**Recherche und Synopse der Evidenz zur Bestimmung
der zweckmäßigen Vergleichstherapie nach § 35a
SGB V**

Vorgang: Plaque Psoriasis

Stand: November 2016

I. Zweckmäßige Vergleichstherapie: Kriterien gemäß 5. Kapitel § 6 VerfO G-BA

Plaque Psoriasis

[Behandlung erwachsener Patienten mit mittelschwerer bis schwerer Plaque-Psoriasis, die für eine systemische Therapie geeignet sind.]

Kriterien gemäß 5. Kapitel § 6 VerfO

| | |
|--|--|
| Sofern als Vergleichstherapie eine Arzneimittelanwendung in Betracht kommt, muss das Arzneimittel grundsätzlich eine Zulassung für das Anwendungsgebiet haben. | Siehe Übersicht „II. Zugelassene Arzneimittel im Anwendungsgebiet“ |
| Sofern als Vergleichstherapie eine nicht-medikamentöse Behandlung in Betracht kommt, muss diese im Rahmen der GKV erbringbar sein. | Phototherapie: NB-UV-B, Balneo-Photo, PUVA |
| Beschlüsse/Bewertungen/Empfehlungen des Gemeinsamen Bundesausschusses zu im Anwendungsgebiet zugelassenen Arzneimitteln/nicht-medikamentösen Behandlungen | <p><i>Beschluss des Gemeinsamen Bundesausschusses über eine Änderung der Richtlinie Methoden vertragsärztliche Versorgung: Balneophototherapie vom 13. März 2008; Richtlinie Methoden vertragsärztliche Versorgung, Stand: 3. Oktober 2014 des Gemeinsamen Bundesausschusses zu Untersuchungs- und Behandlungsmethoden der vertragsärztlichen Versorgung (Richtlinie Methoden vertragsärztliche Versorgung) in der Fassung vom 17. Januar 2006 veröffentlicht im Bundesanzeiger 2006 Nr. 48 (S. 1 523) in Kraft getreten am 1. April 2006; zuletzt geändert am 17. Juli 2014 veröffentlicht im Bundesanzeiger (BAnz AT 02.10.2014 B2); in Kraft getreten am 3. Oktober 2014.</i></p> <p><i>15. Balneophototherapie</i></p> <p><i>Beschluss zu Apremilast vom 06.08.2015</i> <i>Beschluss zu Secukinumab vom 27.11.2015</i></p> |
| Die Vergleichstherapie soll nach dem allgemein anerkannten Stand der medizinischen Erkenntnisse zur zweckmäßigen Therapie im Anwendungsgebiet gehören. | Siehe systematische Literaturrecherche |

II. Zugelassene Arzneimittel im Anwendungsgebiet

| Wirkstoff ATC-Code Handelsname | Anwendungsgebiet (Text aus Fachinformation) |
|---|--|
| Zu bewertendes Arzneimittel | |
| Systemische Therapie | |
| Adalimumab L04AB04 Humira® | Humira ist indiziert zur Behandlung der mittelschweren bis schweren chronischen Plaque-Psoriasis bei erwachsenen Patienten, die Kandidaten für eine systemische Therapie sind. |
| Etanercept L04AB01 Enbrel® | Behandlung Erwachsener mit mittelschwerer bis schwerer Plaque-Psoriasis, die auf eine andere systemische Therapie wie Ciclosporin, Methotrexat oder Psoralen und UVA-Licht (PUVA) nicht angesprochen haben, oder bei denen eine Kontraindikation oder Unverträglichkeit einer solchen Therapie vorliegt. (Stand 04/2016) |
| Infliximab L04AB02 Remicade® | Remicade ist indiziert zur Behandlung der mittelschweren bis schweren Psoriasis vom Plaque-Typ bei erwachsenen Patienten, die auf eine andere systemische Therapie, einschließlich Ciclosporin, Methotrexat oder PUVA, nicht angesprochen haben, bei denen eine solche Therapie kontraindiziert ist oder nicht vertragen wird. (Stand 09/2015) |
| Ustekinumab L04AC05 Stelara® | Stelara ist für die Behandlung erwachsener Patienten mit mittelschwerer bis schwerer Plaque-Psoriasis indiziert, bei denen andere systemische Therapien einschließlich Ciclosporin, Methotrexat (MTX) oder PUVA (Psoralen und Ultraviolet A) nicht angesprochen haben, kontraindiziert sind oder nicht vertragen wurden. (Stand 03/2014) |
| Apremilast L04AA32 Otezla® | Otezla ist indiziert zur Behandlung der mittelschweren bis schweren chronischen Plaque-Psoriasis bei erwachsenen Patienten, die auf eine andere systemische Therapie, wie Ciclosporin oder Methotrexat oder Psoralen in Kombination mit UVA-Licht (PUVA), nicht angesprochen haben oder bei denen eine solche Therapie kontraindiziert ist oder die diese nicht vertragen haben. (Stand 01/2016) |
| Secukinumab L04AC10 Cosentyx® (GB) | Cosentyx ist angezeigt für die Behandlung erwachsener Patienten mit mittelschwerer bis schwerer Plaque-Psoriasis, die für eine systemische Therapie in Frage kommen. (Stand 04/2016) |
| Ciclosporin L04AD01 | Behandlung von schwerer Psoriasis bei Patienten, bei denen eine herkömmliche Therapie nicht geeignet oder nicht wirksam ist. (Stand 01/2014) |

| | |
|---|--|
| Ciclosporin Pro 100 mg/ml Lösung | |
| Dimethylfumarat, Ethylhydrogenfumarat D05BX51 FUMADERM® initial FUMADERM® | FUMADERM initial: Zur verträglichkeitsverbessernden Einleitung der FUMADERM-Therapie. FUMADERM: Zur Behandlung von mittelschweren bis schweren Formen der Psoriasis vulgaris, sofern eine alleinige äußerliche Therapie nicht ausreichend ist. Eine vorhergehende Verträglichkeitsanpassung mit FUMADERM initial ist erforderlich. (Stand 01/2016) |
| Methotrexat M01CX01 Lantarel® Tabletten | Schwere Formen der Psoriasis vulgaris, insbesondere vom Plaque-Typ, und der Psoriasis arthropathica, die mit einer konventionellen Therapie nicht ausreichend behandelbar sind. (Stand 01/2014) |
| Acitretin D05BB02 Neotigason® | Zur symptomatischen Behandlung von schwersten, einer konventionellen Therapie nicht zugänglichen Verhorngungsstörungen des Hautorgans wie: - Psoriasis vulgaris, vor allem erythrodermatische und pustulöse Formen |
| Kortikosteroide, z.B. Prednisolon H02AB06 Prednisolon-ratiopharm® Tabletten | [...] Dermatologie: Erkrankungen der Haut und Schleimhäute, die aufgrund ihres Schweregrades und/oder Ausdehnung bzw. Systembeteiligung nicht oder nicht ausreichend mit topischen Glucocorticoiden behandelt werden können. Dazu gehören: [...] - Erythema-squamöse Dermatosen: z. B. Psoriasis pustulosa, Pityriasis rubra pilaris, Parapsoriasis-Gruppe (DS: c –a) [...] (Stand: 08/2010) |

Systematische Recherche:

Es wurde eine systematische Literaturrecherche nach systematischen Reviews, Meta-Analysen, HTA-Berichten und Evidenz-basierten systematischen Leitlinien zur Indikation „Plaque Psoriasis“ durchgeführt. Der Suchzeitraum wurde auf die letzten 5 Jahre eingeschränkt und die Recherche am 11.07.2016 abgeschlossen. Die Suche erfolgte in folgenden Datenbanken bzw. Internetseiten folgender Organisationen: The Cochrane Library (Cochrane Database of Systematic Reviews, Database of Abstracts of Reviews of Effects, Health Technology Assessment Database), PubMed (inkl. MEDLINE), AWMF, Clinical Evidence, CADTH, DAHTA, G-BA, GIN, IQWiG, NGC, NICE, SIGN, TRIP und WHO. Ergänzend erfolgte eine freie Internetsuche nach aktuellen deutschen und europäischen Leitlinien. Bei der Recherche wurde keine Sprachrestriktion vorgenommen.

Die detaillierte Darstellung der Suchstrategie ist am Ende der Synopse aufgeführt. Die Recherche ergab 858 Quellen, die anschließend in einem zweistufigen Screeningverfahren nach Themenrelevanz und methodischer Qualität gesichtet wurden. Zudem wurde eine Sprachrestriktion auf deutsche und englische Quellen vorgenommen. Insgesamt ergab dies 29 Quellen, die in die synoptische Evidenz-Übersicht aufgenommen wurden.

Indikation:

Zur Behandlung von Patienten mit mittelschwerer bis schwerer Plaque-Psoriasis, die für eine systemische Therapie geeignet sind.

IQWiG Berichte / G-BA Beschlüsse

| | |
|--|--|
| <p>G-BA, 2008 [9,13, #30].</p> <p>Zusammenfassende Dokumentation zum Beratungsverfahren des Unterausschusses „Ärztliche Behandlung des Gemeinsamen Bundesausschusses.“</p> <p>G-BA, 2010 [12].</p> <p>Asynchrone Photosoletherapie im Vollbad.</p> <p><i>Siehe auch IQWiG, 2006 [14].</i></p> <p>Abschlussbericht: Balneophototherapie (IQWiG-Berichte. Jahr: 2006 Nr. 14)</p> | <p>Unter Balneophototherapie versteht man in Deutschland die Kombination aus einem Bad in verschiedenen Medien und einer UV-Lichttherapie. Es gibt grundsätzlich zwei Typen von Balneophototherapie:</p> <ul style="list-style-type: none"> • asynchrone Balneophototherapie: zuerst Bad, anschließend Bestrahlung und • synchrone Balneophototherapie: Bestrahlung während des Bades. Die asynchrone Balneophototherapie wiederum kommt in zwei Formen vor: <ul style="list-style-type: none"> • Bade-PUVA: Das Bad enthält einen Psoralenzusatz (8-Methoxypsoralen, kurz: 8-MOP oder Trioxsalen [Trimethylpsoralen, kurz: TMP] in alkoholischer Lösung), die anschließende Bestrahlung erfolgt mit UVA-Licht. • asynchrone Photosoletherapie: Das Bad ist mit Sole (10 %ig bei atopischer Dermatitis bis zu 25 %ig bei Psoriasis vulgaris) angereichert, die anschließende Bestrahlung erfolgt in der Regel mit UVB (Ultraviolett-strahlung-B)-Licht. Bei der asynchronen Balneophototherapie wird bei Verwendung 25 %iger Solelösung aus technischen Gründen erst Leitungswasser in die Wanne eingelassen, eine Folie auf das Wasser gelegt und danach die 25 %ige Sole aufgegossen, in der der Patient dann badet. <p>Die synchrone Balneophototherapie spielt in der Praxis nur in Form der „TOMESA-Therapie“ eine Rolle in der Versorgung. Bei der TOMESA-Therapie werden die Patienten während des Bades in Totes-Meer-Salzwasser mit UV-Licht bestrahlt. Totes-Meer-Salzwasser enthält im Gegensatz zu einer üblichen Salzlösung einen hohen Anteil an Magnesium- und Kalziumionen.</p> <p>Fazit: Psoriasis vulgaris</p> <p><u>Bade-PUVA</u></p> <p>Das IQWiG kam zu folgendem Fazit: „Die asynchrone Bade-PUVA hat einen Zusatznutzen gegenüber der trockenen UVB-Therapie beziehungsweise Leitungswasser plus UVB im Hinblick auf die Besserung des Hautbeschwerdebildes und eine Reduktion der unerwünschten Wirkungen/Folgeschäden. Diese Aussage gilt nur für eine Mischung der zur Anwendung kommenden UVB-Spektren bei den Vergleichsinterventionen. (...). Für die Bade-PUVA gibt es Hinweise auf einen Zusatznutzen gegenüber der asynchronen Photosoletherapie (Sole + UVB) im Hinblick auf die Besserung des Hautbeschwerdebildes und eine Reduktion der unerwünschten Wirkungen/Folgeschäden. Diese Aussage gilt nur für eine Mischung der zur Anwendung kommenden UVB-Spektren bei der Vergleichsintervention (...). Für die Bade-PUVA besteht gegenüber der oralen PUVA ein geringeres Schadenspotenzial bezogen auf akute Nebenwirkungen (Übelkeit und Erbrechen). Es finden sich schwache Hinweise auf ein verminderteres Schadenspotenzial bezogen auf langfristige Folgeschäden (Plattenepithelkarzinome der Haut). Der</p> |
|--|--|

| | |
|--|--|
| | <p>Behandlungsaufwand ist prozedural bedingt geringer. Ein gleichwertiger Nutzen der asynchronen Bade-PUVA im Hinblick auf die Besserung des Hautbeschwerdebildes ist allerdings weder belegt noch ausgeschlossen.“</p> <p>➔ Die Themengruppe Balneophototherapie des G-BA schloss sich dem Fazit des IQWiG zur Bade-PUVA-Therapie bei Psoriasis vulgaris an. Der Nutzen wurde auf der Basis des IQWiG-Berichtes als belegt angesehen.</p> <p><u>Asynchrone Photo-Sole-Therapie:</u></p> <p>Das IQWiG kam zu folgendem Fazit: „Die asynchrone Photosoletherapie (Sole plus UVB) hat einen Zusatznutzen gegenüber der trockenen UVB-Therapie (und auch Leitungswasser plus UVB) bezogen auf die Besserung des Hautbeschwerdebildes.“</p> <p>➔ Die Themengruppe schloss sich dem Fazit des IQWiG zur asynchronen Photosole-Therapie bei Psoriasis vulgaris an. Der Nutzen wurde auf der Basis des IQWiG-Berichtes als belegt angesehen.</p> <p><u>Synchrone Balneophototherapie (TOMESA-Verfahren):</u></p> <p>Das IQWiG kam zu folgendem Fazit: „Für die synchrone Balneophototherapie (TOMESA-Verfahren) zeigt sich bei der Indikation Psoriasis vulgaris ein Zusatznutzen gegenüber der trockenen UVB-Therapie im Hinblick auf die Reduktion des Hautbeschwerdebildes und eingeschränkt auch für das Therapieziel krankheitsbezogene Lebensqualität.“</p> <p>➔ Die Themengruppe schloss sich dem Fazit des IQWiG zur synchronen Balneophototherapie bei Psoriasis vulgaris an. Der Nutzen wurde auf der Basis des IQWiG-Berichtes als belegt angesehen.</p> |
| | <p>In dem Abschlussbericht des G-BA (2010) [9] erfolgte eine Anpassung des Beschlusses:</p> <p>„Für die Indikationen der mittelschweren und schweren Psoriasis vulgaris kann die Balneophototherapie auf Basis der vorliegenden Richtlinie zukünftig als asynchrone Photosoletherapie sowohl in Form eines Folienbades als auch eines Vollbades im Rahmen der vertragsärztlichen Versorgung erbracht werden. Die bereits in der Richtlinie beschriebenen anderen Behandlungsformen bleiben von diesem Beschluss unberührt.“</p> |
| | <p>Der Zusammenfassende Bericht des Arbeitsausschusses "Ärztliche Behandlung" des Bundesausschusses der Ärzte und Krankenkassen über die Beratungen des Jahres 1999 zur Bewertung der Balneophototherapie gemäß §135 Abs.1 SGB V wurde aufgrund des Umfangs der vorliegenden Evidenzsynopse hier nicht explizit dargestellt.</p> <p>Der Abschlussbericht befasste sich mit der ambulanten Balneophototherapie in Form der Nicht-synchronen Photosoletherapie bzw. der Bade-PUVA bei schwerer Psoriasis [2].</p> |

|---|---|
| Atwan A et al., 2015 [4]. Oral fumaric acid esters for psoriasis. | 1. Fragestellung To assess the effects and safety of oral fumaric acid esters for psoriasis. |
| | 2. Methodik <p>Population: We included individuals of either sex and any age and ethnicity, with a clinical diagnosis of psoriasis made by a medical practitioner. <u>We included all subtypes of psoriasis.</u></p> <p>Intervention/Komparator:</p> <ul style="list-style-type: none"> - oral fumaric acid esters versus oral placebo; - oral fumaric acid esters versus active treatment; - oral fumaric acid esters in combination with another active treatment versus placebo; or - oral fumaric acid esters in combination with another active treatment versus active treatment. |
| | <p>Endpunkt:</p> <ul style="list-style-type: none"> • <u>Primary outcomes</u>: PASI score; proportion of participants who discontinued treatment due to adverse effects that are common but sufficiently serious that the drug has had to be stopped, such as severe diarrhoea, infections, or cutaneous malignancy. • <u>Secondary outcomes</u>: Quality of life; proportion of participants attaining PASI 50, 75, and 90; proportion of participants experiencing any adverse effects of treatment, i.e., all nuisance side-effects that are common, but do not mean that the drug is stopped; proportion of participants experiencing serious adverse effects of treatment, defined as resulting in death, hospital admission, or increased duration of hospital stay <p>Suchzeitraum (Aktualität der Recherche): up to 7 May 2015</p> <p>Anzahl eingeschlossene Studien/Patienten (Gesamt): 6 studies (2 full reports, 2 abstracts, 1 brief communication, and 1 letter), with a total of 544 participants</p> <p>Qualitätsbewertung der Studien: The Cochrane Collaboration's 'Risk of bias' tool. I^2 for heterogeneity</p> |
| | 3. Ergebnisdarstellung <u>Qualität der Studien:</u> |

| | Random sequence generation (selection bias) | Allocation concealment (selection bias) | Blinding of participants and personnel (performance bias) | Blinding of outcome assessment (detection bias) | Incomplete outcome data (attrition bias) | Selective reporting (reporting bias) | Other bias |
|---------------------|---|---|---|---|--|--------------------------------------|------------|
| | ? | ? | - | - | ? | ? | + |
| Altmeyer 1994 | ? | ? | - | - | ? | ? | + |
| Fallah Arani 2011 | + | + | - | - | + | + | - |
| Langner 2004 | ? | ? | ? | ? | ? | - | ? |
| Mrowietz 2006 | ? | ? | ? | ? | ? | ? | ? |
| Nugteren-Huyng 1990 | ? | ? | ? | ? | ? | ? | ? |
| Peeters 1992 | ? | ? | ? | + | + | ? | ? |

→ *Hinweis:* Two studies included only participants with chronic plaque psoriasis (Fallah Arani 2011; Mrowietz 2006); two included chronic plaque, guttate, pustular, and erythrodermic types (Altmeyer 1994; Langner 2004)

Five studies compared FAE with placebo, and one study (Fallah Arani 2011) compared FAE with methotrexate. All studies reported data at 12 to 16 weeks, and we identified no longer-term studies.

FAE vs. MTX:

- PASI score at follow-up showed superiority of MTX (mean Difference (MD): 3.80, 95% CI 0.68 to 6.92; 51 participants; very low-quality evidence), but the difference was not significant after adjustment for baseline disease severity.
- The difference between groups for the proportion of participants who discontinued treatment due to adverse effects was uncertain because of imprecision (RR: 0.19, 95% CI 0.02 to 1.53; 1 study, 51 participants; very low-quality evidence).
- Overall, the number of participants experiencing common nuisance adverse effects was not significantly different between the 2 groups,

| | |
|--|---|
| | <p>with 89% of the FAE group affected compared with 100% of the MTX group (RR 0.89, 95% CI 0.77 to 1.03; 54 participants; very low-quality evidence).</p> <ul style="list-style-type: none"> • <u>Flushing</u> was more frequent in those on FAE, with 13 out of 27 participants affected compared with 2 out of 27 given MTX. • There was no significant difference in the number of participants who attained <u>PASI 50, 75, and 90</u> in the 2 groups (very low-quality evidence) whereas this study did not measure the effect of treatments on QoL. |
| | <p>4. Fazit der Autoren: <i>Evidence suggests that FAE are [...] similar in efficacy to MTX for psoriasis; however, the evidence provided in this review was limited, and it must be noted that four out of six included studies were abstracts or brief reports, restricting study reporting. FAE are associated with nuisance adverse effects, including flushing and gastrointestinal disturbance, but short-term studies reported no serious adverse effects.</i></p> <p>5. Hinweise durch FB Med:</p> <ul style="list-style-type: none"> • Lediglich 2 Studien mit Plaque P. Patienten, nur eine Studie die gegen einen aktiven Komparator (hier MTX) verglichen hat. |

- adalimumab 40 mg every other week (MD 3.30 (95% CI: 0.56, 6.04), low quality)

Percentage reduction in mean DLQI.

- Etanercept 50 mg twice weekly (b.i.w.) superior vs placebo in longterm treatment with an MD 57.00 (95% CI: 38.52, 75.48, high quality)

Safety:

Patients with at least one AE. No differences were found between adalimumab and placebo and between infliximab and placebo

Patients with at least one SAE. Compared with placebo, no differences in the risks of SAE were shown for adalimumab, etanercept 50 mg once weekly (q.w.) and infliximab

Withdrawal due to AE. In comparison with placebo, no statistically significant differences in withdrawal due to AE for adalimumab, and infliximab

Head to Head comparisons:

Acitretin 0.4 mg kg⁻¹ once daily (q.d.) versus etanercept 25 mg b.i.w.: no statistically significant differences were found between acitretin and etanercept with respect to PASI 75 and the number of patients with at least one AE

Acitretin 0.4 mg kg⁻¹ q.d. versus combination of acitretin 0.4 mg kg⁻¹ q.d. and etanercept 25 mg q.w.: No differences were found between acitretin monotherapy and acitretin in combination with etanercept with respect to PASI 75 and in the number of patients with at least one AE

Etanercept 25 mg b.i.w. versus combination of acitretin 0.4 mg kg⁻¹ q.d. and etanercept 25 mg q.w.: There are no differences in PASI 75 response between etanercept combined with acitretin and etanercept monotherapy after long-term treatment period. With respect to the number of patients with at least one AE, it is uncertain whether there is any difference (RR 0.28 (95% CI: 0.01, 6.38). The quality of evidence is very low for both outcomes

Etanercept 50 mg b.i.w. for 12 weeks followed by 50 mg kg⁻¹ q.w. versus combination of etanercept 50 mg b.i.w./q.w. and MTX 7.5–15 mg q.w.: statistically significant differences with a small effect were observed in favor of the combination etanercept/MTX based on PASI 75 (RR 0.78 (95% CI: 0.69, 0.88), low quality), PASI 90 (RR 0.64 (95% CI: 0.51, 0.78), moderate quality), and PGA ‘clear/almost clear’ (RR 0.76 (95% CI: 0.66, 0.88), low quality). In contrast, a slightly increased risk for the occurrence

| | |
|----|--|
| | <p>of at least one AE was seen with the combination (RR 0.80 (95% CI: 0.70, 0.91), moderate quality), no statistically significant difference was found for the number of patients with at least one SAE</p> <p><i><u>Etanercept 50 mg b.i.w. versus infliximab 5mg kg⁻¹:</u></i> After long-term treatment, etanercept was inferior to infliximab based on PASI 75 (RR 0.48 (95% CI: 0.26, 0.89), moderate quality)</p> <p><i><u>Etanercept 50 mg b.i.w./q.w. versus secukinumab 150–300 mg monthly:</u></i></p> <ul style="list-style-type: none"> - small statistically significant differences in favor of secukinumab 150 mg based on PASI 75 (RR 0.80 (95% CI: 0.72, 0.89), moderate quality), PASI 90 (RR 0.67 (95% CI: 0.57, 0.79), high quality), and PGA ‘clear/almost clear’ (RR 0.74 (95% CI: 0.64, 0.86), moderate quality) - Secukinumab 300 mg is superior to etanercept based on PASI 75 (RR 0.72 (95% CI: 0.65, 0.79), moderate quality), PASI 90 (RR 0.54 (95% CI: 0.46, 0.63), high quality), and PGA ‘clear/almost clear’ (RR 0.61 (95% CI: 0.53, 0.69), high quality) (Langley et al., 2014). <p><i><u>MTX 15–20 mg q.w. versus infliximab 5mg kg⁻¹:</u></i></p> <ul style="list-style-type: none"> - MTX is inferior to infliximab in long-term treatment based on PASI 75 (RR 0.40 (95% CI: 0.33, 0.49)), PASI 90 (RR 0.29 (95% CI: 0.21, 0.41)), and PGA ‘clear/almost clear’ (RR 0.38 (95% CI: 0.31, 0.48)), moderate quality for all outcomes) - With respect to quality of life, MTX and infliximab showed a percentage reduction in DLQI of 62% and 84%, respectively. |
| 4. | <p>Anmerkungen/Fazit der Autoren</p> <p>From the available evidence, infliximab, secukinumab, and ustekinumab are the most efficacious long-term treatments. Data on conventionals are insufficient.</p> <p>Based on low quality of evidence, all biologics and apremilast have been shown to be clinically effective in long-term therapy compared with placebo. Patient relevant outcomes support this finding with high to low quality of evidence. With respect to the addressed safety outcomes, none of the results showed a statistically significant difference for adalimumab, etanercept, or infliximab compared with placebo. However, a trend of a less favorable safety profile of infliximab over placebo can be assumed from these data.</p> <p>For secukinumab, ustekinumab, and apremilast, no data for the selected safety outcomes were available.</p> <p>Head-to-head trials allow a much better direct comparison of efficacy and safety. However, the number of direct longterm comparisons is limited. With respect to efficacy, based on PASI 75, superiority of secukinumab over etanercept, of infliximab over MTX (dosages of 15–20 mg), and of infliximab over etanercept was shown in head-to-head trials of at least 24</p> |

| | |
|---|---|
| | <p>weeks (moderate quality of evidence).</p> <p>In head-to-head comparisons, the combination of etanercept plus methotrexate has been found to be superior to etanercept monotherapy with a low to moderate quality of evidence. This effect was accompanied by a slight increase in AEs. Acitretin as a combination partner to etanercept low dose was shown to have some dose sparing potential compared with monotherapy with high-dose etanercept.</p> <p>5. Anmerkung FB Med:</p> <p>Großteil der Studien stoppten Placeboarm nach Induktionsphase (16 Wochen). 3 Studien lieferten Daten zu Patienten unter Placebo bis zu Woche 24, die dann als Vergleich für alle aktiven Substanzen herangezogen wurden (Imputation der Placebodaten in Großteil der Studien durch Ersetzen der „fehlenden“ Werte durch das mittlere Ansprechen in den Placeboarmen der 3 relevanten Studien). Das Verzerrungspotential ist dadurch groß, da keine echte Randomisierung gegeben ist.</p> |
| Busard C et al., 2014 [6]. Combined Use of Systemic Agents for Psoriasis A Systematic Review | <p>1. Fragestellung</p> <p>To summarize and critically appraise the evidence on efficacy and safety of combination therapy with systemic agents in plaque-type psoriasis.</p> <p>2. Methodik</p> <p>Population: patients with psoriasis Intervention: combination therapy with systemic agents Komparator: systemic monotherapy or another systemic combination therapy Endpunkte: PASI 75, PASI 90, PGA, AEs, SAEs, DLQI Suchzeitraum: bis 03/2013 in MEDLINE, PubMed, EMBASE, Cochrane Library und Trial Register Anzahl eingeschlossene Studien/Patienten (Gesamt): 17 (n=1071)</p> <p>Qualitätsbewertung der Studien:</p> <ul style="list-style-type: none"> • The risk of bias in the individual studies was assessed in duplicate using the Cochrane Risk of Bias tool. • The quality of evidence for each outcome (body of evidence) was assessed according to the GRADE approach. • Assessment of the risk of bias of the individual studies resulted in low risk for 3 trials, intermediate risk for 5 trials high risk for 9 trials. <p>3. Ergebnisdarstellung</p> <p>Etanercept plus methotrexate was the only combination therapy investigated with an adequate sample size (n = 478). In the short term, this combination had superior efficacy with a moderate quality of evidence compared with etanercept monotherapy (Psoriasis Area and Severity Index, 75; relative risk, 1.28; 95%CI, 1.14-1.45). Although this finding coincided with an increase in adverse events (relative risk, 1.25; 95%CI, 1.10-1.42), the overall safety profile remained acceptable.</p> |

| | <p>4. Anmerkungen/Fazit der Autoren</p> <p>This systematic review provides a comprehensive overview on the validity of different systemic combination therapies. For most combinations, insufficient evidence is available. Initial results indicate that combined therapy with etanercept plus methotrexate may be beneficial in patients that are therapy resistant under intensive follow-up. Dose reductions should be taken into account to minimize adverse effects.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

There was also no significant difference between the two doses of ustekinumab for the incidence of AEs. |
| | <p>4. Anmerkungen/Fazit der Autoren</p> <p>Our results indicate that ustekinumab is safe for patients with moderate to severe plaque psoriasis over a period of 5 years, and it is effective after 12 weeks. There was no significant superiority in efficacy between the 45 mg and 90 mg doses for short-term therapy. Results of the long-term safety evaluation are consistent with short-term reports of ustekinumab safety. More long-term studies and RCTs are needed to validate these results.</p> <p>5. | | |
|--|---|
| | <p>the rate of adverse events did not differ significantly between infliximab and placebo or between infliximab and MTX in the trials identified</p> <p>Adalimumab (4 studies):</p> <p><u>Efficacy:</u></p> <p>adalimumab for psoriasis, indicating superiority vs. placebo and vs. MTX (initial dose 7.5 mg per week), with PASI 75 response rates between 53% and 80%</p> <p><u>Safety:</u></p> <p>the rate of adverse events did not differ significantly between adalimumab and placebo or between adalimumab and MTX in the trials identified</p> <p>Ustekinumab (5 studies):</p> <p><u>Efficacy:</u></p> <p>Ustekinumab was superior to placebo with PASI 75 response rates in patients receiving ustekinumab 90 mg of between 66% and 76%, and for 45 mg between 59% and 67%.</p> <p><u>Safety:</u></p> <p>the risk of adverse events did not differ significantly between ustekinumab and placebo or between ustekinumab and etanercept.</p> |
| | <p>4. Anmerkungen/Fazit der Autoren</p> <p>The evidence base indicating efficacy of the biologics infliximab, adalimumab, ustekinumab and etanercept is much stronger than the evidence for efficacy of conventional treatment options for moderate-to-severe psoriasis.</p> |
| Almutawa F et al., 2013 [1]. Systematic Review of UV-Based Therapy for Psoriasis | <p>1. Fragestellung</p> <p>The aim of the study was to evaluate the efficacy, short-term safety, and tolerability of UV-based therapy in the treatment of adults with moderate to severe plaque psoriasis.</p> <p>2. Methodik</p> <p>We performed a systematic review and metaanalysis of randomized controlled trials (RCTs).</p> <p>Population: Adults with moderate to severe plaque-type psoriasis</p> <p>Intervention/Komparator: NB-UVB, BB-UVB, and PUVA</p> <p>Endpunkt: PASI 75, clearance, short-term safety, tolerability from the percentage of adverse effects and withdrawal due to adverse effects</p> <p>Suchzeitraum: 1980 to 2011 in MEDLINE, EMBASE, and Cochrane databases</p> <p>Anzahl eingeschlossene Studien/Patienten (Gesamt): 41 RCTs (N=2.416 patients)</p> <p>3. Ergebnisdarstellung:</p> <p><u>Efficacy:</u></p> <ul style="list-style-type: none"> • PASI-75: In monotherapy trials, PUVA was the most effective modality (mean: 73 %, 95 % CI 56–88). Trials with BB-UVB also showed a high PASI-75 (73 %) but with a wide CI (18–98) due to heterogeneity of the total available three studies. This was followed |

| | |
|--|---|
| | <p>by NB-UVB (mean: 62 %, 95 % CI 45–79) then bath PUVA (mean: 47 %, 95 % CI 30–65).</p> <ul style="list-style-type: none"> Clearance: In the monotherapy trials, PUVA (mean: 79 %, 95 % CI 69–88) was superior to NB-UVB (mean: 68 %, 95 % CI 57–78), BB-UVB (mean: 59 %, 95 % CI 44–72), and bath PUVA (mean: 58 %, 95 % CI 44–72). <p><u>Safety:</u></p> <p>The percentages of asymptomatic erythema development in monotherapy trials were 64 % for BB-UVB, 57 % for NB-UVB, 45 % for PUVA, and 34 % for bath PUVA. Symptomatic erythema or blistering percentages for the monotherapy trials were as follows: 7.8 % for NB-UVB, 2 % for BB-UVB, 17 % for PUVA, and 21 % for bath PUVA.</p> <p><u>Withdrawal due to adverse effects:</u></p> <p>The percentages of withdrawal due to adverse effects were 2 % for NB-UVB, 4.6 % for BB-UVB, 5 % for PUVA, and 0.7 % for bath PUVA monotherapy trials.</p> |
| | <p>4. Fazit der Autoren</p> <p>As a monotherapy, PUVA was more effective than NB-UVB, and NB-UVB was more effective than BB-UVB and bath PUVA in the treatment of adults with moderate to severe plaque-type psoriasis, based on clearance as an end point. Based on PASI-75, the results were similar except for BB-UVB, which showed a high mean PASI-75 (73 %) that was similar to PUVA, but with a wide CI (18–98). The short-term adverse effects were mild as shown by the low rate of withdrawal due to adverse effects.</p> |
| Correr CJ et al., 2013 [7]. Efficacy and safety of biologics in the treatment of moderate to severe psoriasis: a comprehensive meta-analysis of randomized controlled trials | <p>1. Fragestellung</p> <p>As the use of biologic medications for psoriasis is a recent development, the objective of this article is to provide comprehensive and up-to-date evidence regarding the efficacy and safety of the use of all biologic therapies available for moderate to severe psoriasis.</p> <p>2. Methodik</p> <p>Population: patients with moderate to severe psoriasis Intervention: adalimumab, alefacept, anakinra, briakinumab, certolizumab, efalizumab, etanercept, infliximab, golimumab, rituximab, siplizumab, onercept or ustekinumab Komparator: Placebo Endpunkt: improvement of 50%, 75%, and 90% in the Psoriasis Area and Severity Index (PASI 50, 75, and 90, respectively) at 10-14 weeks of treatment, serious adverse events, adverse events leading to discontinuation of treatment (withdrawals), and infection occurrence Suchzeitraum (Aktualität der Recherche): Cochrane, EMBASE, IPA (International Pharmaceutical Abstracts), LILACS, PubMed, SciELO, Science Direct, Scopus, and Web of Science. Manual search in relevant periodic, symposium and congress annals and reference lists of articles found in the search were performed, published up until May 2011 and written in English, Portuguese or Spanish</p> |

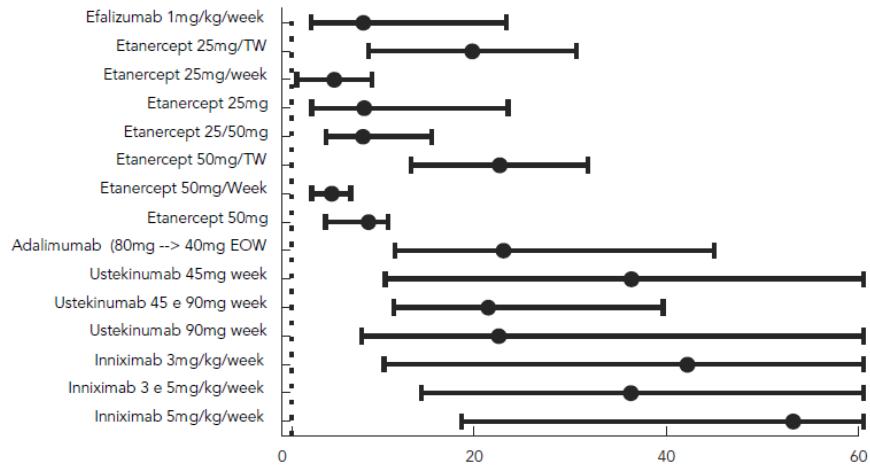

| | <p>Anzahl eingeschlossene Studien/Patienten (Gesamt): 41 RCTs in Meta-Analyse</p> <p>Qualitätsbewertung der Studien: Jadad score, Cochrane risk of bias tool: selection, performance, detection, attrition, reporting and other biases</p> <p>Untersuchung der Heterogenität mittels: I^2</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

4. Anmerkungen/Fazit der Autoren

- Individual biologics and classes showed consistent benefits across non-PASI health outcomes in patients with moderate-to severe plaque psoriasis while MTC metaanalyses suggested that some differences exist.
- Anti-TNF agents, as well as anti-IL 12/23 agents, significantly improve clinical efficacy (via the PGA) and HRQoL (via the DLQI) as compared with the anti-T cell agents in patients with moderate-to-severe plaque psoriasis.

| | <p>3. Ergebnisdarstellung</p> <ul style="list-style-type: none"> • Ustekinumab use was associated with statistically significantly higher odds for achieving PASI 75 compared with adalimumab use (OR, 1.84; 95% credible interval [CI], 1.01-3.54), ..., and etanercept use (2.07; 1.42-3.06). • Ustekinumab use was associated with lower odds for achieving PASI 75 compared with infliximab use (OR, 0.36; 95% CI, 0.14-0.82). • Infliximab had the highest odds for PASI 75 response compared with adalimumab (5.04; 2.40-14.09), ..., etanercept (5.67; 2.70-14.98), and ustekinumab (2.77; 1.28-7.14). • In the therapeutic class comparison, the interleukin-12/23 inhibitor had the highest odds for achieving a 75% reduction in the PASI compared with placebo (OR, 69.48; 95% CI, 36.89-136.46), followed by tumor necrosis factor inhibitors (OR, 42.22; 95% CI, 27.94-69.34) and the T-cell inhibitor (OR, 5.63; 95% CI, 1.35-24.24). |

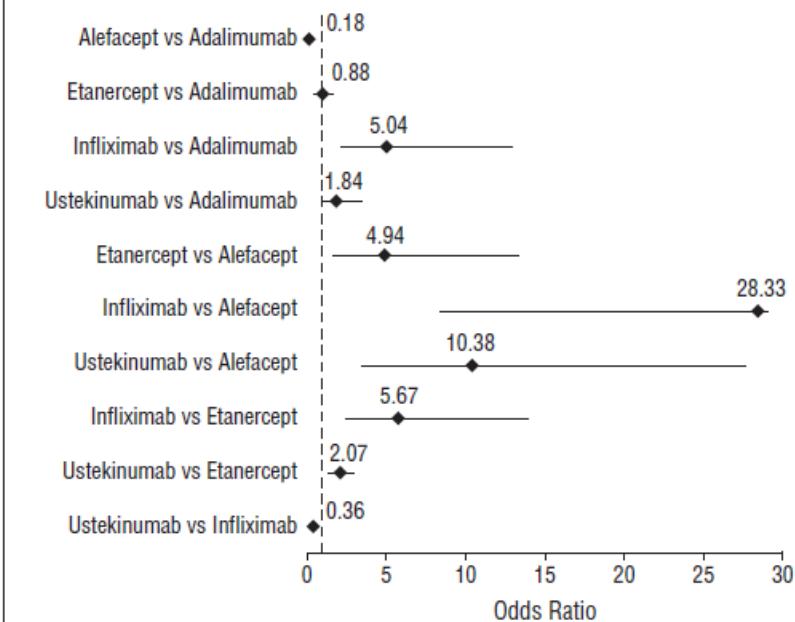

Figure 3. Random-effects model showing pairwise comparisons of 75% reductions in the Psoriasis Area and Severity Index among Food and Drug Administration-approved dosing of biological agents for the treatment of plaque psoriasis. Diamonds represent odds ratios; lines, 95% credible intervals.

4. Anmerkungen/Fazit der Autoren

In conclusion, the use of a Bayesian network metaanalysis enabled us to compare the efficacy of ustekinumab with that of other biological agents using PASI responses as the outcome among adult patients with moderate to severe plaque psoriasis during the induction phase of the first 10 to 16 weeks. Ustekinumab, the newest agent that targets IL-12/23, seems to be more efficacious than adalimumab, etanercept, and alefacept but not infliximab.

Für die Behandlung von mittelschwerer bis schwerer Plaque-Psoriasis, kann Ustekinumab wirksamer sein als Adalimumab, Etanercept und Alefacept aber nicht als Infliximab.

| | <ul style="list-style-type: none"> Based on the indirect comparison and given a placebo PASI 50 response of 13%, infliximab had the highest predicted mean probability of response at PASI levels 50 (93%), 75 (80%) and 90 (54%), followed by ustekinumab 90 mg at 90%, 74% and 46%, respectively, and then ustekinumab 45 mg, adalimumab, etanercept and efalizumab. There is an estimated 93% probability that infliximab is the most effective treatment followed by an 81% probability that ustekinumab 90 mg is the second most effective treatment and a 79% probability that ustekinumab 45 mg is the third most-effective treatment. <p>4. Anmerkungen/Fazit der Autoren</p> <p>The analysis suggests a ranking of treatments in terms of effectiveness from infliximab, through ustekinumab, adalimumab, etanercept to efalizumab.</p> <p>5. Hinweise durch FB Med</p> <ul style="list-style-type: none"> Heterogene Studienpopulation: unterschiedliche Patientencharakteristika, Vortherapie, Erkrankungsdauer, Behandlungsdauer bis zum primären Endpunkt Funding: This study has been funded by Janssen-Cilag Ltd. but no restrictions have been placed on the design or results of the analysis. Col: KR has served as consultant and/or paid speaker for and/or participated in clinical trials sponsored by companies that manufacture drugs used for the treatment of psoriasis including Abbott, Biogen Idec, Celgene, Centocor, Janssen-Cilag, Leo, Medac, Merck, MSD (formerly Essex, Schering- Plough), Novartis, Pfizer (formerly Wyeth). ADB has acted as lecturer, consultant and researcher for Abbott, Janssen, Leo, MSD, Novartis and Pfizer. JNE and NSH work for an international consultancy and as such have received funding from numerous device and pharmaceutical companies to conduct studies similar to that presented in this paper. |
| Yamauchi PS et al., 2016 [28]. Systematic review of efficacy of antietumor necrosis factor (TNF) therapy in patients with psoriasis previously | <p>1. Fragestellung</p> <p>We sought to systematically investigate the efficacy and safety of a second TNF antagonist after failure of a first TNF antagonist</p> <p>2. Methodik</p> <p>Population: patients with psoriasis Intervention/Komparator: TNF antagonists for the treatment of moderate to severe psoriasis in adults who previously experienced treatment failure with another TNF antagonist. Endpunkte: Physician Global Assessment (PGA), PASI 50, or 75, adverse events, Lebensqualität (Dermatology Life Quality Index) Suchzeitraum: February 2015 Anzahl eingeschlossene Studien/Patienten (Gesamt): 15 studies Quality of studies assessed: k.A.</p> <p>3. Ergebnisdarstellung</p> |

| | |
|---|---|
| treated with a different antieTNF agent | <p><u>Hinweis:</u> All patients from the included studies had moderate to severe plaque psoriasis.</p> <ul style="list-style-type: none"> • Although response rates to a second TNF antagonist were lower than for a first, a substantial proportion of patients in every study achieved treatment success. • Week-24 response rates for a second antagonist were 30% to 74% for a 75% improvement in PASI score and 20% to 70% for achieving a PGA score of 0/1 → siehe Anhang: Figure 1 aus Yamauchi et al. 2016 • Mean improvements in Dermatology Life Quality Index ranged from -3.5 to -13. • In general, patients who experienced secondary failure achieved better responses than patients with primary failure. • Adverse event incidences ranged from 20% to 71%, without unexpected adverse events; 0% to 11% of patients experienced serious adverse events. |
| | <p>4. Fazit der Autoren: <i>This systematic literature review suggests that a lack of response to an initial TNF antagonist does not preclude patients from responding favorably to a subsequent TNF antagonist. Switching patients who are not responding to treatment with an antieTNF agent to another TNF antagonist can be considered as a therapeutic option that may produce clinically meaningful responses in a substantial proportion of patients, with improved quality of life.</i></p> <p>5. Hinweise durch FB Med</p> <ul style="list-style-type: none"> • Differences in study designs precluded conducting a meta-analysis or making direct comparisons between studies. |
| Zweegers J et al. 2016 [29]. Effectiveness of Biologic and Conventional Systemic Therapies in Adults with Chronic Plaque Psoriasis in Daily Practice: A | <p>1. Fragestellung</p> <p>This systematic review searched PubMed and EMBASE and summarized the real-world evidence on effectiveness of biologics (adalimumab, etanercept, infliximab and ustekinumab) and conventional systemic therapies (acitretin, cyclosporine, fumarates and methotrexate) for the treatment of plaque psoriasis in adults.</p> <p>2. Methodik</p> <p>Population: Adults with Chronic Plaque Psoriasis Intervention/Komparator: Biologics and Conventionaly systemic therapies (siehe Ergebnisteil) Endpunkte:</p> <ul style="list-style-type: none"> • Primary outcome: PASI75 score at week 12–16. • Secondary outcomes: PASI75 with intermediate-term (17–28 weeks) and long-term (≥ 1 year data) treatment, PASI50, PASI90, PASI100 and decrease in mean PASI, PhGA and BSA with short-, intermediate- and long-term treatment. | localized phototherapy and photodynamic therapy for psoriasis: a systematic review and meta-analysis | <p>and PDT in the treatment of localized plaque psoriasis including palmoplantar psoriasis. We also performed a meta-analysis of all published clinical trials that compared the UVB to PUVA.</p> |
| | <p>2. Methodik</p> <p>Population: Intervention/Komparator: topical PUVA vs. targeted UVB phototherapy Endpunkte: PASI75 (primary endpoint), side effects Suchzeitraum: January 1980 to June 2012 Anzahl eingeschlossene Studien/Patienten (Gesamt): 23 studies. Of the 23 studies, 13 evaluated targeted UVB, 4 evaluated topical PUVA, 3 compared topical PUVA vs. targeted UVB, and 3 evaluated PDT. Quality of studies assessed: The quality of the randomized clinical trials were assessed by the Jadad scoring system</p> |
| | <p>3. Ergebnisdarstellung</p> <p>1. Analyse: Meta-analysis of topical PUVA vs. targeted UVB phototherapy (basierend auf 3 RCTs)</p> <ul style="list-style-type: none"> Fixed effects models showed significantly better patient outcome using PUVA compared with targeted UVB. <i>Hinweis:</i> Cochrane Q statistics (6.244, df = 2) showed significant heterogeneity between studies ($P = 0.044$) and I^2 was almost closer to 70%. Therefore, our conclusion was based on the random effects model, which indicated that PUVA had a statistically nonsignificant advantage over targeted UVB. <p>2. Analyse: Quantification of the patient outcome, defined by a 75% reduction in psoriasis score after each of the phototherapy and PDT treatment. We computed the pooled weighted estimates of each treatment separately using all available research publications, including randomized and nonrandomized studies.</p> <ul style="list-style-type: none"> Targeted UVB phototherapy (basierend auf 15 Studien): The pooled weighted estimate of the percentage of patients achieving 75% reduction in their severity score from these studies was 61% (95%CI 50–71%). The main side effects, which are painful erythema and blistering, ranged from 0% to 92%. The pooled weighted estimate for painful erythema and blistering was 16% (95% CI 4–31%). Topical PUVA (basierend auf 6 Studien): The pooled weighted estimate of the efficacy from these studies was 77% (95% CI 62–89%). The percentage of patients who developed painful erythema or blisters ranged from 0% to 27% with an average of 5%. PDT (basierend auf 3 Studien): The pooled efficacy estimate from these studies was 22% (95% CI 10–37%) (Fig. 10). The main side effect was pain that occurred in 80–100% of the patients, and in 30–38% of them, it was described as intolerable. <p>4. Fazit der Autoren: <i>Despite the limitations of this systematic review, it can be concluded that topical PUVA and targeted UVB phototherapy are very effective in the treatment of localized psoriasis. Both should be</i></p> |
| | |

| | |
|--|---|
| | <p><i>considered if topical treatments fail prior to progressing to systemic treatments or biologics. Topical PUVA therapy appears to be more effective than non-laser targeted UVB phototherapy. However, some studies showed that the efficacy of excimer (308-nm) laser approximates that of topical PUVA. PDT with ALA showed low efficacy and high incidence of side effects when used to treat localized psoriasis.</i></p> <p>5. Hinweise durch FB Med</p> <ul style="list-style-type: none"> • limited number of randomized controlled studies that assessed efficacy and safety with small number of patients (→ largest trial including only 163 patients) • High heterogeneity of the treatment protocols in regard to the starting dose, increment, treatment frequency, and the use of different severity scores |

Methotrexat

| Recommendation | | Strength of consensus | Comment |
|--|-----------|-----------------------|------------------------------|
| We recommend MTX for the induction and long-term treatment. | ↑↑ | Strong consensus | Evidence and consensus based |
| Methotrexate can be given by oral or subcutaneous delivery. In general, a starting dose of 15 mg/week is used but individual dosages can range from 5 to 25 mg/week depending on individual factors. | Statement | Strong consensus | Expert opinion |

| Therapeutic combinations | | Strength of consensus | Comments |
|--------------------------|---|-----------------------|--|
| Acitretin | ↓ | Strong consensus | Expert opinion: increased risk of hepatotoxicity possible |
| Adalimumab | ↑ | consensus | Expert opinion: combination widely used in rheumatology; combination with low-dose MTX (e.g., 7.5 to 10 mg/week) is likely sufficient to reduce formation of anti-drug antibodies (ADA) and increase trough levels of adalimumab |
| Ciclosporin | ↓ | Weak consensus | Expert opinion: increased risk of immunosuppression |
| Etanercept | ↑ | consensus | Evidence (additional benefit of adding MTX to etanercept compared to etanercept monotherapy) and consensus based |
| Fumaric acid esters | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Infliximab | ↑ | Consensus | Expert opinion: combination widely used in rheumatology; combination with low-dose MTX (e.g., 7.5 to 10 mg/week) is likely sufficient to reduce formation of anti-drug antibodies (ADA) and increase trough levels of infliximab |
| Ustekinumab | ○ | Consensus | No evidence available |

Etanercept

| Recommendation | | Strength of consensus | Comment |
|--|-----------|-----------------------|------------------------------|
| We recommend etanercept as second line* medication for the induction and long-term treatment. | ↑↑ | Strong consensus | Evidence and consensus based |
| In general, a starting dose of 50 mg once or twice weekly is used depending on individual factors. | Statement | Strong consensus | Expert opinion |
| For maintenance therapy 50 mg once weekly is a commonly used dose. | Statement | Strong consensus | Expert opinion |

* if phototherapy and conventional systemic agents were inadequate in response or if they are contraindicated or not tolerated.

| Therapeutic combinations | | Strength of consensus | Comments |
|--------------------------|---|-----------------------|--|
| Acitretin | ↑ | Consensus | Expert opinion: good safety profile assumed, possibly increased efficacy |
| Ciclosporin | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Fumaric acid esters | ○ | Strong consensus | No evidence available |
| Methotrexate | ↑ | Consensus | Evidence (additional benefit of adding MTX to etanercept compared to etanercept monotherapy) and consensus based |
| Ustekinumab | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |

Infliximab

| Recommendation | Strength of consensus | Comment |
|---|-----------------------|--|
| We recommend infliximab as second line* medication for the induction and long-term treatment. | ↑↑ | Strong consensus Evidence and consensus based |
| We recommend using infliximab 5 mg/kg bodyweight continuously every eight weeks during long-term treatment. | ↑↑ | Strong consensus Evidence and consensus based |

* if phototherapy and conventional systemic agents were inadequate in response or if they are contraindicated or not tolerated.

| Therapeutic combinations | | Strength of consensus | Comments |
|--------------------------|---|-----------------------|---|
| Acitretin | o | Consensus | No evidence available |
| Ciclosporin | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Fumaric acid esters | ↓ | Strong consensus | Expert opinion: increased risk of immunosuppression, lymphocytopenia |
| Methotrexate | ↑ | Consensus | Expert opinion: combination widely used in rheumatology; combination with low-dose MTX (e. g., 7.5 to 10 mg/week) is likely sufficient to reduce formation of ADA and increase trough levels of fumacitinib |
| Ustekinumab | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |

Ustekinumab

| Recommendation | Strength of consensus | Comment |
|--|-----------------------|--|
| We recommend ustekinumab as second line* medication for the induction and long-term treatment. | ↑↑ | Strong consensus Evidence and consensus based |
| We suggest using 45 mg for patients with a bodyweight of ≤ 100 kg and 90 mg ustekinumab for patients with a body weight of > 100 kg. | ↑ | Strong consensus Evidence and consensus based |

* if phototherapy and conventional systemic agents were inadequate in response or if they are contraindicated or not tolerated (the label currently states: if PUVA or other systemic therapies including cyclosporin, methotrexate were inadequate in response or if they are contraindicated or not tolerated). No strong consensus on definition of 'second line' for ustekinumab was achieved, the definition passed with 'weak consensus' (55%).

| Therapeutic combinations | | Strength of consensus | Comments |
|--------------------------|---|-----------------------|---|
| Acitretin | o | Consensus | No evidence available |
| Adalimumab | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Cyclosporin | ↓ | Consensus | Expert opinion: increased immunosuppression, anecdotal evidence of increased toxicity |
| Etanercept | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Fumaric acid esters | o | Consensus | No evidence available |
| Infliximab | ↓ | Consensus | Expert opinion: increased risk of immunosuppression |
| Methotrexate | o | Consensus | No evidence available |

Offer people with psoriasis topical therapy as first-line treatment.</p> <p>Offer second- or third-line treatment options (phototherapy or systemic therapy) at the same time when topical therapy alone is unlikely to adequately control psoriasis, such as:</p> <ul style="list-style-type: none"> - extensive disease (for example more than 10% of body surface area affected) or - at least ‘moderate’ on the static Physician’s Global Assessment or - where topical therapy is ineffective, such as nail disease. <p>Phototherapy (broad- or narrow-band (UVB) light and PUVA)</p> <p>60. Offer narrowband ultraviolet B (UVB) phototherapy to people with plaque or guttate-pattern psoriasis that cannot be controlled with topical treatments alone. Treatment with narrowband UVB phototherapy can be given 3 or 2 times a week depending on patient preference. Tell people receiving narrowband UVB that a response may be achieved more quickly with treatment 3 times a week.</p> <p>61. Offer alternative second- or third-line treatment when:</p> <ul style="list-style-type: none"> - narrowband UVB phototherapy results in an unsatisfactory response or is poorly tolerated or - there is a rapid relapse following completion of treatment (rapid relapse is defined as greater than 50% of baseline disease severity within 3 months) or - accessing treatment is difficult for logistical reasons (for example, travel, distance, time off work or immobility) or - the person is at especially high risk of skin cancer. <p>Systemic nonbiological therapy</p> <p>81. Offer systemic non-biological therapy to people with any type of psoriasis if:</p> |

- it cannot be controlled with topical therapy **and**
- it has a significant impact on physical, psychological or social wellbeing **and**
- one or more of the following apply:
 - psoriasis is extensive (for example, more than 10% of body surface area affected or a Psoriasis Area and Severity Index (PASI) score of more than 10) or
 - psoriasis is localised and associated with significant functional impairment and/or high levels of distress (for example severe nail disease or involvement at high-impact sites) or
 - phototherapy has been ineffective, cannot be used or has resulted in rapid relapse (rapid relapse is defined as greater than 50% of baseline disease severity within 3 months).

Choice of drugs

82. Offer methotrexate^{gg} as the first choice of systemic agent for people with psoriasis who fulfil the criteria for systemic therapy (see recommendation 81) except in the circumstances described in recommendations 84 and 92.

84. Offer ciclosporin^{hh} as the first choice of systemic agent for people who fulfil the criteria for systemic therapy (see recommendation 81) and who:

- need rapid or short-term disease control (for example a psoriasis flare) **or**
- have palmoplantar pustulosis **or**
- are considering conception (both men and women) and systemic therapy cannot be avoided.

85. Consider changing from methotrexate to ciclosporin (or vice-versa) when response to the first-choice systemic treatment is inadequate.

86. Consider acitretin for adults, and in exceptional cases only for children and young people, in the following circumstances:

- if methotrexate and ciclosporin are not appropriate or have failed **or**
- for people with pustular forms of psoriasis.

^{gg} At the time of publication (October 2012), methotrexate did not have UK marketing authorisation for this indication in children and young people. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. The patient (or their parent or carer) should provide informed consent, which should be documented. See the General Medical Council's Good practice in prescribing medicines – guidance for doctors for further information.

^{hh} At the time of publication (October 2012), ciclosporin did not have UK marketing authorisation for this indication in children and young people under 16 years of age. The prescriber should follow relevant professional guidance, taking full responsibility for the decision. The patient (or their parent or carer) should provide informed consent, which should be documented. See the General Medical Council's Good practice in prescribing medicines – guidance for doctors for further information.

| | <p>Freitext/Empfehlungen/Hinweise</p> <p>Recommendations</p> <ol style="list-style-type: none"> 1. PUVA is more effective than NB-UVB. It has a response rate of approximately 80% compared with 70% for NB-UVB (grade A). However, NB-UVB is preferred because of higher convenience except for very thick plaques (grade D). 2. The optimal treatment regimen for phototherapy is 2–3 sessions per week (grade A). 3. Between 20 and 30 treatment sessions are generally required for clearance (grade A). An absence of improvement after 30 sessions is considered a treatment failure (grade D). 4. The starting UV dose and increases in dosage are defined according to prototype and tolerability (grade A). 5. Topical treatments should not be applied less than 30 min before a phototherapy session (grade D). <p>Expert's agreement (mean): 8.80/10</p> <p>The risk of skin cancer is significantly increased with PUVA and there is a theoretical risk with NB-UVB (grade B). The number of cumulative (PUVA/NB-UVB) sessions during a lifetime must not exceed 250–300 (grade D).</p> <p>Expert's agreement (mean): 8.50/10</p> |
| | <p>Freitext/Empfehlungen/Hinweise</p> <p>Therapieempfehlungen (Algorithmus siehe Anhang dieser Synopse)</p> <p>Die Evidenzbasis zu den einzelnen Indikationen bzw. Therapien ist in den jeweiligen Abschnitten in der Leitlinie aufgeführt.</p> |
| | <p>6. Phototherapie</p> <p><u>UV-B und PUVA</u> werden zur Induktionstherapie bei mittelschwerer und schwerer Psoriasis vulgaris vor allem bei großflächiger Erkrankung empfohlen. (↑↑)</p> <p>Trotz der besseren Wirksamkeit von PUVA im Vergleich zur reinen UV-B-Therapie kann auf Grund der besseren Praktikabilität und auf Grund des geringeren Malignitätsrisikos eine Schmalspektrum UVB-Therapie als Phototherapie der ersten Wahl empfohlen werden. (↑)</p> <p>Der Einsatz des Excimer Lasers kann für die gezielte Behandlung einzelner psoriatischer Plaques empfohlen werden. (↑)</p> <p>Eine Kombination mit topischem Vitamin D3-Derivaten kann zur Verbesserung der Ansprechrate empfohlen werden. (↑)</p> <p>Die übliche Kombination mit Dithranol und Kortikoiden kann nur auf Grund klinischer Erfahrung empfohlen werden, nicht aber aufgrund der Datenlage. (↑)</p> |

| | |
|--|--|
| | <p>Wegen der geringen Praktikabilität und der Assoziation langfristiger unerwünschter Wirkungen mit der kumulativen UV-Dosis kann die Phototherapie nicht für Langzeitbehandlungen empfohlen werden. (↓)</p> <p>7. Systemische Therapie</p> <p><u>Adalimumab</u> wird zur Induktionstherapie für Patienten mit mittelschwerer bis schwerer Psoriasis vulgaris empfohlen, vor allem wenn andere Therapieformen keinen ausreichenden Therapieerfolg gezeigt haben, unverträglich oder kontraindiziert sind (↑↑).</p> <p><u>Ciclosporin</u> kann vor allem zur Induktionstherapie bei mittelschwerer bis schwerer Psoriasis vulgaris empfohlen werden (↑).</p> <p>Eine Kombination von <u>Ciclosporin</u> mit topischen Präparaten zur Behandlung der Psoriasis vulgaris kann empfohlen werden (↑).</p> <p><u>Etanercept</u> wird in der Dosierung von 2x50 mg zur Induktionstherapie für Patienten mit mittelschwerer bis schwerer Psoriasis vulgaris empfohlen, vor allem wenn andere Therapieformen keinen ausreichenden Therapieerfolg gezeigt haben, unverträglich oder kontraindiziert sind (↑↑).</p> <p>In der Dosierung von 1 x 50 mg oder 2 x 25 mg kann eine Anwendung zur Induktionstherapie empfohlen werden(↑).</p> <p>Kommentar: Im Rahmen der Konsensuskonferenz konnte kein starker Konsens (>75 %) bezüglich der Therapieempfehlung für Etanercept erzielt werden. Die Empfehlung erfolgte daher mit einem Mehrheitsvotum von 62 % der Experten. Alternativ wurde für die Formulierung „kann empfohlen werden“ (2 x 50 mg) sowie „kann erwogen werden“ (1 x 50 oder 2 x 25) gestimmt. Grund der Diskussion war die initial im Vergleich zu den anderen Biologics niedrigere Wirksamkeit von Etanercept mit einem Erreichen der maximalen Wirksamkeit erst nach der Induktionsphase.</p> <p>Die Behandlung mit <u>Fumarsäureestern</u> kann als Induktionstherapie der mittelschweren bis schweren Psoriasis vulgaris bei Erwachsenen empfohlen werden (↑).</p> <p><u>Infliximab</u> wird zur Induktionstherapie für Patienten mit mittelschwerer bis schwerer Psoriasis vulgaris empfohlen, vor allem wenn andere Therapieformen keinen ausreichenden Therapieerfolg gezeigt haben, unverträglich oder kontraindiziert sind (↑↑).</p> <p><u>MTX</u> kann zur Induktionstherapie der mittelschweren bis schweren Psoriasis vulgaris empfohlen werden (↑).</p> <p><u>Acitretin</u> kann in niedriger Dosis für eine Monotherapie auf Grund mangelnder Wirksamkeit nicht empfohlen werden (↓).</p> <p>Acitretin kann bei gebärfähigen Frauen mit Plaque-Psoriasis nicht empfohlen werden (↓).</p> <p><u>Ustekinumab</u> wird zur Induktionstherapie bei erwachsenen Patienten mit mittelschwerer bis schwerer Psoriasis vulgaris empfohlen, vor allem</p> |

| | wenn andere Therapieformen keinen ausreichenden Therapieerfolg gezeigt haben, unverträglich oder kontraindiziert sind (↑↑). |
| Papp K et al., 2011 [22]. Canadian guidelines for the management of plaque psoriasis: overview | <p>Fragestellung “The Guidelines offer treatment recommendations for mild and moderate to severe body psoriasis, as well as for psoriasis affecting specific areas of the skin, such as the facial, flexural, and genital areas; nails; scalp; and palms and soles.”</p> <p>Methodik Grundlage der Leitlinie: systematische Evidenzrecherche und -bewertung, keine Konsensusprozesse beschrieben Suchzeitraum: 1980 – 02/2008 LoE/GoR (siehe Anhang zu dieser Synopse)</p> <p>Sonstige methodische Hinweise</p> <ul style="list-style-type: none"> • Col of all Committee members declared • Financial assistance for the development of these Guidelines was generously provided by the following sponsors (in alphabetical order): Abbott Laboratories, Limited; Amgen Canada Inc.; Astellas Pharma Canada, Inc.; EMD Serono Canada Inc.; Galderma Canada Inc.; Isotechnika Inc.; Janssen-Ortho Inc.; LEO Pharma Inc.; Schering-Plough Canada Inc.; and Wyeth. |
| | <p>Freitext/Empfehlungen/Hinweise Therapeutic options for ameliorating moderate to severe plaque psoriasis (alphabetical list, grouped by class) Evidenzbasis siehe Papp K et al. (2011) Tabelle 5, Seite 214-216)</p> <p>Oral systemic agent <u>Acitretin</u>: Retinoid drug; highly teratogenic and strictly contraindicated in pregnancy. Not to be used in women of childbearing age unless they are able and willing to use contraception for 3 years after discontinuing acitretin - Rarely used as monotherapy, but often combined with topical agents such as potent corticosteroids, or with other therapeutics to allow for more rapid/complete control, with reduced exposure to the other therapeutic (LoE 1-)</p> <p><u>Cyclosporine</u>: Immunosuppressive drug; leads to cumulative renal toxicity; can exacerbate hypertension and hypertriglyceridemia - Can be highly effective in severe disease, but best employed intermittently, rather than for continuous long-term use (LoE 1++)</p> <p><u>Methotrexate</u>: Immunomodulatory and anti-proliferative drug, often chosen for long-term management - Use is limited by risk of liver toxicity and the requirement for ongoing monitoring of liver function. Sometimes</p> |

| | |
|---|---|
| | <p>administered with folate supplement to reduce systemic toxicity (LoE 1+)</p> <p>Biologic agents</p> <p><u>Adalimumab</u>: Targets TNF-α. Safety profile, primarily based on record of use in rheumatoid and psoriatic arthritis, suggests some overlap in adverse events with other TNF-α antagonists - Approved for use in psoriatic arthritis as well as psoriasis. Appears to be appropriate for long-term continuous use (LoE 1++)</p> <p><u>Etanercept</u>: Targets TNF-α; may be associated with risk of infections, demyelinating disorders, and reactivation of latent TB or melanoma - Approved for use in psoriatic arthritis as well as psoriasis. Appropriate for long-term continuous use (LoE 1++)</p> <p><u>Infliximab</u>: Targets TNF-α. Highly effective on initial exposure, even in severe, acute flares. Variable efficacy following reinitiation or beyond the first year of continuous treatment. - Associated with infusion reactions and risk of infections, demyelinating disorders, and reactivation of latent TB or tumour. - Approved for use in psoriatic arthritis as well as psoriasis (LoE 1++)</p> <p>Photo(chemo)therapeutic methods</p> <p><u>UVA with psoralen (PUVA)</u>: Psoralen may be administered orally or by immersion of affected areas in a psoralen solution, prior to irradiation with UVA (oral versus bath PUVA). Associated with cumulative risk of non-melanoma skin cancer, primarily squamous cell carcinoma. May be combined with other agents in suitable patients to reduce UV exposure (LoE 2++)</p> <p><u>UVB</u>: Broadband UVB has been used for decades; now often applied using narrowband irradiation at 311 nm, a more effective option. Less durable remission than with PUVA but believed to have a more benign safety profile. May be combined with topical, systemic, or biologic agents for more rapid and more complete control, potentially reducing exposure to both UV light and other therapeutic agents (LoE 2++)</p> |

| | <p>outcomes.</p> <p>Sicherheit:</p> <p><u>Systemic biologic agents and systemic nonbiologic agents or phototherapy:</u></p> <ul style="list-style-type: none"> ○ Overall five RCTs (two good, two fair, and one poor quality) and two observational studies (both fair quality) directly compared biologics with nonbiologics and reported at least one adverse outcome of interest. ○ No trials or observational studies directly compared biologics with phototherapy in the evaluation of harms. ○ Infection rate did not differ between adalimumab and methotrexate (low strength of evidence). These data were from a single RCT conducted outside the United States in patients with moderate to severe chronic plaque psoriasis naïve to TNF-alpha antagonists or methotrexate. ○ There was insufficient evidence for other reported outcomes. |
| | <p>4. Fazit der Autoren</p> <p>In patients with CPP, there were limited data directly comparing systemic biologic agents with either systemic nonbiologic agents or with phototherapy on an individual drug level. Overall there is insufficient evidence to determine the comparative effectiveness of individual therapies, as compared with each other between the specified classes, with few exceptions. For the comparisons of adalimumab versus methotrexate, infliximab versus methotrexate, ustekinumab versus methotrexate, and etanercept versus acitretin, there is predominantly low strength of evidence favoring the individual biologic agent versus the nonbiologic agent. Additional trials directly comparing biologic systemic agents, systemic nonbiologic agents, and phototherapy are needed.</p> <p>Hinweise durch FB Med:</p> <ul style="list-style-type: none"> • Prepared for Agency for Healthcare Research and Quality (AHRQ) • Governmental funding • Col: None of the investigators have any affiliations or financial involvement that conflicts with the material presented in this report. • quality of included studies assessed by standardized tools: strength of evidence (risk of bias, consistency, directness, precision) • keine Angaben zur Schwere der Psoriasis |

Details of trials.

| Trials | Study | | | Patients Inclusion criteria | Intervention | Drug | |
|-------------------------------|-------|-------|-------|--|--------------------------|---|--|
| | Year | Jadad | n | | | Dosage | |
| Asahina ¹⁷ | 2010 | 4 | 169 | Diagnosis ≥ 6 months; stable 2 months; PASI ≥ 12 ou BSA ≥ 10 | Adalimumab | 80mg e posterior 40mg EOW – 16 week | |
| CHAMPION ^{24,26,27} | | 5 | 271 | BSA ≥ 10%; PASI score ≥ 10 | Adalimumab | 80mg e posterior 40mg EOW – 16 week | |
| Genovese ¹⁸ | 2007 | 4 | 100 | ≥ 18 years; ≥ 3 swollen joints and ≥ 3 tender or painful joints | Adalimumab | 40mg EOW – 16 week | |
| Gordon ¹⁹ | 2006 | 4 | 148 | ≥ 18 years; diagnosis ≥ 12 months; BSA ≥ 5%; | Adalimumab | 40mg EOW – 16 week | |
| REACH ²¹ | | 4 | 72 | Chronic plaque psoriasis on the hands and/or feet with PGA ≥ 3 | Adalimumab | 80mg e posterior 40mg EOW – 16 week | |
| REVEAL ^{20,22,23,25} | | 5 | 1,212 | Psoriasis ≥ 6 months; Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Adalimumab | 80mg e posterior 40mg EOW – 16 week | |
| Ellis ^{28,29} | 2001 | 3 | 229 | Diagnosis ≥ 12 months; BSA ≥ 10%; candidates to systemic therapy | Alefacept | 0,075mg/kg/week (average weight 96,7kg) – 12 week | |
| Krueger ^{30,1,32,33} | 2002 | 4 | 553 | Diagnosis ≥ 6 months; BSA ≥ 10%; CD4+ normal; ≥ 16 years | Alefacept | 7,5mg/week – 12 week | |
| Ortonne ^{34,36,37} | 2003 | 4 | 507 | PGA score mild to moderate (17%) and moderate to severe (83%); Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Alefacept | 10mg/week – 24 week | |
| Mease ³⁵ | 2006 | 4 | 180 | ≥ 3 swollen joints and ≥ 3 tender joints | Alefacept + methotrexate | 15mg/week | |
| Kimball ^{38,39} | 2008 | 3 | 180 | Diagnosis ≥ 6 months; 2 months stable; PASI ≥ 12; BSA ≥ 10; PGA moderate | Briakinumab | 200mg EOW 12 week | |
| Ortonne ⁴⁰ | 2007 | 3 | 176 | Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Certolizumab | 200mg EOW 12 week | |
| CLEAR ^{41,47,51} | | 4 | 793 | Psoriasis ≥ 6 months; Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Efalizumab | 1mg/kg/week – 12 week | |
| Gordon ^{42,45,46} | 2003 | 4 | 556 | 18-75 years; diagnosis ≥ 6 months; BSA ≥ 10; PASI ≥ 12; use systemic therapy | Efalizumab | 1mg/kg/week – 12 week | |
| Lebwohl ⁴³ | 2003 | 5 | 597 | 18-75 years; diagnosis ≥ 6 months; 3 months stable; BSA ≥ 10; PASI ≥ 12 | Efalizumab | 1mg/kg/week – 12 week | |
| Leonardi ⁴⁴ | 2005 | 4 | 498 | PASI ≥ 12; BSA ≥ 10%; diagnosis ≥ 6 months; stable for 3 months | Efalizumab | 1mg/kg/week – 12 week | |
| Papp ⁴⁸ | 2001 | 3 | 145 | Psoriasis ≥ 6 months; plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Efalizumab | 1mg/kg/week – 12 week | |
| Papp ⁴⁹ | 2006 | 4 | 686 | Psoriasis ≥ 6 months; plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Efalizumab | 1mg/kg/week – 12 week | |
| Papp ⁵⁰ | 2007 | 4 | 107 | Moderate to severe PSA – one of five subtypes and classified as ACR functional class 1, 2 or 3 | Efalizumab | 1mg/kg/week – 12 week | |
| Gottlieb ⁵² | 2003 | 4 | 112 | ≥ 18 years; plaque psoriasis stable; BSA ≥ 10%; use systemic therapy | Etanercept | 25mg TW – 24 week | |
| Leonardi ⁵⁴ | 2003 | 3 | 672 | ≥ 18 years; PASI ≥ 10; BSA ≥ 10%; candidates to phototherapy or systemic therapy | Etanercept | 25mg W, 25mg TW, 50mg TW – 12 week | |
| Mease ⁵⁵ | 2000 | 5 | 60 | ≥ 3 swollen joints and ≥ 3 tender or painful joints | Etanercept | 25mg TW – 12 week | |
| Mease ^{56,57} | 2004 | 4 | 205 | PSA with at least 3 swollen and 3 tender joints; plaque psoriasis with a qualifying target lesion (at least 2cm in diameter) | Etanercept | 25mg TW – 12 week | |

Fortsetzung Tabelle 1: Studiencharakteristika aus Correr C et al., 2013

Table 1 (continued)

| Trials | Study | | | Patients Inclusion criteria | Intervention | Drug | Dosage |
|-----------------------------------|-------|-------|-----|---|--------------|--|--------|
| | Year | Jadad | n | | | | |
| Paller 58,59 | 2008 | 4 | 211 | Plaque psoriasis; static PGA at least 3; BSA ≥ 10% | Etanercept | 0,8mg/kg/week – 12 week | |
| Papp 53,60 | 2005 | 5 | 583 | Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 10 | Etanercept | 25mg TW, 50mg TW – 12 week | |
| Siegfried 62 | 2010 | 3 | 138 | Plaque psoriasis; PGA ≥ 3; BSA ≥ 10%; PASI score ≥ 12 | Etanercept | 50mg OW – 12 week | |
| Tyring 63 | 2006 | 5 | 618 | PASI score ≥ 10; BSA ≥ 10%; candidates to phototherapy or systemic therapy | Etanercept | 50mg TW – 12 week | |
| van der Kerkhof 64 | 2008 | 4 | 142 | Plaque psoriasis; BSA 6-10%; PASI score ≥ 10 | Etanercept | 50mg OW – 12 week | |
| Bissonnette 70 | 2011 | 5 | 24 | ≥ 18 years; palmoplantar psoriasis | Infliximab | 5mg/kg/week – 14 week | |
| Chaudari 71,74 | 2001 | 4 | 33 | Plaque psoriasis; diagnosis ≥ 6months; BSA ≥ 5% | Infliximab | 5mg/kg/week – 6 week | |
| EXPRESS I 82,83,84,85,86 | 5 | 378 | | Psoriasis ≥ 6 months, plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Infliximab | 5mg/kg/week – 10 week | |
| EXPRESS II 72,80,81 | 5 | 835 | | Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Infliximab | 3mg/kg/week, 5mg/kg/week – 10 week | |
| Gottlieb 75 | 2004 | 5 | 249 | ≥ 18years; diagnosis ≥ 6 months; PASI ≥ 12; BSA ≥ 10%; candidates to phototherapy or systemic therapy | Infliximab | 3mg/kg/week, 5mg/kg/week – 10 week | |
| IMPACT I 68,69,78 | 4 | 104 | | Diagnosis ≥ 6 months; peripheral polyarthritis active, morning stiffness ≥ 15 min, negative rheumatoid factor, tuberculosis negative | Infliximab | 5mg/kg/week – 16 week | |
| IMPACT II 67,73,76,77,79,87,89 | 4 | 200 | | Diagnosis ≥ 6 months; swelling of the tendon or joints by at least 5; CRP ≥ 15mg/L | Infliximab | 3mg/kg/week, 5mg/kg/week – 10 week | |
| Tonii 92 | 2010 | 4 | 54 | Plaque psoriasis; BSA ≥ 10%; PASI score ≥ 12 | Infliximab | 5mg/kg/week – 10 week | |
| Kavanaugh 75,76 | 2009 | 4 | 405 | Active psoriasis; 3 swollen and painful joints, rheumatoid factor negative, at least one type of psoriasis and plaque psoriasis than 2cm in diameter | Golimumab | 50mg EOW – 16 week | |
| Gottlieb 90 | 2009 | 5 | 146 | ≥ 18 years; psoriatic arthritis; ≥ 3 swollen joints and ≥ 3 tender or painful joints; CRP ≥ 15mg/L; diagnosis ≥ 6 months; plaque psoriasis ≥ 2cm | Ustekinumab | 90mg week 0, 4 and every 12 week | |
| PHOENIX I 92,93,94,95,98 | 5 | 766 | | Psoriasis ≥ 6 months, PASI score ≥ 12, BSA ≥ 10%, candidates to phototherapy or systemic therapy | Ustekinumab | 45mg, 90mg week 0, 4 and every 12 week | |
| PHOENIX II 91,96,95 | 4 | 1,230 | | BSA ≥ 10%; PASI score ≥ 10 | Ustekinumab | 45mg, 90mg week 0, 4 and every 12 week | |

ACR: American College of Rheumatology; BSA: body surface area; CRP: C-reactive protein; PASI: Psoriasis Area and Severity Index; PGA: Physician's Global Assessment; PSA: psoriatic arthritis.

Tabelle 2: aus EDF, 2015: Table 1: Strength of recommendations: wording, symbols and implications

| Strength | Wording | Symbols | Implications |
|---|---|---------|---|
| <u>Strong recommendation for the use of an intervention</u> | "We recommend ..." | ↑↑ | We believe that all or almost all informed people would make that choice. Clinicians will have to spend less time on the process of decision making, and may devote that time to overcome barriers to implementation and adherence. In most clinical situations, the recommendation may be adopted as a policy. |
| <u>Weak recommendation for the use of an intervention</u> | "We suggest ..." | ↑ | We believe that most informed people would make that choice, but a substantial number would not. Clinicians and health care providers will need to devote more time on the process of shared decision making. Policy makers will have to involve many stakeholders and policy making requires substantial debate. |
| <u>No recommendation with respect to an intervention</u> | "We cannot make a recommendation with respect to ..." | 0 | At the moment, a recommendation in favour or against an intervention cannot be made due to certain reasons (e. g., no evidence data available, conflicting outcomes, etc.) |
| <u>Weak recommendation against the use of an intervention</u> | "We suggest not (using) ..." | ↓ | We believe that most informed people would make a choice against that intervention, but a substantial number would not. |
| <u>Strong recommendation against the use of an intervention</u> | "We recommend not (using) ..." | ↓↓ | We believe that all or almost all informed people would make a choice against that intervention. This recommendation can be adopted as a policy in most clinical situations. |

Appendix 1. Levels of Evidence (US Preventive Service Task Force)

| Level of Evidence | Type of study |
|-------------------|--|
| I | Evidence obtained from at least one properly randomized controlled trial. |
| II-1 | Evidence obtained from well-designed controlled trials without randomization. |
| II-2 | Evidence obtained from well-designed cohort or case-control analytic studies, preferably from more than one center or research group. |
| II-3 | Evidence obtained from multiple time series with or without the intervention. Dramatic results in uncontrolled experiments (such as the results of the introduction of penicillin treatment in the 1940s) could also be regarded as this type of evidence. |
| III | Opinions of respected authorities, based on clinical experience, descriptive studies and case reports, or reports of expert committees. |
| IV | Evidence deemed inadequate because of methodological problems (for example, sample size, length of follow-up, conflicting evidence). |

Grade of Recommendation and Quality of Evidence for Treatment with Biologic Agents for Psoriasis in Difficult-to-Treat Sites

| Grade of Recommendation | Definition |
|-------------------------|---|
| A | Strongly recommended (good evidence that the intervention is effective and that the benefits substantially outweigh harms) |
| B | Recommended (at least fair evidence that the intervention is effective and the benefits outweigh harms) |
| C | No Recommendation (at least fair evidence that the intervention is effective, but concludes that the balance of benefits and harms is too close to justify a general recommendation) |
| D | Not recommended (at least fair evidence that the intervention is ineffective or that harms outweigh benefits) |
| E | Insufficient Evidence to Make a Recommendation (evidence that the intervention is effective is lacking, of poor quality, or conflicting and the balance of benefits and harms cannot be determined) |

Abbildung 2: aus Sánchez-Regaña M et al., (2014) [27]

Table 1. Modified SIGN System Used by the Evidence and Recommendations Committees

| <i>Levels of Evidence</i> | |
|---------------------------------|---|
| 1++ | High-quality meta-analyses, systematic reviews of RCTs, or RCTs with a very low risk of bias |
| 1+ | Well-conducted meta-analyses, systematic reviews of RCTs, or RCTs with a low risk of bias |
| 1- | Meta-analyses, systematic reviews of RCTs, or RCTs with a high risk of bias |
| 2++ | High-quality systematic reviews of case-control or cohort studies |
| | High-quality case-control or cohort studies with a very low risk of confounding, bias, or chance and a high probability that the relationship is causal |
| 2+ | Well-conducted case-control or cohort studies with a low risk of confounding, bias, or chance and a moderate probability that the relationship is causal |
| 2- | Case-control or cohort studies with a high risk of confounding, bias, or chance and a significant risk that the relationship is not causal |
| 3 | Nonanalytic studies (e.g., case reports, case series) |
| 4 | Expert opinion |
| <i>Grades of Recommendation</i> | |
| A | At least one meta-analysis, systematic review, or RCT rated as 1++ and directly applicable to the target population or A systematic review of RCTs or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results |
| B | A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results or Extrapolated evidence from studies rated as 1++ or 1+ |
| C | A body of evidence including studies rated as 1-, 2-, or 2+, directly applicable to the target population and demonstrating overall consistency of results or Extrapolated evidence from studies rated as 2++ |
| D | Evidence level 3 or 4 or Extrapolated evidence from studies rated as 2+ |
