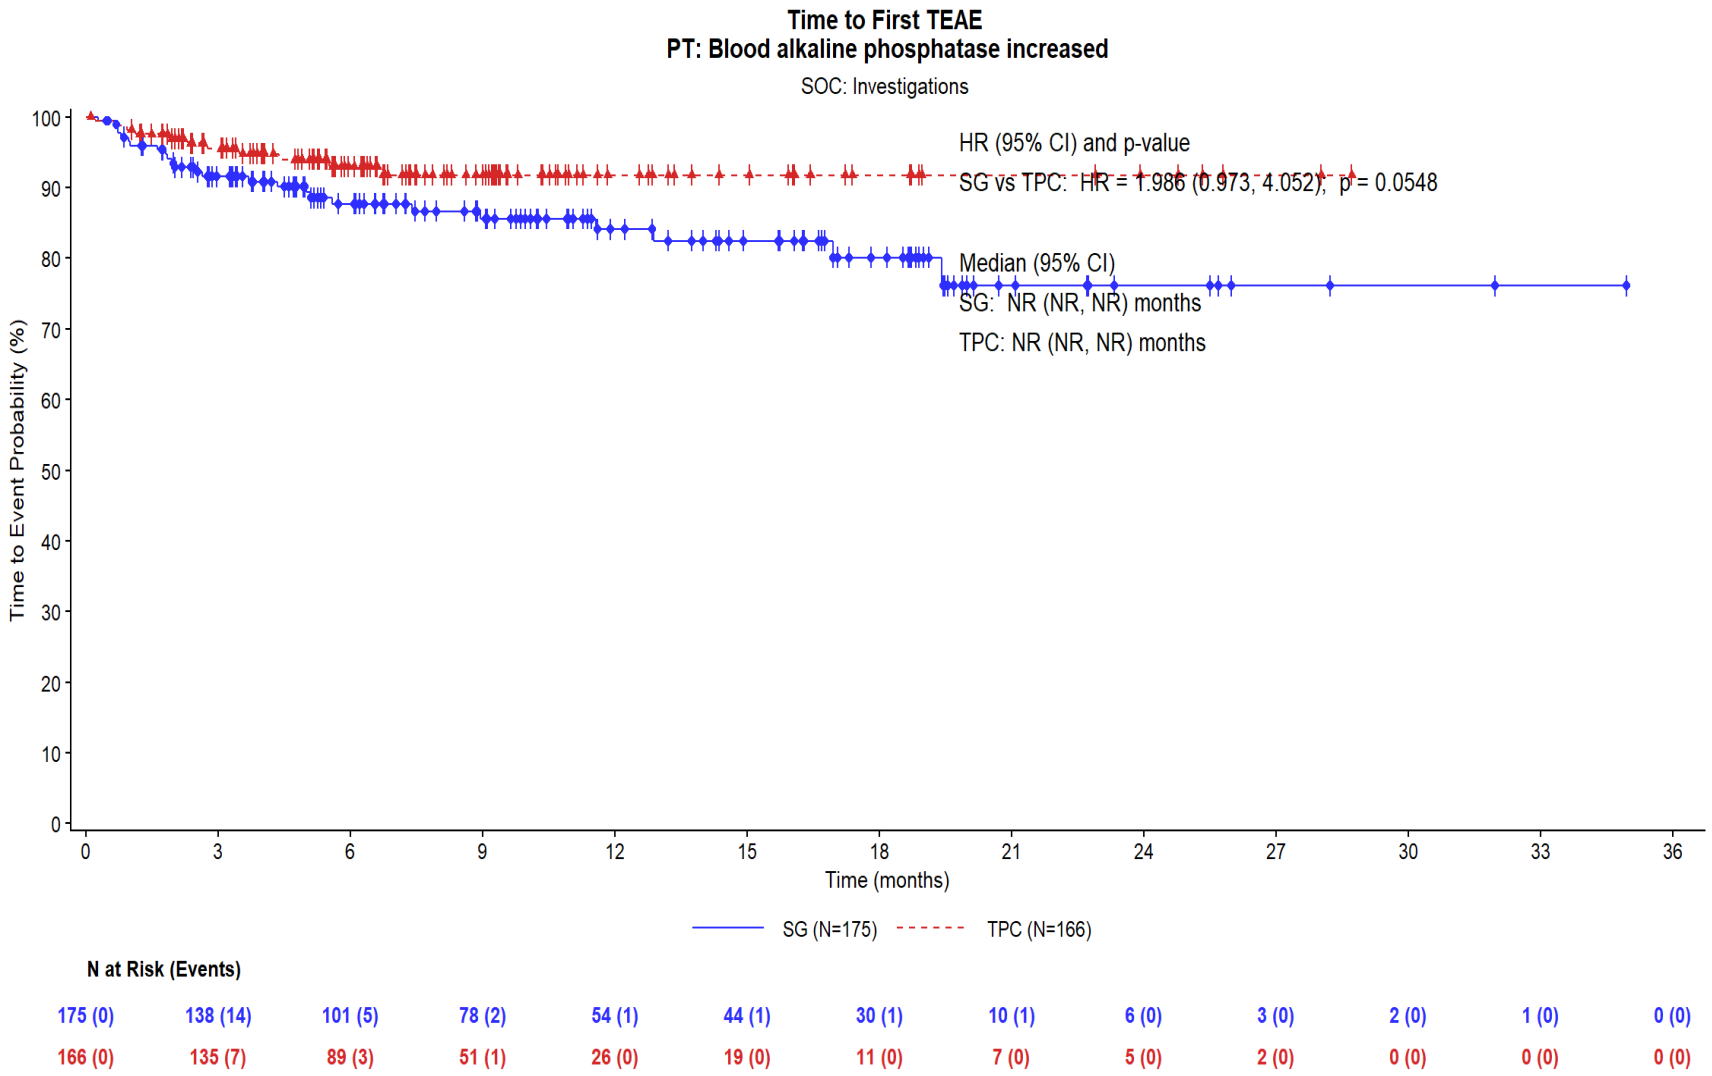
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.68. Figure 1.1.69: Kaplan Meier Plot of Time to First TEAE by PT Infusion related reaction — mSAF — Excluding patients preselected to receive nab-paclitaxel



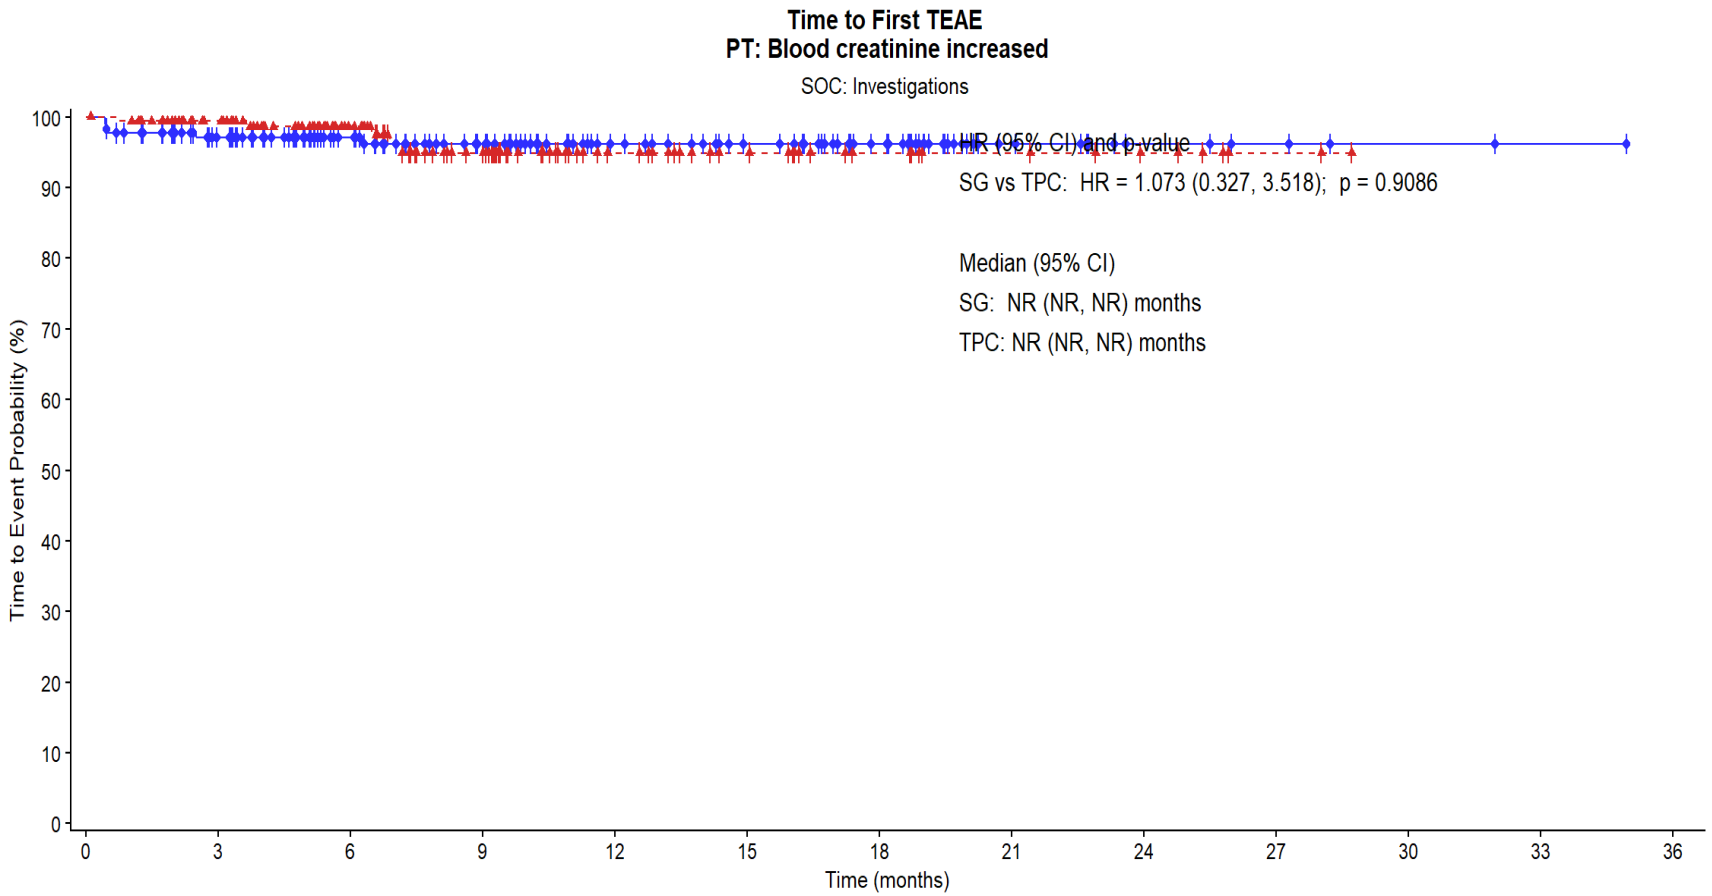
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.69. Figure 1.1.70: Kaplan Meier Plot of Time to First TEAE by PT Alanine aminotransferase increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



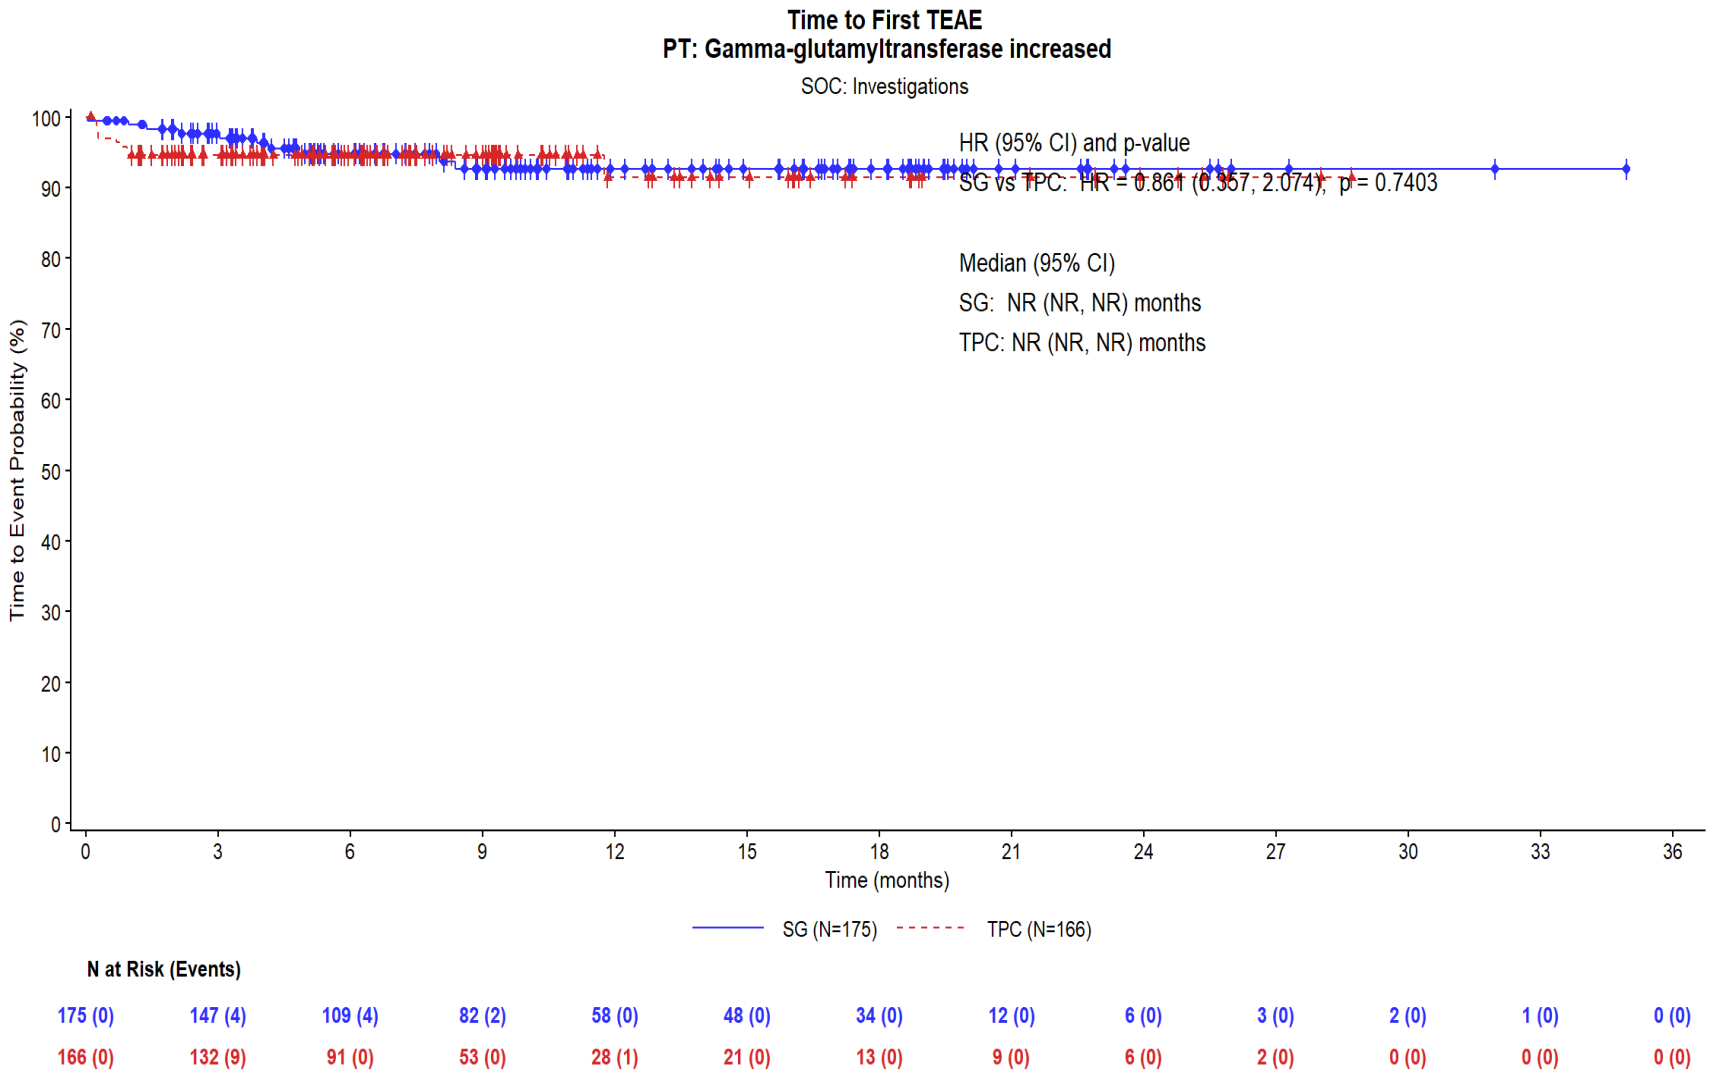
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.70. Figure 1.1.71: Kaplan Meier Plot of Time to First TEAE by PT Aspartate aminotransferase increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



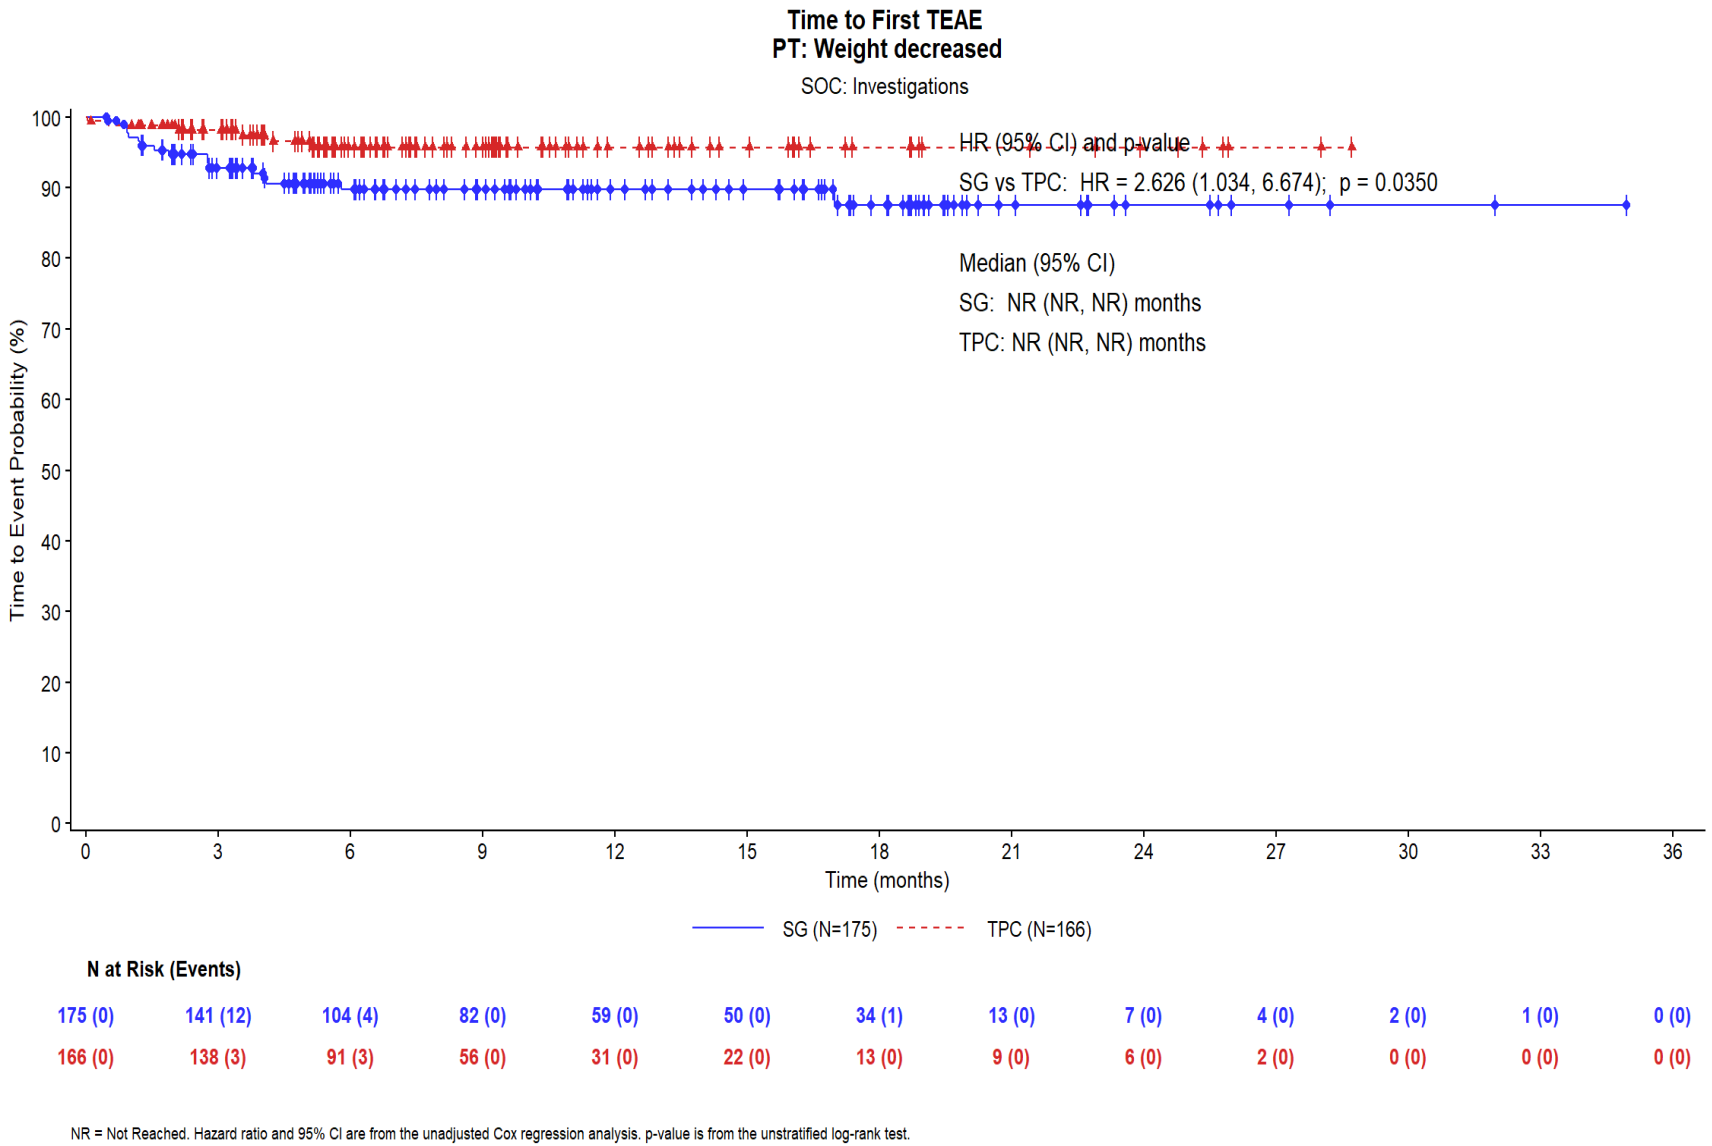
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.71. Figure 1.1.72: Kaplan Meier Plot of Time to First TEAE by PT Blood alkaline phosphatase increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



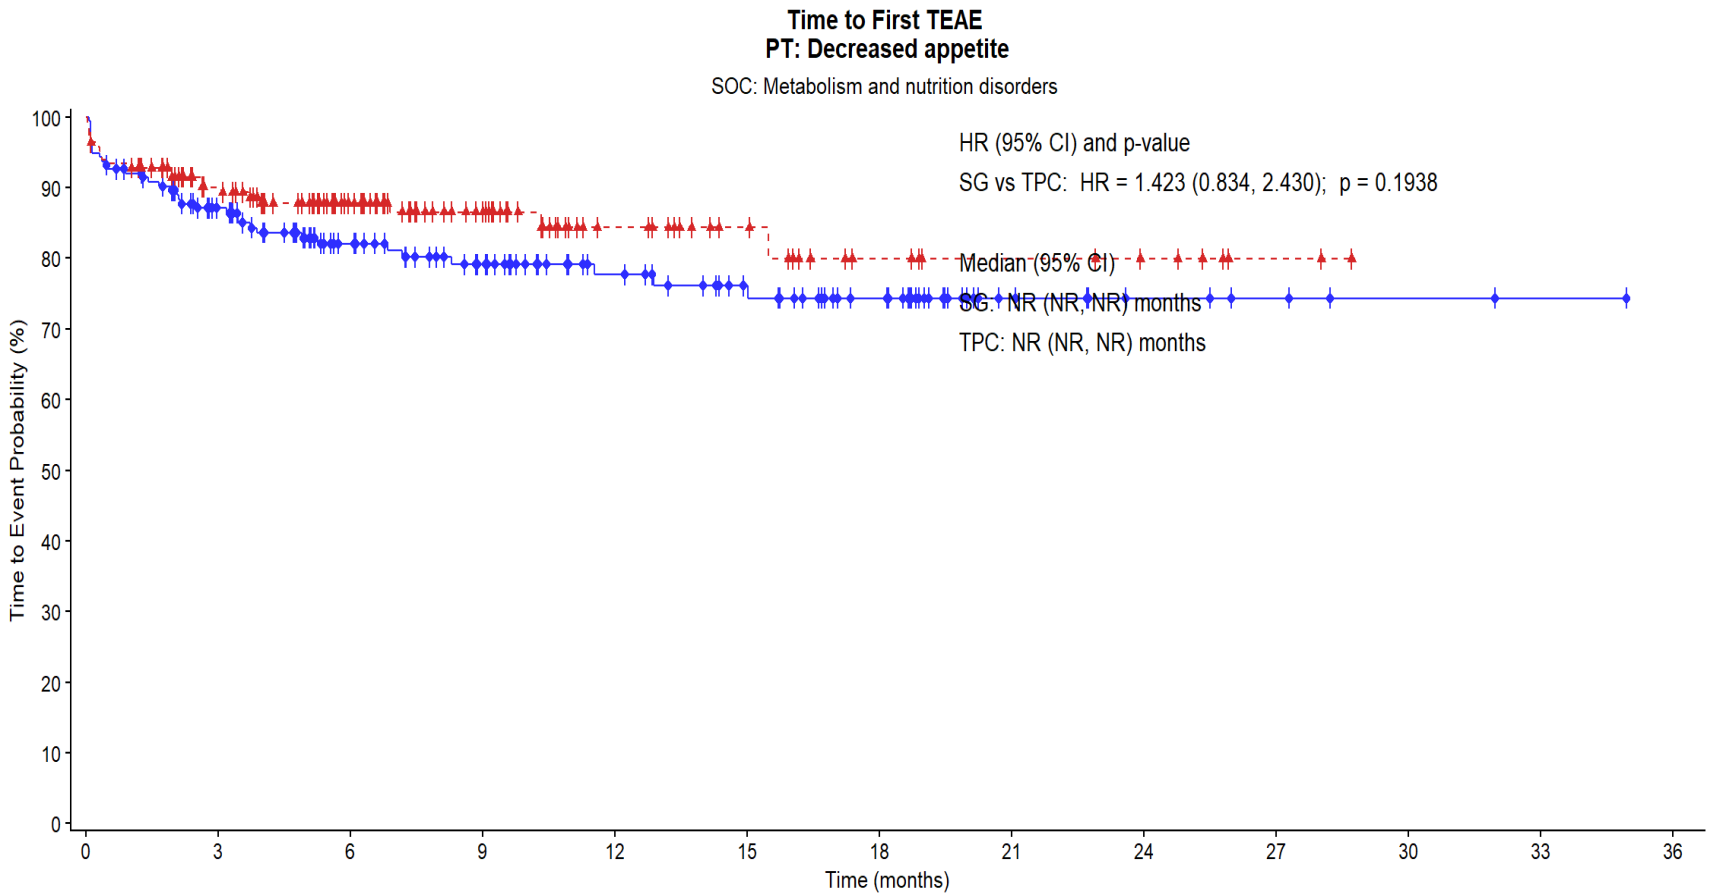
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.72. Figure 1.1.73: Kaplan Meier Plot of Time to First TEAE by PT Blood creatinine increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



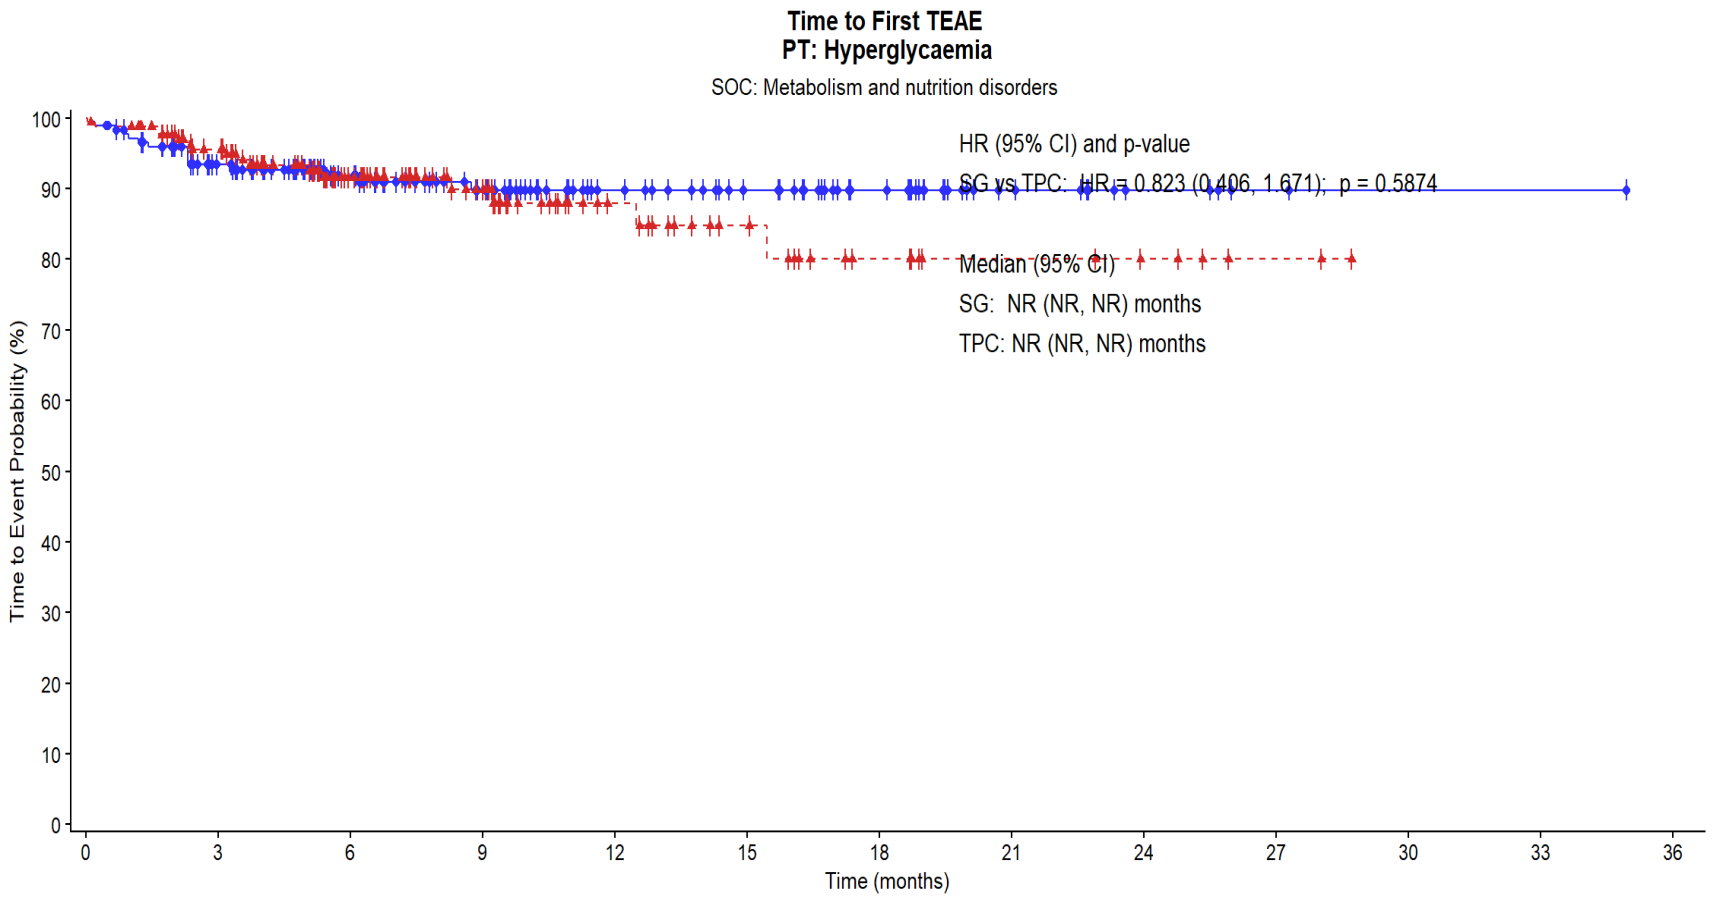
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.73. Figure 1.1.74: Kaplan Meier Plot of Time to First TEAE by PT Gamma glutamyltransferase increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



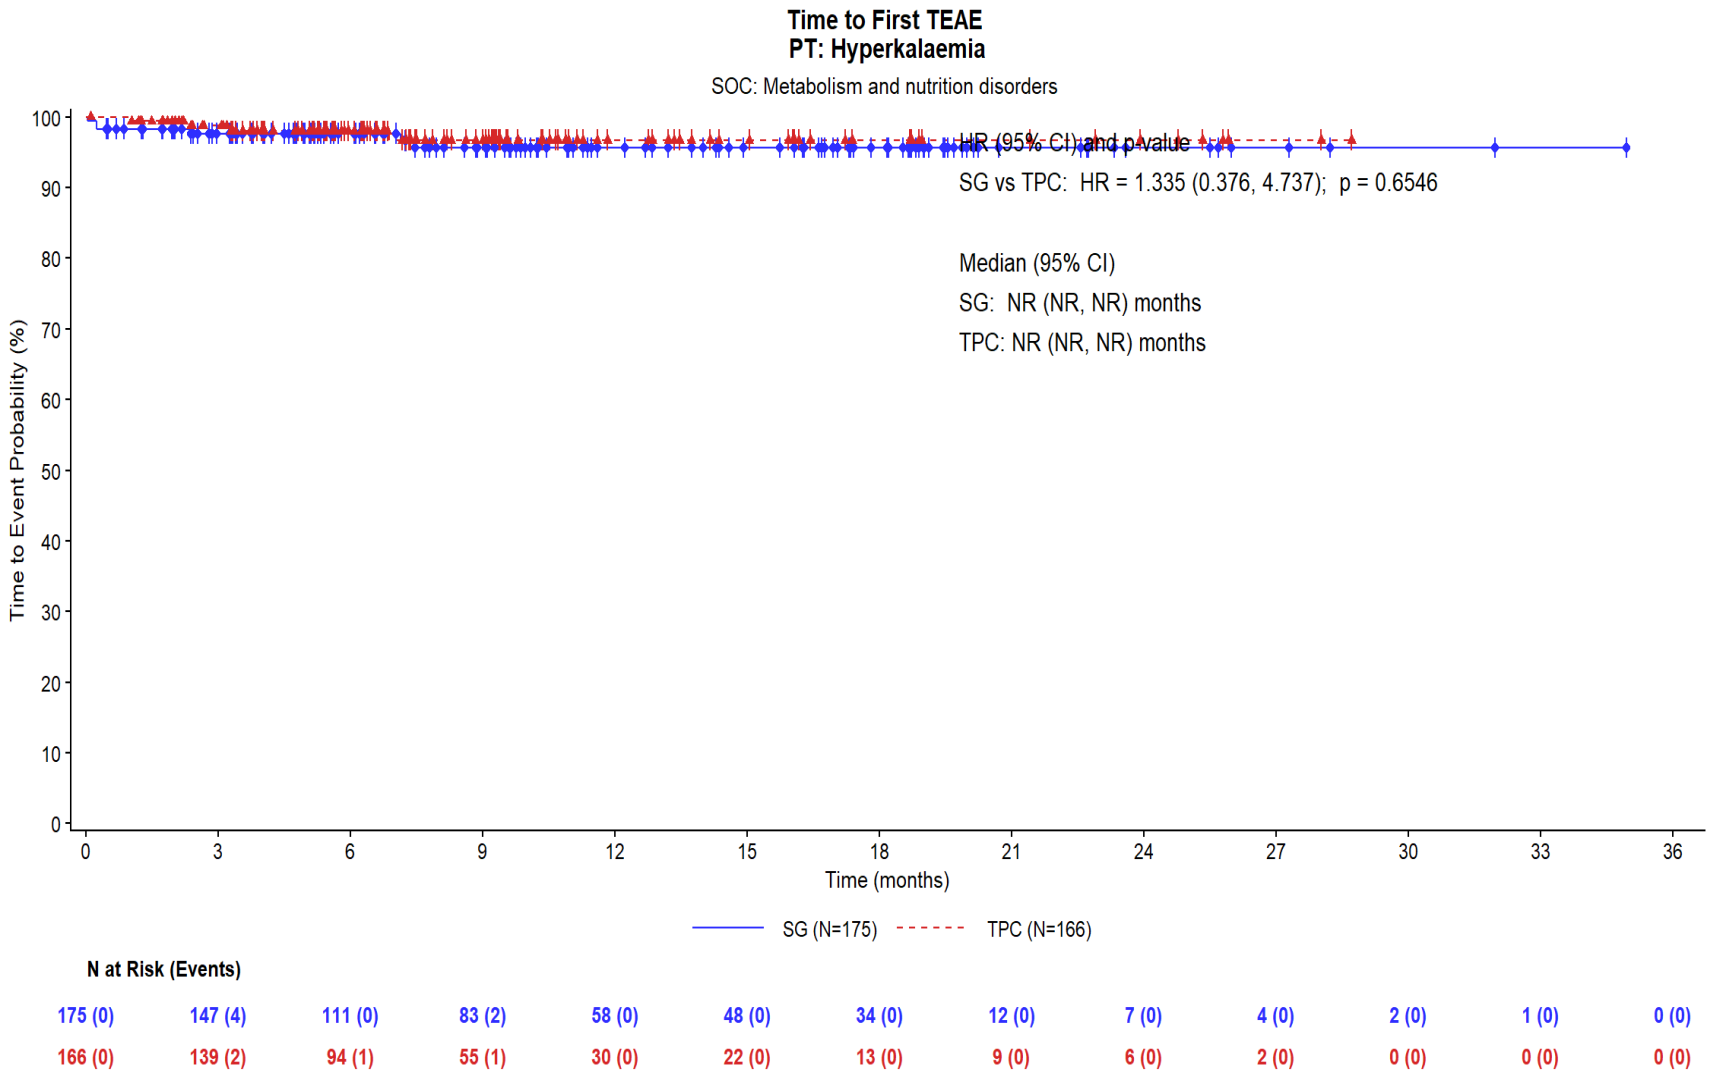
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.74. Figure 1.1.75: Kaplan Meier Plot of Time to First TEAE by PT Weight decreased — mSAF — Excluding patients preselected to receive nab-paclitaxel



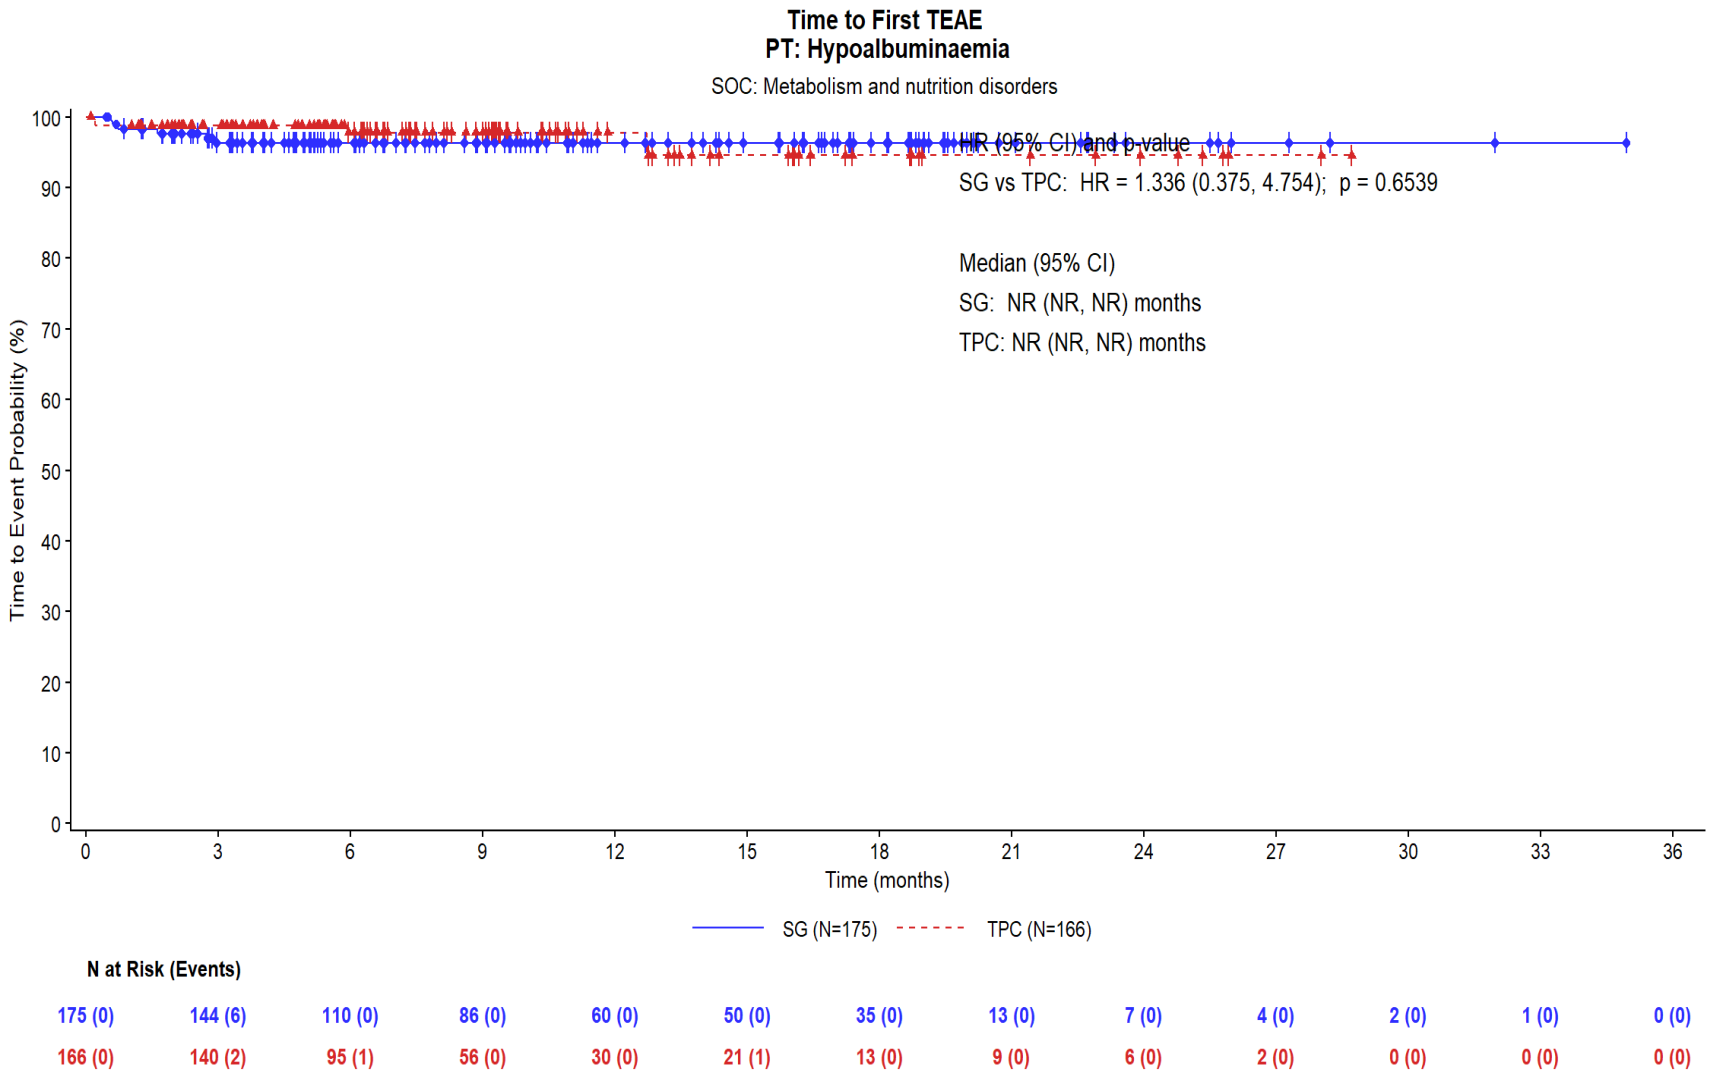
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.75. Figure 1.1.76: Kaplan Meier Plot of Time to First TEAE by PT Decreased appetite — mSAF — Excluding patients preselected to receive nab-paclitaxel



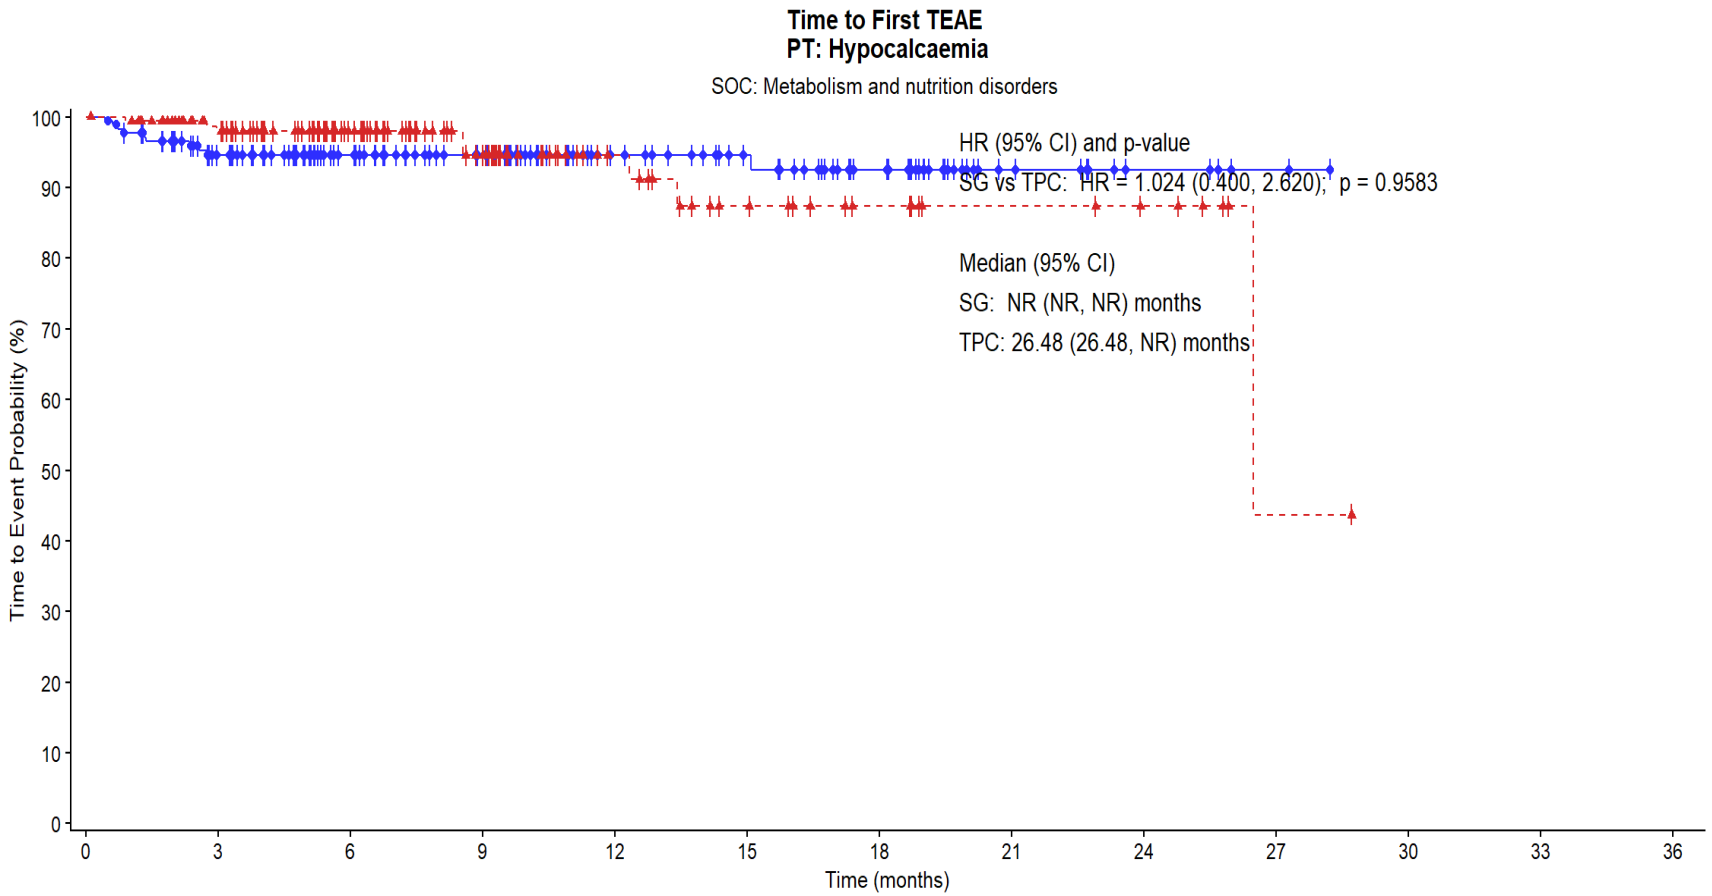
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.76. Figure 1.1.77: Kaplan Meier Plot of Time to First TEAE by PT Hyperglycaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



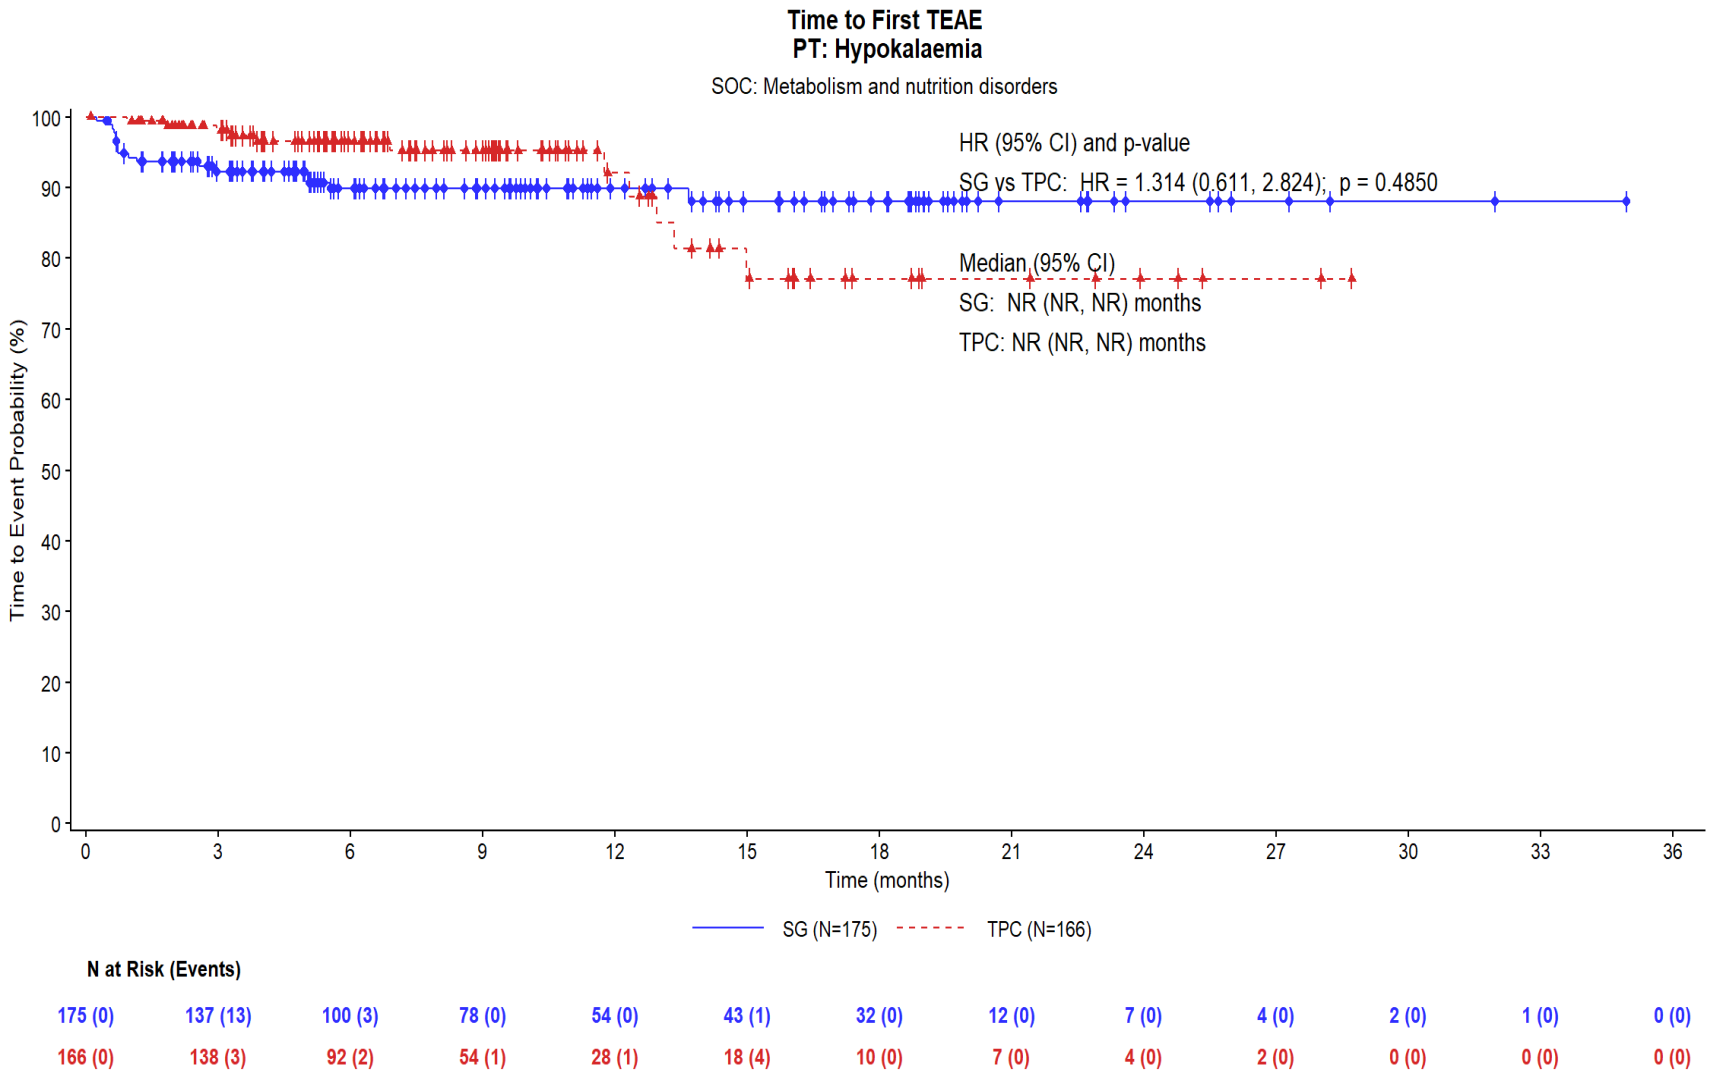
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.77. Figure 1.1.78: Kaplan Meier Plot of Time to First TEAE by PT Hyperkalaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



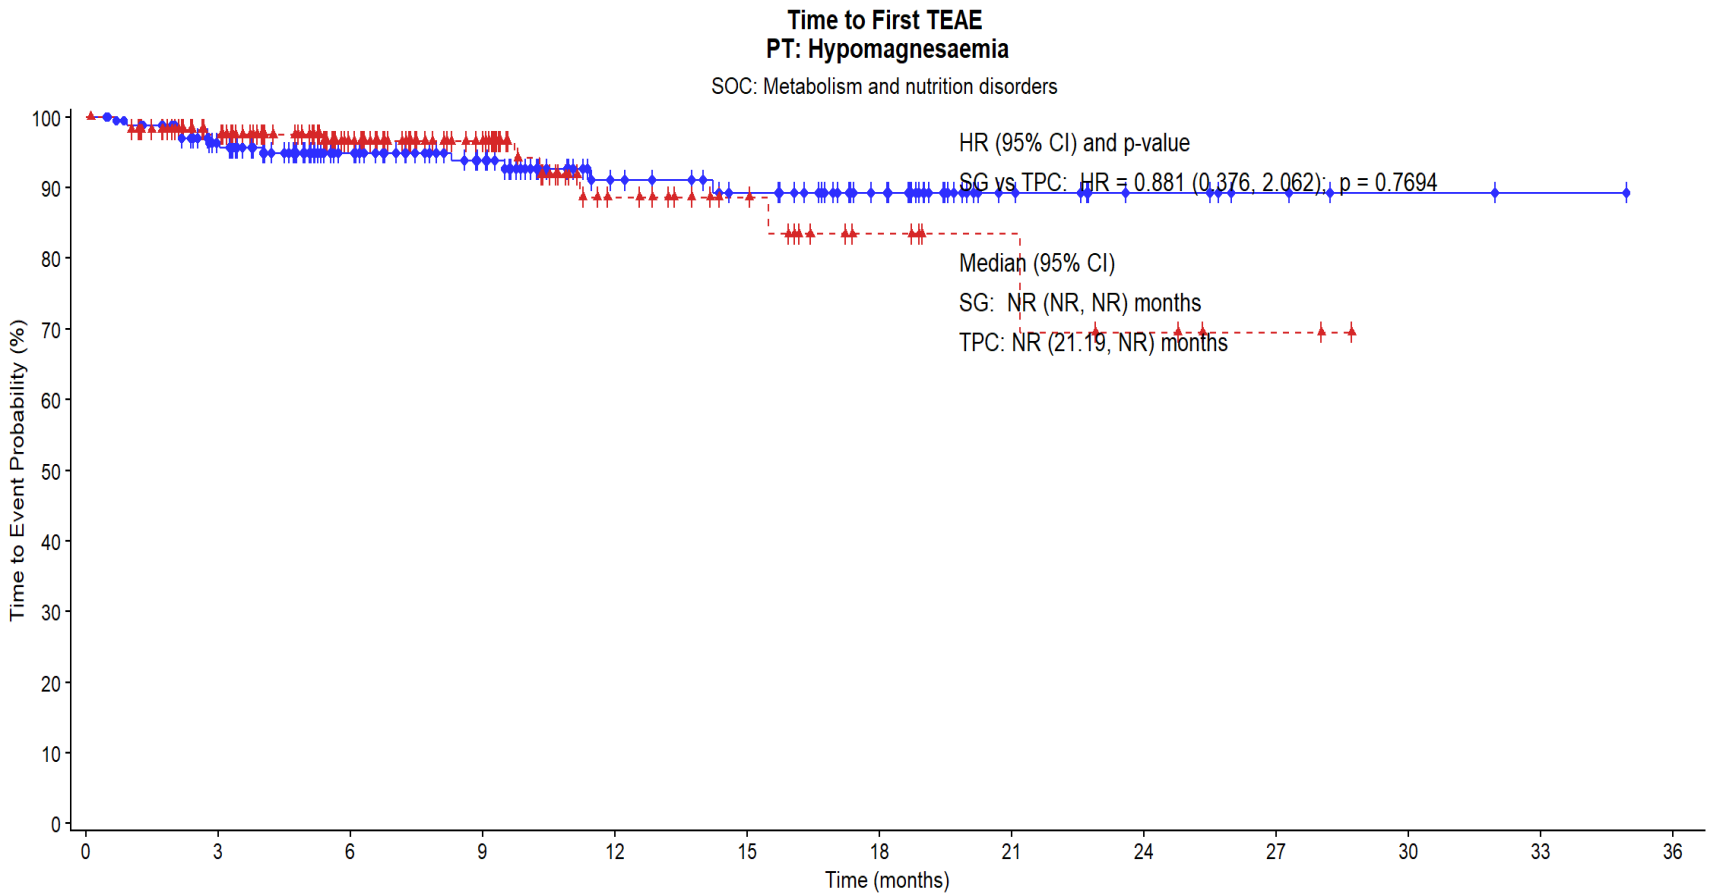
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.78. Figure 1.1.79: Kaplan Meier Plot of Time to First TEAE by PT Hypoalbuminaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



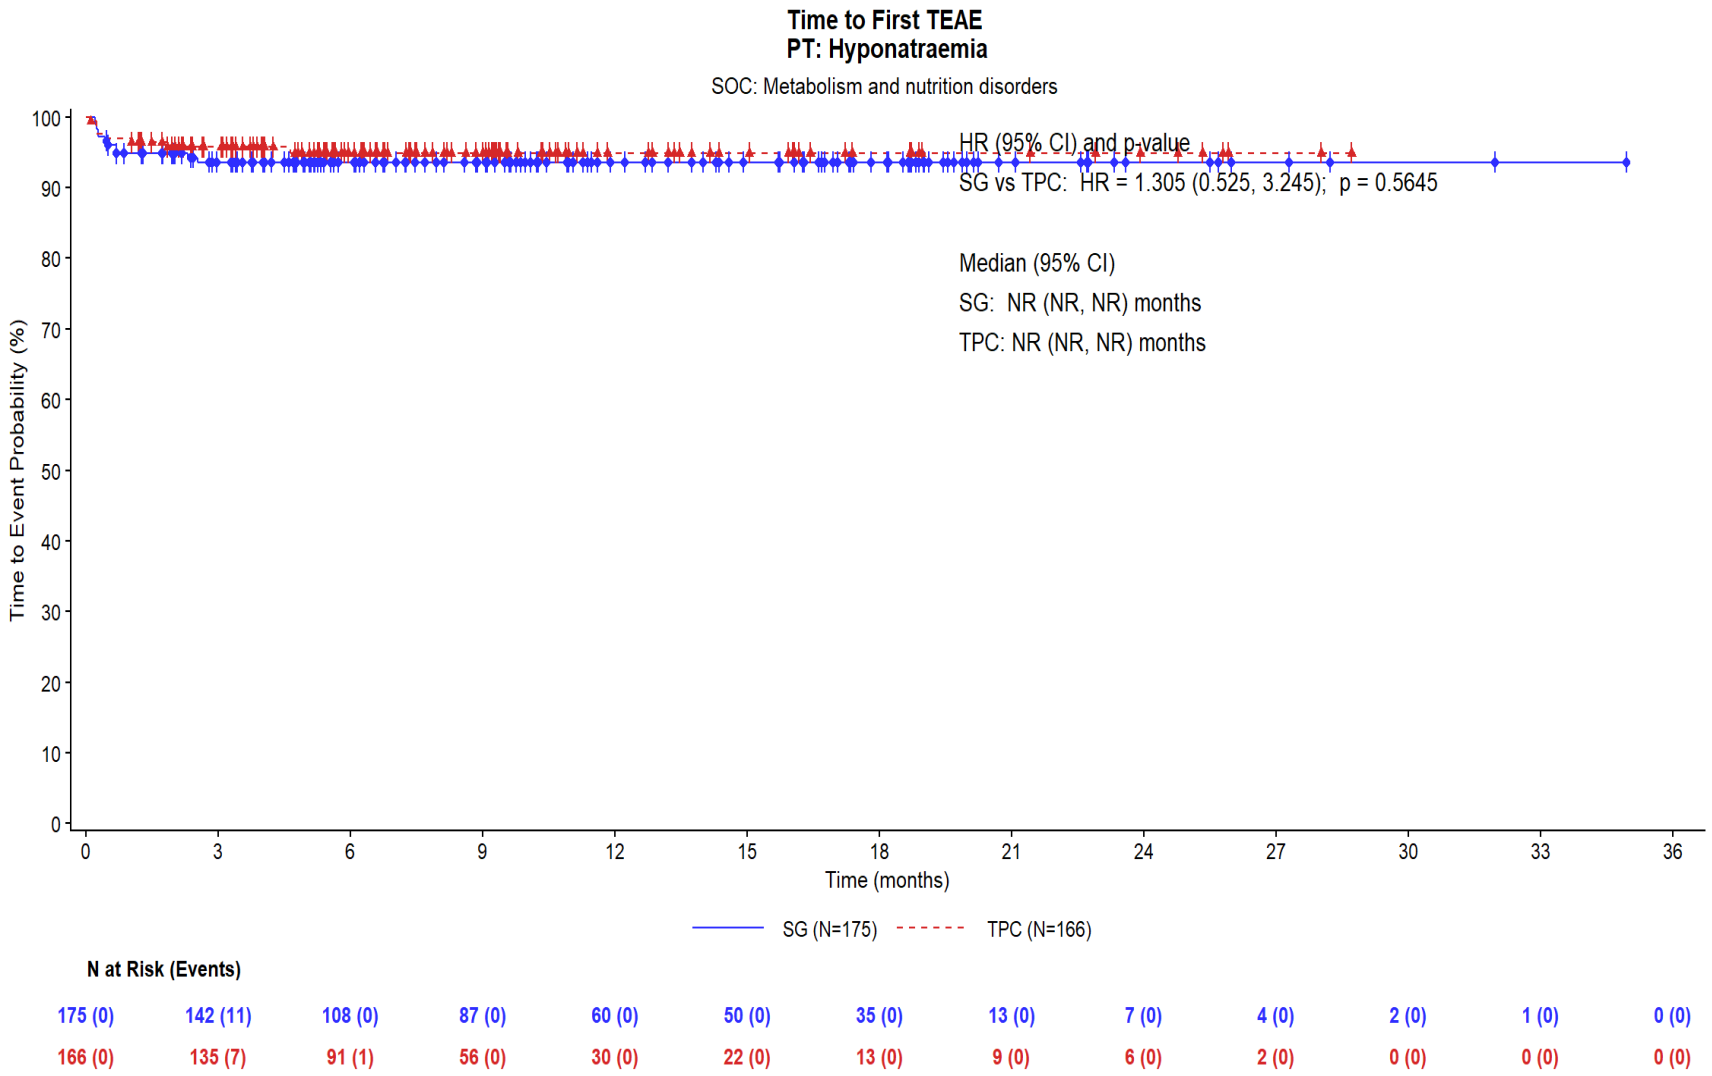
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.79. Figure 1.1.80: Kaplan Meier Plot of Time to First TEAE by PT Hypocalcaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



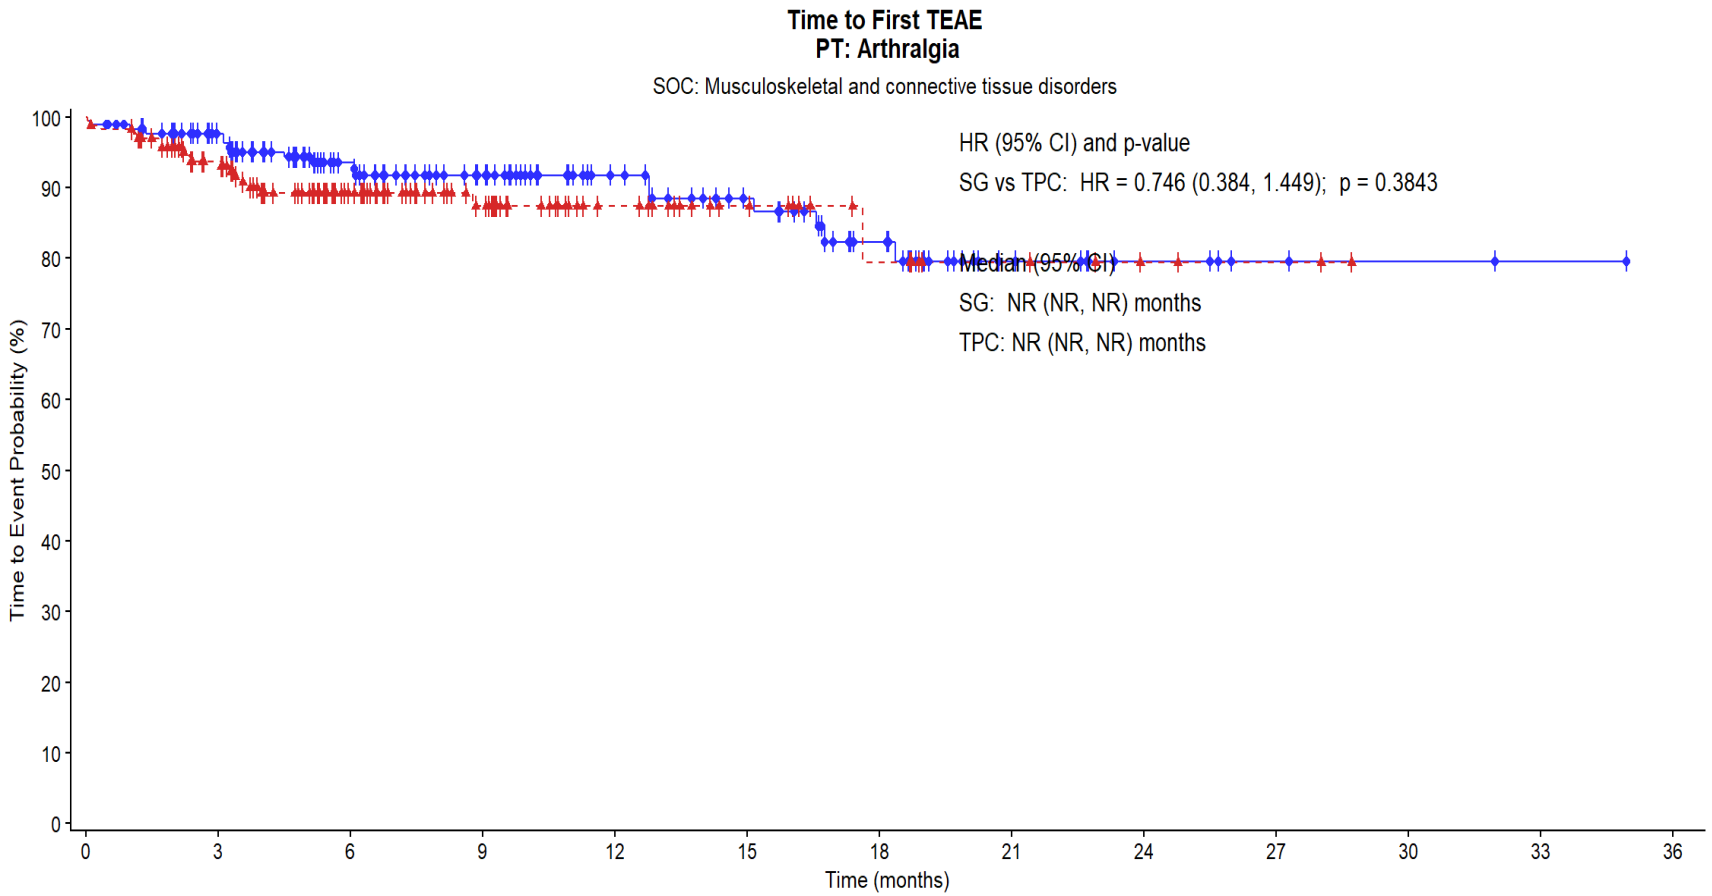
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.80. Figure 1.1.81: Kaplan Meier Plot of Time to First TEAE by PT Hypokalaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



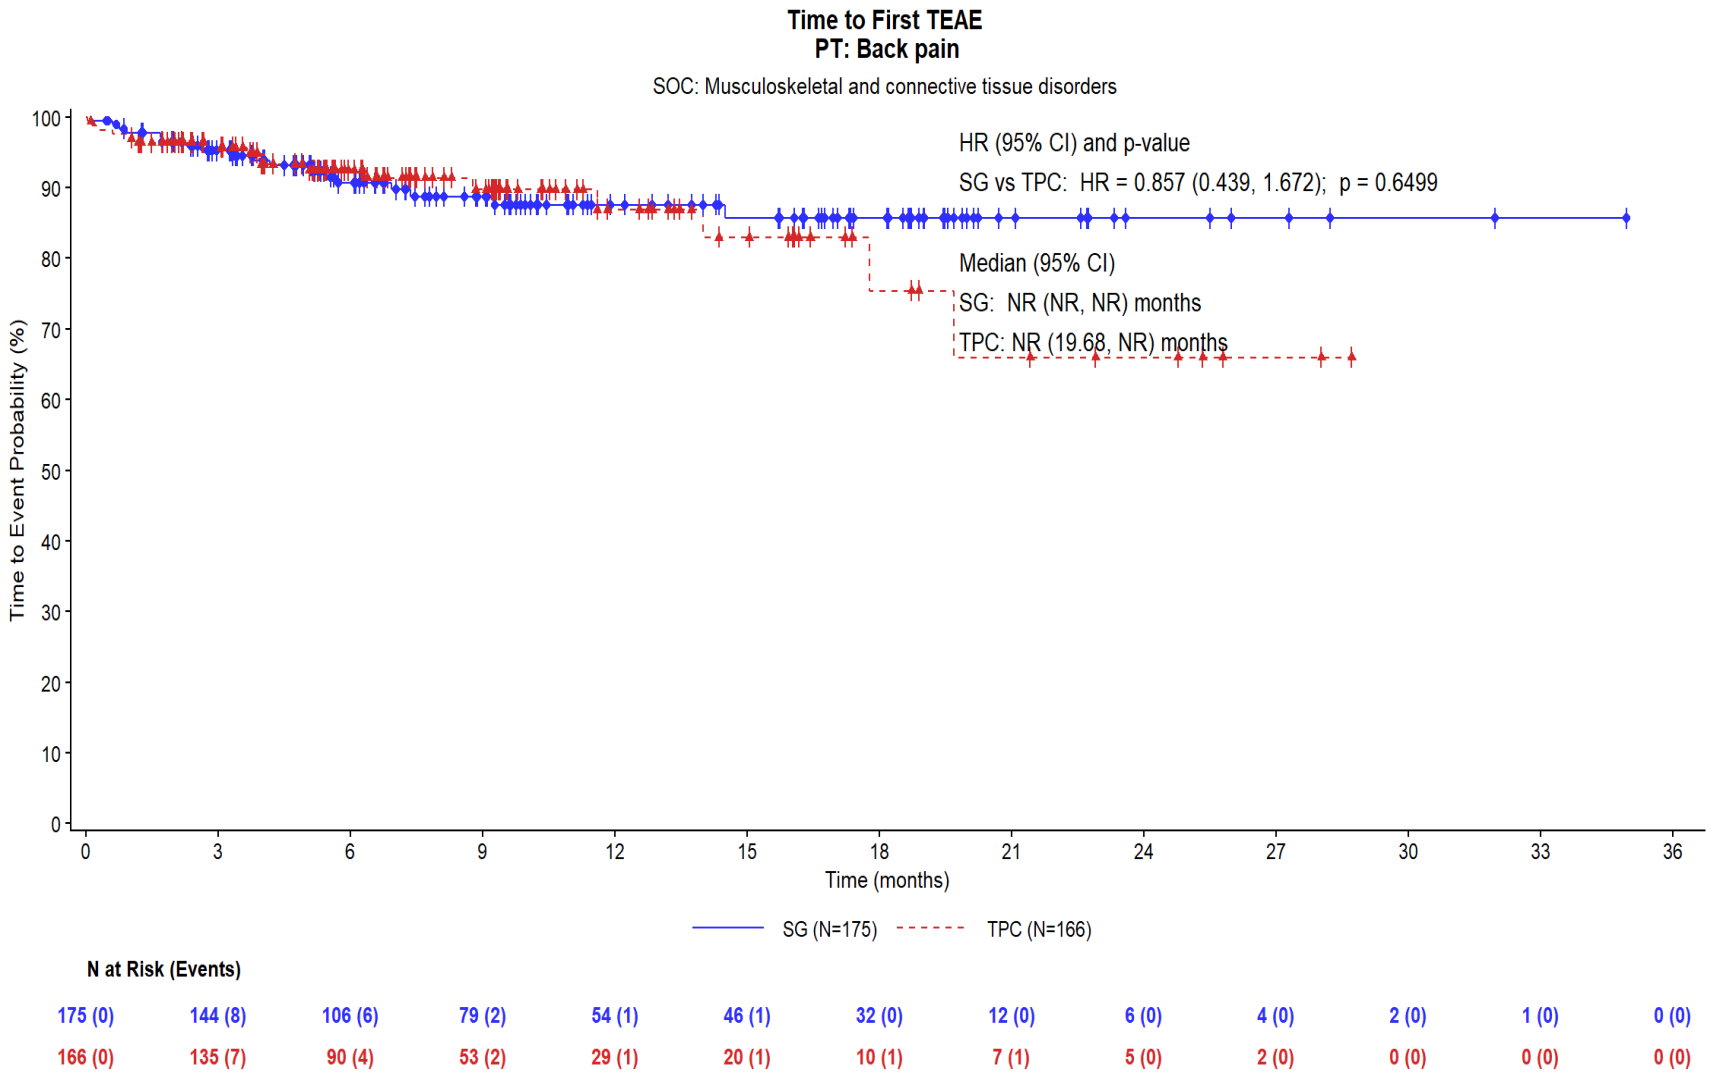
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.81. Figure 1.1.82: Kaplan Meier Plot of Time to First TEAE by PT Hypomagnesaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



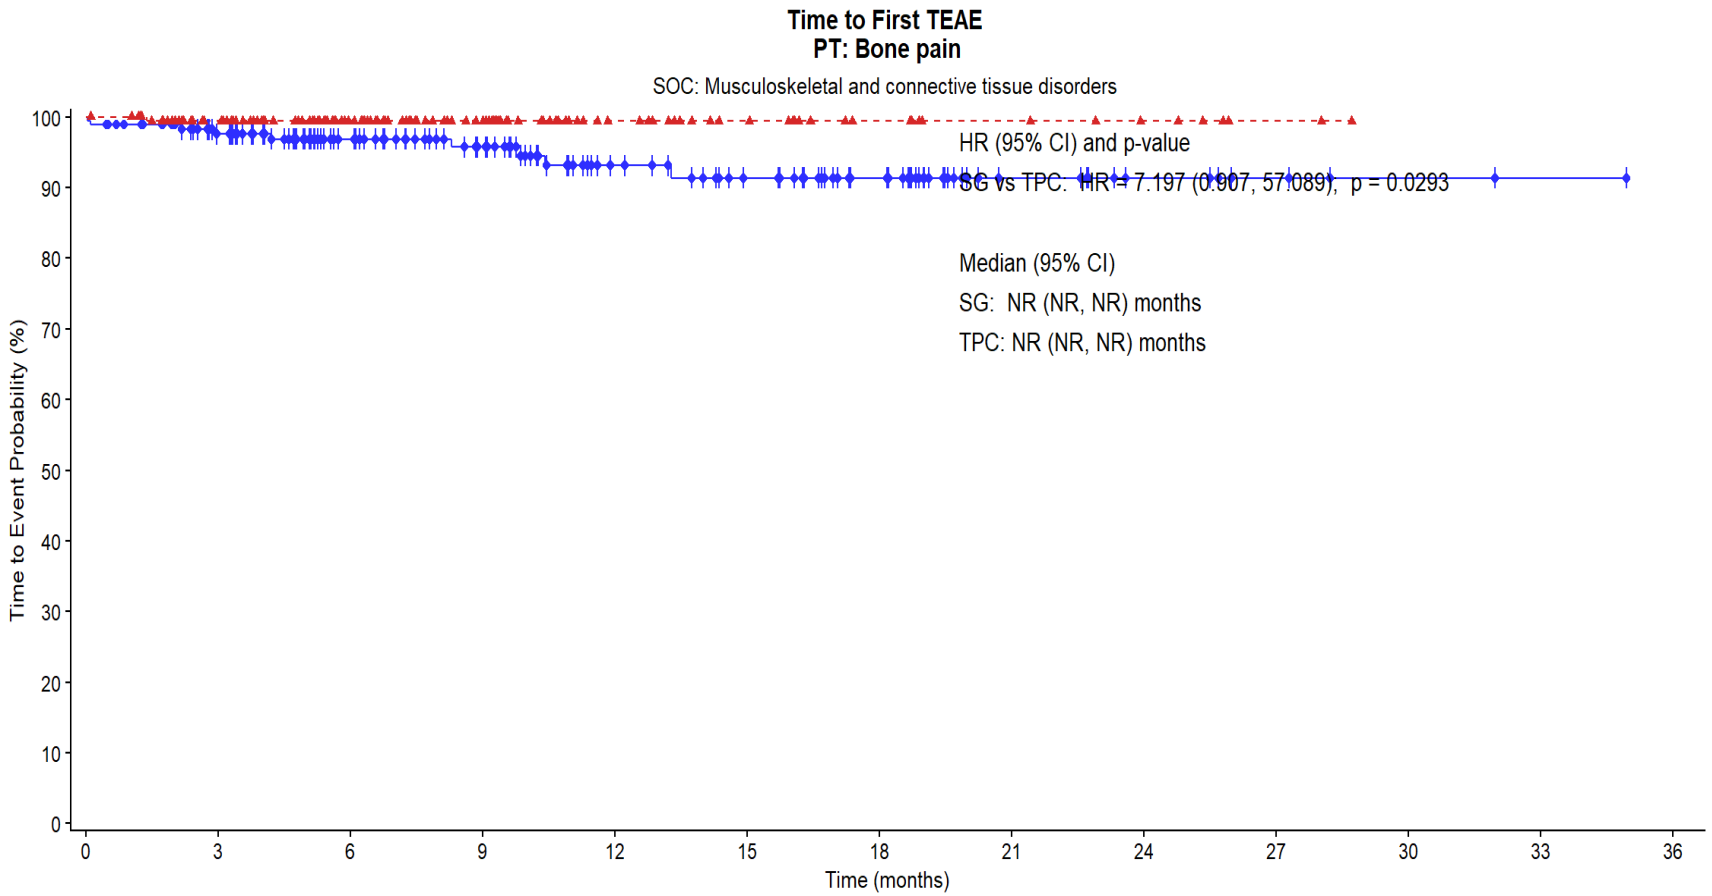
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.82. Figure 1.1.83: Kaplan Meier Plot of Time to First TEAE by PT Hyponatraemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



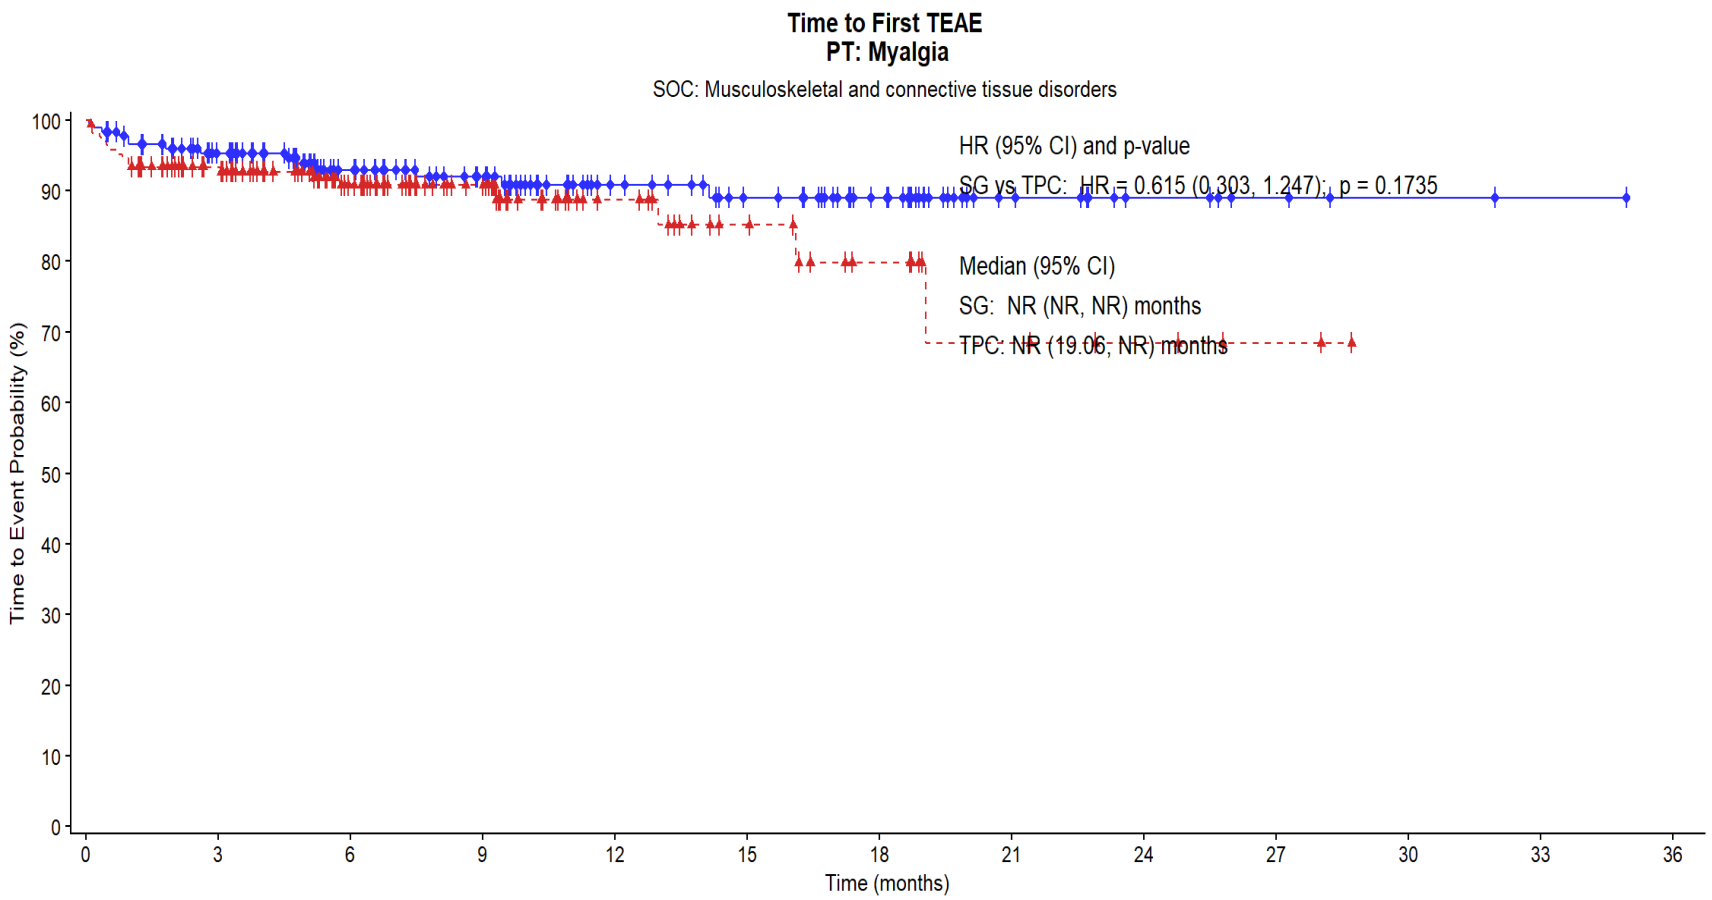
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.83. Figure 1.1.84: Kaplan Meier Plot of Time to First TEAE by PT Arthralgia — mSAF — Excluding patients preselected to receive nab-paclitaxel



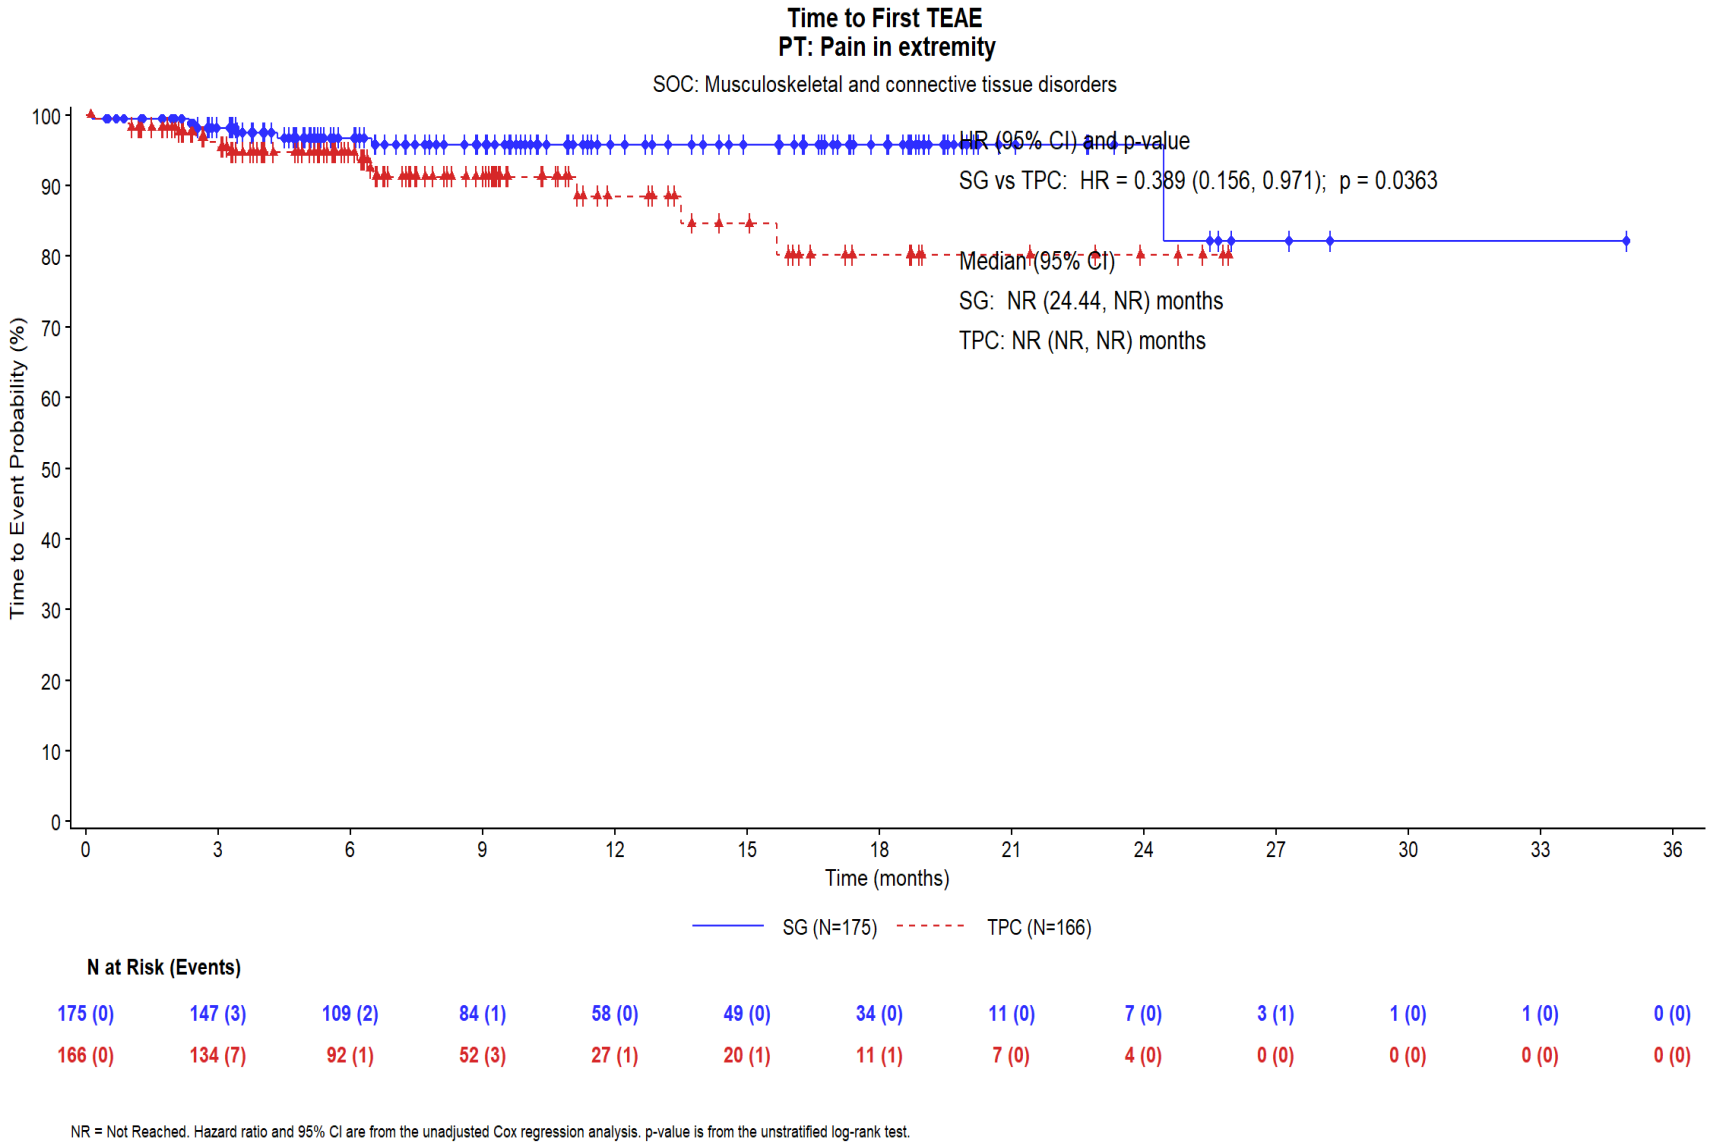
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.84. Figure 1.1.85: Kaplan Meier Plot of Time to First TEAE by PT Back pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.85. Figure 1.1.86: Kaplan Meier Plot of Time to First TEAE by PT Bone pain — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.86. Figure 1.1.87: Kaplan Meier Plot of Time to First TEAE by PT Myalgia — mSAF — Excluding patients preselected to receive nab-paclitaxel

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

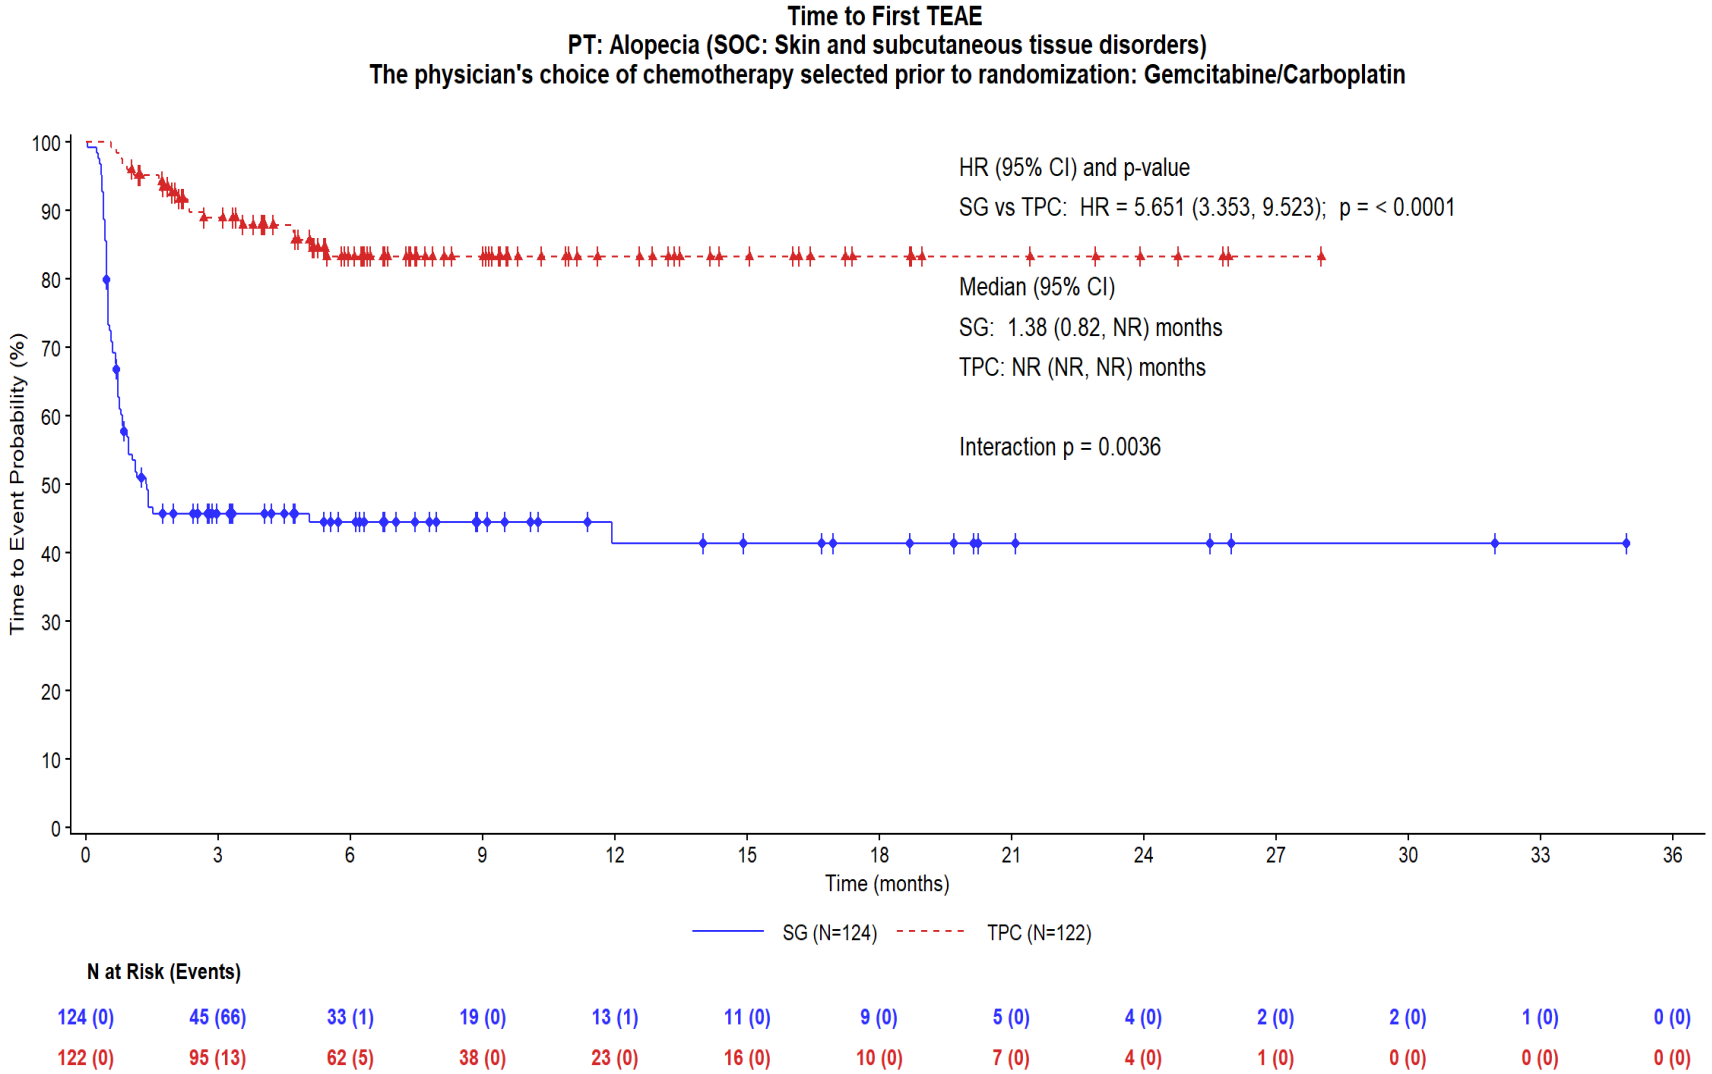
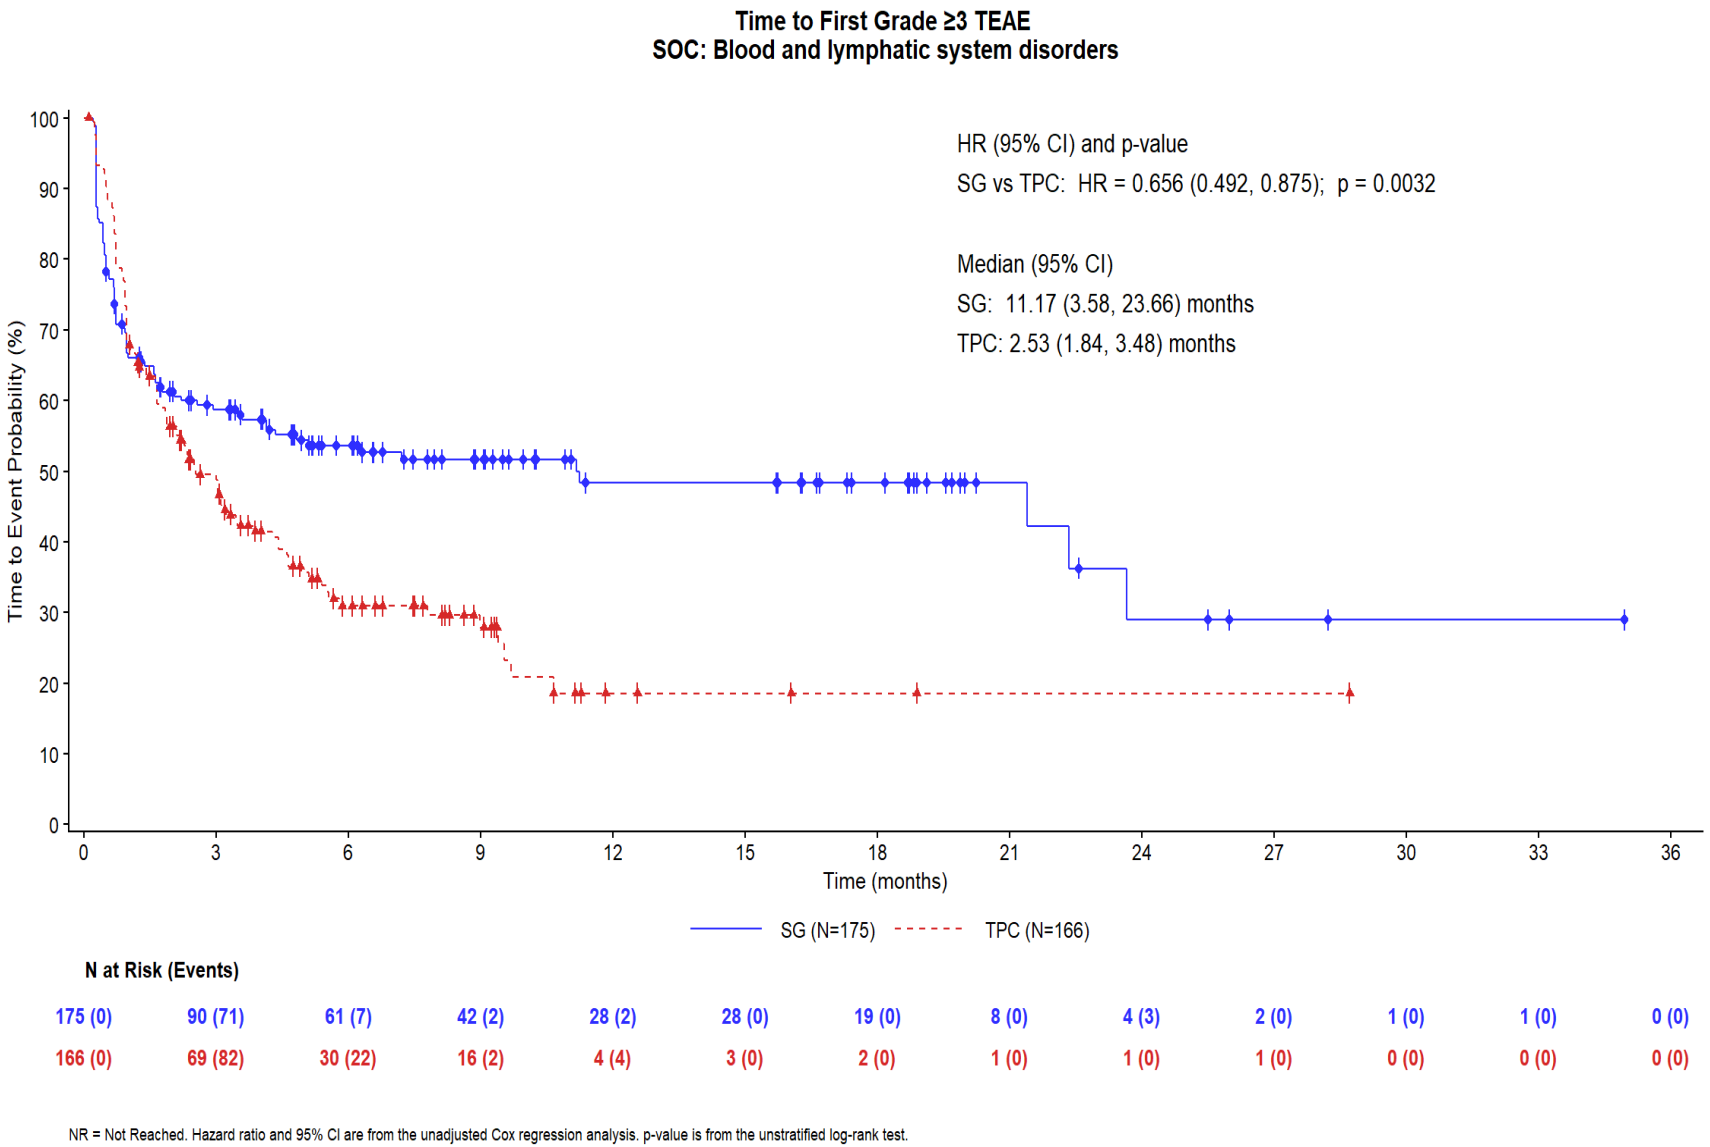
8.126. Figure 1.1.127: Kaplan Meier Plot of Time to First TEAE by PT Alopecia (SOC Skin and subcutaneous tissue disorders) Age group greater than or equal to 65 — mSAF — Excluding patients preselected to receive nab-paclitaxel



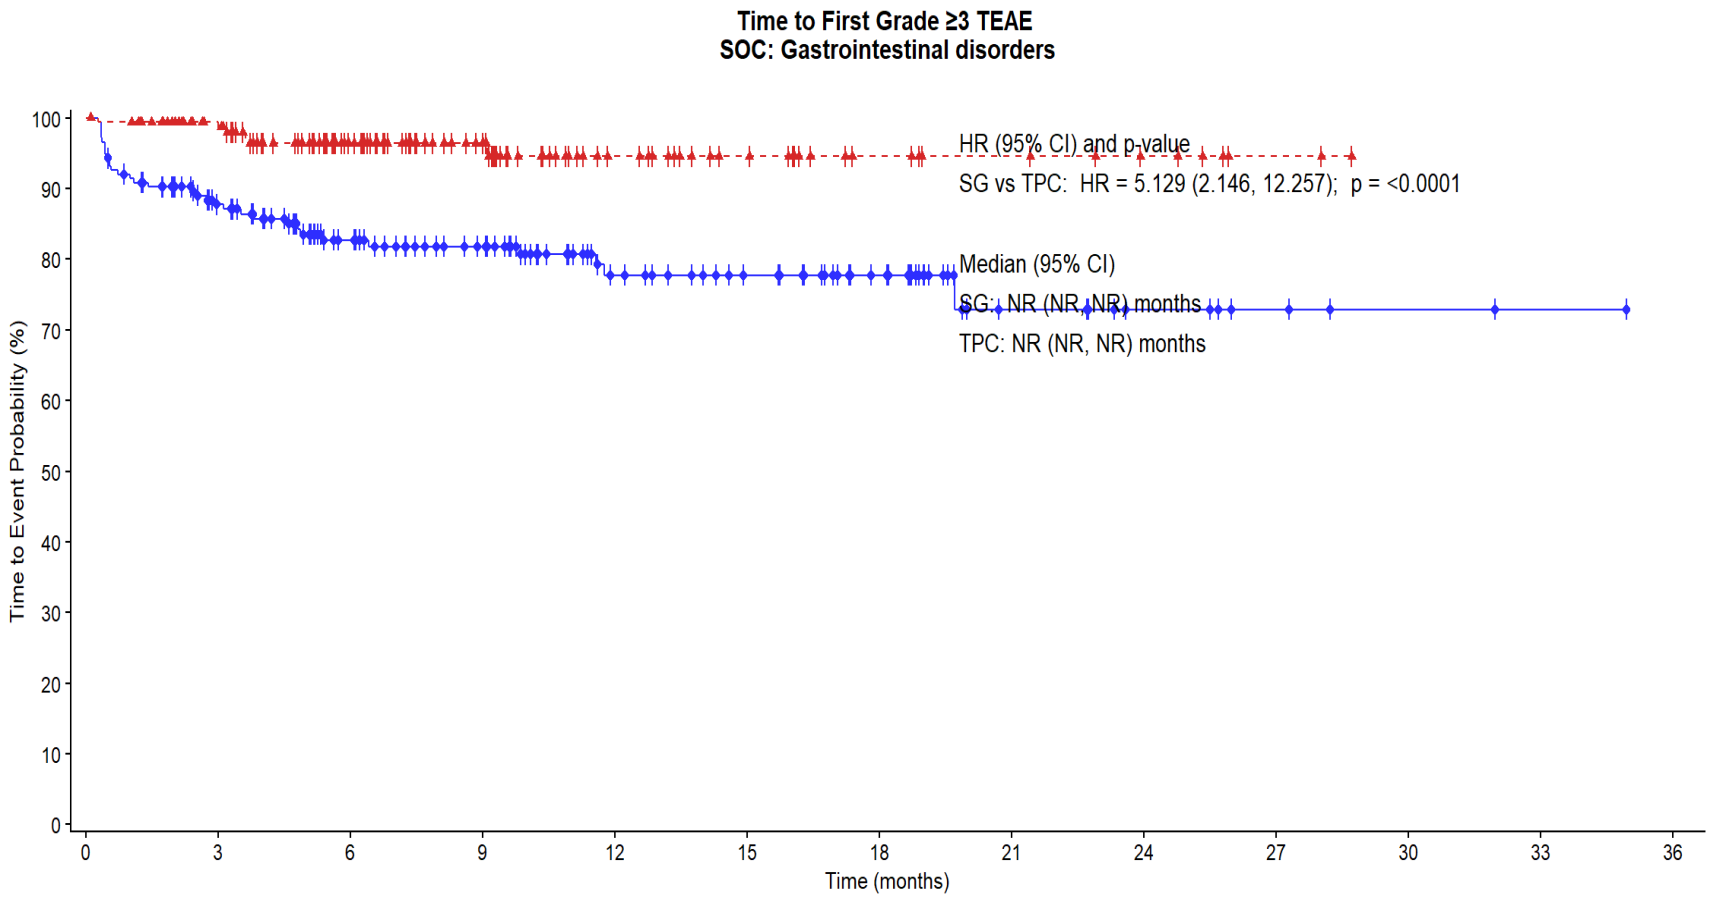
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.127. Figure 1.1.128: Kaplan Meier Plot of Time to First TEAE by PT Alopecia (SOC Skin and subcutaneous tissue disorders) The physician s choice of chemotherapy selected prior to randomization Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



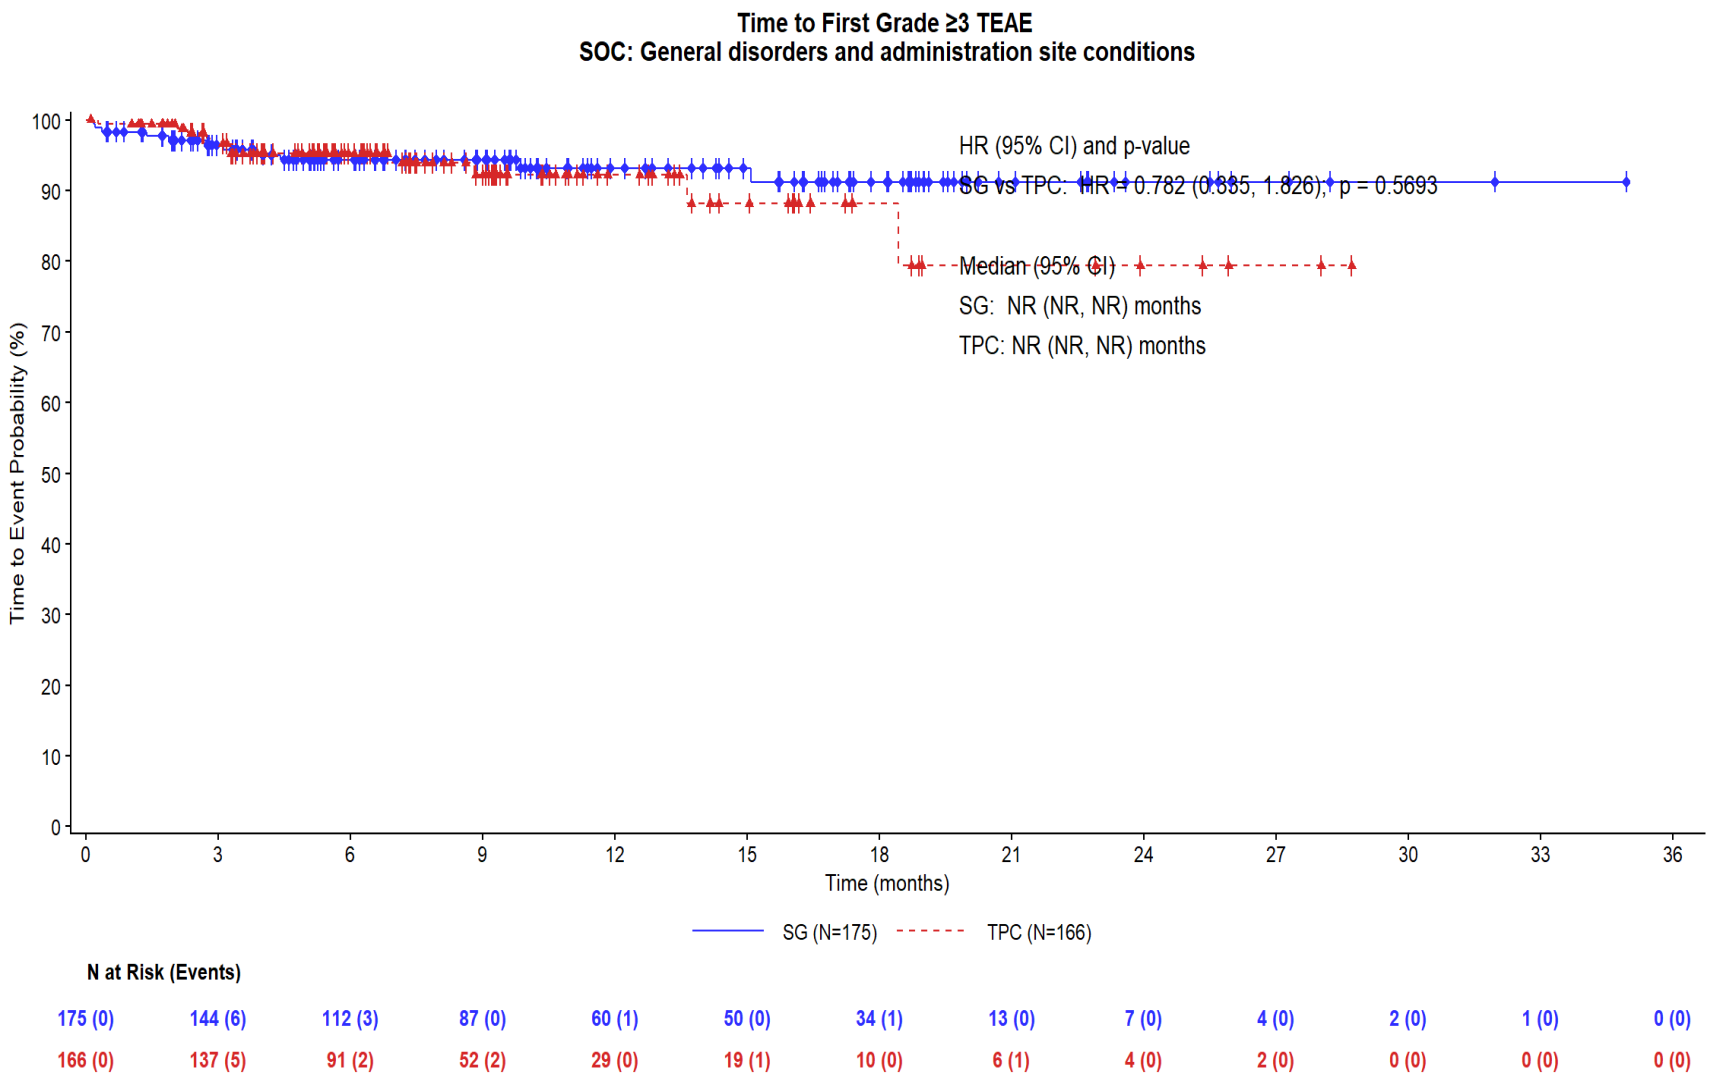
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.128. Figure 1.1.129: Kaplan Meier Plot of Time to First TEAE by PT Alopecia (SOC Skin and subcutaneous tissue disorders) The physician s choice of chemotherapy selected prior to randomization Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



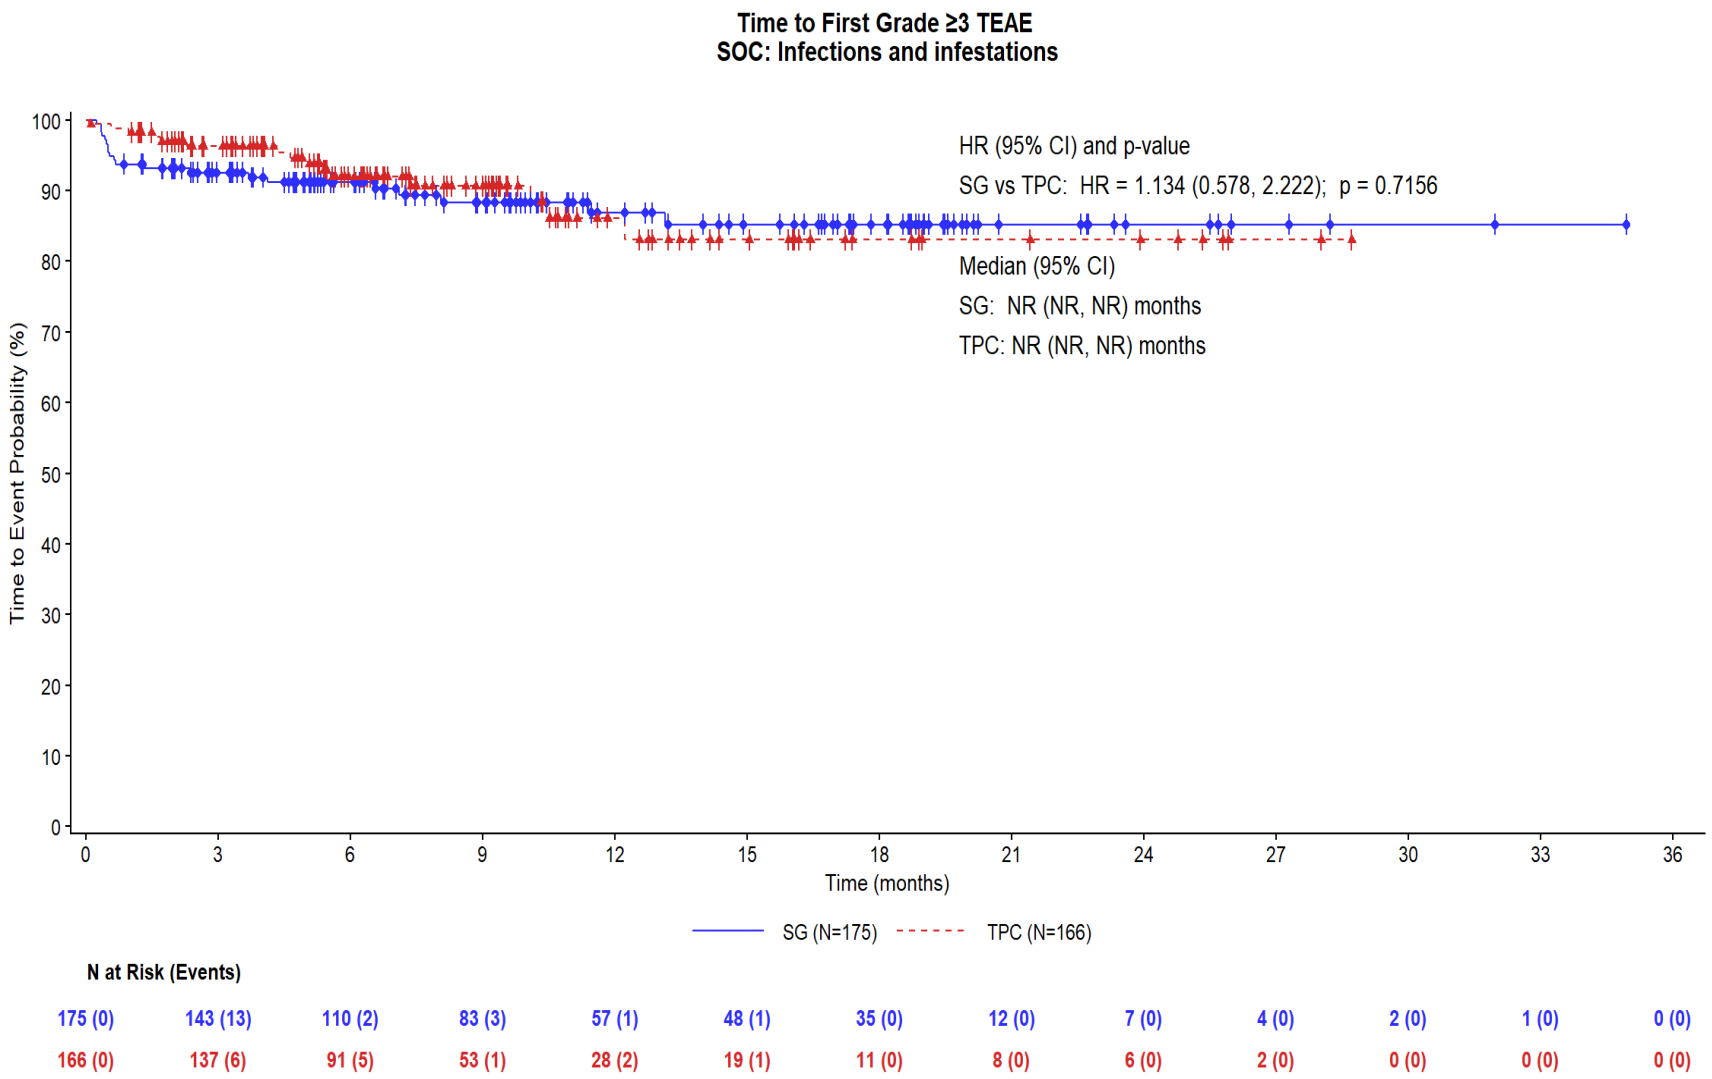
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.129. Figure 1.1.130: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Blood and lymphatic system disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



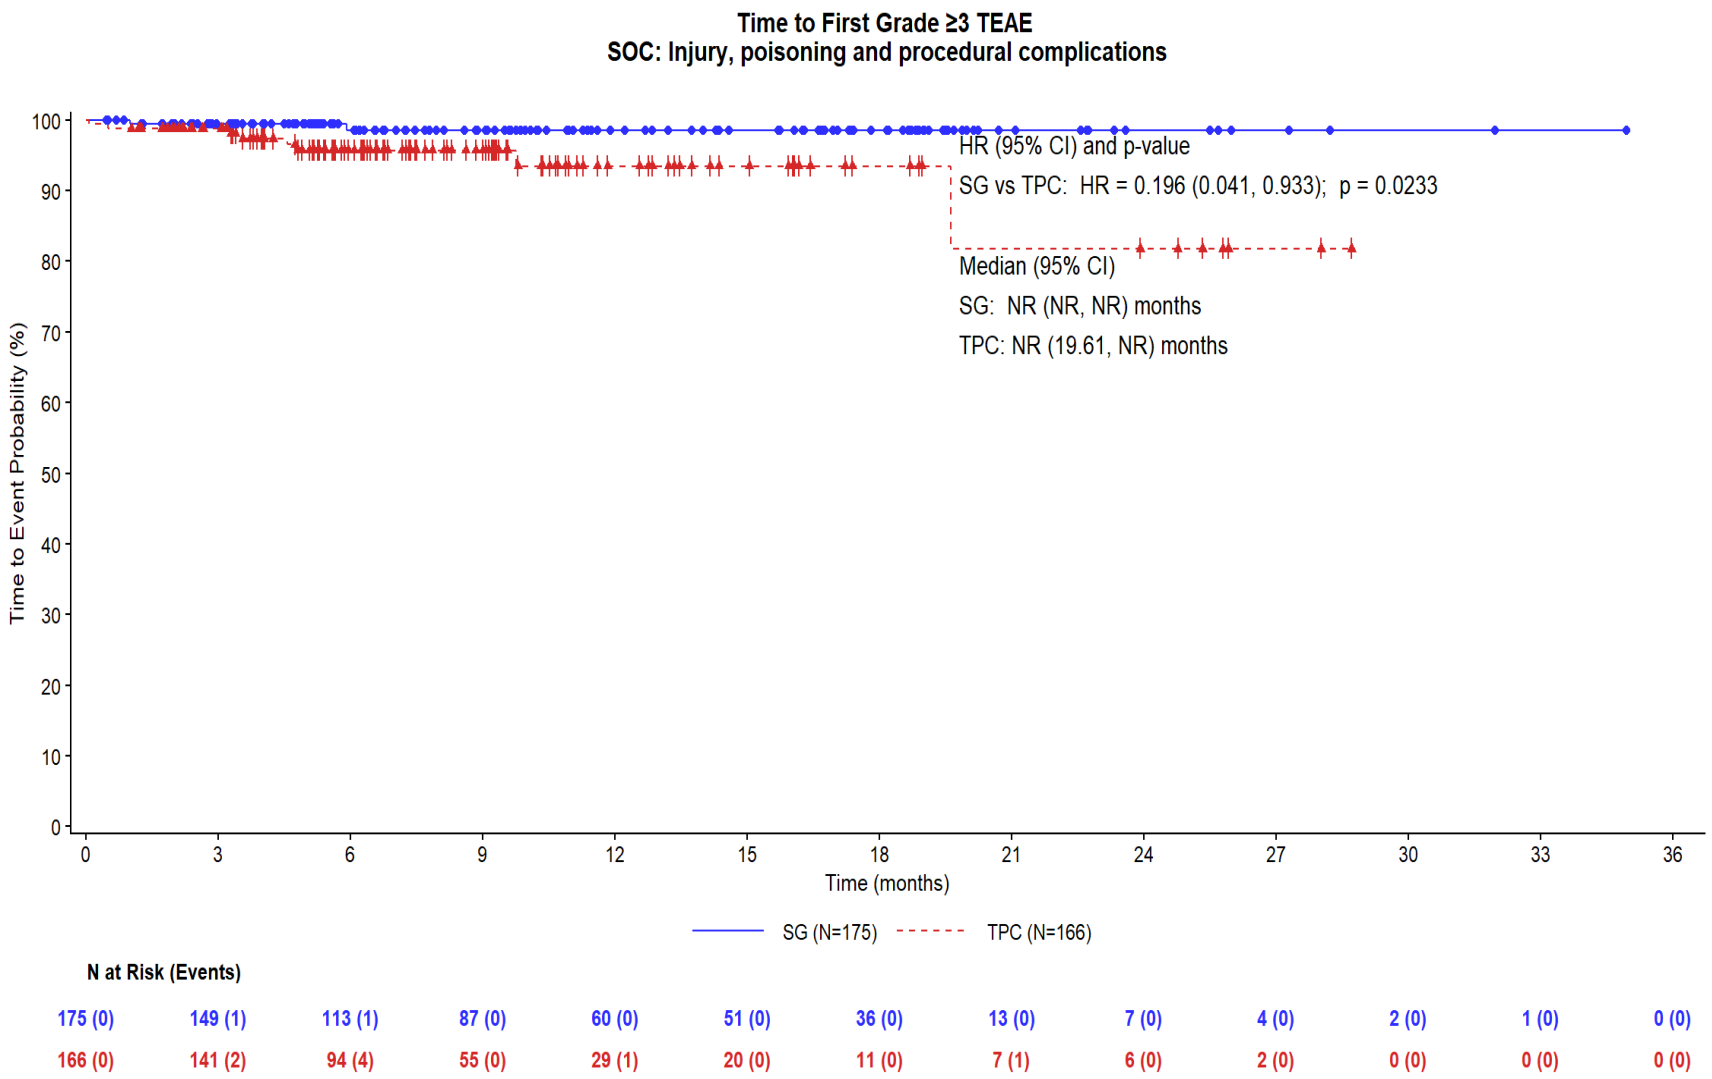
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.130. Figure 1.1.131: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Gastrointestinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



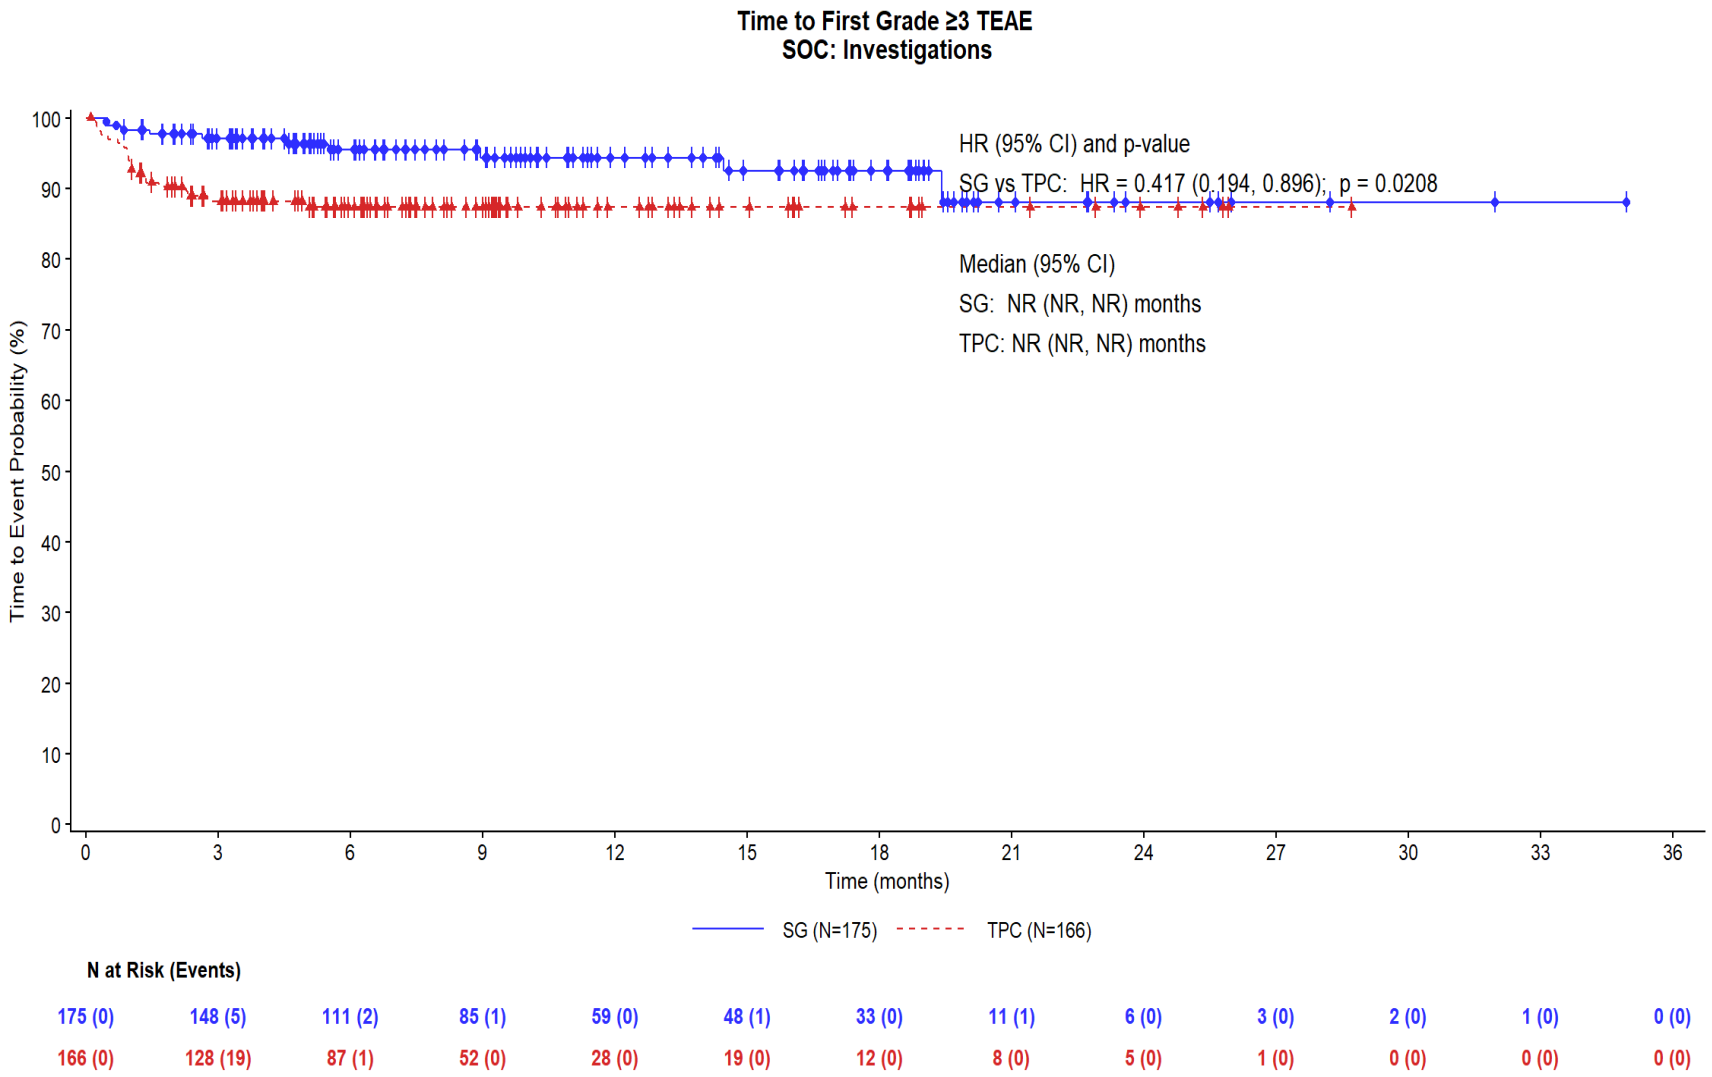
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.131. Figure 1.1.132: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC General disorders and administration site conditions — mSAF — Excluding patients preselected to receive nab-paclitaxel



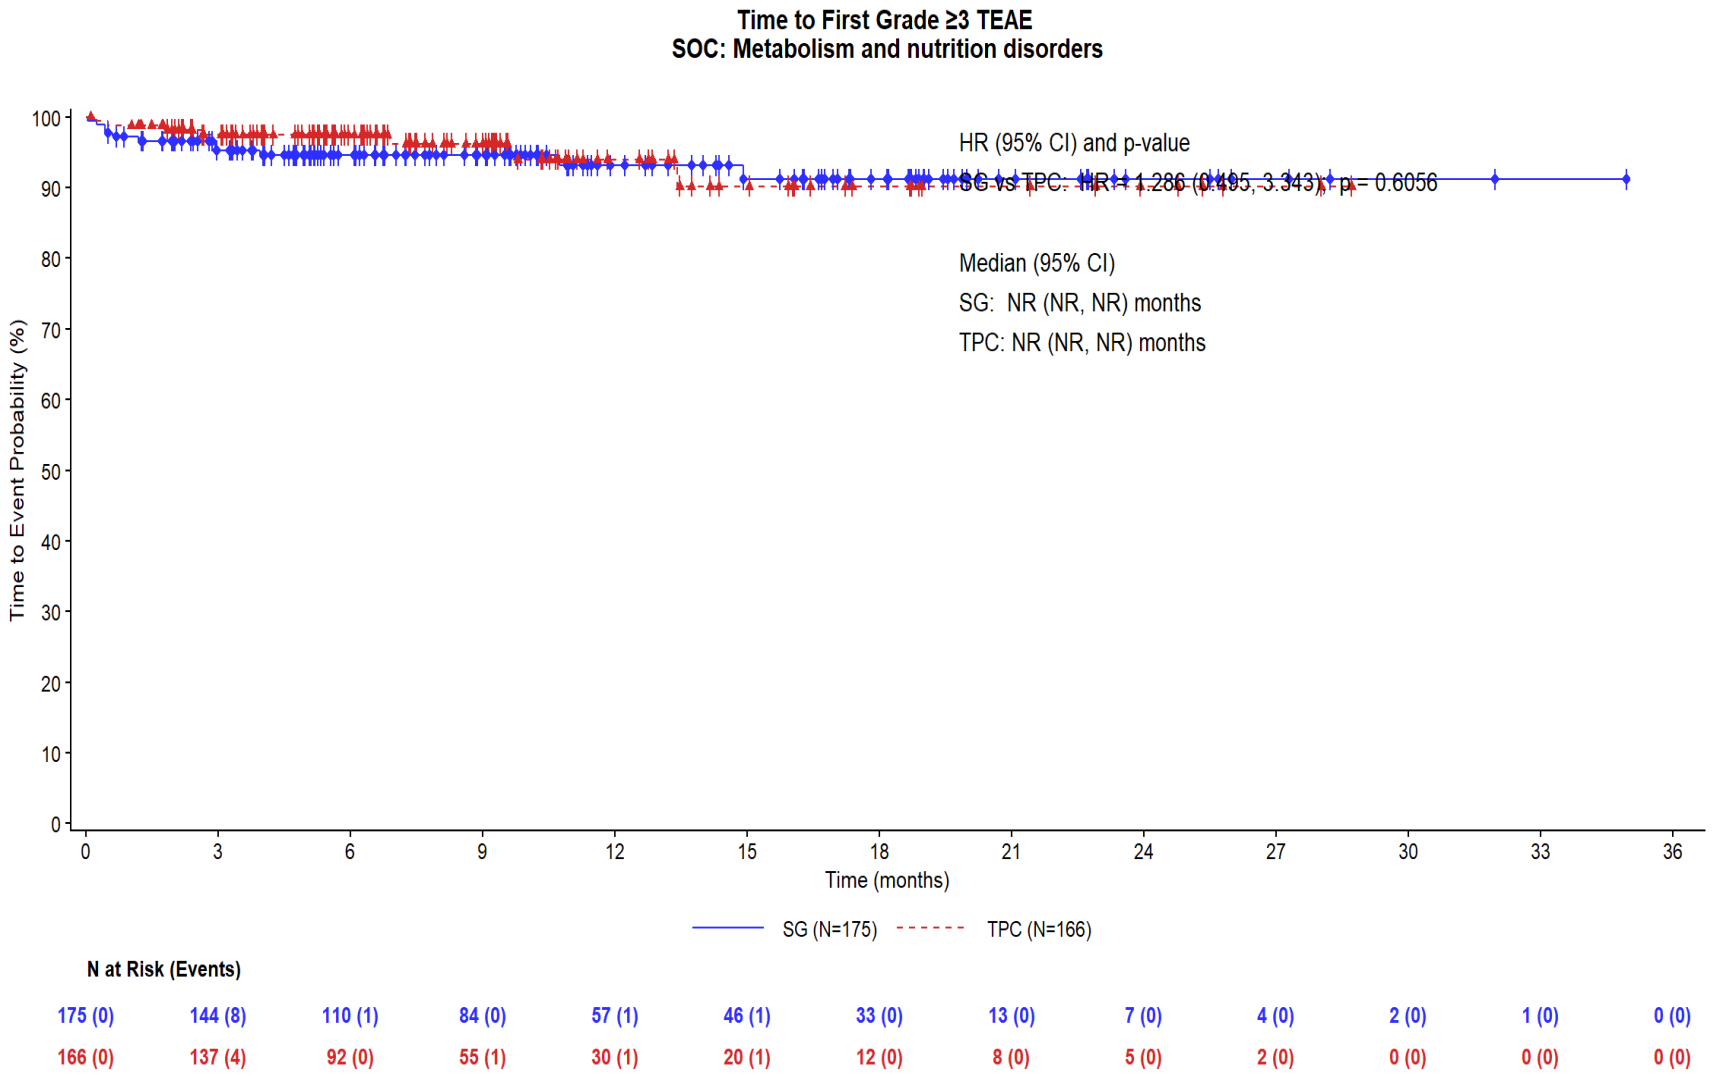
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.132. Figure 1.1.133: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Infections and infestations — mSAF — Excluding patients preselected to receive nab-paclitaxel



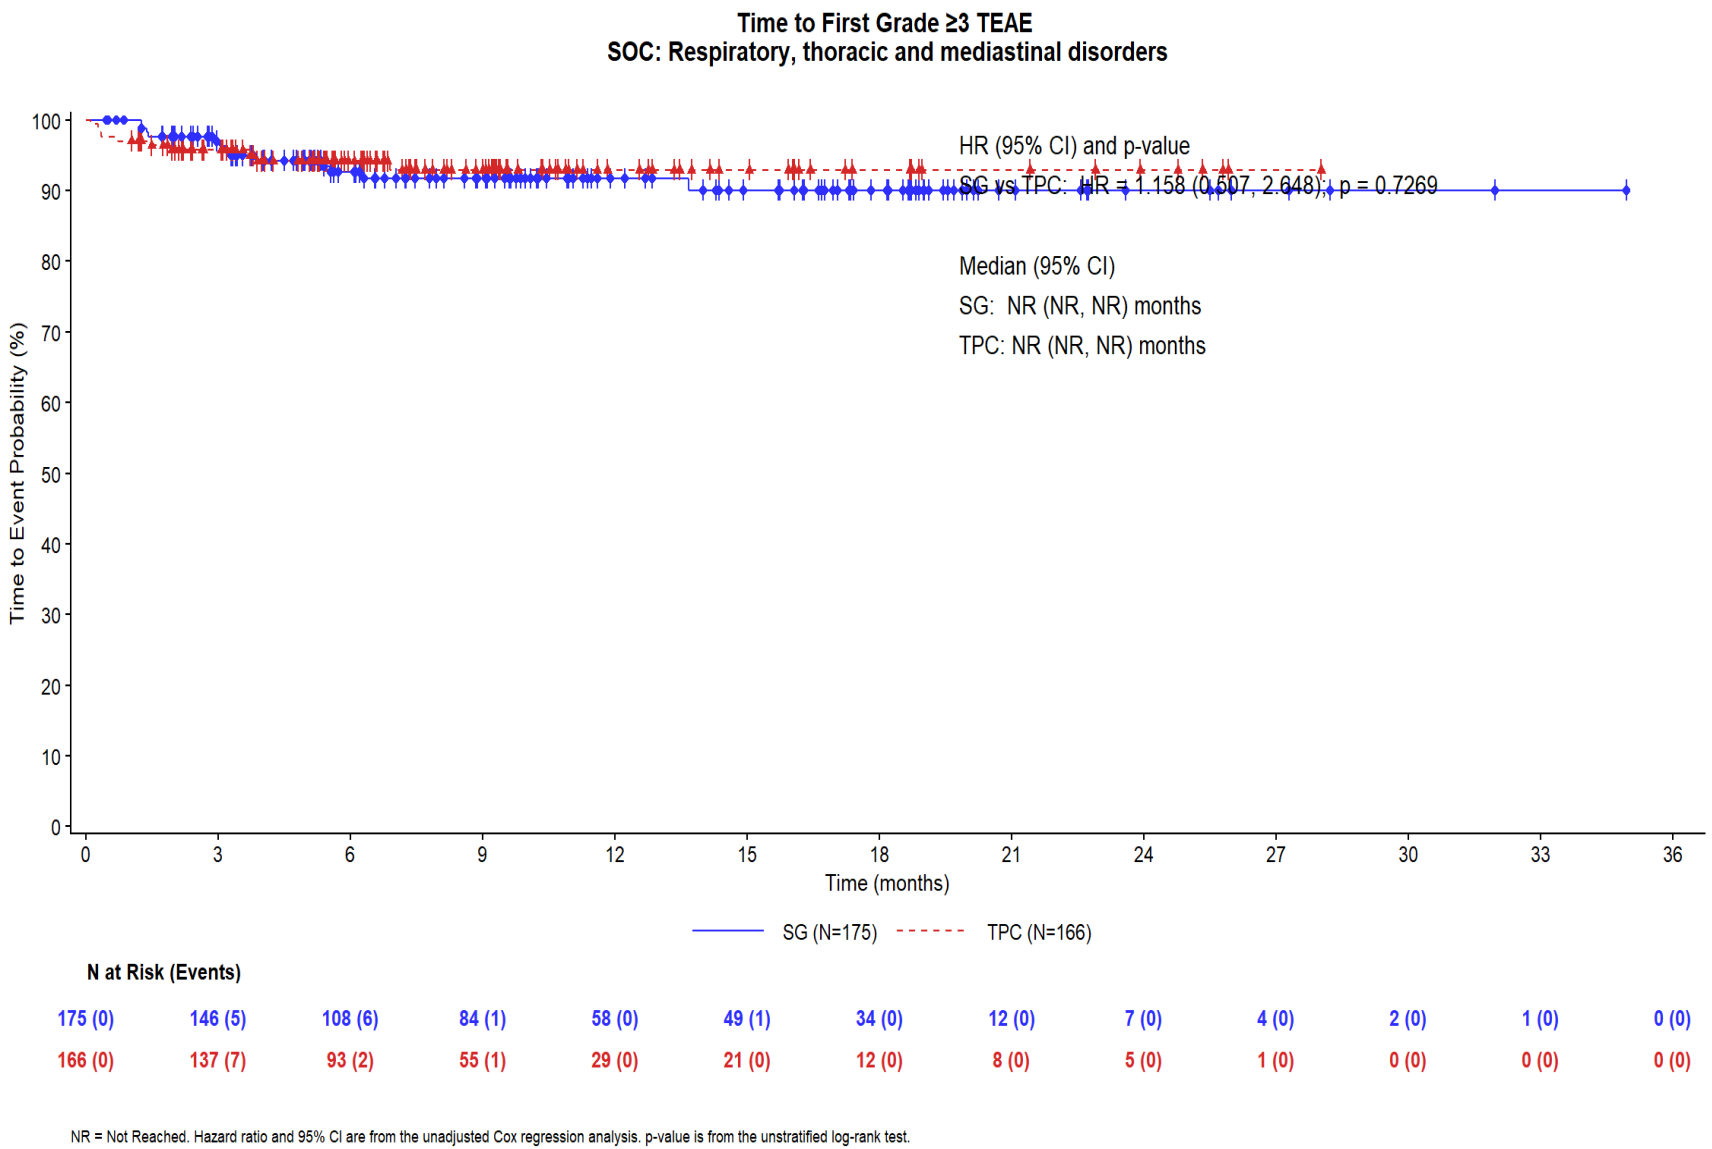
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.133. Figure 1.1.134: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Injury poisoning and procedural complications — mSAF — Excluding patients preselected to receive nab-paclitaxel



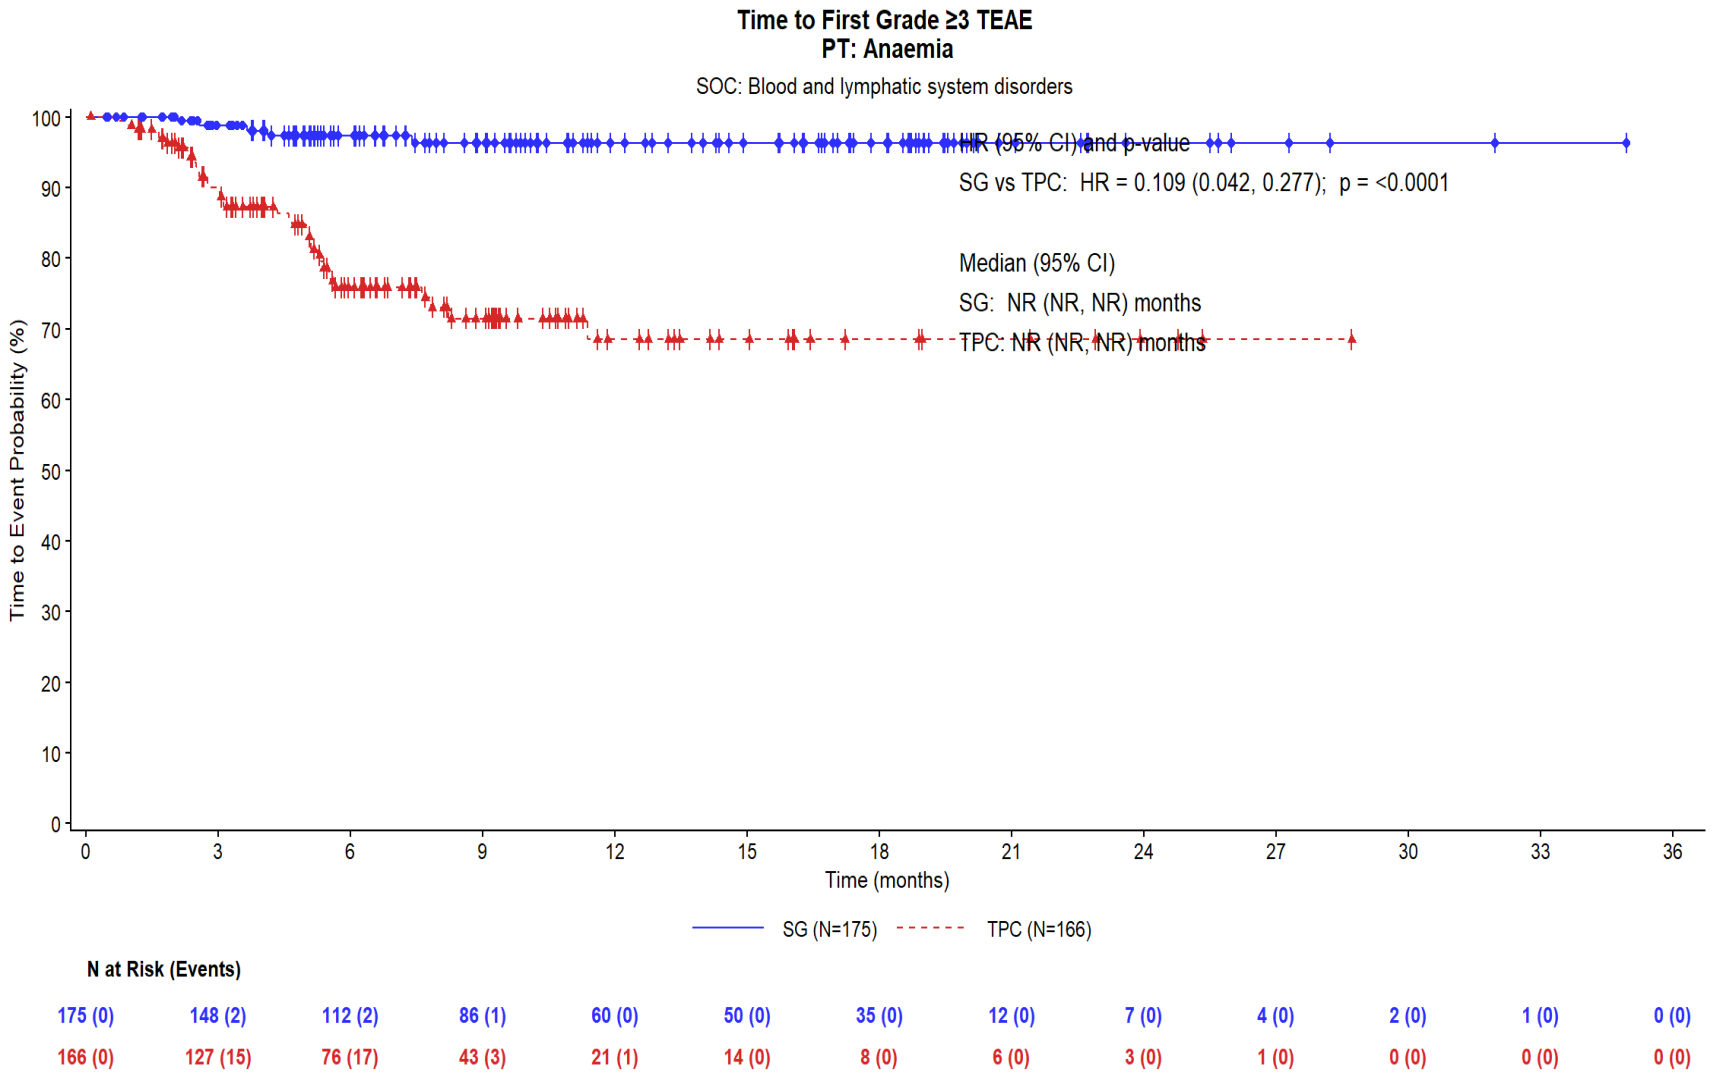
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.134. Figure 1.1.135: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Investigations — mSAF — Excluding patients preselected to receive nab-paclitaxel



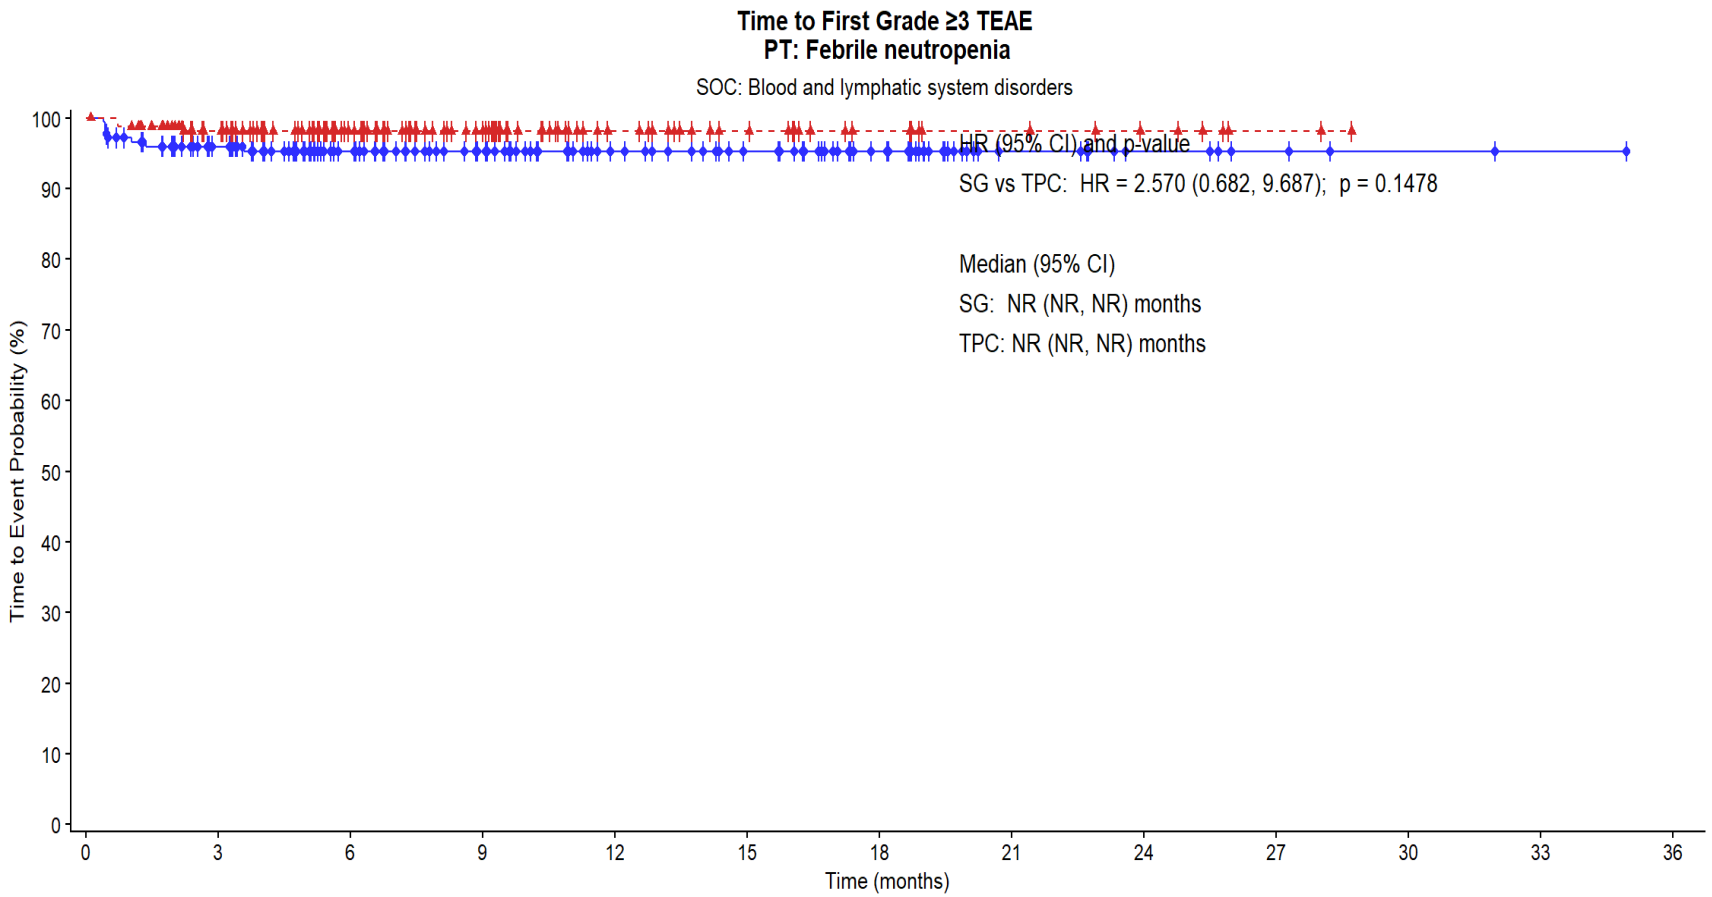
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.135. Figure 1.1.136: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Metabolism and nutrition disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



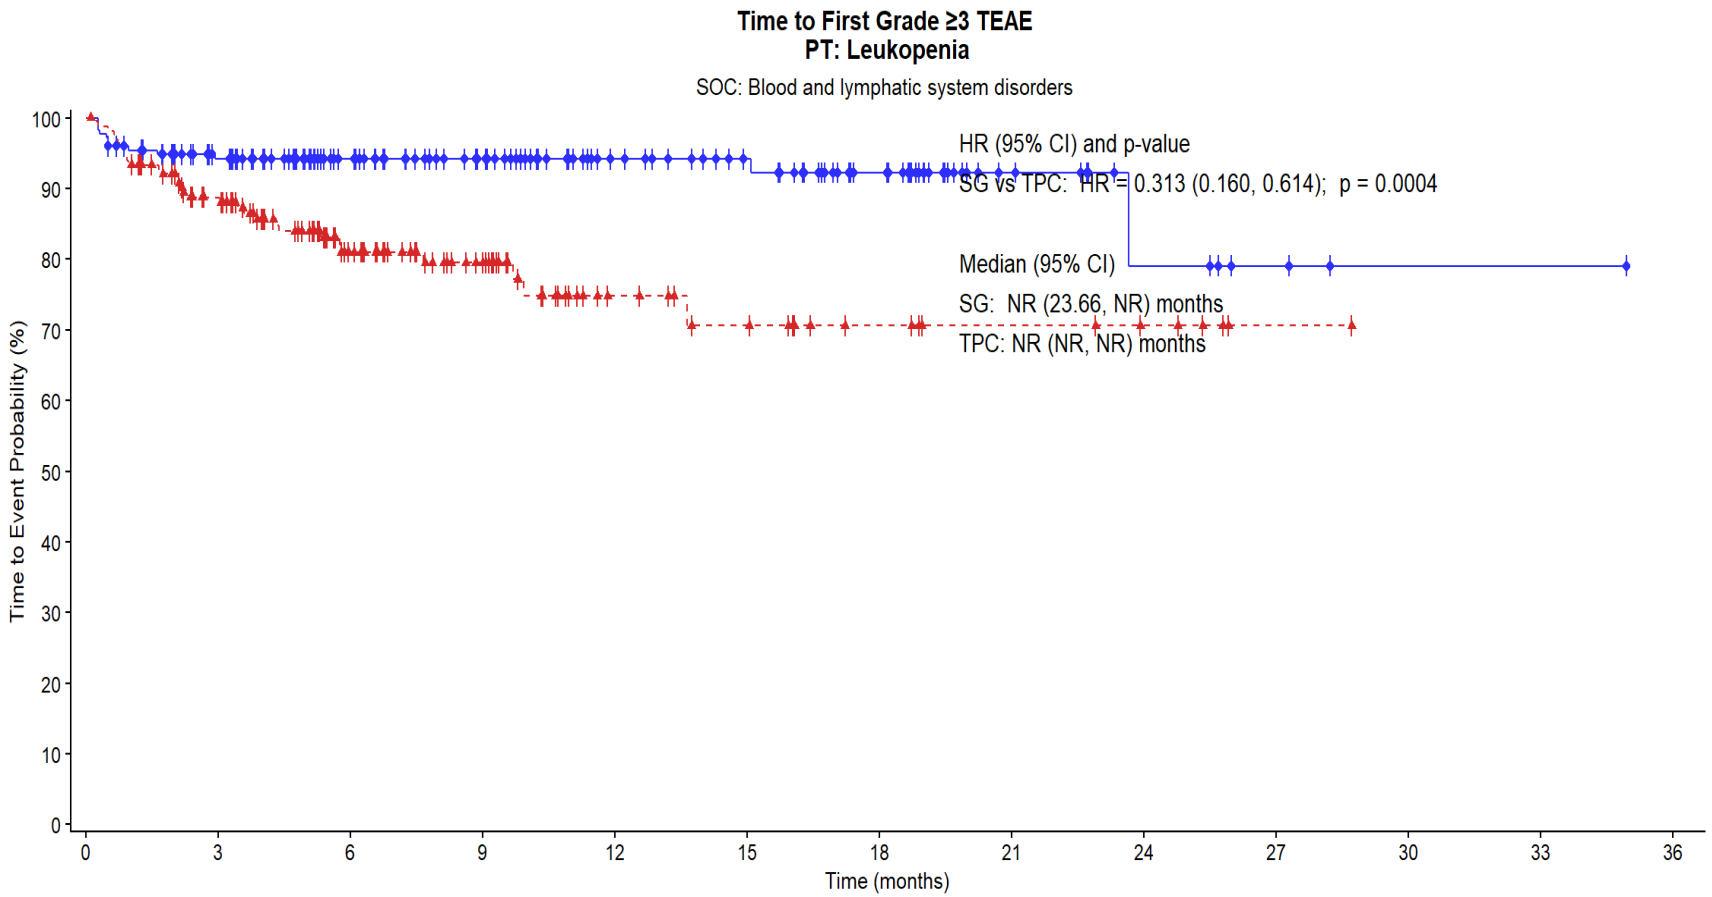
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.136. Figure 1.1.137: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by SOC Respiratory thoracic and mediastinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



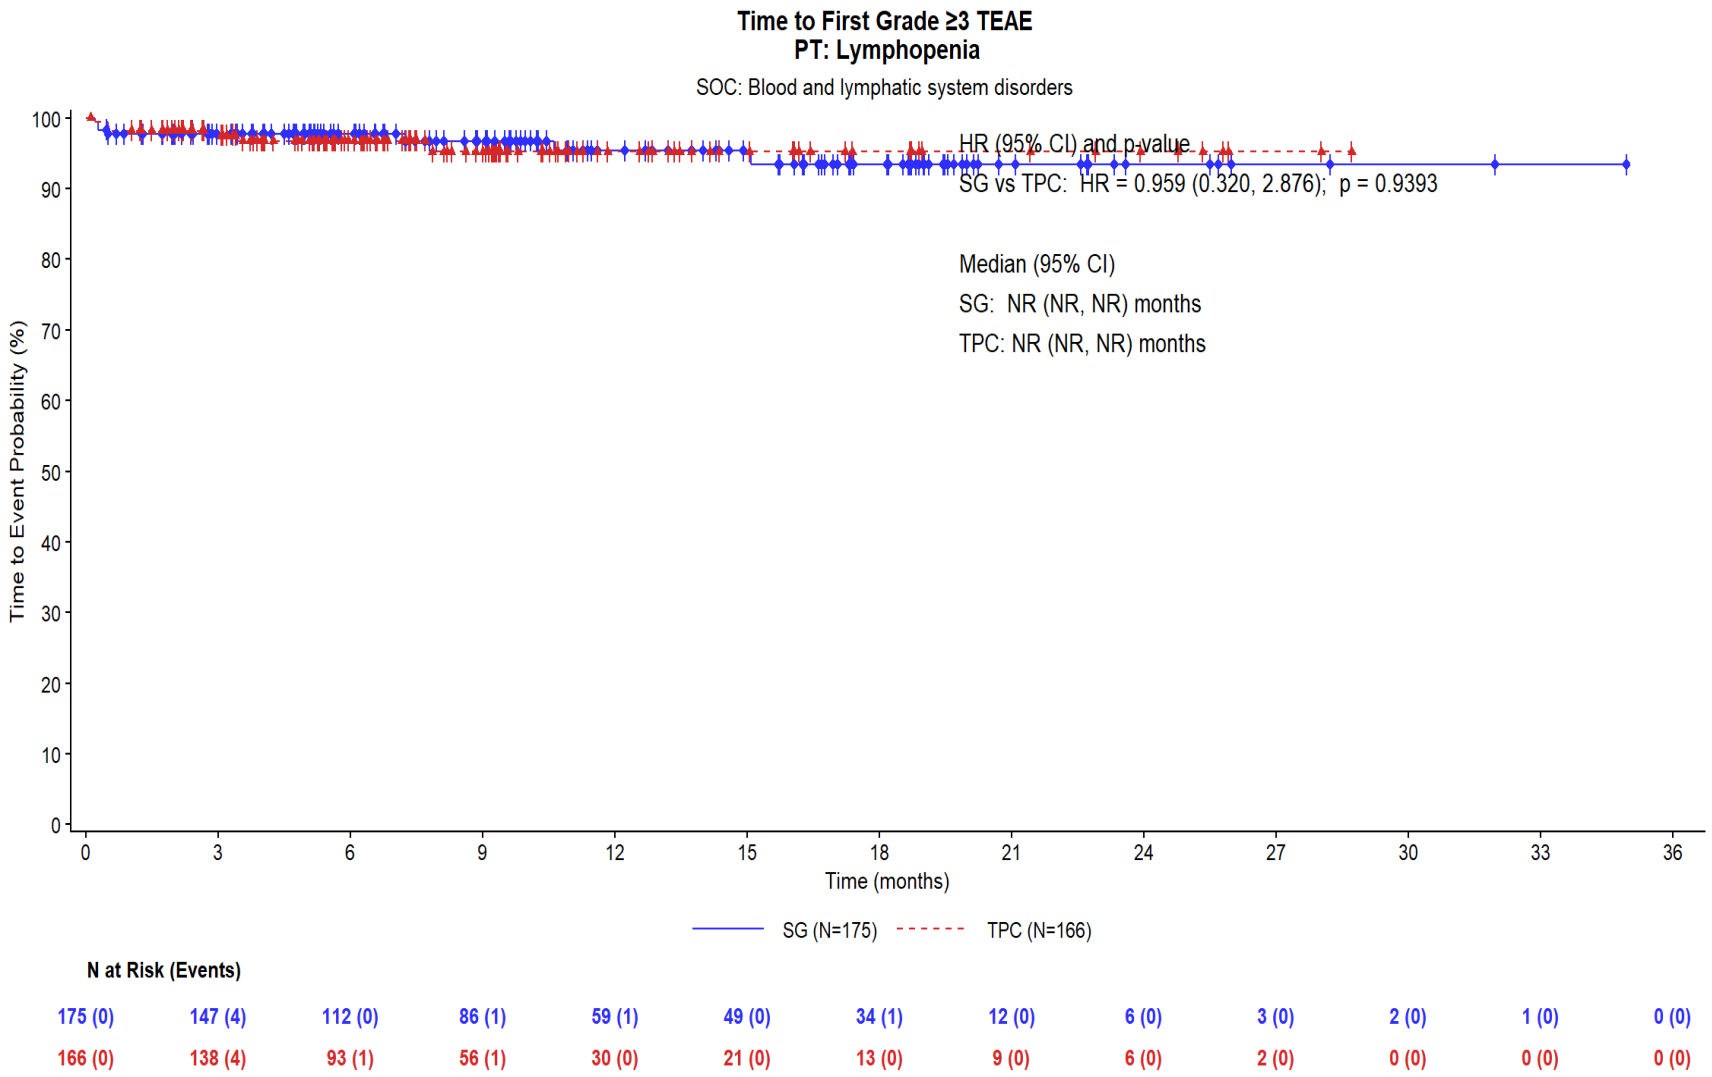
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.137. Figure 1.1.138: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Anaemia — mSAF — Excluding patients preselected to receive nab-paclitaxel



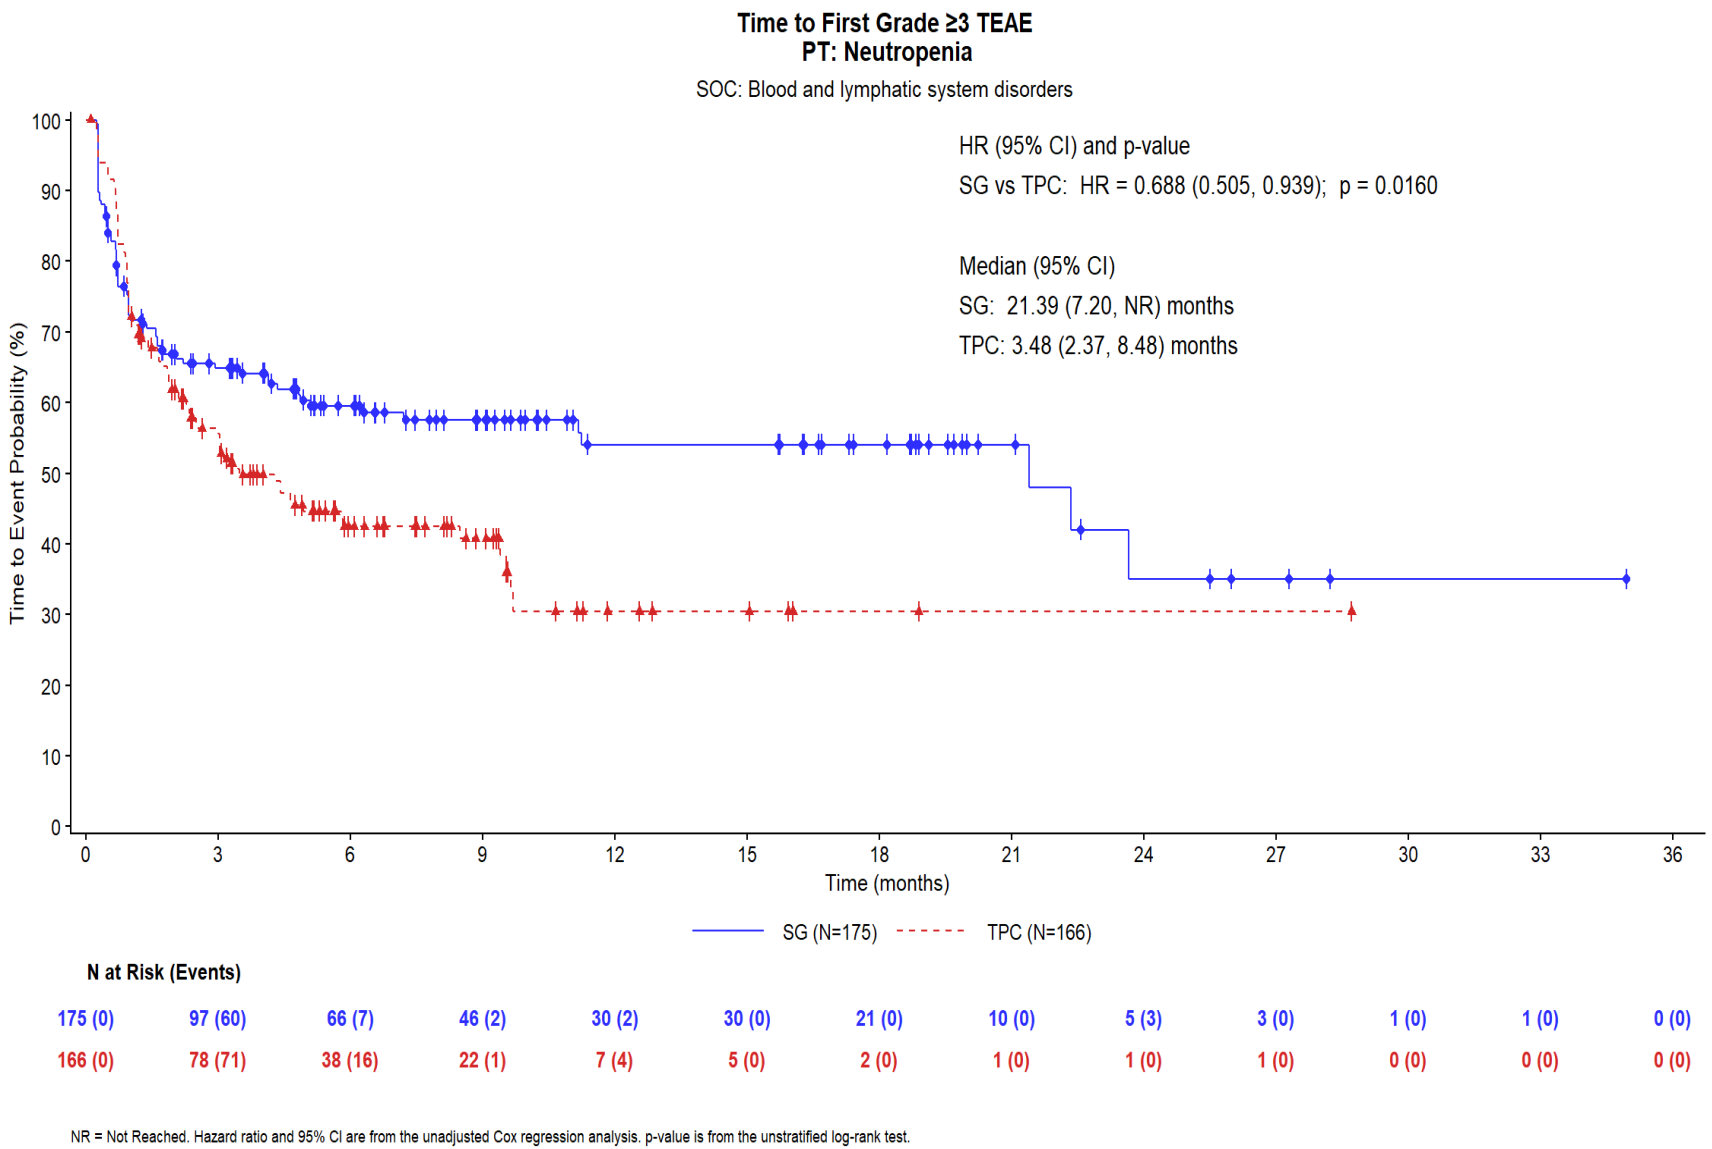
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.138. Figure 1.1.139: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Febrile neutropenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



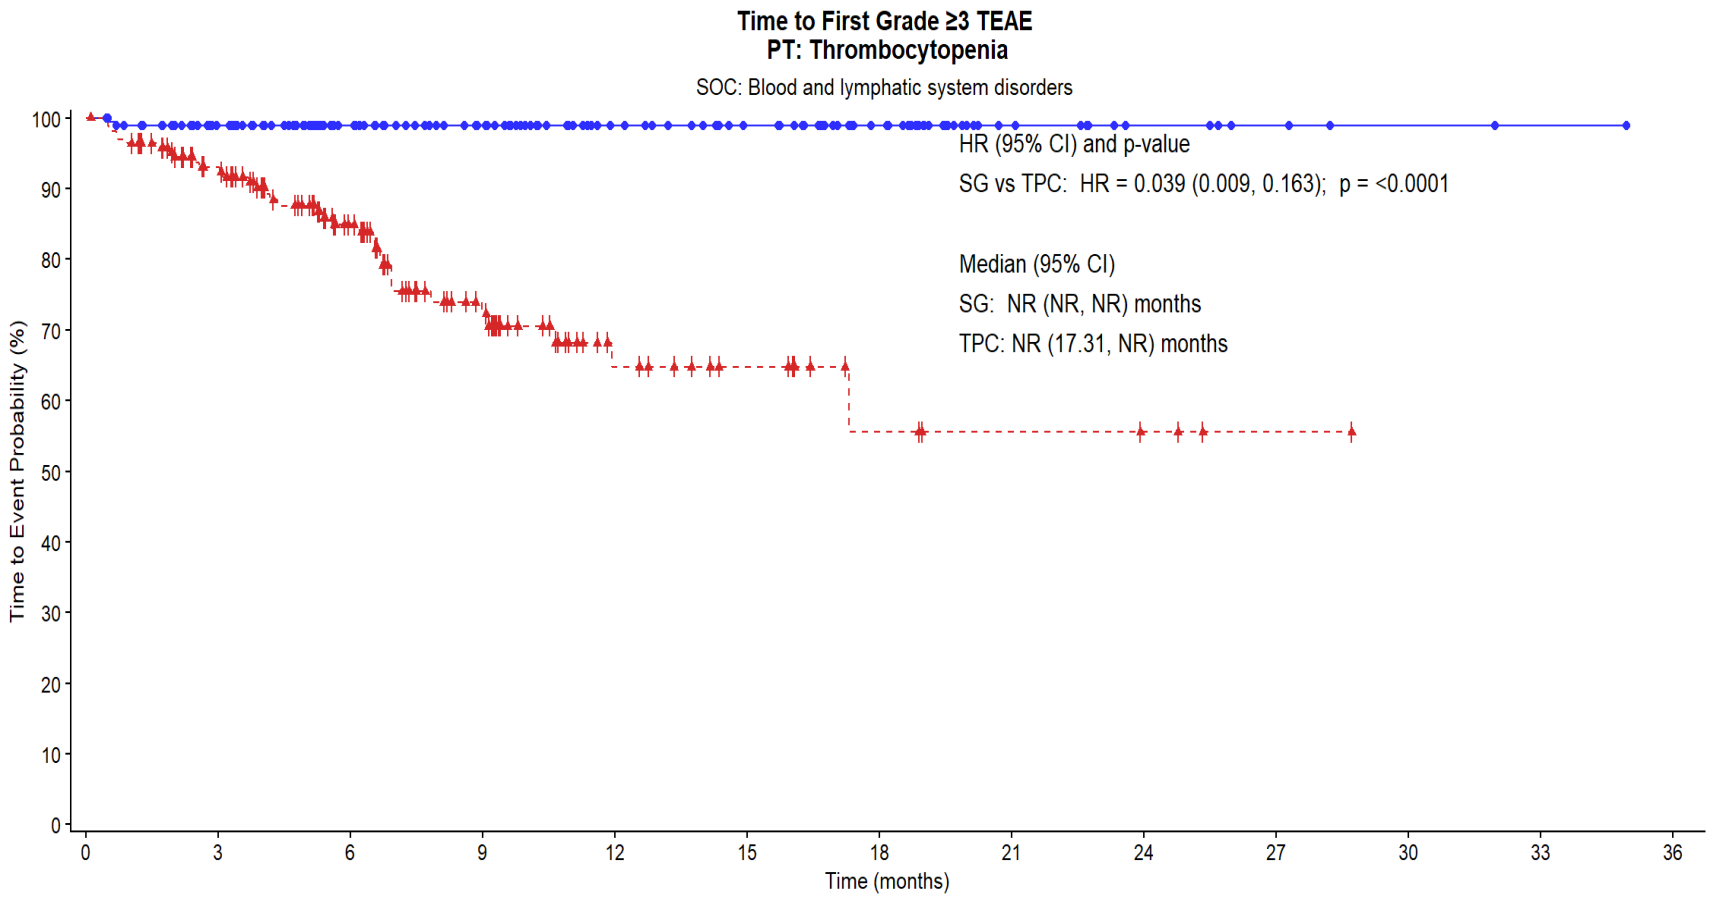
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.139. Figure 1.1.140: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Leukopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



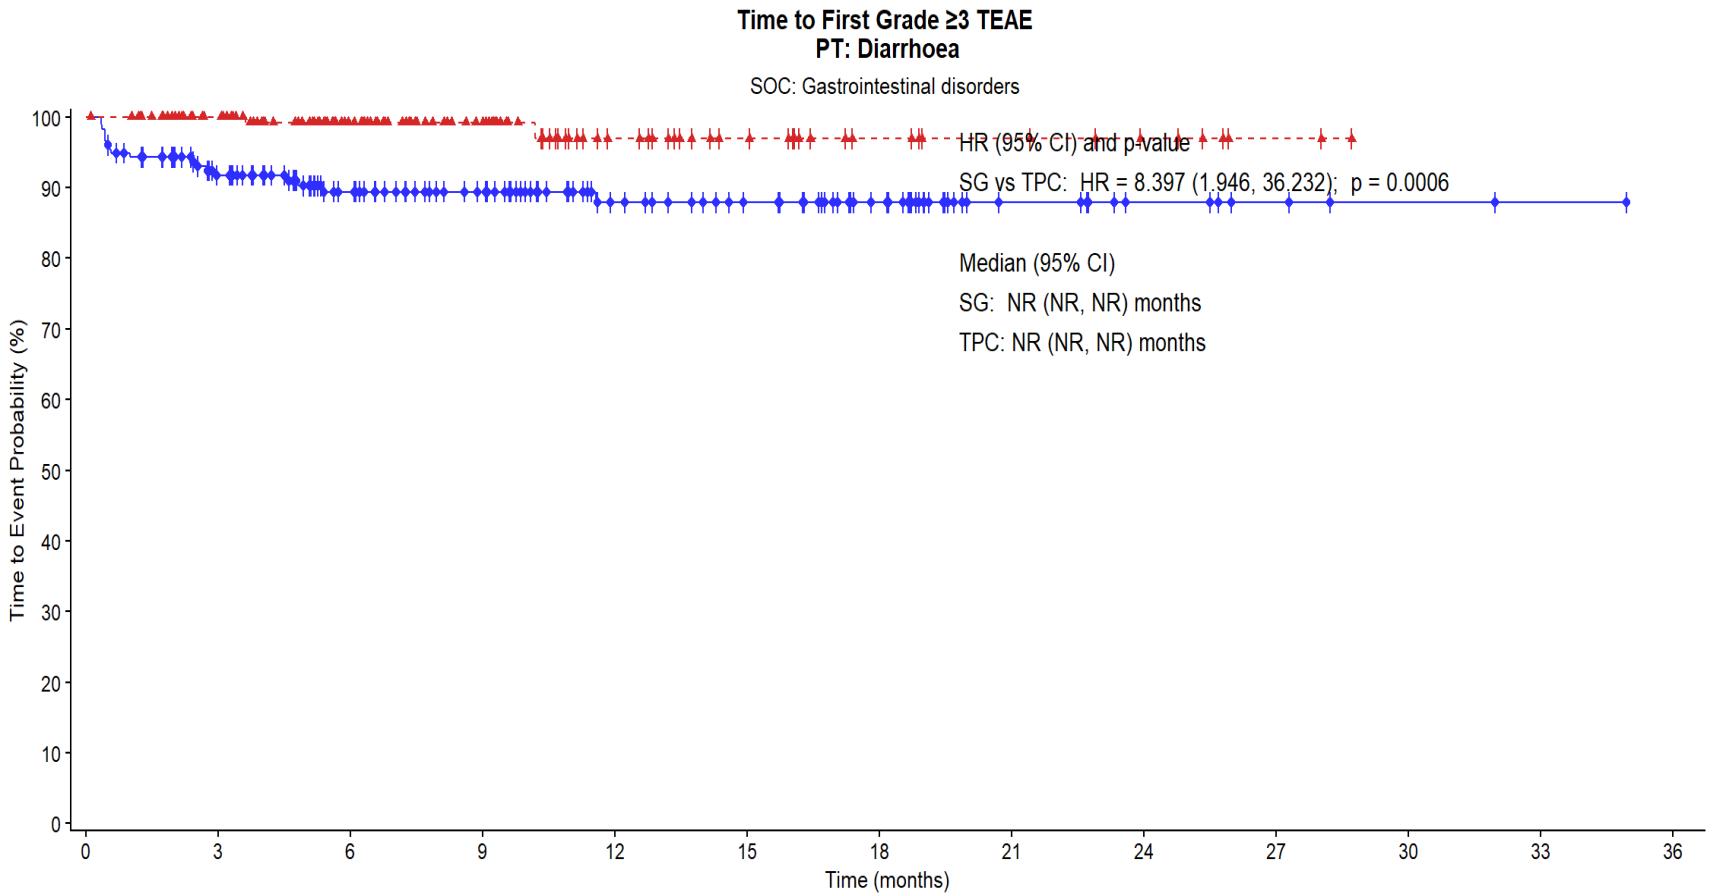
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.140. Figure 1.1.141: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Lymphopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



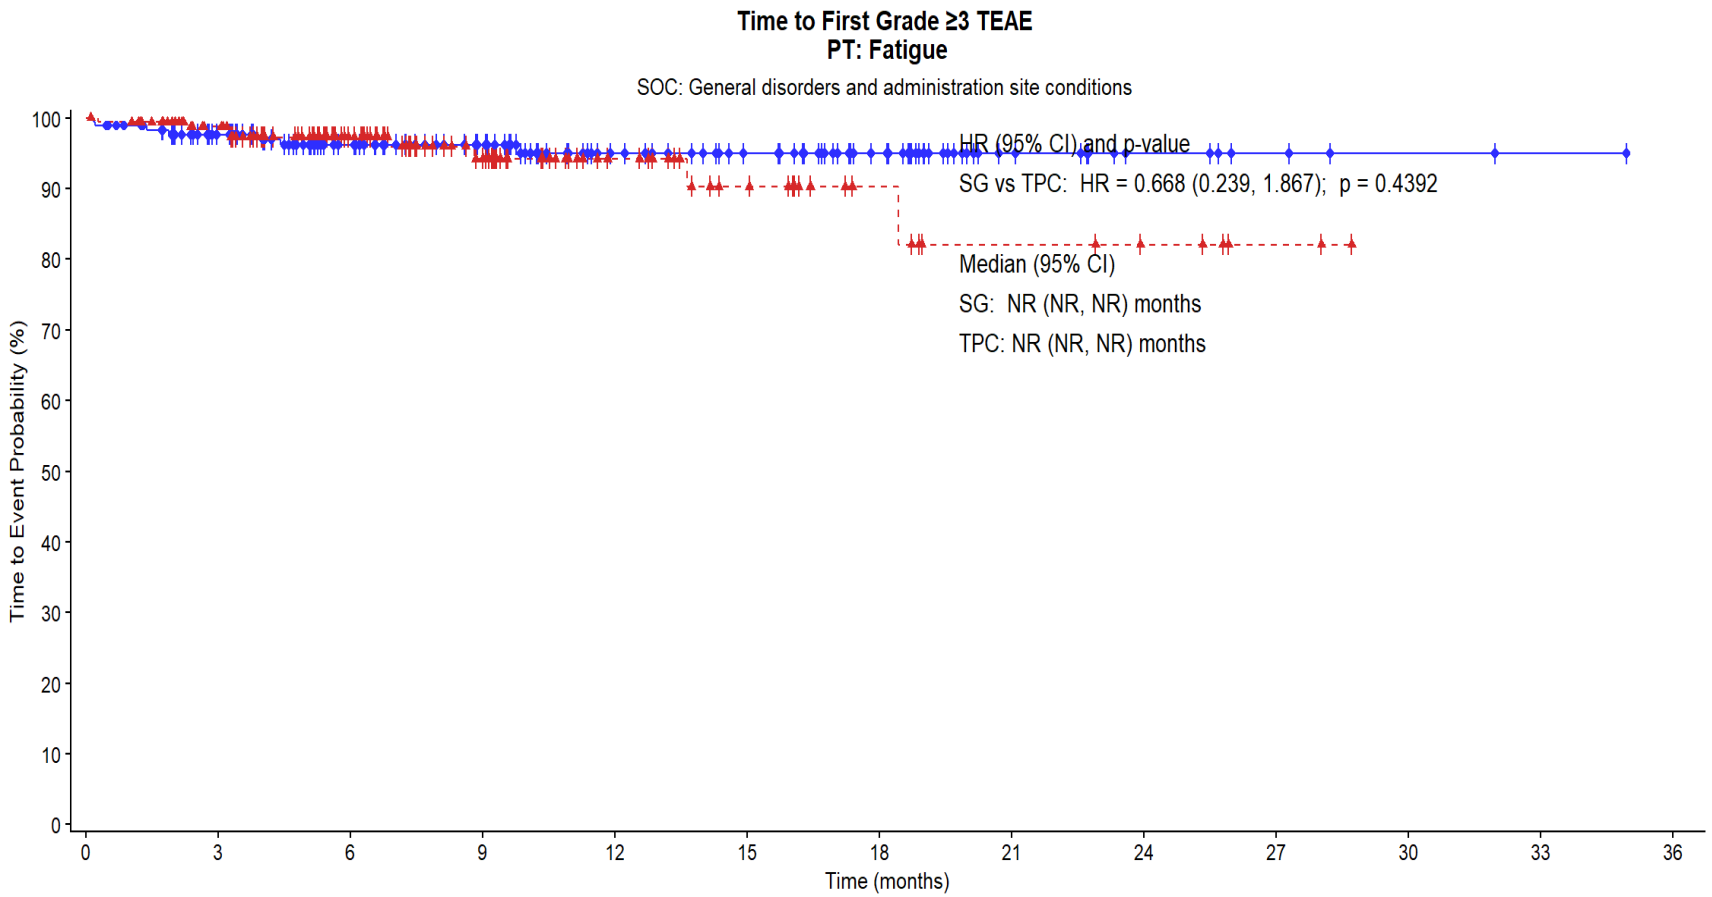
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.141. Figure 1.1.142: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Neutropenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



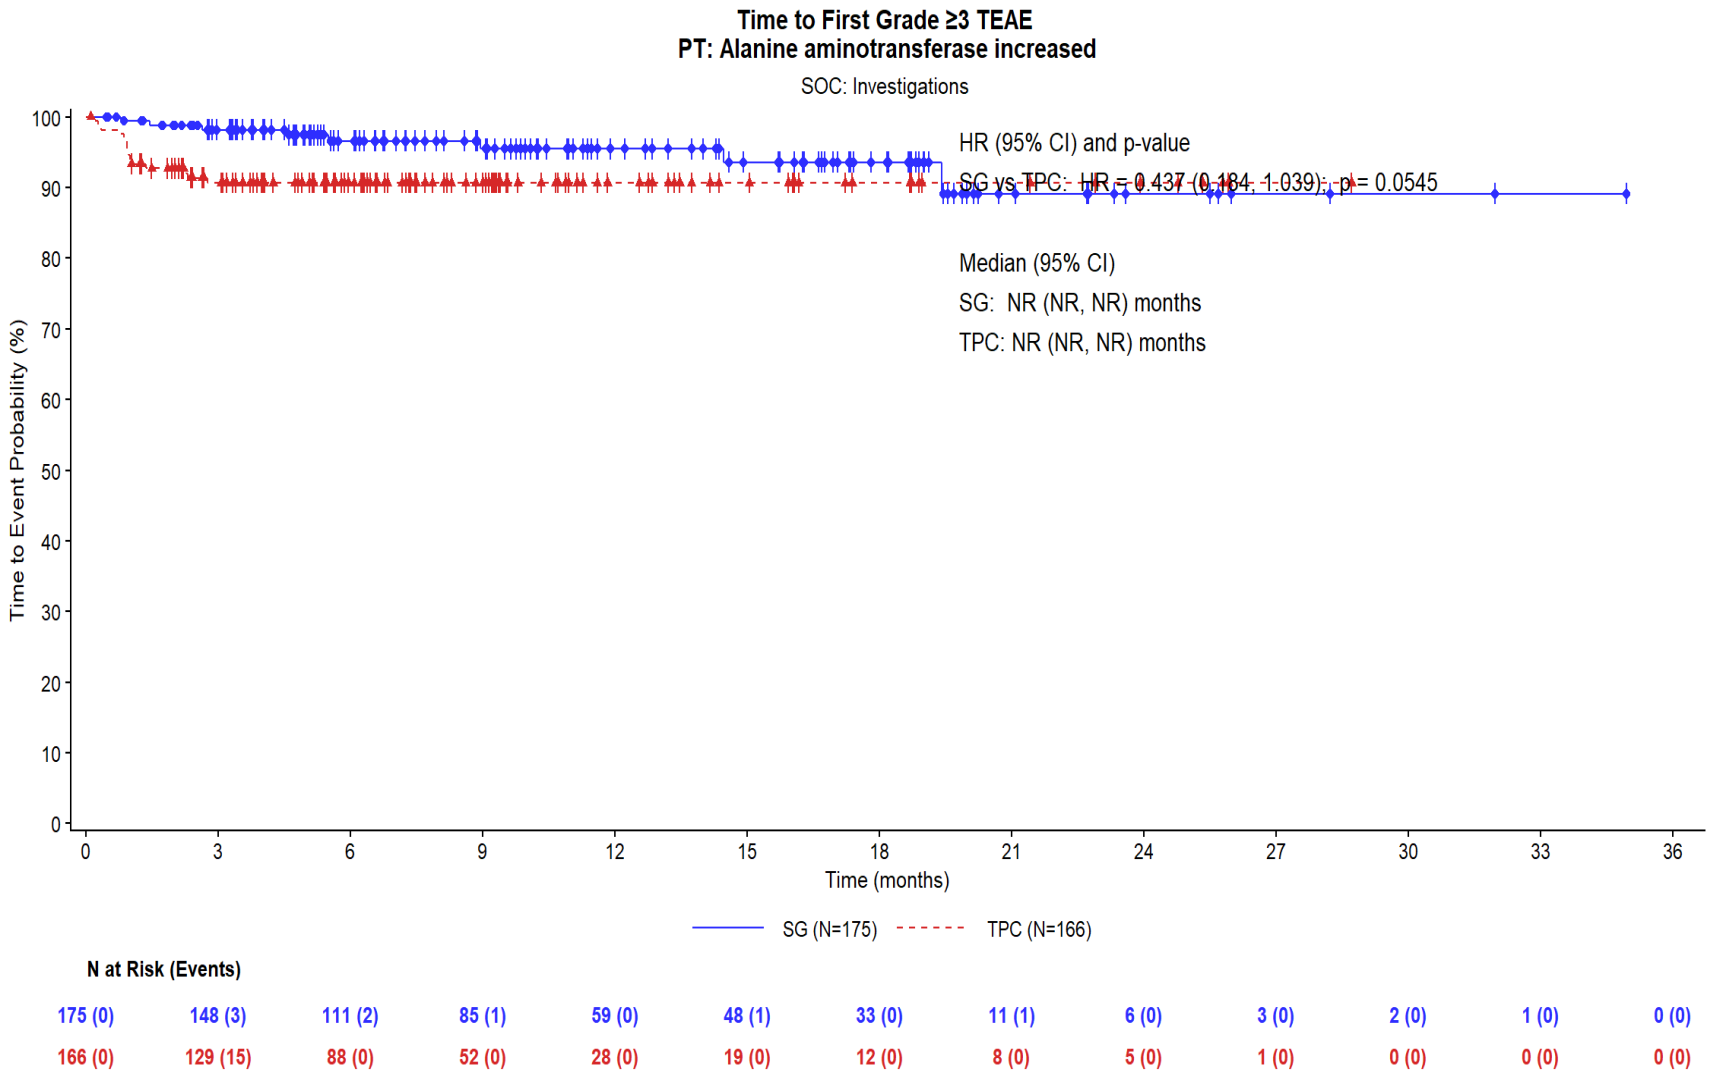
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.142. Figure 1.1.143: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Thrombocytopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel



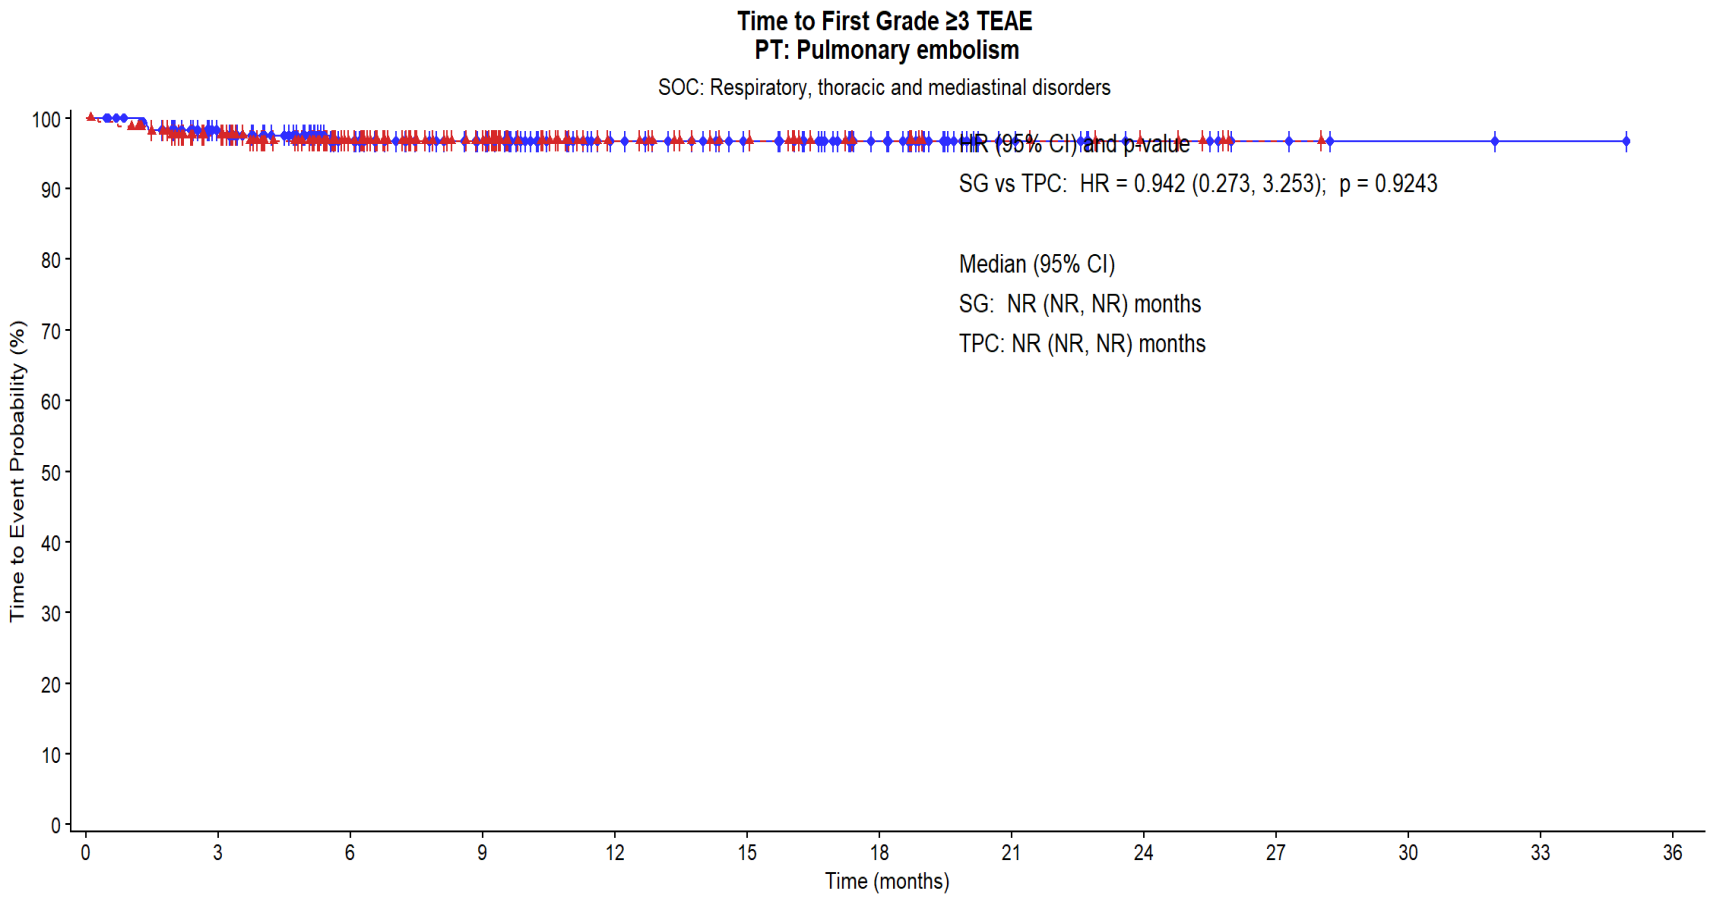
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.143. Figure 1.1.144: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Diarrhoea — mSAF — Excluding patients preselected to receive nab-paclitaxel



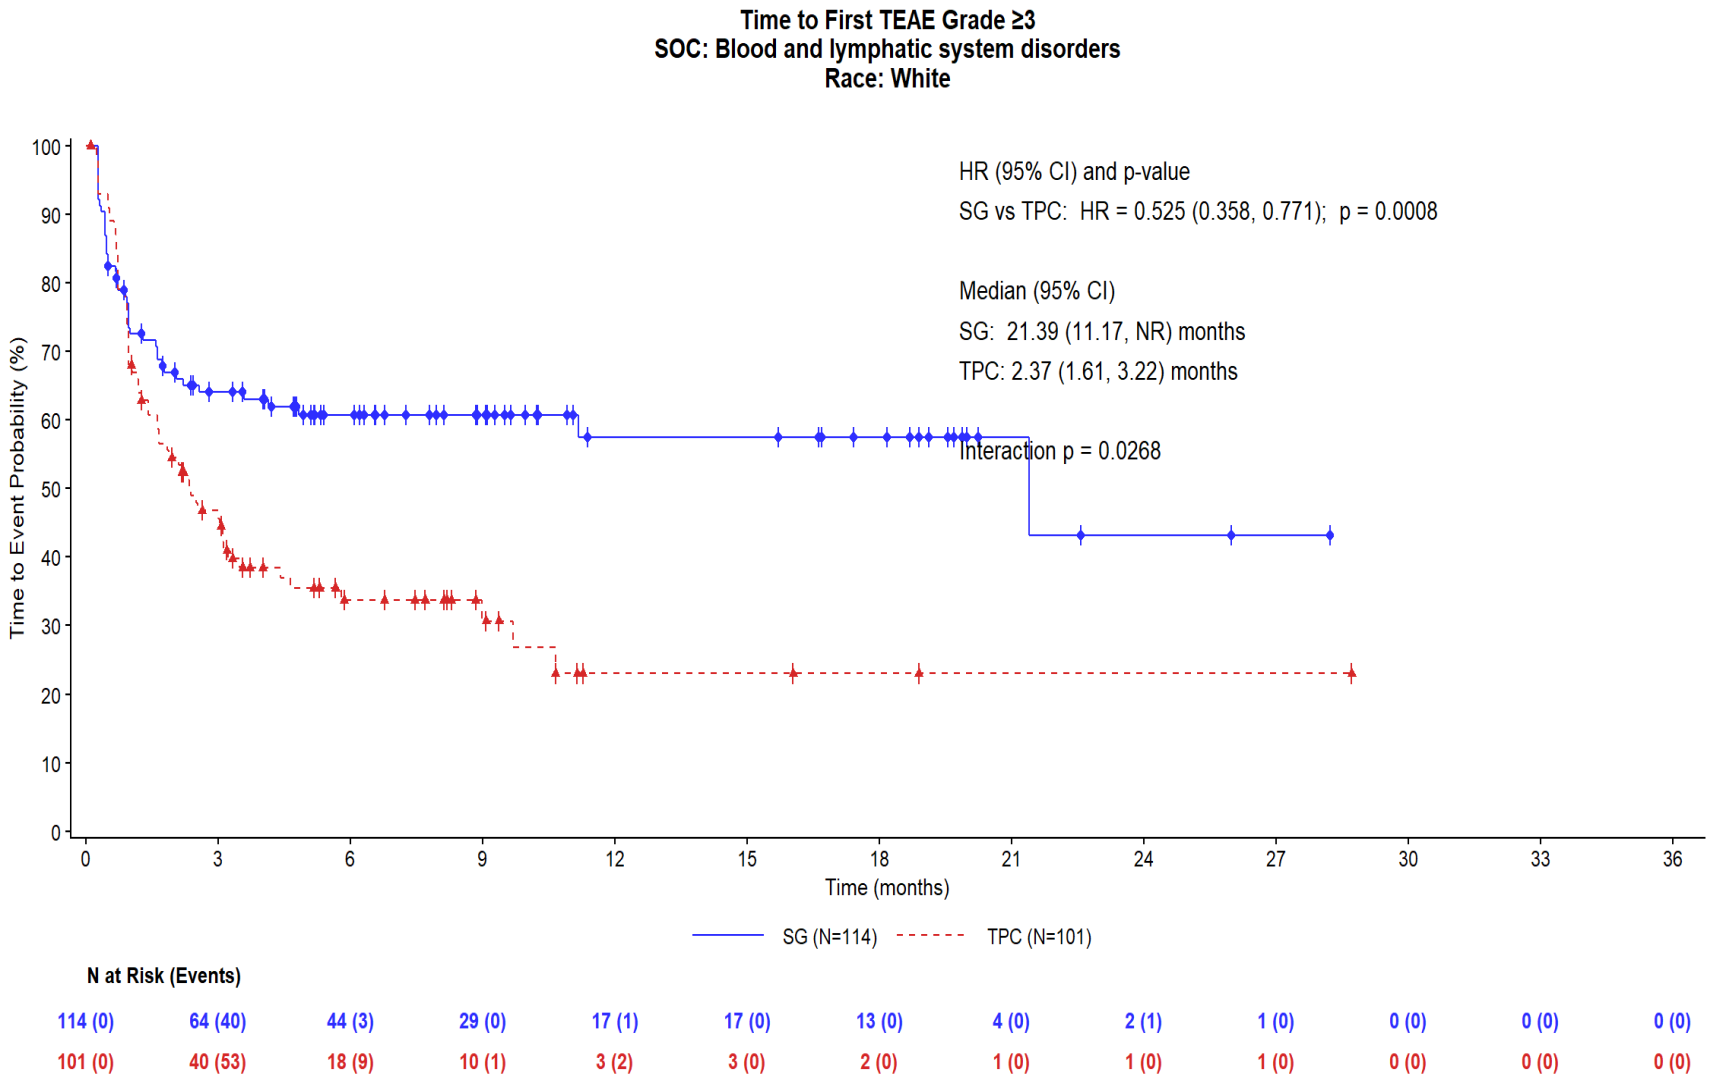
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.144. Figure 1.1.145: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Fatigue — mSAF — Excluding patients preselected to receive nab-paclitaxel



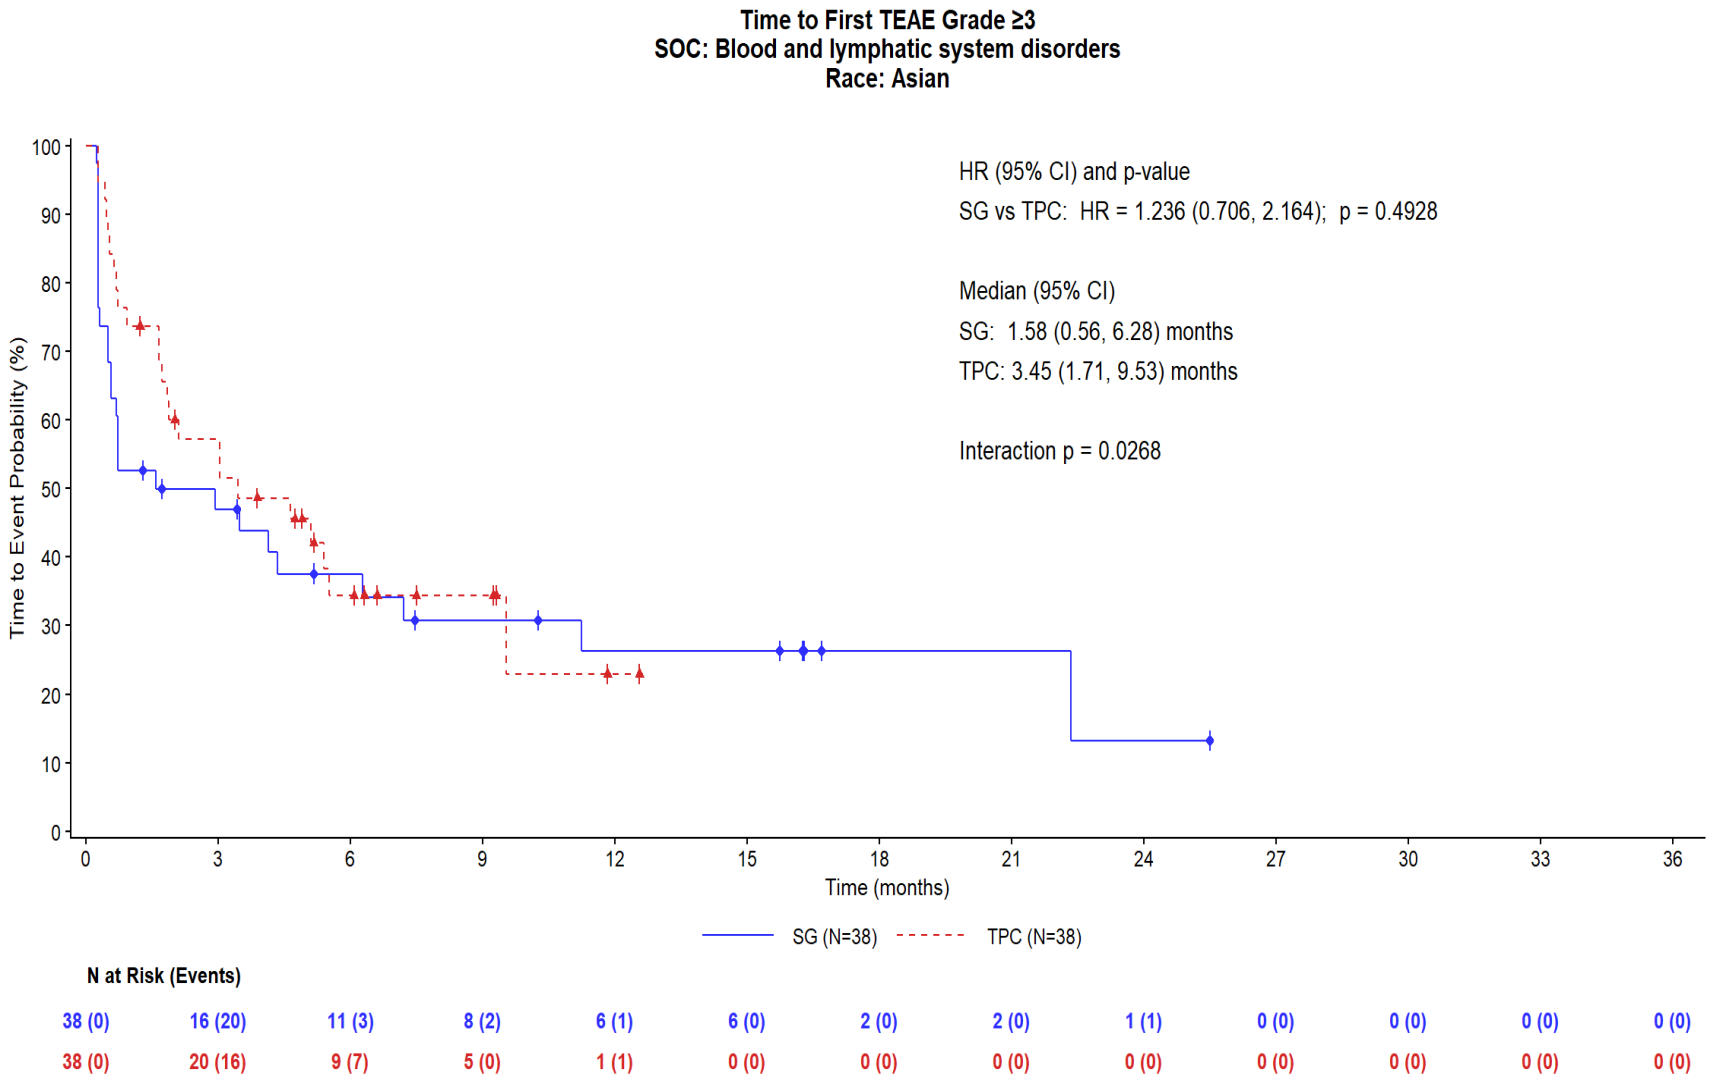
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.145. Figure 1.1.146: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Alanine aminotransferase increased — mSAF — Excluding patients preselected to receive nab-paclitaxel



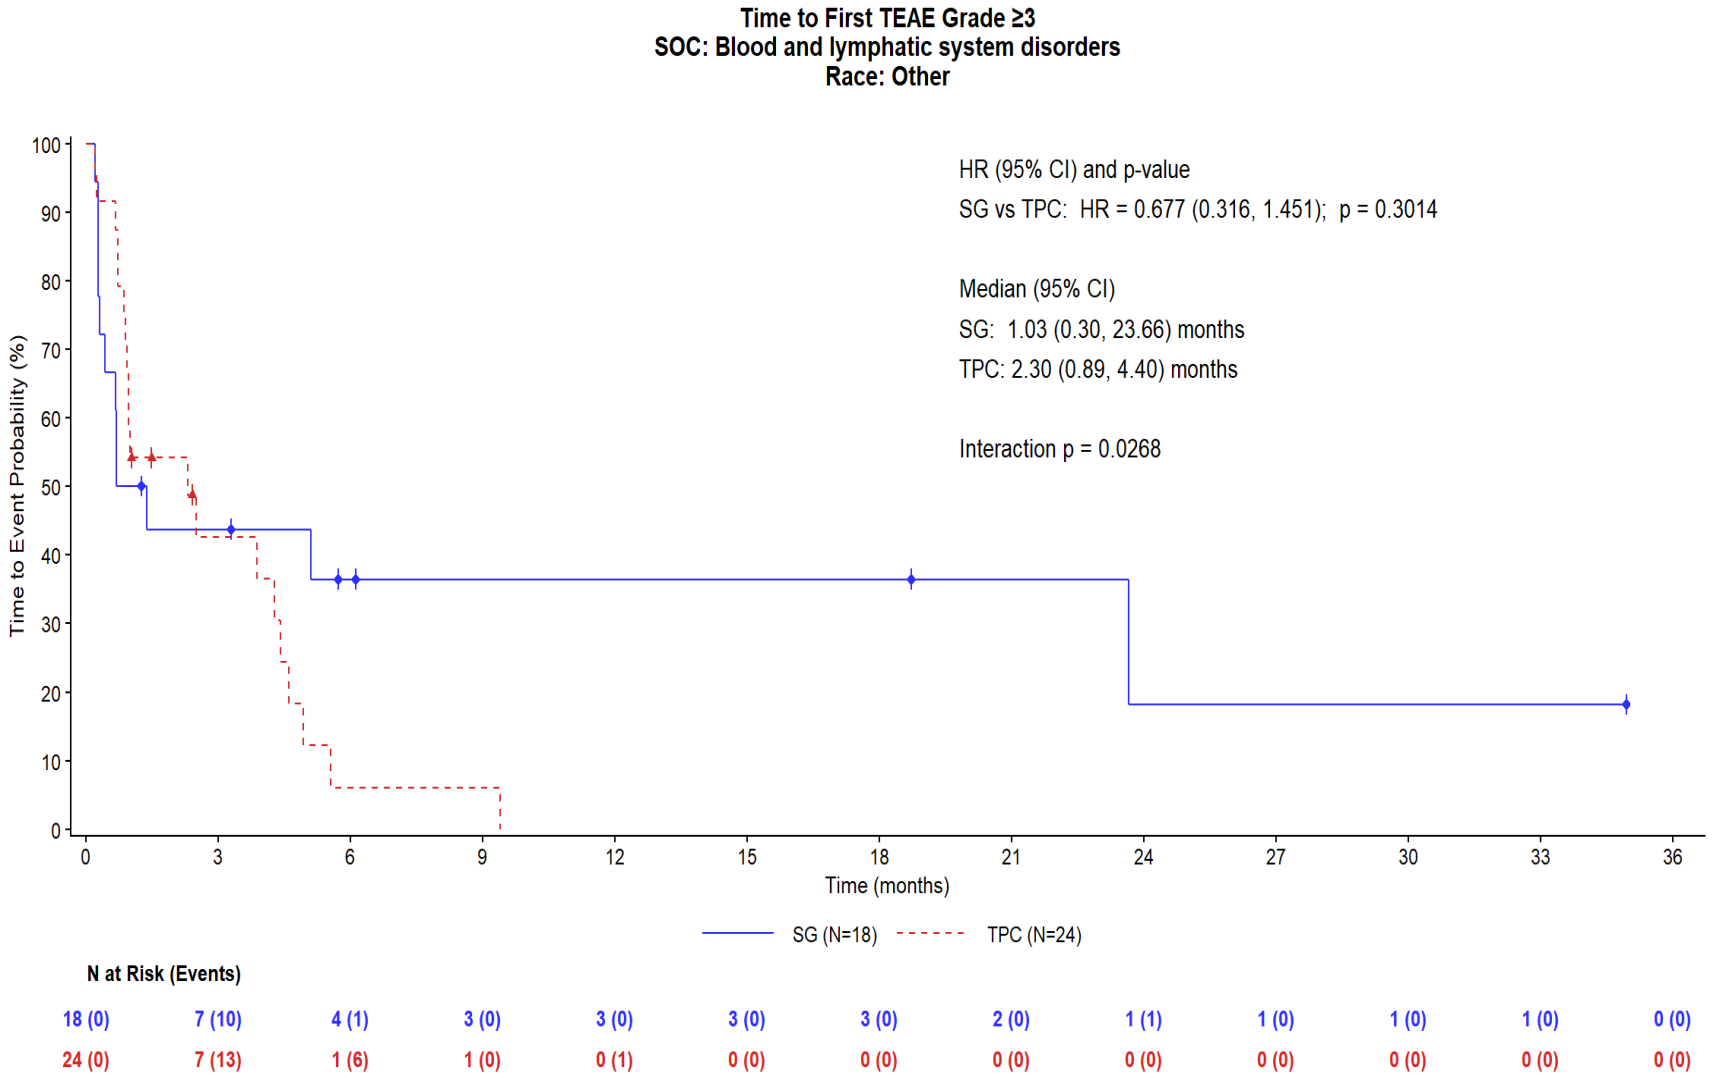
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.146. Figure 1.1.147: Kaplan Meier Plot of Time to First TEAE with CTCAE Grade 3 or higher by PT Pulmonary embolism — mSAF — Excluding patients preselected to receive nab-paclitaxel



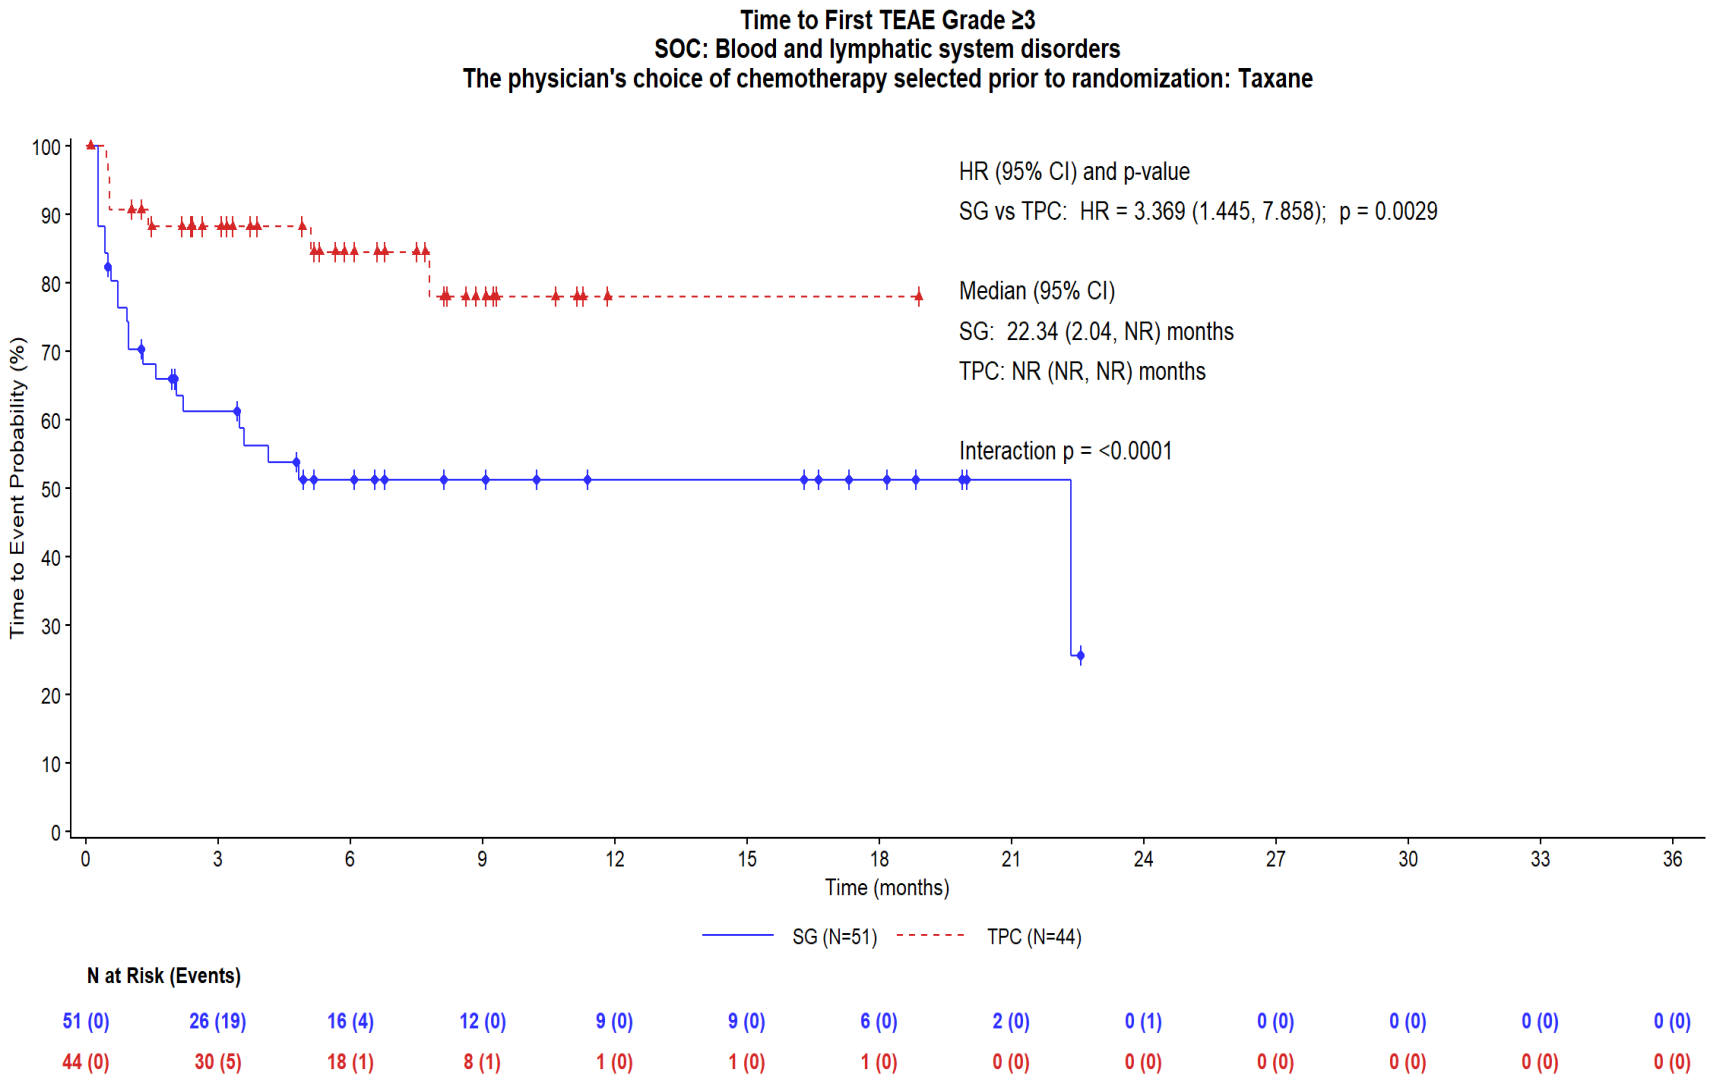
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.147. Figure 1.1.148: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Blood and lymphatic system disorders Race White — mSAF — Excluding patients preselected to receive nab-paclitaxel



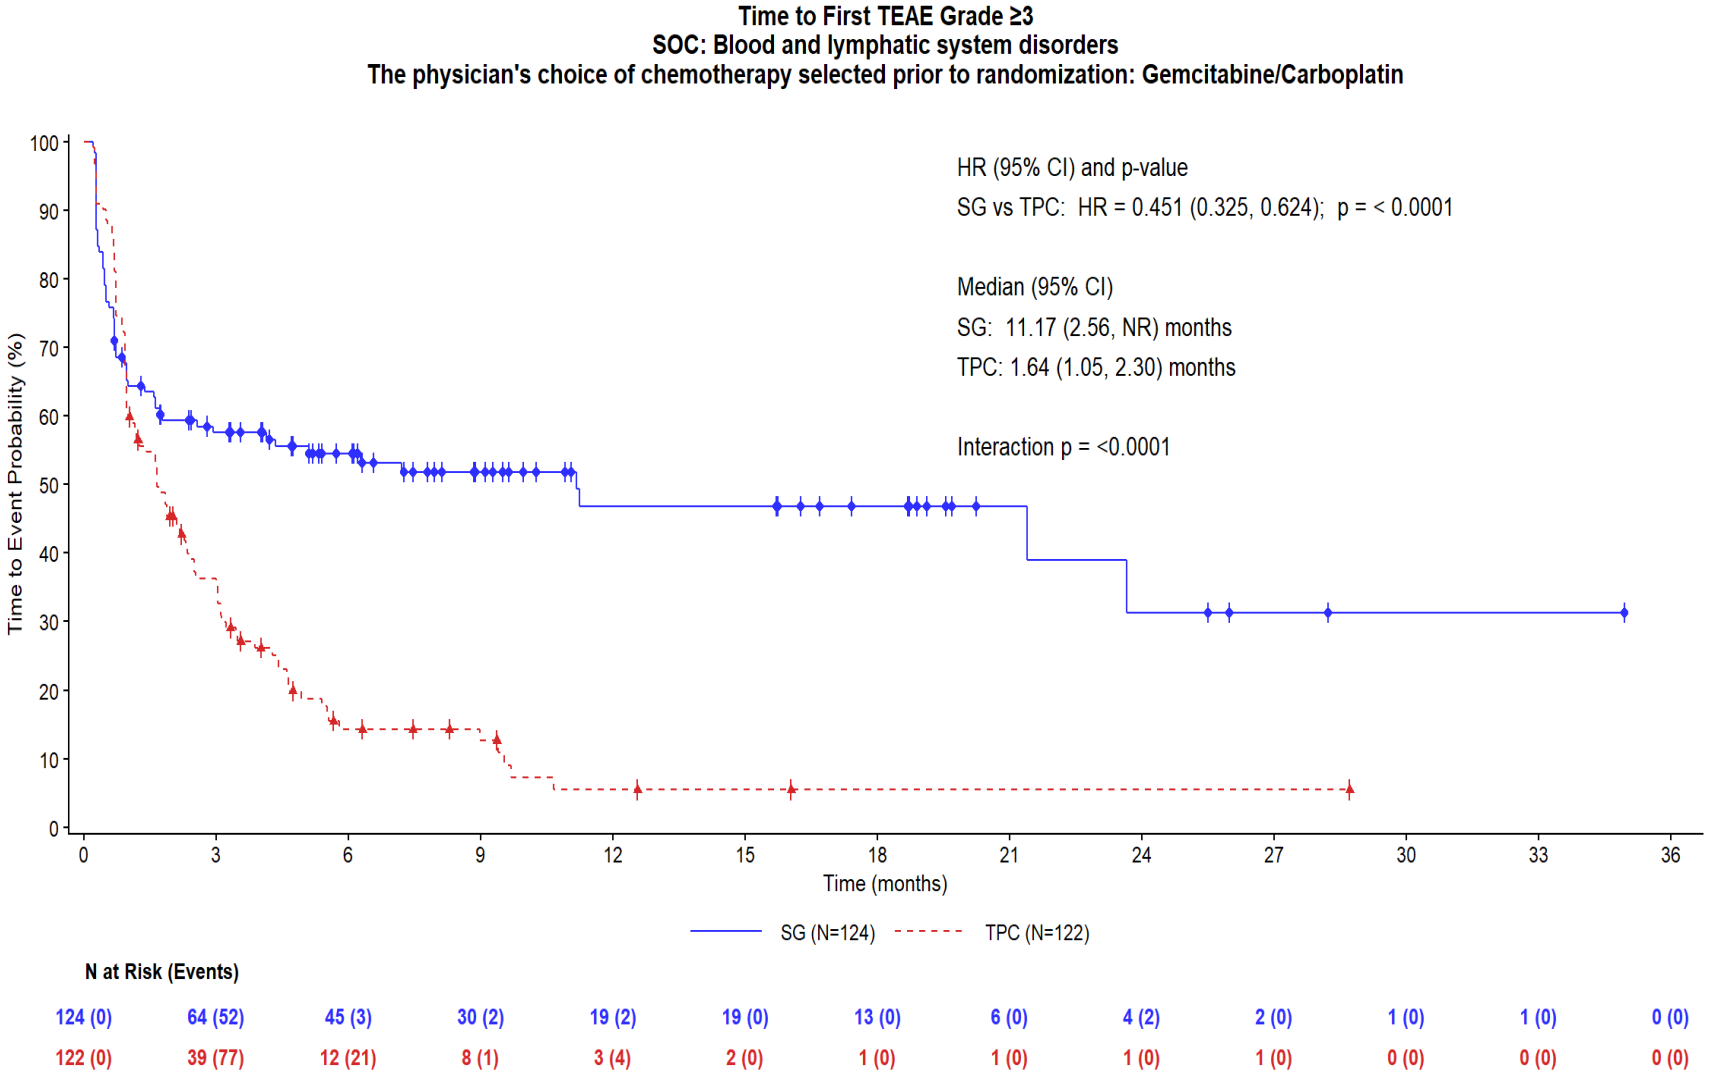
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.148. Figure 1.1.149: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Blood and lymphatic system disorders Race Asian — mSAF — Excluding patients preselected to receive nab-paclitaxel



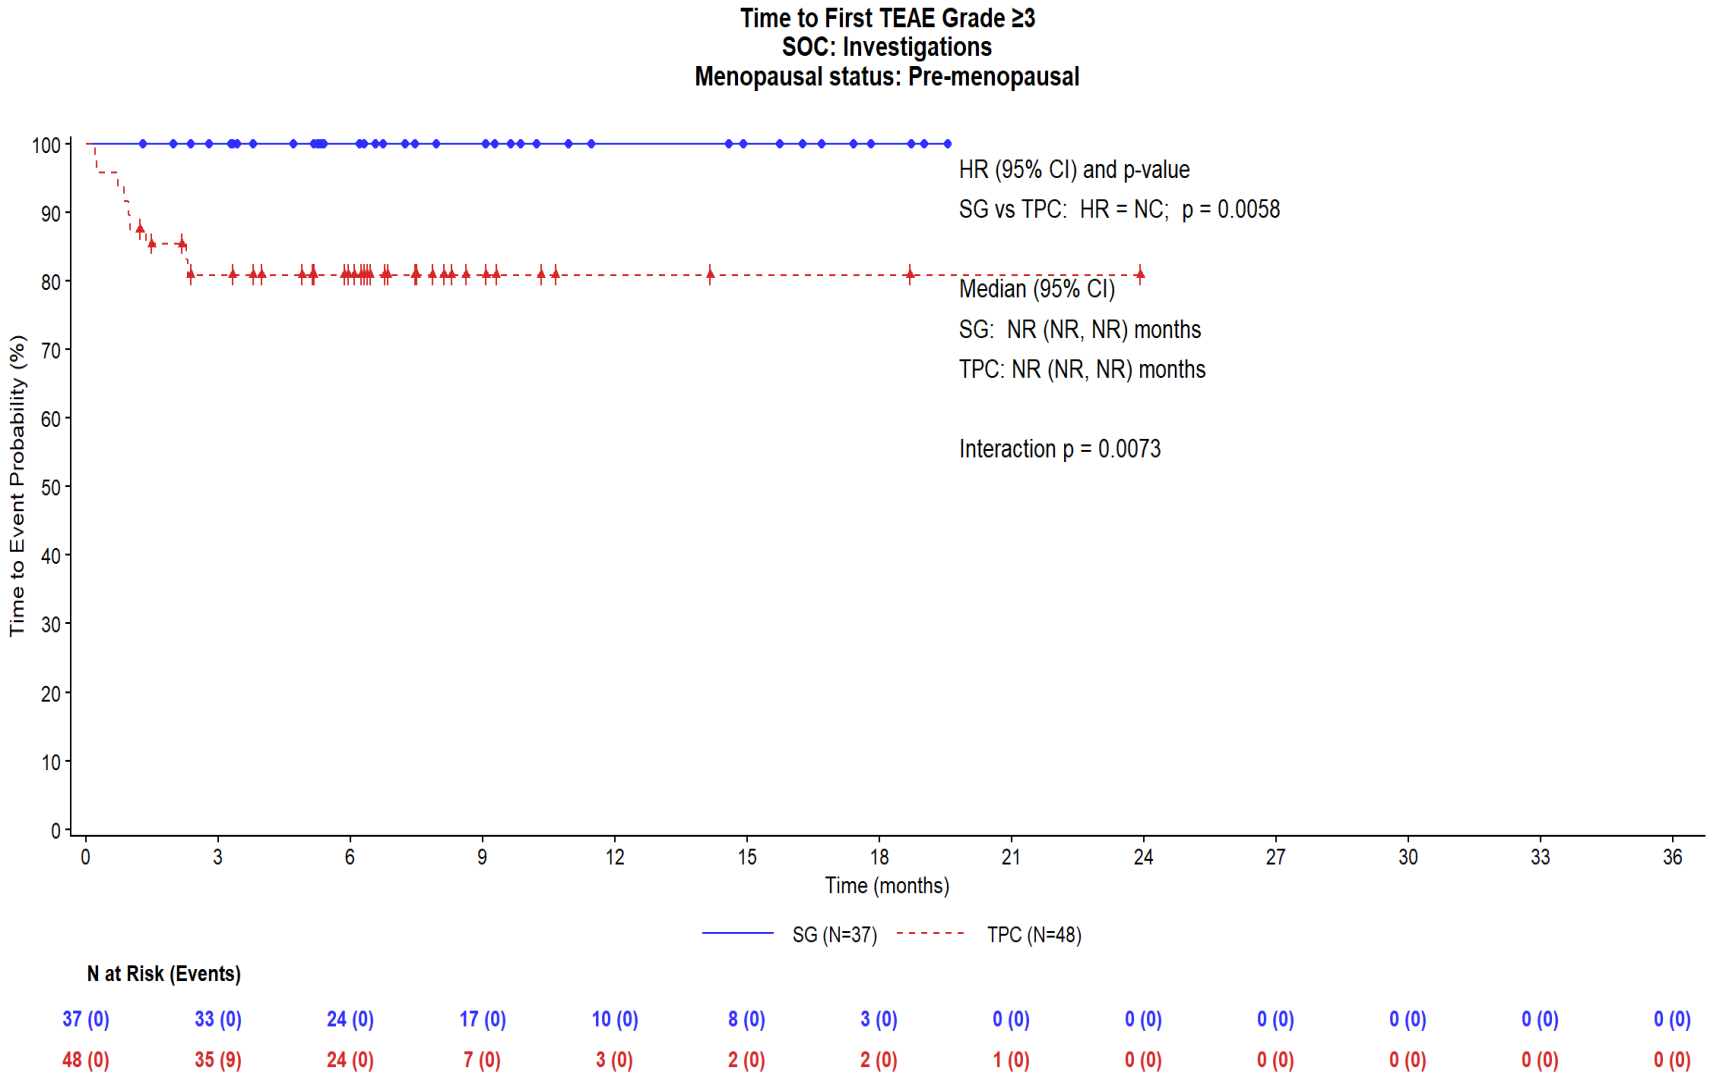
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.149. Figure 1.1.150: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Blood and lymphatic system disorders Race Other — mSAF — Excluding patients preselected to receive nab-paclitaxel



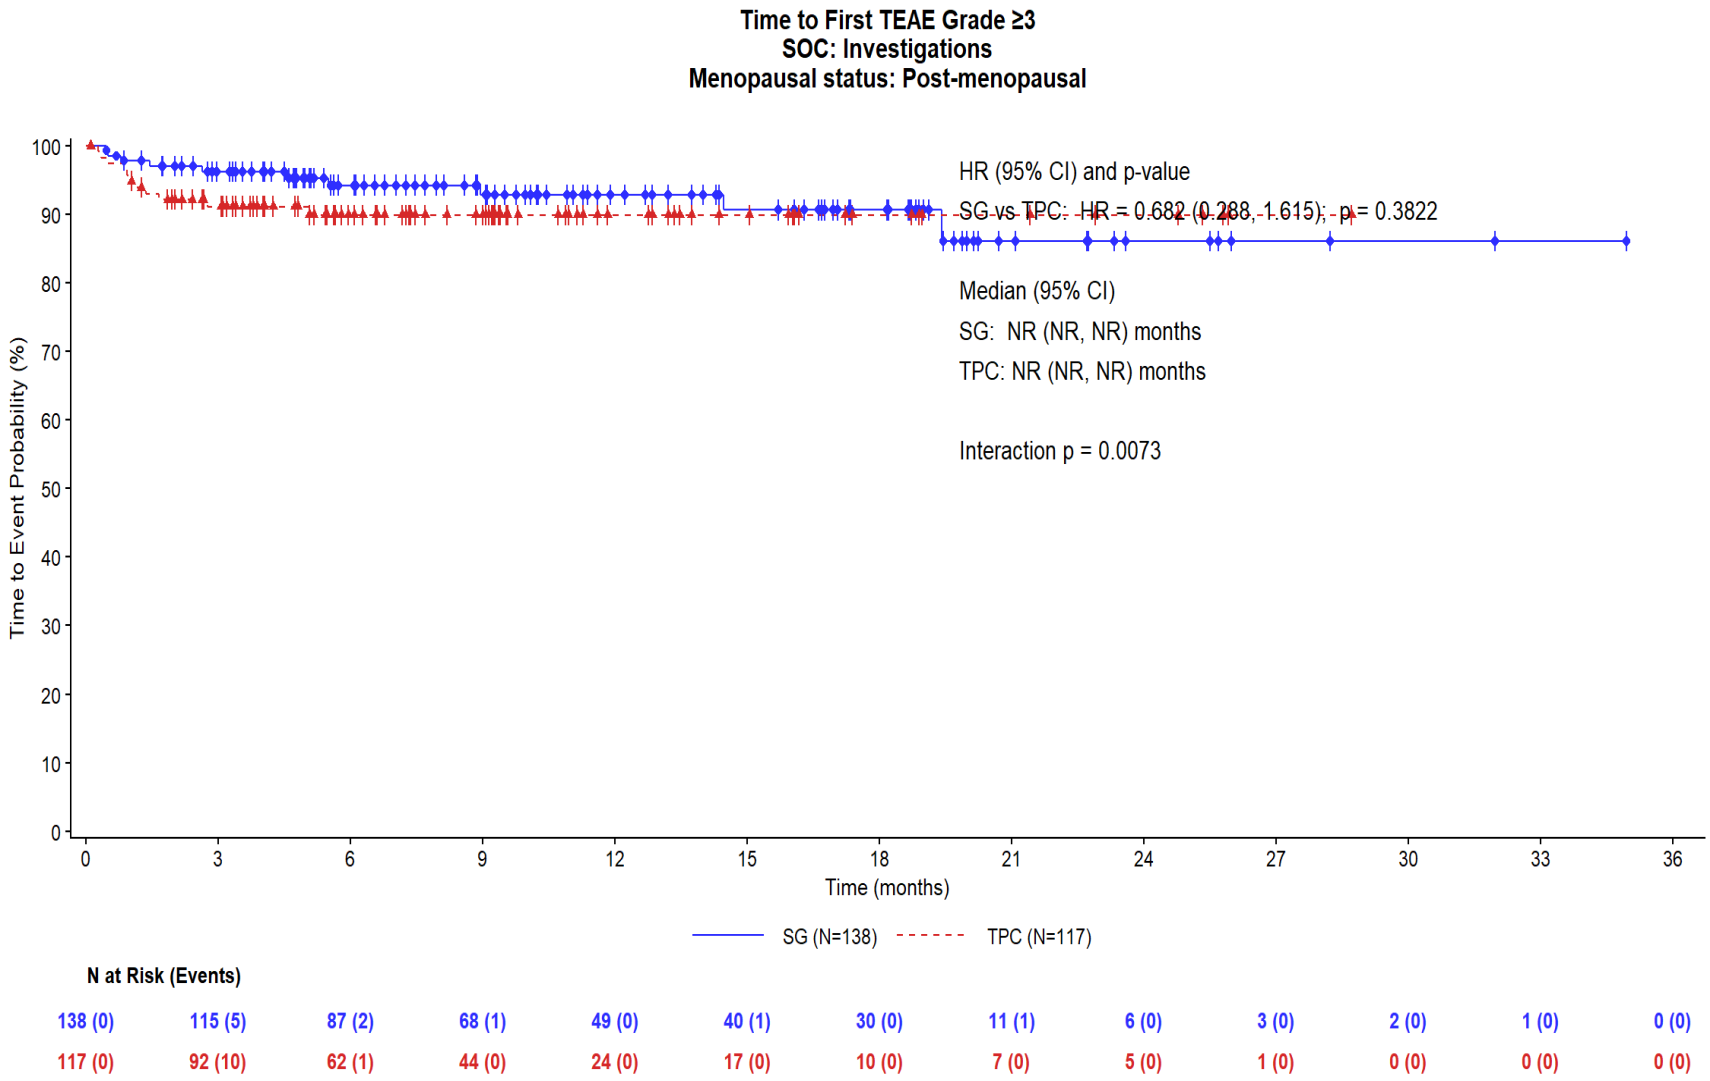
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.150. Figure 1.1.151: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Blood and lymphatic system disorders Physician s chemotherapy choice Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



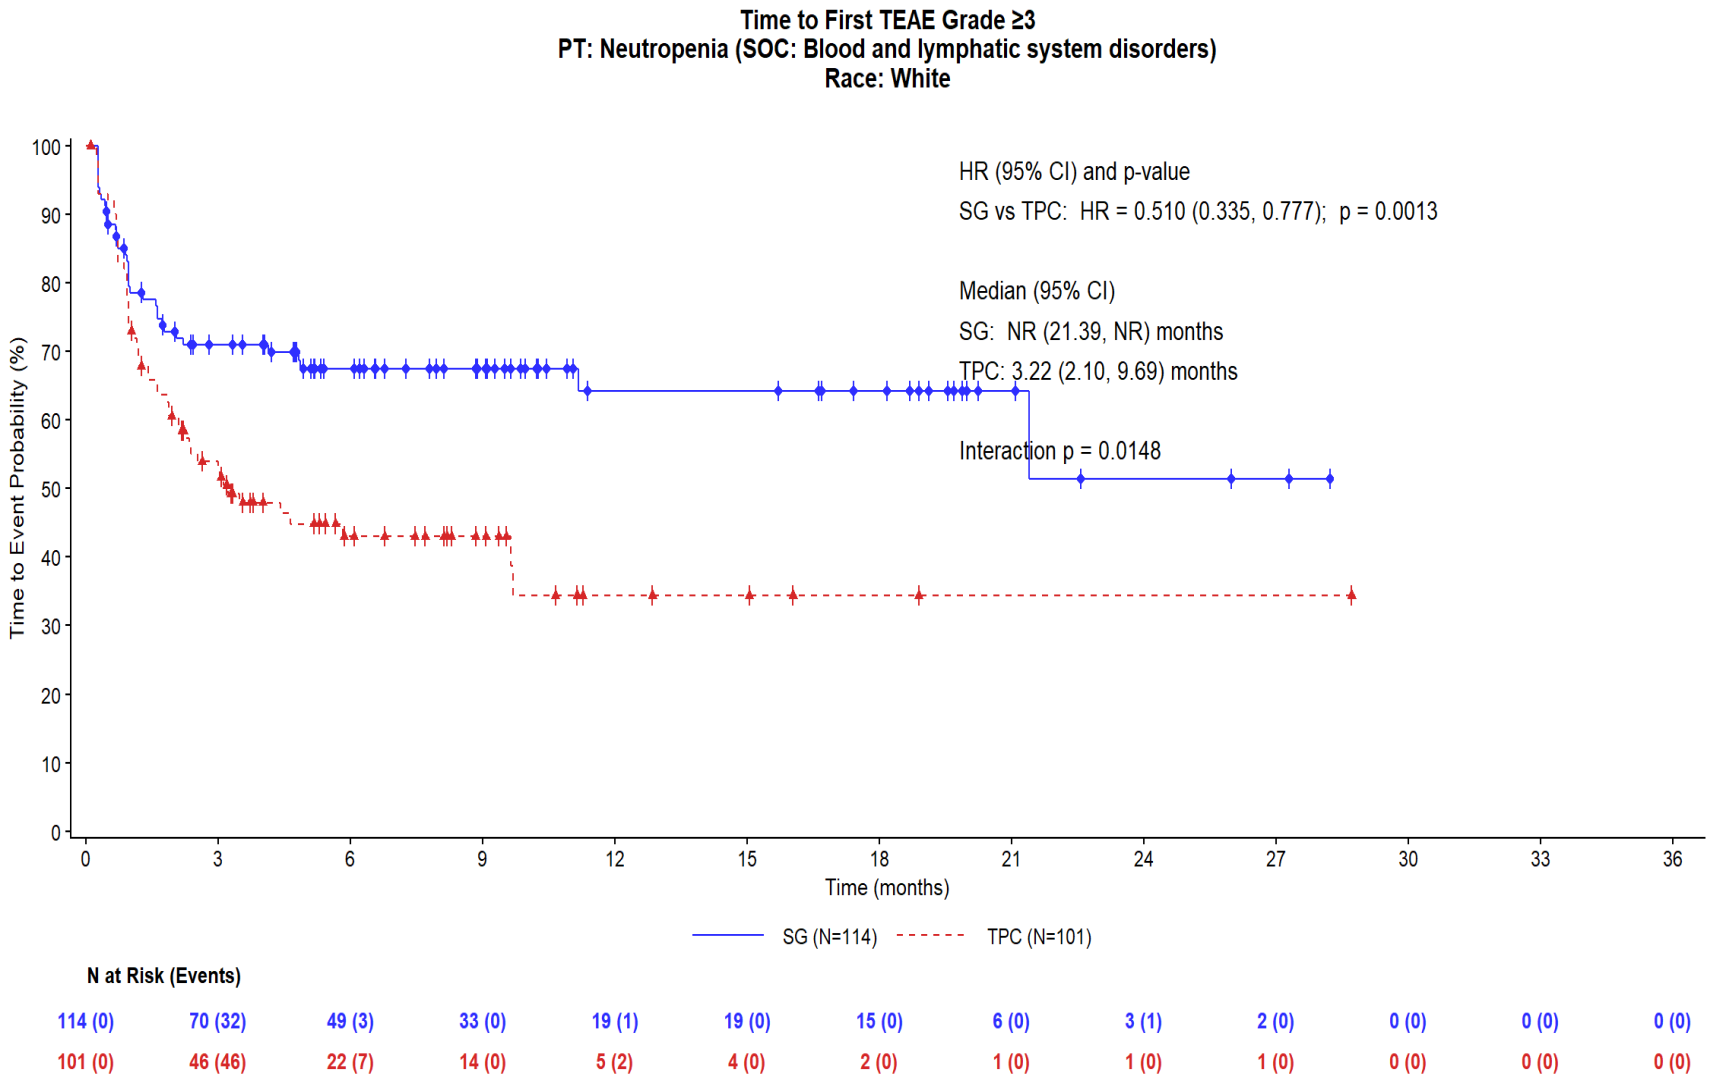
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.151. Figure 1.1.152: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Blood and lymphatic system disorders Physician s chemotherapy choice Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



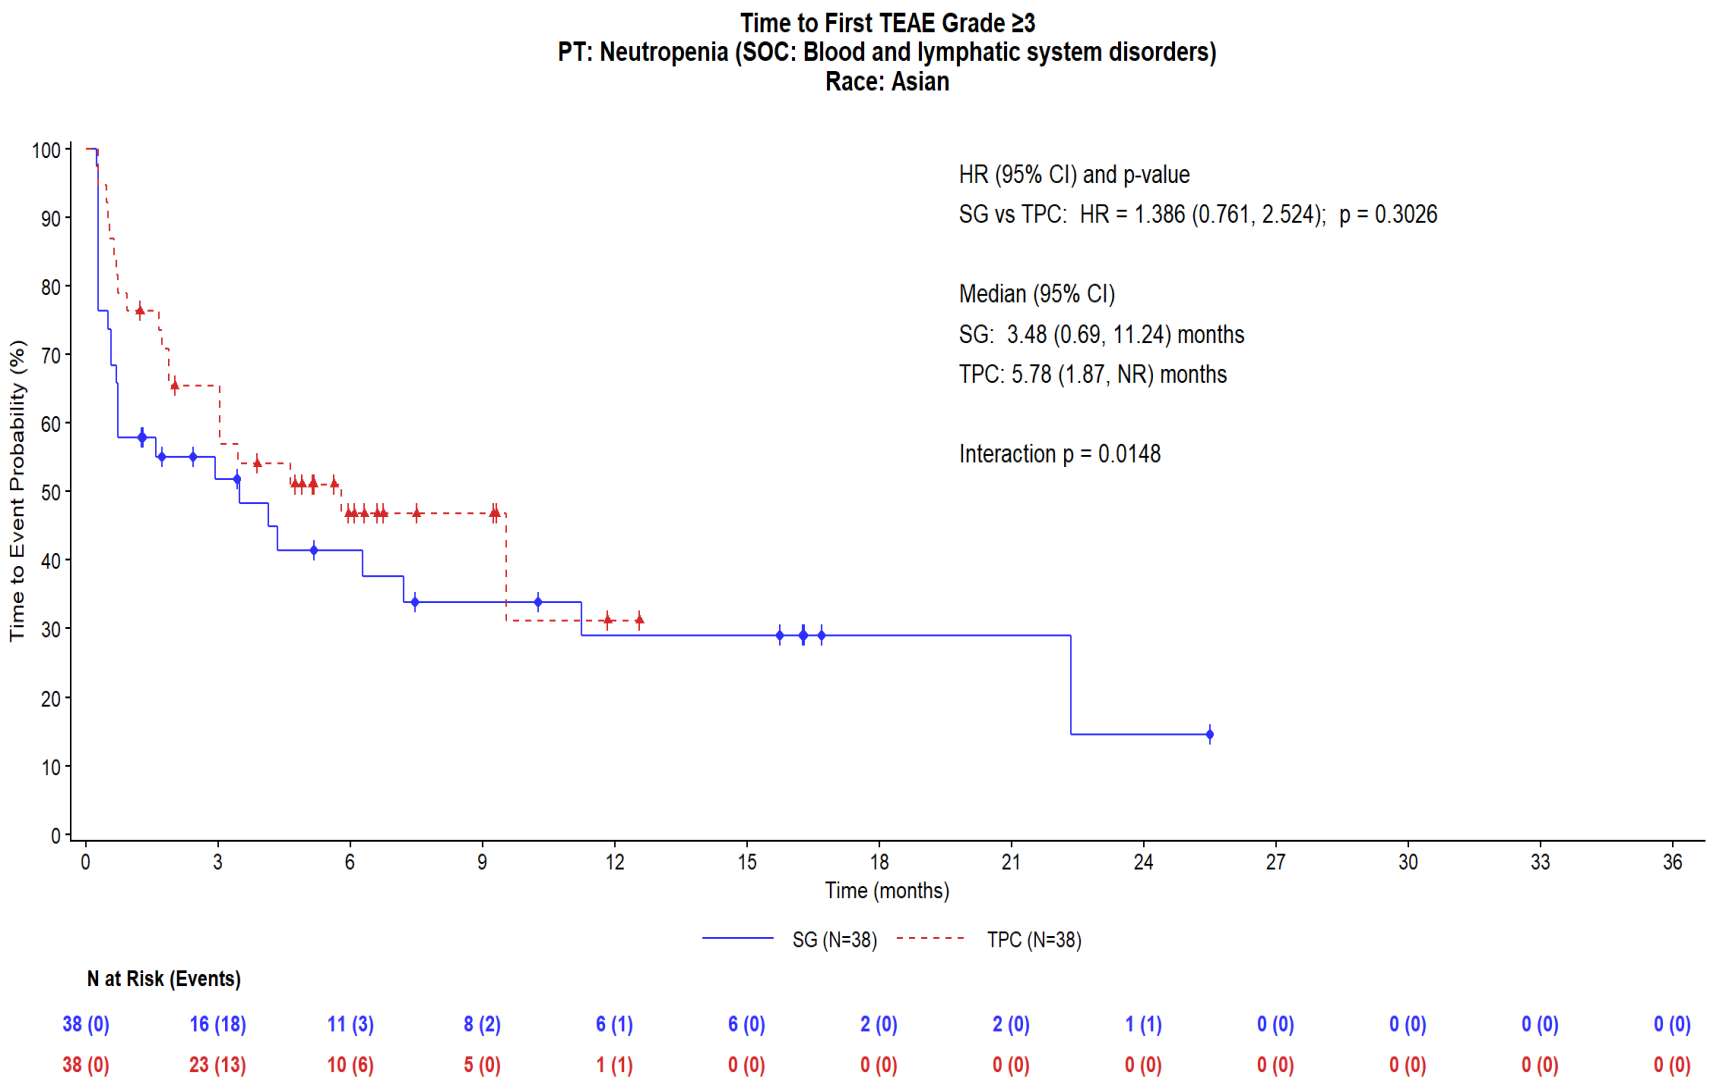
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.152. Figure 1.1.153: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Investigations Menopausal status Pre menopausal — mSAF — Excluding patients preselected to receive nab-paclitaxel



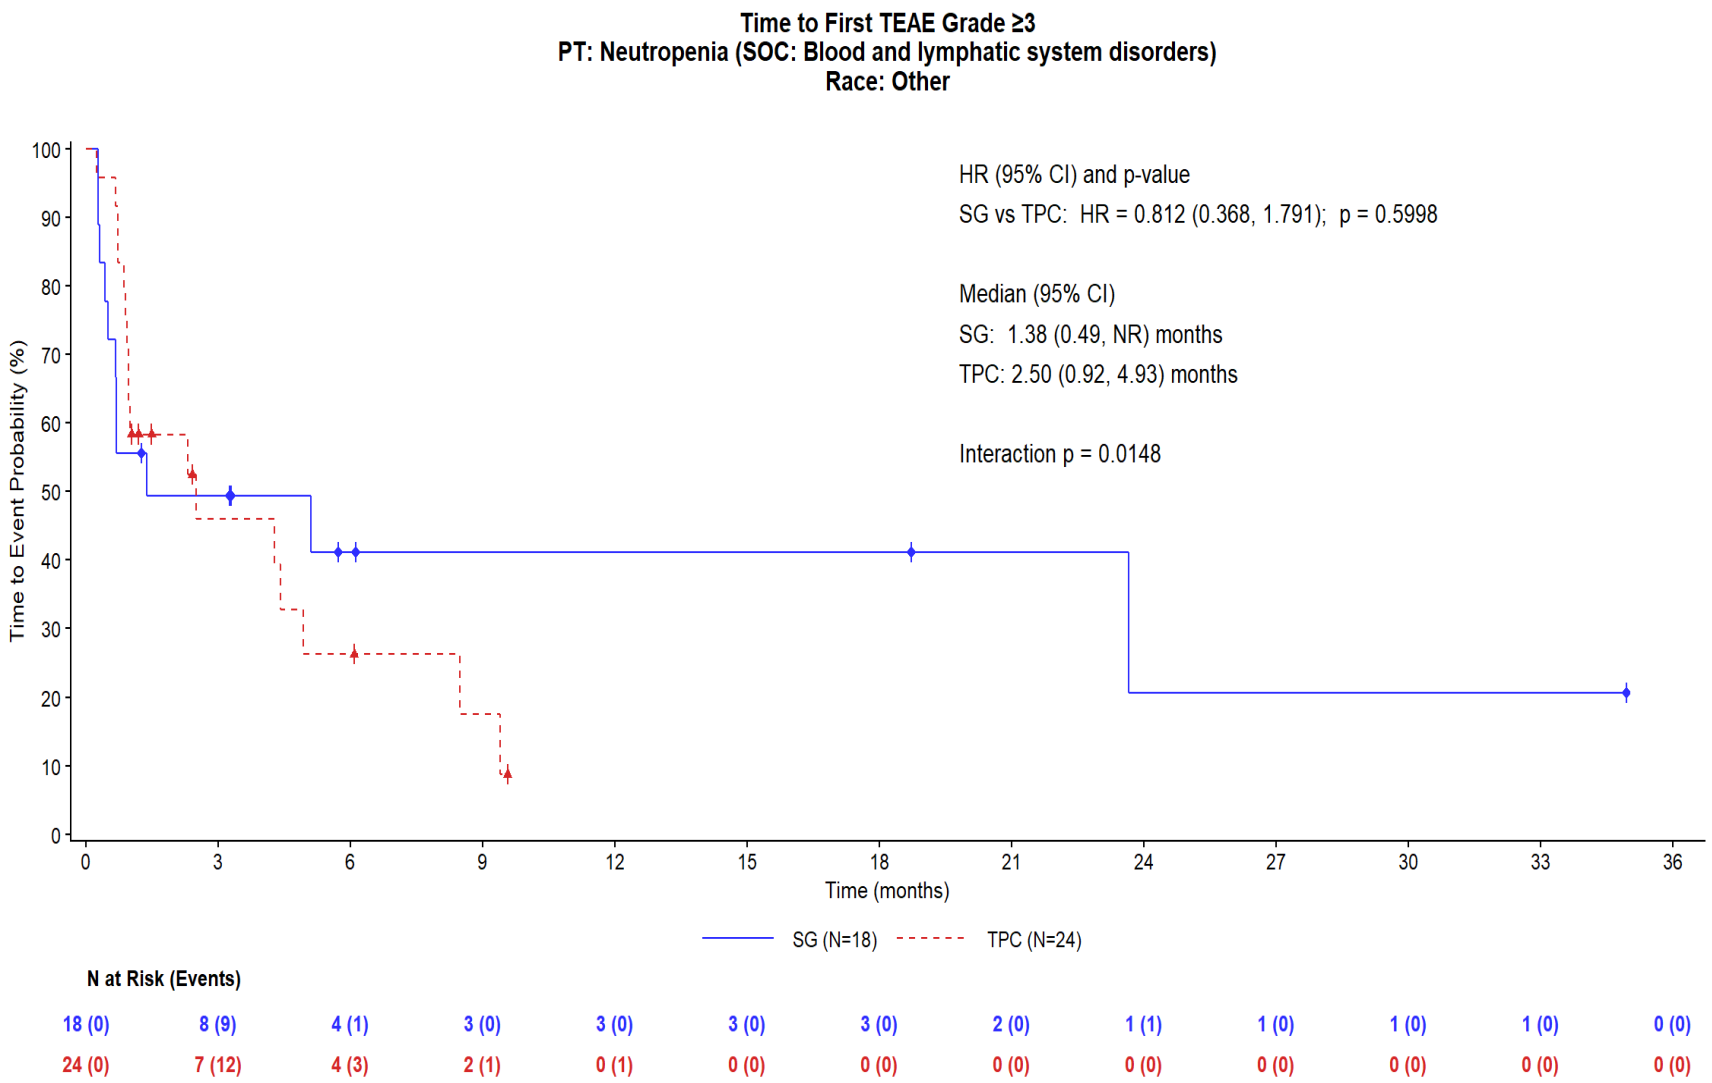
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.153. Figure 1.1.154: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by SOC Investigations Menopausal status Post menopausal — mSAF — Excluding patients preselected to receive nab-paclitaxel



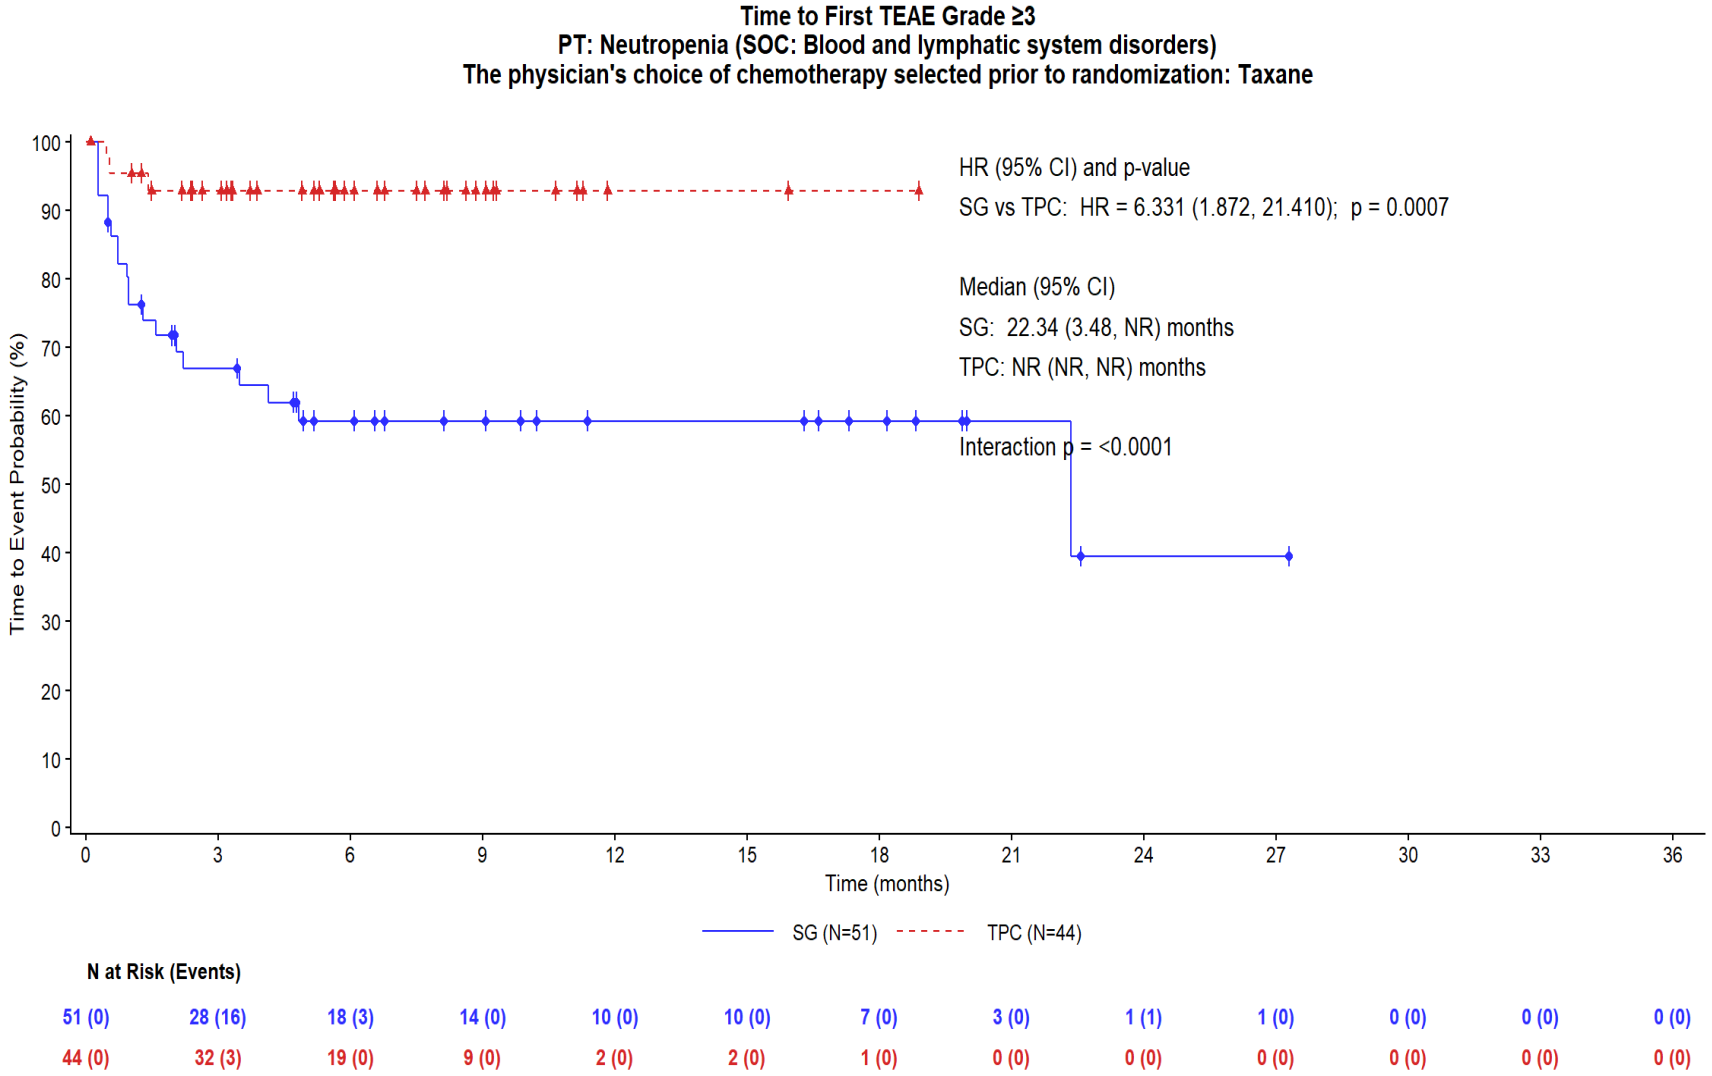
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.154. Figure 1.1.155: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Race White — mSAF — Excluding patients preselected to receive nab-paclitaxel



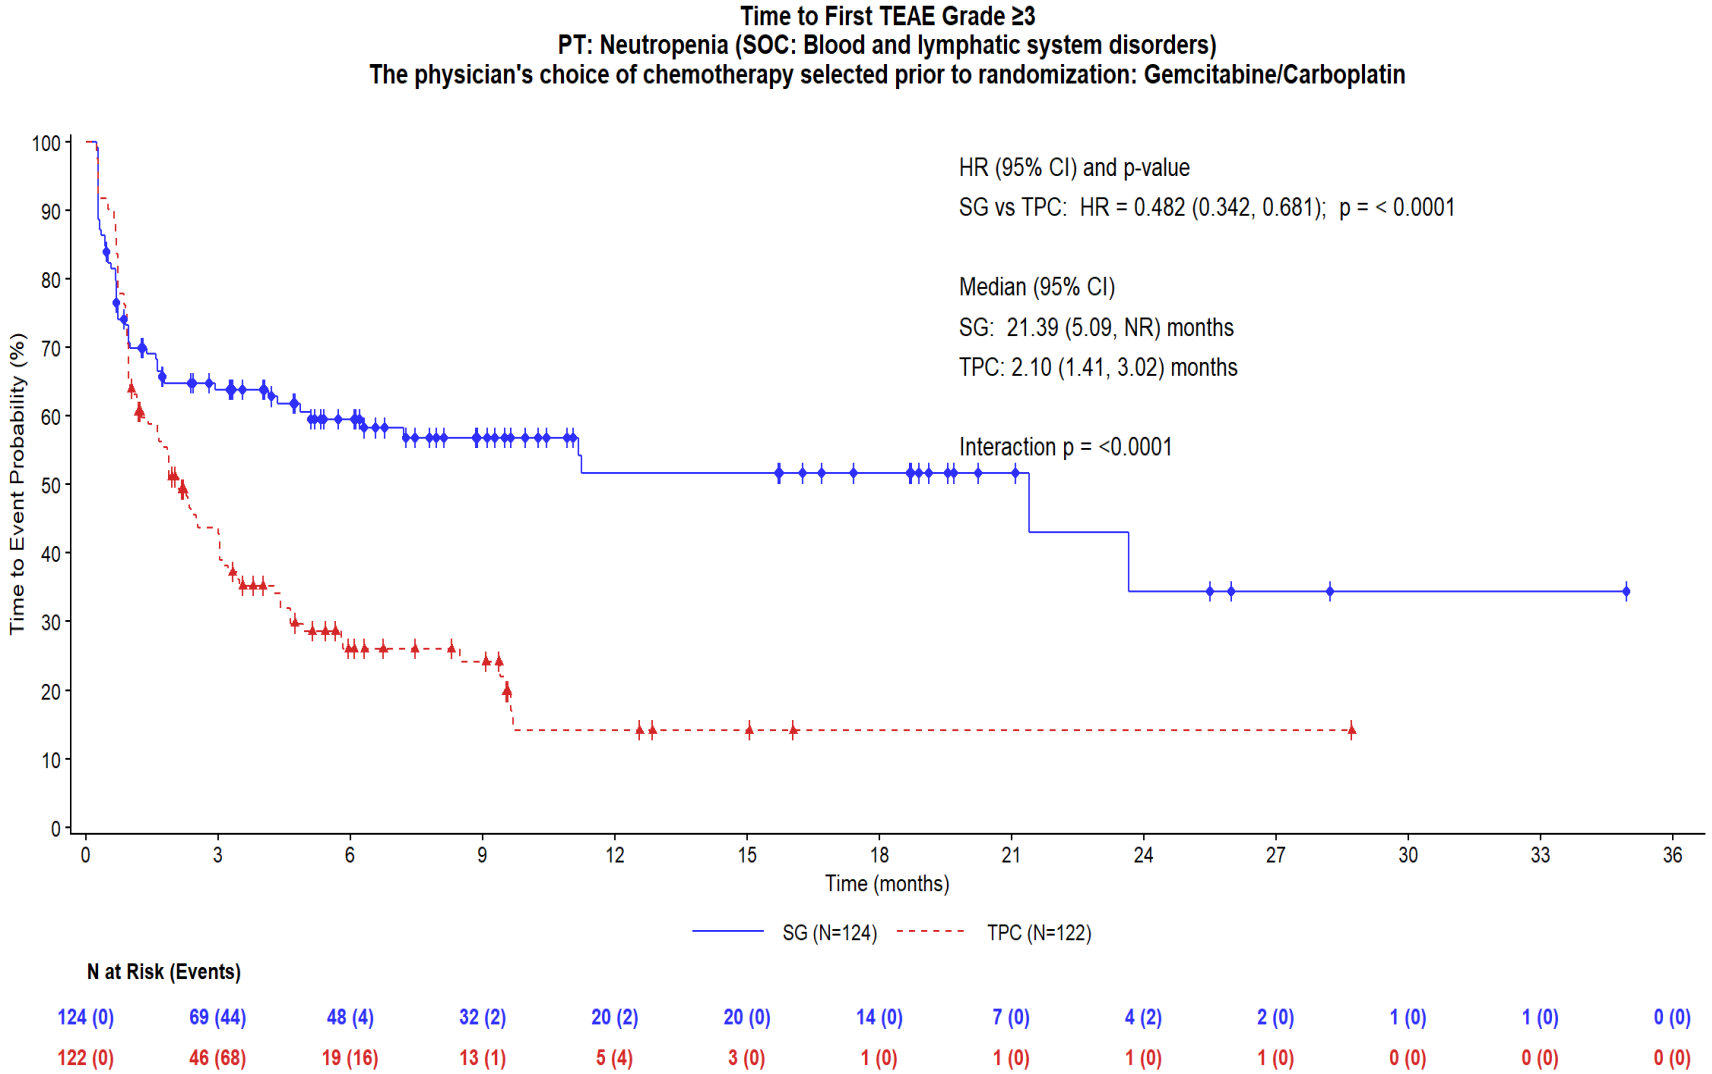
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.155. Figure 1.1.156: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Race Asian — mSAF — Excluding patients preselected to receive nab-paclitaxel



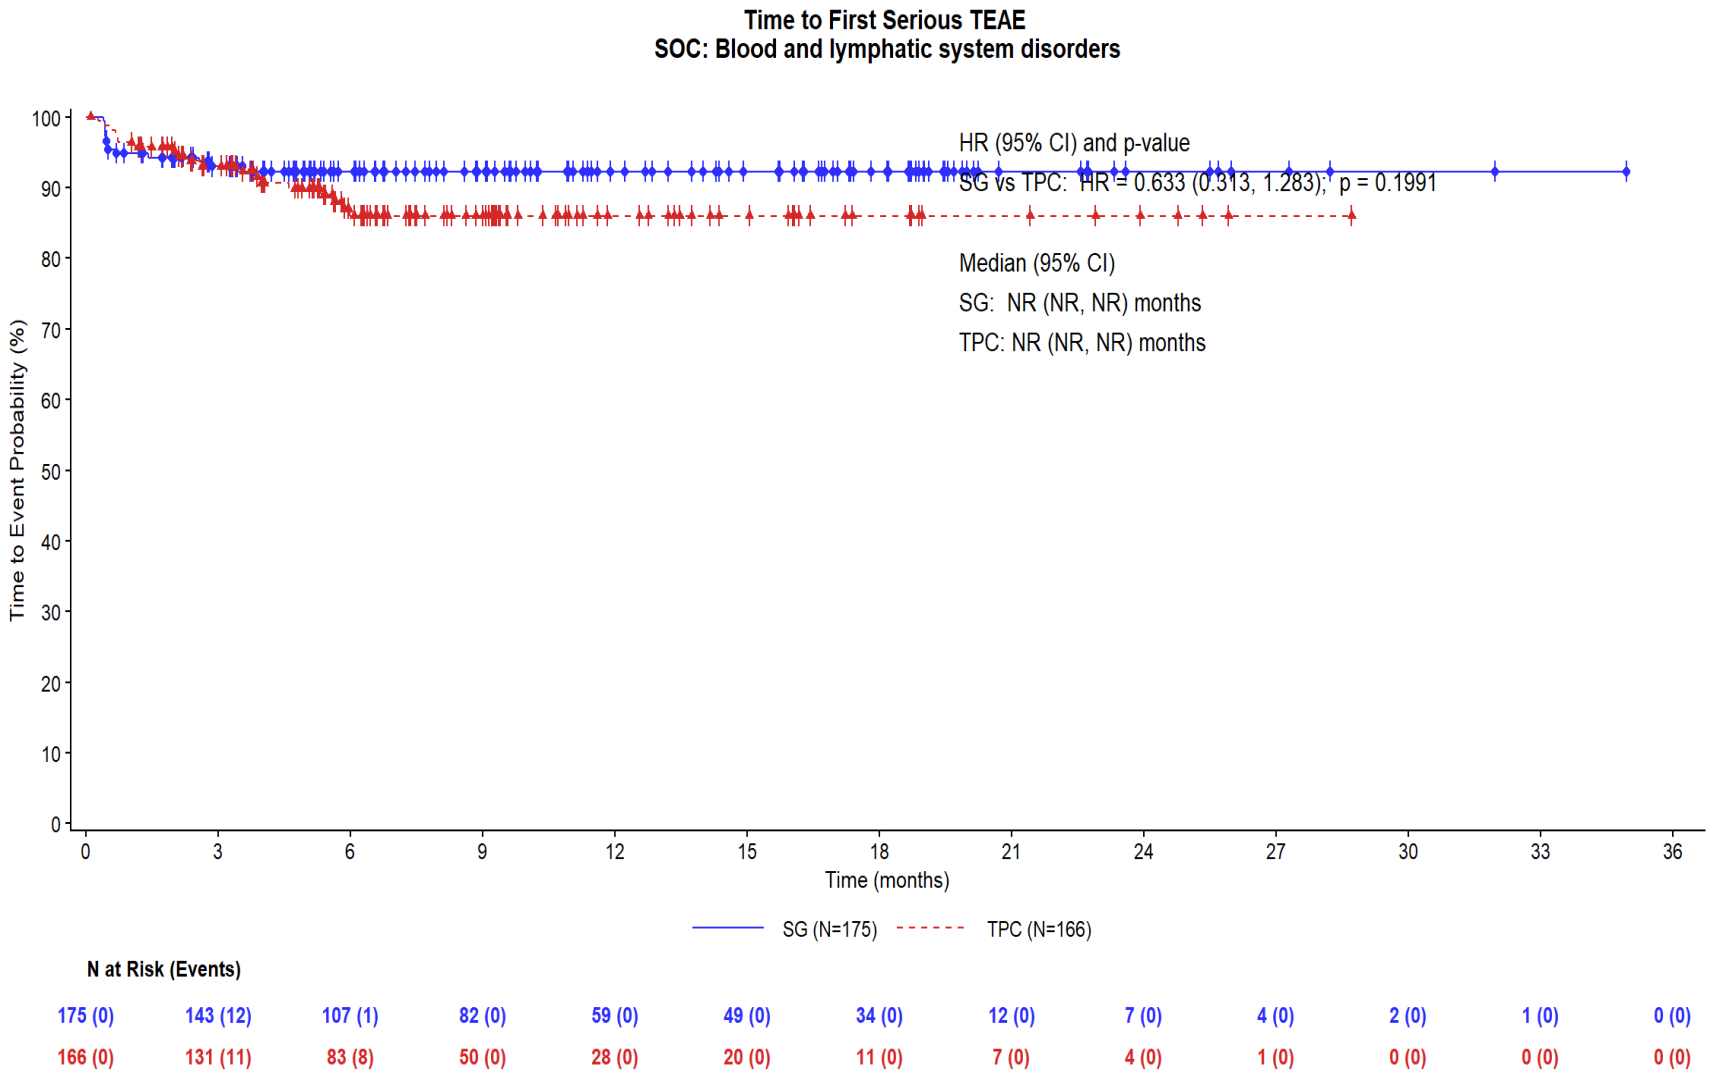
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.156. Figure 1.1.157: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Race Other — mSAF — Excluding patients preselected to receive nab-paclitaxel



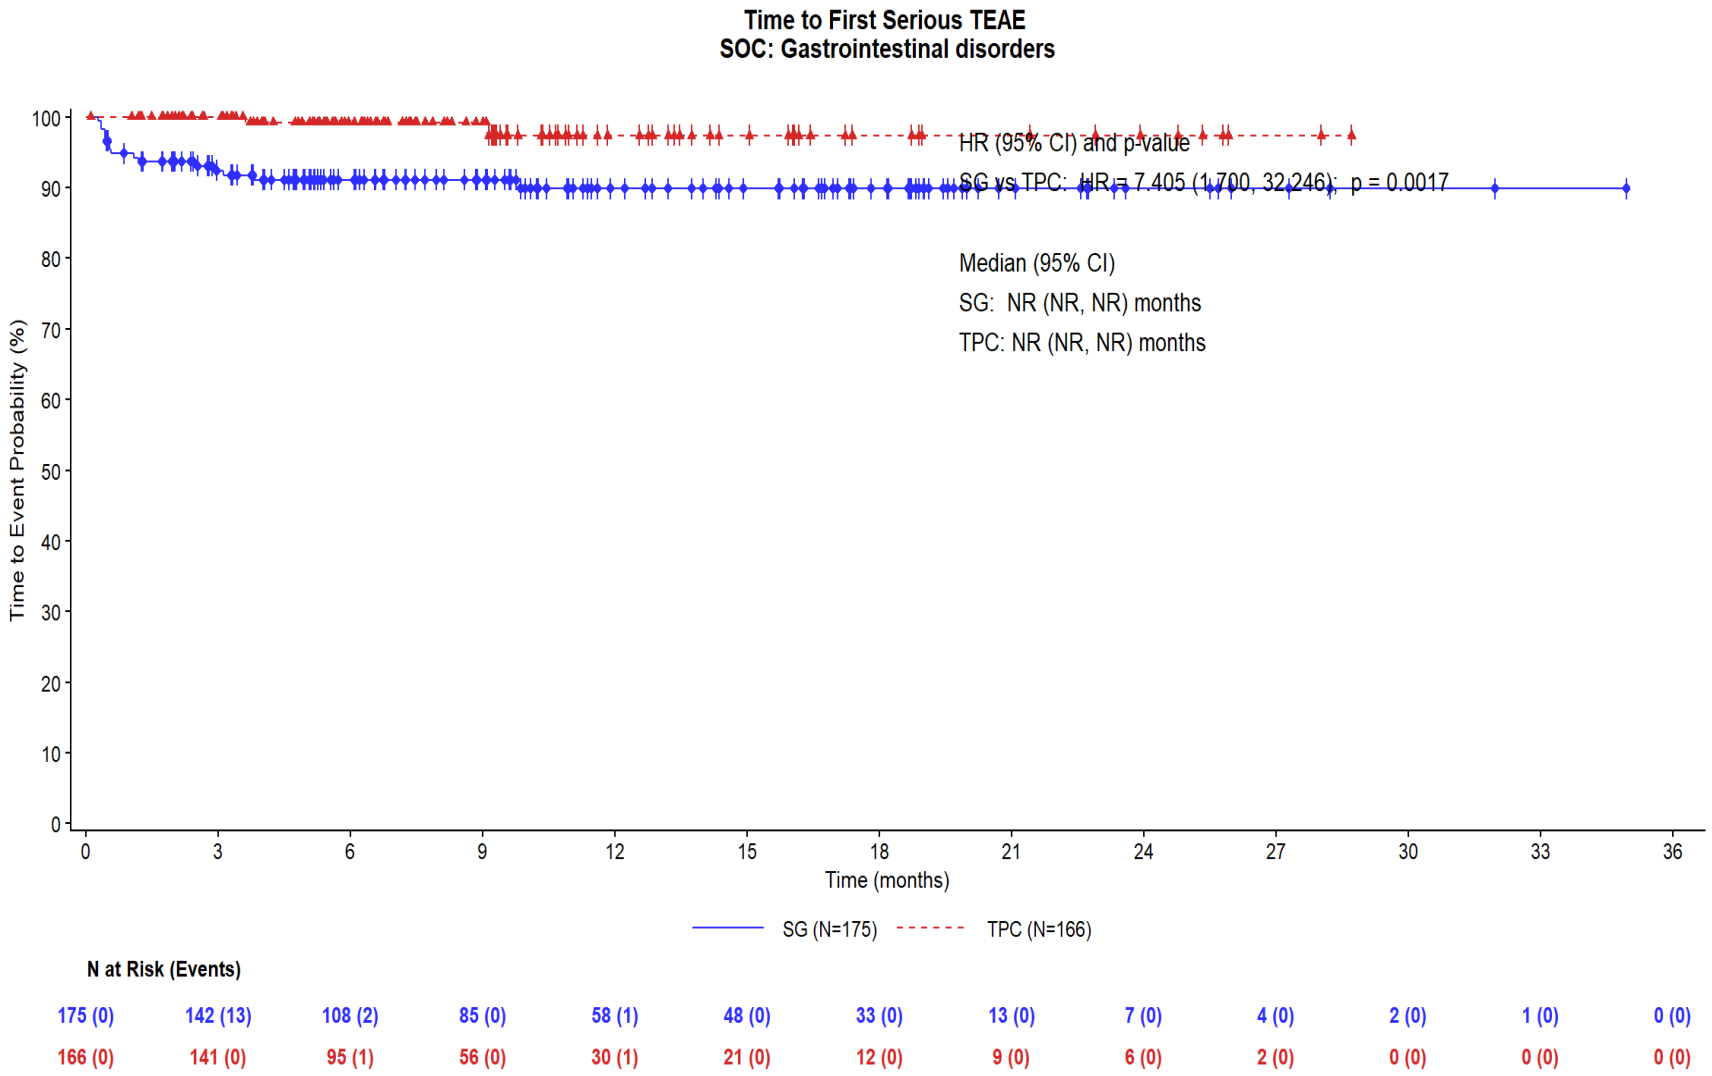
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.157. Figure 1.1.158: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Physician s chemotherapy choice Taxane — mSAF — Excluding patients preselected to receive nab-paclitaxel



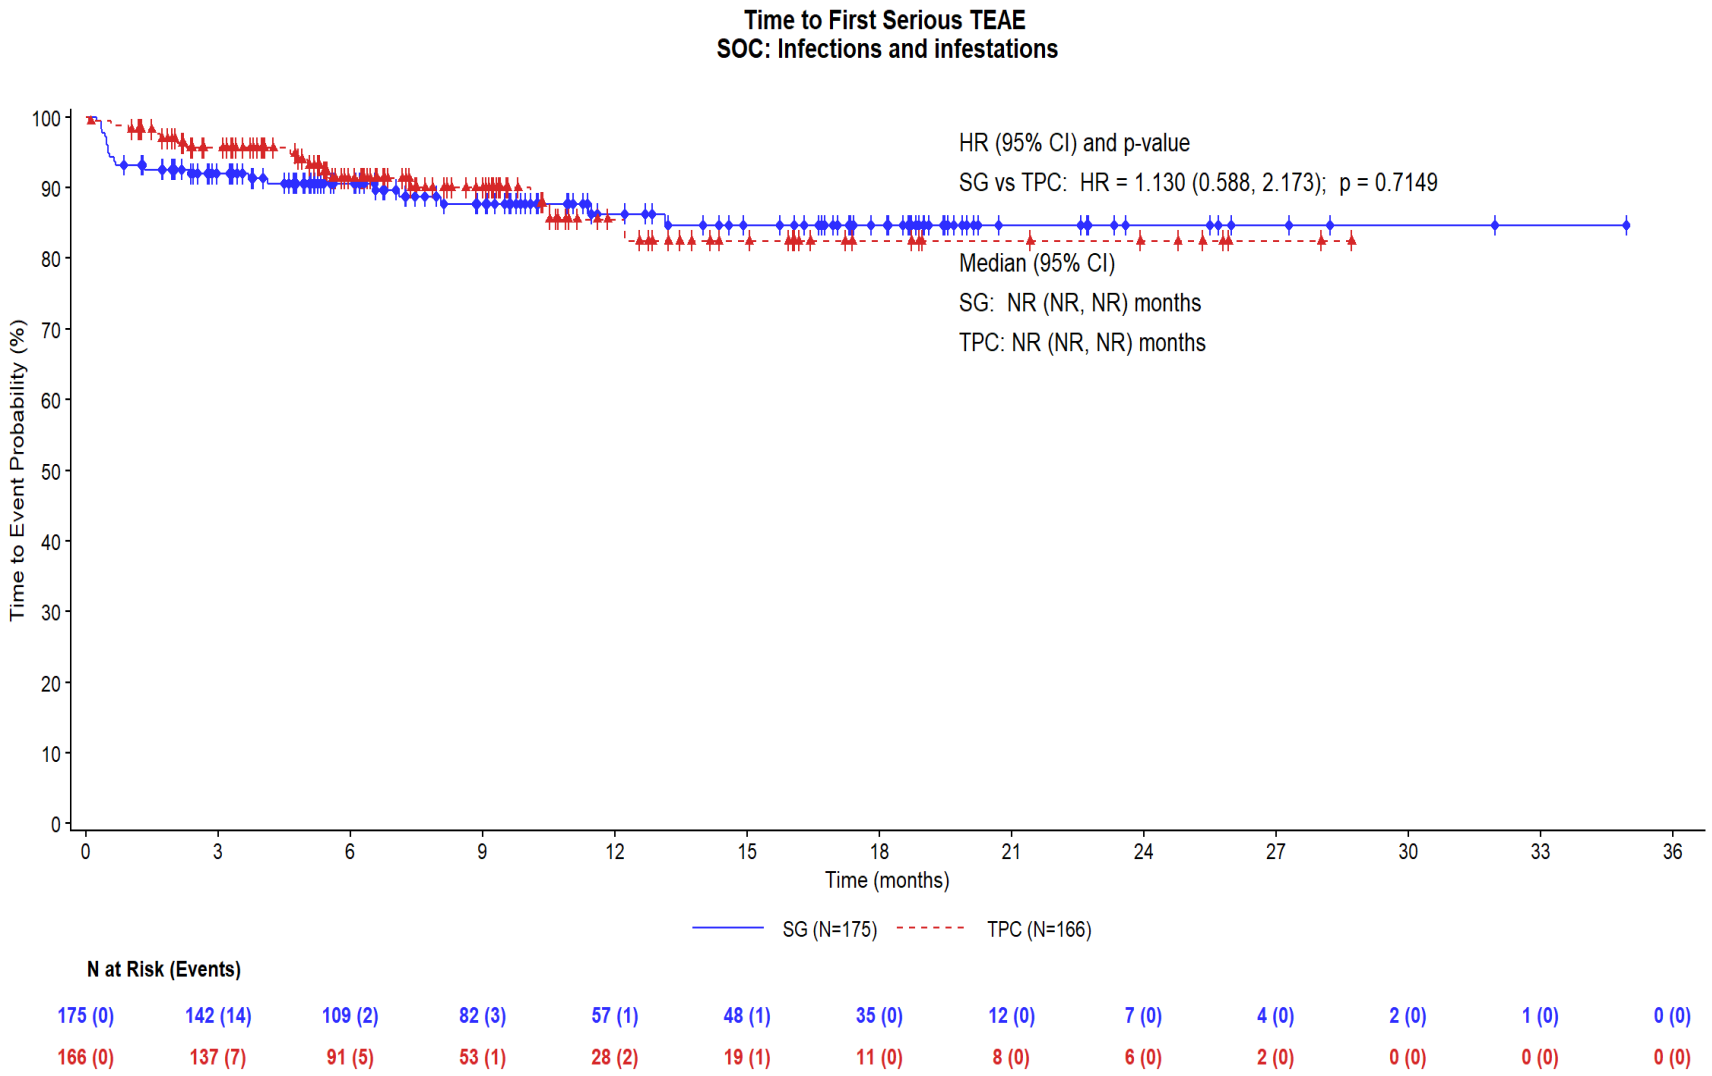
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.158. Figure 1.1.159: Kaplan Meier Plot of Time to First Severe TEAE (CTCAE Grade 3 and above) by PT Neutropenia (SOC Blood and lymphatic system disorders) Physician s chemotherapy choice Gemcitabine Carboplatin — mSAF — Excluding patients preselected to receive nab-paclitaxel



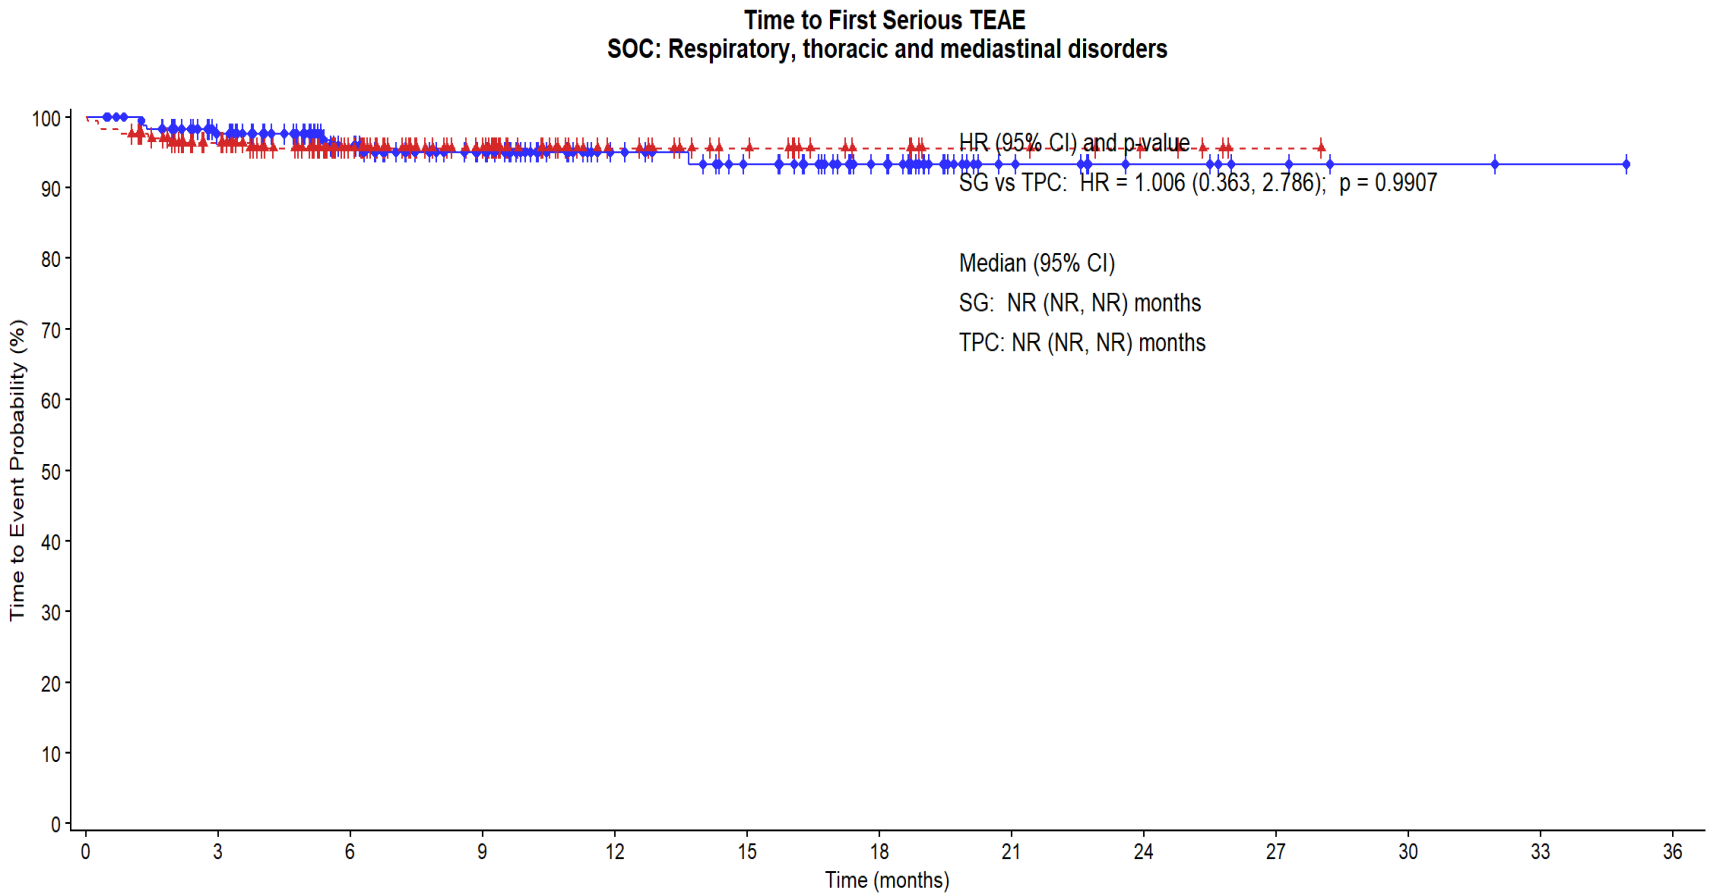
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test. Interaction p-value is from a likelihood ratio test comparing a Cox model with treatment + subgroup + treatment×subgroup interaction versus treatment + subgroup only.

8.159. Figure 1.1.160: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Blood and lymphatic system disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



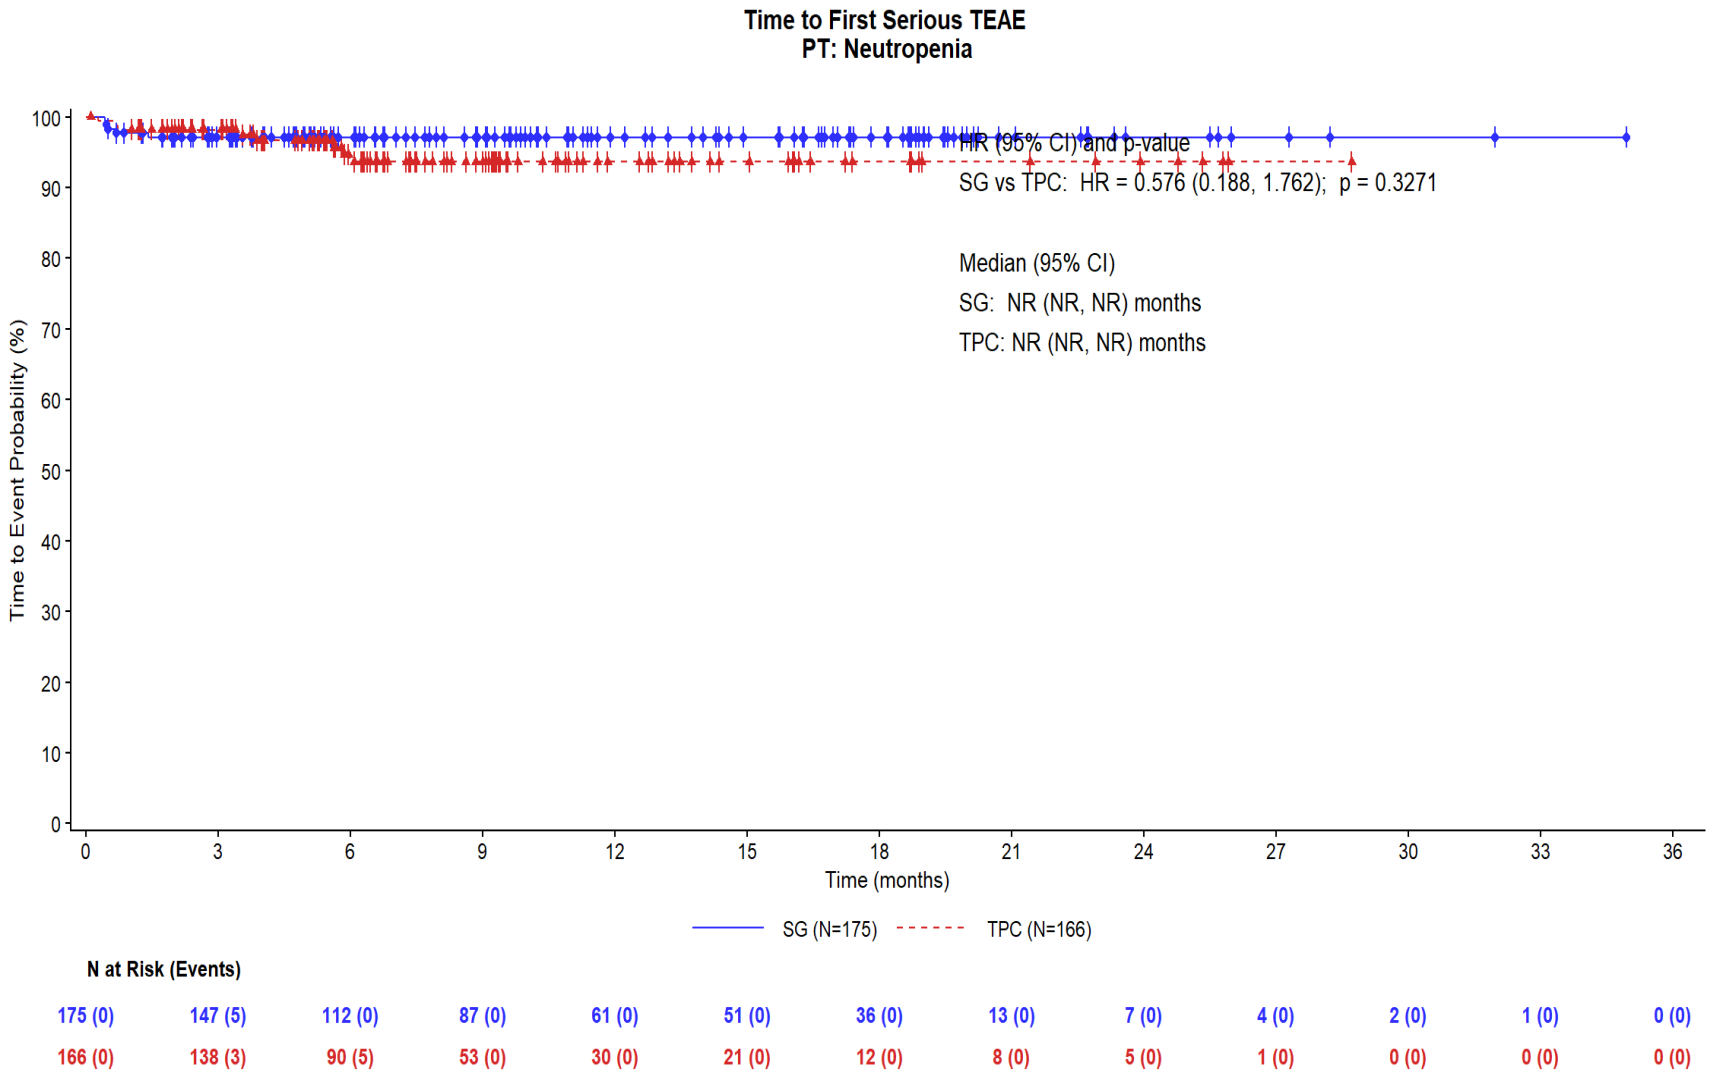
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.160. Figure 1.1.161: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Gastrointestinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



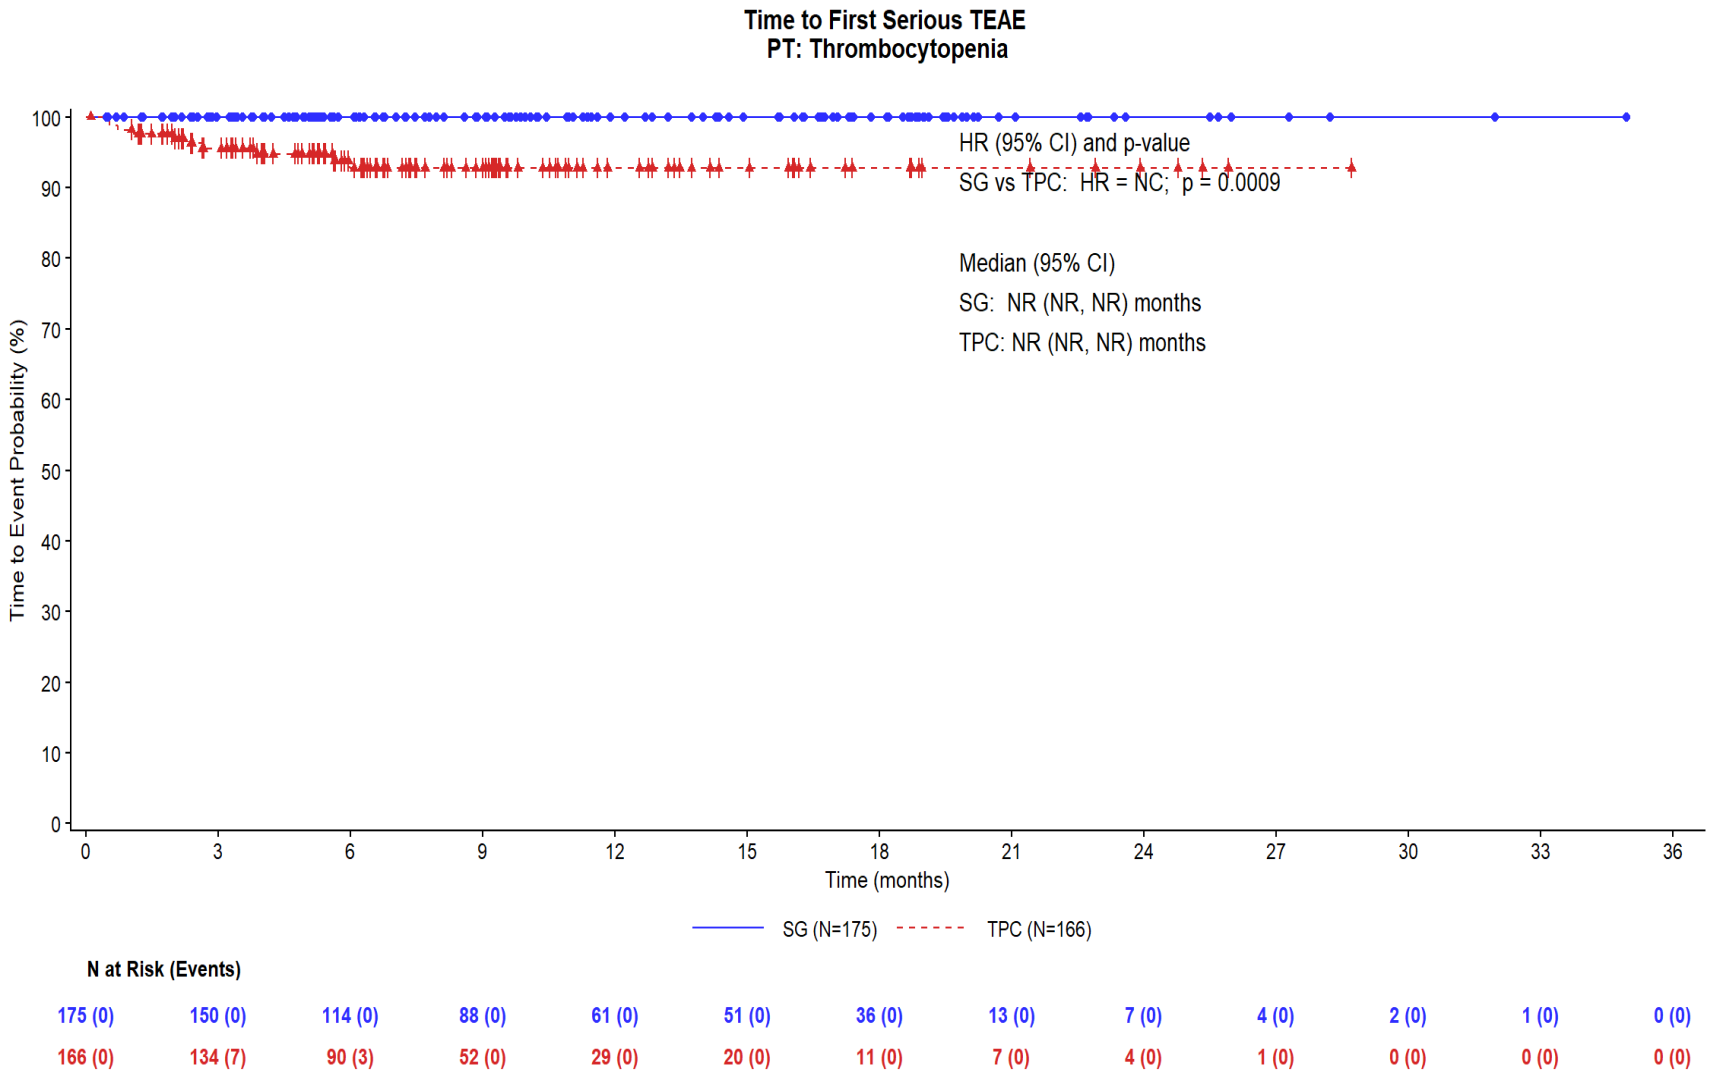
NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.161. Figure 1.1.162: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Infections and infestations — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.162. Figure 1.1.163: Kaplan Meier Plot of Time to First TEAE (SAE) by SOC Respiratory thoracic and mediastinal disorders — mSAF — Excluding patients preselected to receive nab-paclitaxel



NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.163. Figure 1.1.164: Kaplan Meier Plot of Time to First TEAE (SAE) by PT Neutropenia — mSAF — Excluding patients preselected to receive nab-paclitaxel

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

8.164. Figure 1.1.165: Kaplan Meier Plot of Time to First TEAE (SAE) by PT Thrombocytopenia — mSAF — Excluding patients preselected to receive nab-paclitaxel

NR = Not Reached. Hazard ratio and 95% CI are from the unadjusted Cox regression analysis. p-value is from the unstratified log-rank test.

Table. Recurrence of diarrhoea TEAE — mSAF: Excluding patients preselected to nab-paclitaxel

	SG (N=175)			TPC (N=166)		
Incidence of diarrhoea TEAE	**1 event**	**2 events**	**>2 events**	**1 event**	**2 events**	**>2 events**
Grade 1	46 (26.3%)	16 (9.1%)	18 (10.3%)	27 (16.3%)	2 (1.2%)	4 (2.4%)
Grade 2	36 (20.6%)	9 (5.1%)	5 (2.9%)	11 (6.6%)	2 (1.2%)	1 (0.6%)
Grade ≥3	17 (9.7%)	1 (0.6%)	0	2 (1.2%)	0	0
Grade 3	18 (10.3%)	0	0	2 (1.2%)	0	0
Grade 4	1 (0.6%)	0	0	0	0	0
Grade 5	0	0	0	0	0	0

n = number of events per patient;

GS-US-592-6238-20788-92106 (SG): 2 diarrhoea episodes at Grade≥3 (1×Grade 3 + 1×Grade 4)

Table 1.1.1
Summary of Observation Period (Months) for EORTC QLQ-C30
(mITT excluding patients preselected to receive nab-paclitaxel)

Statistic	SG (N=177)	TPC (N=169)	Overall (N=346)
N	176	167	343
Mean (SD)	9.9 (7.44)	7.8 (5.96)	8.8 (6.83)
95% CI	8.7, 11.0	6.8, 8.7	8.1, 9.6
Median	8.2	6.1	6.9
Q1, Q3	4.2, 16.1	3.7, 9.9	4.1, 12.9
Min, Max	0.0, 34.5	0.0, 27.3	0.0, 34.5

Note: Observation period is defined as the time from the start of treatment to the final study visit and is truncated at the date of the last questionnaire completion if it occurs earlier. If the treatment start date is missing, the randomization date is used. The final study visit is defined as the maximum of Period 01 end date and Period 02 end date.

CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; SD = standard deviation; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

	P-value of subgroup*treatment interaction [e]	0.182	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.3.1.11
Time to First Meaningful Deterioration for EORTC QLQ-C30 Insomnia by Subgroup - Age Group
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
<65 Years	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	133	131
	The number (%) of patients with an event [a]	67 (50.4%)	68 (51.9%)
	The number (%) of patients censored [a]	66 (49.6%)	63 (48.1%)
	Median time to event (95% CI) [b]	5.5 (3.5, 10.8)	4.2 (3.3, 6.0)
	Nominal p-value for unstratified log-rank test [c]	0.316	
	HR (95% CI) [d]	0.84 (0.60, 1.18)	
≥65 Years	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	44	38
	The number (%) of patients with an event [a]	13 (29.5%)	19 (50.0%)
	The number (%) of patients censored [a]	31 (70.5%)	19 (50.0%)
	Median time to event (95% CI) [b]	5.4 (2.6, NE)	3.3 (1.8, NE)
	Nominal p-value for unstratified log-rank test [c]	0.356	
	HR (95% CI) [d]	0.72 (0.36, 1.46)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.4.2.2
Time to First Meaningful Deterioration for EORTC QLQ-BR23 Sexual Function by Subgroup - Race
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Other	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	19	24
	The number (%) of patients with an event [a]	4 (21.1%)	5 (20.8%)
	The number (%) of patients censored [a]	15 (78.9%)	19 (79.2%)
	Median time to event (95% CI) [b]	NE (1.7, NE)	NE (3.8, NE)
	Nominal p-value for unstratified log-rank test [c]	0.931	
	HR (95% CI) [d]	0.94 (0.25, 3.52)	
	P-value of subgroup*treatment interaction [e]	0.936	

Note: The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.5.1.3
Time to First Meaningful Deterioration for EORTC QLQ-C30 Role Functioning by Subgroup - Baseline ECOG
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
	P-value of subgroup*treatment interaction [e]	0.683	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.5.2.3
Time to First Meaningful Deterioration for EORTC QLQ-BR23 Sexual Enjoyment by Subgroup - Baseline ECOG
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
0	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	116	106
	The number (%) of patients with an event [a]	6 (5.2%)	6 (5.7%)
	The number (%) of patients censored [a]	110 (94.8%)	100 (94.3%)
	Median time to event (95% CI) [b]	NE (1.1, NE)	NE (NE, NE)
	Nominal p-value for unstratified log-rank test [c]	0.414	
	HR (95% CI) [d]	1.60 (0.51, 4.96)	
1	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	61	63
	The number (%) of patients with an event [a]	1 (1.6%)	3 (4.8%)
	The number (%) of patients censored [a]	60 (98.4%)	60 (95.2%)
	Median time to event (95% CI) [b]	NE (1.4, NE)	3.1 (0.9, NE)
	Nominal p-value for unstratified log-rank test [c]	0.087	
	HR (95% CI) [d]	0.15 (0.01, 1.66)	

Note: The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.6.5
Time to First Meaningful Deterioration for PGIC by Subgroup - TPC of Chemotherapy Prior to Randomization
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
	P-value of subgroup*treatment interaction [e]	0.505	

Note: 'Minimally worsened', 'much worsened', and 'very much worsened' are classified as responders.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; HR = hazard ratio; NE = Not Estimable; PGIC = Patient Global Impression of Change; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.7.1.7
Time to First Meaningful Deterioration for EORTC QLQ-C30 Fatigue by Subgroup - Liver Metastasis
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Yes	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	47	39
	The number (%) of patients with an event [a]	32 (68.1%)	20 (51.3%)
	The number (%) of patients censored [a]	15 (31.9%)	19 (48.7%)
	Median time to event (95% CI) [b]	0.9 (0.8, 1.7)	1.9 (1.1, 5.4)
	Nominal p-value for unstratified log-rank test [c]	0.120	
	HR (95% CI) [d]	1.57 (0.90, 2.75)	
No	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	130	130
	The number (%) of patients with an event [a]	87 (66.9%)	104 (80.0%)
	The number (%) of patients censored [a]	43 (33.1%)	26 (20.0%)
	Median time to event (95% CI) [b]	1.5 (1.0, 1.8)	1.2 (1.0, 1.9)
	Nominal p-value for unstratified log-rank test [c]	0.250	
	HR (95% CI) [d]	0.85 (0.64, 1.13)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.7.1.14
Time to First Meaningful Deterioration for EORTC QLQ-C30 Diarrhoea by Subgroup - Liver Metastasis
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Yes	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	47	39
	The number (%) of patients with an event [a]	35 (74.5%)	10 (25.6%)
	The number (%) of patients censored [a]	12 (25.5%)	29 (74.4%)
	Median time to event (95% CI) [b]	1.0 (0.9, 2.2)	10.1 (3.9, NE)
	Nominal p-value for unstratified log-rank test [c]	<.001	
	HR (95% CI) [d]	3.68 (1.81, 7.48)	
No	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	130	130
	The number (%) of patients with an event [a]	83 (63.8%)	61 (46.9%)
	The number (%) of patients censored [a]	47 (36.2%)	69 (53.1%)
	Median time to event (95% CI) [b]	1.7 (1.4, 2.9)	6.0 (4.2, NE)
	Nominal p-value for unstratified log-rank test [c]	<.001	
	HR (95% CI) [d]	2.05 (1.47, 2.86)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.8.1.9
Time to First Meaningful Deterioration for EORTC QLQ-C30 Pain by Subgroup - Brain Metastasis
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Yes	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	8	9
	The number (%) of patients with an event [a]	4 (50.0%)	5 (55.6%)
	The number (%) of patients censored [a]	4 (50.0%)	4 (44.4%)
	Median time to event (95% CI) [b]	1.7 (0.8, NE)	1.4 (0.8, NE)
	Nominal p-value for unstratified log-rank test [c]	0.914	
	HR (95% CI) [d]	1.08 (0.27, 4.32)	
No	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	169	160
	The number (%) of patients with an event [a]	84 (49.7%)	95 (59.4%)
	The number (%) of patients censored [a]	85 (50.3%)	65 (40.6%)
	Median time to event (95% CI) [b]	5.6 (2.4, 8.8)	3.0 (2.4, 4.4)
	Nominal p-value for unstratified log-rank test [c]	0.140	
	HR (95% CI) [d]	0.80 (0.60, 1.08)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.9.1.11
Time to First Meaningful Deterioration for EORTC QLQ-C30 Insomnia by Subgroup - BRCA1/2 Status
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Wild-type	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	66	65
	The number (%) of patients with an event [a]	31 (47.0%)	31 (47.7%)
	The number (%) of patients censored [a]	35 (53.0%)	34 (52.3%)
	Median time to event (95% CI) [b]	5.4 (3.5, 14.4)	4.2 (1.8, NE)
	Nominal p-value for unstratified log-rank test [c]	0.541	
	HR (95% CI) [d]	0.85 (0.52, 1.40)	
Mutant	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	12	10
	The number (%) of patients with an event [a]	7 (58.3%)	4 (40.0%)
	The number (%) of patients censored [a]	5 (41.7%)	6 (60.0%)
	Median time to event (95% CI) [b]	1.9 (0.8, NE)	9.0 (1.9, NE)
	Nominal p-value for unstratified log-rank test [c]	0.113	
	HR (95% CI) [d]	2.70 (0.76, 9.60)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.10.1.6
Time to First Meaningful Deterioration for EORTC QLQ-C30 Social Functioning by Subgroup - Menopausal Status
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Pre-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	37	49
	The number (%) of patients with an event [a]	22 (59.5%)	33 (67.3%)
	The number (%) of patients censored [a]	15 (40.5%)	16 (32.7%)
	Median time to event (95% CI) [b]	3.8 (1.6, 12.2)	3.1 (1.4, 5.8)
	Nominal p-value for unstratified log-rank test [c]	0.218	
	HR (95% CI) [d]	0.70 (0.40, 1.24)	
Post-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	140	119
	The number (%) of patients with an event [a]	80 (57.1%)	66 (55.5%)
	The number (%) of patients censored [a]	60 (42.9%)	53 (44.5%)
	Median time to event (95% CI) [b]	2.2 (1.4, 3.6)	3.3 (1.9, 4.9)
	Nominal p-value for unstratified log-rank test [c]	0.722	
	HR (95% CI) [d]	1.06 (0.77, 1.47)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.10.1.13
Time to First Meaningful Deterioration for EORTC QLQ-C30 Constipation by Subgroup - Menopausal Status
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Pre-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	37	49
	The number (%) of patients with an event [a]	15 (40.5%)	22 (44.9%)
	The number (%) of patients censored [a]	22 (59.5%)	27 (55.1%)
	Median time to event (95% CI) [b]	12.4 (1.4, NE)	6.9 (1.9, NE)
	Nominal p-value for unstratified log-rank test [c]	0.590	
	HR (95% CI) [d]	0.84 (0.43, 1.62)	
Post-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	140	119
	The number (%) of patients with an event [a]	82 (58.6%)	66 (55.5%)
	The number (%) of patients censored [a]	58 (41.4%)	53 (44.5%)
	Median time to event (95% CI) [b]	2.2 (1.7, 3.0)	2.7 (1.6, 5.6)
	Nominal p-value for unstratified log-rank test [c]	0.914	
	HR (95% CI) [d]	1.01 (0.73, 1.40)	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Subgroup	Parameter	SG (N=177)	TPC (N=169)
Pre-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	37	49
	The number (%) of patients with an event [a]	31 (83.8%)	34 (69.4%)
	The number (%) of patients censored [a]	6 (16.2%)	15 (30.6%)
	Median time to event (95% CI) [b]	0.8 (0.8, 1.0)	1.4 (1.0, 3.5)
	Nominal p-value for unstratified log-rank test [c]	0.003	
	HR (95% CI) [d]	2.11 (1.29, 3.45)	
Post-menopausal	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	140	119
	The number (%) of patients with an event [a]	100 (71.4%)	72 (60.5%)
	The number (%) of patients censored [a]	40 (28.6%)	47 (39.5%)
	Median time to event (95% CI) [b]	1.0 (0.8, 1.4)	2.7 (1.4, 4.9)
	Nominal p-value for unstratified log-rank test [c]	0.001	
	HR (95% CI) [d]	1.69 (1.25, 2.29)	

Note: The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Note: 'Very poor' and 'poor' are classified as responders.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; HR = hazard ratio; NE = Not Estimable; PGIS = Patient Global Impression of Severity; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.11.1.14
Time to First Meaningful Deterioration for EORTC QLQ-C30 Diarrhoea by Subgroup - PD-L1 Status
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
	P-value of subgroup*treatment interaction [e]	0.818	

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Table 7.1.11.2.7
Time to First Meaningful Deterioration for EORTC QLQ-BR23 Arm Symptoms by Subgroup - PD-L1 Status
(mITT excluding patients preselected to receive nab-paclitaxel)

Subgroup	Parameter	SG (N=177)	TPC (N=169)
CPS <1	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	67	59
	The number (%) of patients with an event [a]	35 (52.2%)	31 (52.5%)
	The number (%) of patients censored [a]	32 (47.8%)	28 (47.5%)
	Median time to event (95% CI) [b]	4.5 (2.2, 13.3)	4.2 (2.9, 6.3)
	Nominal p-value for unstratified log-rank test [c]	0.512	
	HR (95% CI) [d]	0.85 (0.52, 1.38)	
CPS ≥1	The number of patients in the mITT excluding patients preselected to receive nab-paclitaxel	109	110
	The number (%) of patients with an event [a]	54 (49.5%)	58 (52.7%)
	The number (%) of patients censored [a]	55 (50.5%)	52 (47.3%)
	Median time to event (95% CI) [b]	6.8 (4.1, 12.7)	3.5 (2.8, 6.2)
	Nominal p-value for unstratified log-rank test [c]	0.130	
	HR (95% CI) [d]	0.75 (0.51, 1.09)	

Note: The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
[a] Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel per subgroup.
[b] Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
[c] P-value was estimated from the unstratified log-rank test.
[d] HR (95% CI) of SG vs. TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
[e] P-value of subgroup*treatment interaction from a Cox model with treatment, subgroup and treatment*subgroup interaction.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] P-value was estimated from the unstratified log-rank test .
[b] HR (95% CI) of SG versus TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Figure 4.1.8.1
Kaplan-Meier Plot of Time to First Meaningful Deterioration in EORTC QLQ-C30 Cognitive Functioning by Treatment Group (Menopausal Status = Pre-menopausal)
(mITT excluding patients preselected to receive nab-paclitaxel)

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] P-value was estimated from the unstratified log-rank test .
[b] HR (95% CI) of SG versus TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

Figure 4.1.8.2
Kaplan-Meier Plot of Time to First Meaningful Deterioration in EORTC QLQ-C30 Cognitive Functioning by Treatment Group (Menopausal Status = Post-menopausal)
(mITT excluding patients preselected to receive nab-paclitaxel)

Note: The response threshold for EORTC QLQ-C30 domains is ≥10 points.
[a] P-value was estimated from the unstratified log-rank test .
[b] HR (95% CI) of SG versus TPC was estimated using an unadjusted/unstratified Cox proportional hazards regression model.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30; HR = hazard ratio; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.

1. Statistical Analysis for German Submission of ASCENT-03

2. TFLs

Population: Triple-negative breast cancer (mTNBC)

Sub-Populations:
— Excluding patients preselected to receive nab-paclitaxel or gemcitabine+carboplatin

Data Cut Date: 22 APR 2026

Version 1.0

Visit	Sacituzumab Govitecan (N=52)	Treatment Physician Choice (N=45)	Overall (N=97)
Baseline (Week 1)	49/52 (94.2%)	43/45 (95.6%)	92/97 (94.8%)
Week 4	37/52 (71.2%)	30/45 (66.7%)	67/97 (69.1%)
Week 7	40/52 (76.9%)	8/45 (17.8%)	48/97 (49.5%)
Week 10	36/52 (69.2%)	31/45 (68.9%)	67/97 (69.1%)
Week 13	34/52 (65.4%)	30/45 (66.7%)	64/97 (66.0%)
Week 16	36/52 (69.2%)	19/45 (42.2%)	55/97 (56.7%)
Week 19	31/52 (59.6%)	11/45 (24.4%)	42/97 (43.3%)
Week 22	30/52 (57.7%)	21/45 (46.7%)	51/97 (52.6%)
Week 25	30/52 (57.7%)	17/45 (37.8%)	47/97 (48.5%)
Week 28	27/52 (51.9%)	13/45 (28.9%)	40/97 (41.2%)
Week 31	25/52 (48.1%)	5/45 (11.1%)	30/97 (30.9%)
Week 34	22/52 (42.3%)	9/45 (20.0%)	31/97 (32.0%)
Week 37	26/52 (50.0%)	8/45 (17.8%)	34/97 (35.1%)
Week 40	21/52 (40.4%)	5/45 (11.1%)	26/97 (26.8%)
Week 43	22/52 (42.3%)	4/45 (8.9%)	26/97 (26.8%)
Week 46	23/52 (44.2%)	4/45 (8.9%)	27/97 (27.8%)
Week 49	16/52 (30.8%)	2/45 (4.4%)	18/97 (18.6%)
Week 52	16/52 (30.8%)	2/45 (4.4%)	18/97 (18.6%)
Week 55	18/52 (34.6%)	2/45 (4.4%)	20/97 (20.6%)
Week 58	17/52 (32.7%)	3/45 (6.7%)	20/97 (20.6%)
Week 61	15/52 (28.8%)	3/45 (6.7%)	18/97 (18.6%)
Week 64	14/52 (26.9%)	2/45 (4.4%)	16/97 (16.5%)
Week 67	15/52 (28.8%)	1/45 (2.2%)	16/97 (16.5%)

Visit	Sacituzumab Govitecan (N=52)	Treatment Physician Choice (N=45)	Overall (N=97)
Week 70	17/52 (32.7%)	1/45 (2.2%)	18/97 (18.6%)
Week 73	16/52 (30.8%)	2/45 (4.4%)	18/97 (18.6%)
Week 76	12/52 (23.1%)	2/45 (4.4%)	14/97 (14.4%)
Week 79	12/52 (23.1%)	0/45 (0.0%)	12/97 (12.4%)
Week 82	9/52 (17.3%)	0/45 (0.0%)	9/97 (9.3%)
Week 85	10/52 (19.2%)	0/45 (0.0%)	10/97 (10.3%)
Week 88	7/52 (13.5%)	0/45 (0.0%)	7/97 (7.2%)
Week 91	7/52 (13.5%)	0/45 (0.0%)	7/97 (7.2%)
Week 94	7/52 (13.5%)	0/45 (0.0%)	7/97 (7.2%)
Week 97	7/52 (13.5%)	0/45 (0.0%)	7/97 (7.2%)
Week 100	7/52 (13.5%)	0/45 (0.0%)	7/97 (7.2%)
Week 103	5/52 (9.6%)	0/45 (0.0%)	5/97 (5.2%)
Week 106	5/52 (9.6%)	0/45 (0.0%)	5/97 (5.2%)
Week 109	4/52 (7.7%)	0/45 (0.0%)	4/97 (4.1%)
Week 112	3/52 (5.8%)	0/45 (0.0%)	3/97 (3.1%)
Week 115	4/52 (7.7%)	0/45 (0.0%)	4/97 (4.1%)
Week 118	2/52 (3.8%)	0/45 (0.0%)	2/97 (2.1%)
Week 121	2/52 (3.8%)	0/45 (0.0%)	2/97 (2.1%)
Week 124	3/52 (5.8%)	0/45 (0.0%)	3/97 (3.1%)
Week 127	2/52 (3.8%)	0/45 (0.0%)	2/97 (2.1%)
Week 130	1/52 (1.9%)	0/45 (0.0%)	1/97 (1.0%)
Week 133	2/52 (3.8%)	0/45 (0.0%)	2/97 (2.1%)
Week 136	2/52 (3.8%)	0/45 (0.0%)	2/97 (2.1%)
Week 139	1/52 (1.9%)	0/45 (0.0%)	1/97 (1.0%)

Visit	Sacituzumab Govitecan (N=52)	Treatment Physician Choice (N=45)	Overall (N=97)
Week 142	1/52 (1.9%)	0/45 (0.0%)	1/97 (1.0%)
End of Treatment	33/52 (63.5%)	31/45 (68.9%)	64/97 (66.0%)

SG = Sacituzumab Govitecan, TPC = Treatment Physician Choice,
Available data rate is defined as the number of patients in the mITT Analysis Set submitting an evaluable PRO at a given timepoint over the number of patients in the mITT Analysis Set.
Data cut off: 22 APR 2026

4.9. Table 1.1.3.5: — Summary of Available Data Rates of PGIS by Visit — mITT — Excluding patients preselected to receive nab-paclitaxel or gemcitabine+carboplatin

Visit	Sacituzumab Govitecan (N=52)	Treatment Physician Choice (N=45)	Overall (N=97)
Baseline (Week 1)	48/52 (92.3%)	43/45 (95.6%)	91/97 (93.8%)

At 24 months	12.2 (1.4, 35.7)	20.2 (6.9, 38.3)
p-value (two-sided, stratified log-rank)	0.6087	
Adjusted HR (95% CI), SG vs TPC	1.1811 (0.6842, 2.0389)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or gemcitabine+carboplatin.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; QoL = Quality of life; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice
Note that deaths are not considered as events.

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or gemcitabine+carboplatin.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice

Adjusted HR (95% CI), SG vs TPC	1.7036 (0.6839, 4.2437)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or gemcitabine+carboplatin.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.

Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.

Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

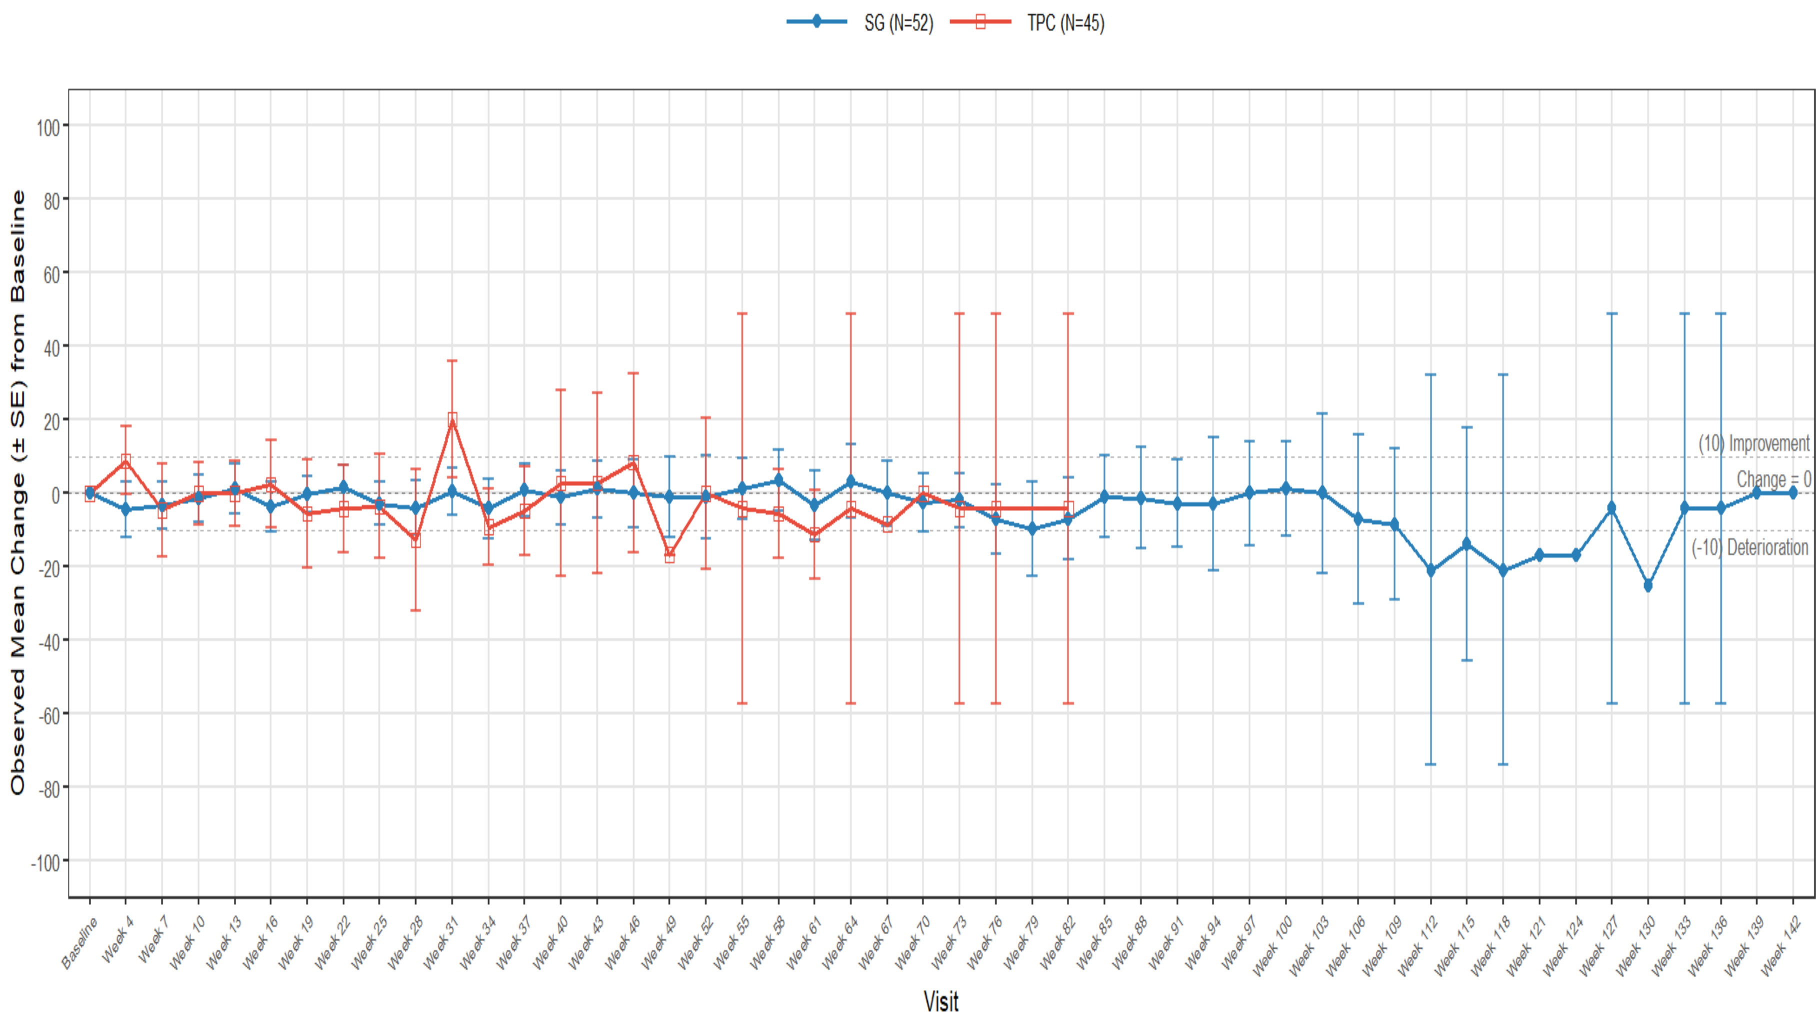
Hazard Ratio of SG vs TPC (95% CI) from Cox Model	1.142 (0.209, 6.241)		



SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

Min, Max	0.0, 40.7	0.0, 33.4	0.0, 40.7

SG = Sacituzumab Govitecan, TPC = Treatment Physician Choice,
Observation period is defined as time from start of treatment until final study visit and shortened to date of last questionnaire completion if occured earlier.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; SD = standard deviation; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice.
Data Cut off : 22 APR 2026

At 24 months	27.8 (17.8, 38.6)	17.7 (7.2, 31.9)
p-value (two-sided, stratified log-rank)	0.6493	
Adjusted HR (95% CI), SG vs TPC	0.8903 (0.6392, 1.2401)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or paclitaxel.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; QoL = Quality of life; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice
Note that deaths are not considered as events.

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or paclitaxel.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice

At 24 months	36.3 (23.6, 49.0)	22.0 (6.2, 43.7)
p-value (two-sided, stratified log-rank)	0.7689	
Adjusted HR (95% CI), SG vs TPC	0.8761 (0.5804, 1.3224)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel or paclitaxel.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.

Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

4.57. Table 1.1.20.14: — Subgroup Analysis of Time to First Meaningful Deterioration | EORTC QLQ-C30: Diarrhoea | — mITT — Excluding patients preselected to receive nab-paclitaxel or paclitaxel

Hazard Ratio of SG vs TPC (95% CI) from Cox Model	2.738 (1.780, 4.213)		

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.

Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

4.64. Table 1.1.21.6: — Subgroup Analysis of Time to First Meaningful Deterioration | EORTC QLQ-BR23: Breast Symptoms | — mITT — Excluding patients preselected to receive nab-paclitaxel or paclitaxel

Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).

Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

p-value (two-sided, stratified log-rank)	0.7667	
Adjusted HR (95% CI), SG vs TPC	0.9594 (0.7237, 1.2718)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; QoL = Quality of life; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice
Note that deaths are not considered as events.

Adjusted HR (95% CI), SG vs TPC	0.9637 (0.7366, 1.2608)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice

Events, n (%)	87 (49.2%)	84 (49.7%)
A meaningful deterioration	87 (49.2%)	84 (49.7%)
Censored, n (%)	90 (50.8%)	85 (50.3%)
Not at risk at baseline	3 (1.7%)	6 (3.6%)
Missing baseline only	3 (1.7%)	2 (1.2%)
Having baseline but no postbaseline visit	12 (6.8%)	6 (3.6%)
No baseline or any postbaseline	1 (0.6%)	2 (1.2%)
Missing PRO for two consecutive visits	16 (9.0%)	8 (4.7%)
Premature treatment discontinuation	49 (27.7%)	60 (35.5%)
Others	6 (3.4%)	1 (0.6%)
Median TTD, months (95% CI)	3.6 (2.1, 8.8)	4.9 (2.4, 7.9)
Q1	0.9 (0.8, 1.4)	1.0 (0.9, 1.4)
Q3	NE	15.5 (11.1, NE)
Event-free rate, % (95% CI)		
At 3 months	52.7 (44.4, 60.3)	56.8 (48.2, 64.5)
At 6 months	43.9 (35.7, 51.9)	45.5 (36.8, 53.8)
At 12 months	39.7 (30.9, 48.3)	35.1 (24.2, 46.2)
At 18 months	37.0 (27.5, 46.6)	18.8 (6.7, 35.5)
At 24 months	37.0 (27.5, 46.6)	12.5 (2.8, 30.0)
p-value (two-sided, stratified log-rank)	0.8822	

	SG (N=177)	TPC (N=169)
Adjusted HR (95% CI), SG vs TPC	0.9836 (0.7276, 1.3297)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-C30 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-C30 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire–Core 30; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice
Note that deaths are not considered as events.

p-value (two-sided, stratified log-rank)	0.0001	
Adjusted HR (95% CI), SG vs TPC	1.7170 (1.3243, 2.2262)	

Time to first deterioration (TTFD) is defined as the time between the date of randomization and the date of assessment at which a participant experienced a first deterioration (i.e., ≥ the threshold for Deterioration from baseline (if applicable); based on the assessments after applying analysis visit window).
The response threshold for EORTC QLQ-BR23 domains is ≥10 points.
Denominator was the number of patients in the mITT excluding patients preselected to receive nab-paclitaxel.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
P-value was estimated from the stratified log-rank test by randomization stratification factors.
CI = Confidence Interval; EORTC QLQ-BR23 = European Organization for Research and Treatment of Cancer Quality of Life Questionnaire Breast Cancer Module; HR = hazard ratio; NE = Not Estimable; SG = Sacituzumab Govitecan; TPC = Treatment Physician Choice
Note that deaths are not considered as events.
Data Cut off: 22 APR 2026

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.

Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

4.53. Table 1.1.20.10: — Subgroup Analysis of Time to First Meaningful Deterioration | EORTC QLQ-C30: Dyspnoea | — mITT — Excluding patients preselected to receive nab-paclitaxel

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC= Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.

Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.

Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.

Log-Rank Test p-value (unstratified)	0.3173		

	SG (N=177)	TPC (N=169)	Interaction
Hazard Ratio of SG vs TPC (95% CI) from Cox Model	NC		
Menopausal status			
Pre-menopausal	37	49	0.4814
Number (%) of Participants with Events (Deterioration)	3 (8.1%)	6 (12.2%)	
Number (%) of Participants Censored	34 (91.9%)	43 (87.8%)	
Kaplan-Meier Estimate of TTFD (Months) (95% CI)			
Median	NE (NE, NE)	NE (NE, NE)	
Log-Rank Test p-value (unstratified)	0.6423		
Hazard Ratio of SG vs TPC (95% CI) from Cox Model	0.721 (0.180, 2.889)		
Post-menopausal	140	119	
Number (%) of Participants with Events (Deterioration)	14 (10.0%)	9 (7.6%)	
Number (%) of Participants Censored	126 (90.0%)	110 (92.4%)	
Kaplan-Meier Estimate of TTFD (Months) (95% CI)			
Median	NE (NE, NE)	NE (6.64, NE)	
Log-Rank Test p-value (unstratified)	0.6329		
Hazard Ratio of SG vs TPC (95% CI) from Cox Model	1.231 (0.526, 2.882)		

SG = sacituzumab govitecan; TPC = treatment of physician's choice; NC = Not Calculable; NEst = Not Estimable; NR = Not Reached.
Denominator of percentages is the number of participants in each treatment group of each subgroup.
Hazard ratio and 95% CIs were calculated by unstratified Cox proportional hazards model without any adjustment. Efron method was used to handle ties.
The two-sided p-value is from Unstratified log-rank test.
Median time to event (95% CI) was estimated from the Kaplan-Meier product-limit method.
Only subgroups where all categories contain ≥ 10 patients (both arms combined) are presented.
Disease stratification and geographic region are collected from IWRS (Interactive Web Response System).
Race subgroup Other - includes American Indian or Alaska Native, Black, Native Hawaiian or Pacific Islander and Other collected in clinical database.
Interaction p-value from a Cox model with treatment, subgroup factor, and treatment×subgroup interaction term; computed via likelihood ratio test (full vs. main-effects model). Displayed once per subgroup variable at first category level.
Data Cut Date: 22 APR 2026.
