Anhang 4G – Teil 1

Angaben zum Pooling der Daten aus STARTRK-2 und STARTRK-1, ALKA-372-001 und STARTRK-NG

Das vorliegende Dossier basiert auf der einarmigen Studie STARTRK-2. Neben der STARTRK-2 wurden noch drei weitere Studien im Anwendungsgebiet ROS1+ ROS1-Inhibitor-naiven NSCLC durchgeführt (STARTRK-1, ALKA-372-001 und STARTRK-NG). Die ALKA-372-001 sowie STARTRK-1 waren Phase I/Ib-Dosiseskalationsstudien. In der Studie STARTRK-NG wurde die Wirksamkeit und Verträglichkeit von Entrectinib bei pädiatrischen Patienten untersucht.

Gepoolte Efficacy Evaluable Population

Für die gepoolte Efficacy Evaluable Population wurden alle Patienten aus STARTRK-1 und ALKA-372-001, die eine Dosierung von 600 mg/m^2 (Zulassungsdosierung) oder höher erhalten haben, mit den Patienten aus STARTRK-2 gepoolt und analysiert**.** Aufgrund des einarmigen Studiendesigns und des damit einhergehenden fehlenden Behandlungseffektes, wurde der Faktor „Studie“ bei der Auswertung nicht berücksichtigt.

Da die drei zugrundeliegenden Studien übereinstimmenden Prüfplänen folgten, wird von homogenen Studienpopulationen ausgegangen.

Es wurden alle patientenrelevanten Endpunkte, vorausgesetzt sie wurden in allen drei Studien erhoben, mit denselben statistischen Modellen wie unter Abschnitt 4.2.5.2 beschrieben auf Basis individueller Patientendaten metaanalytisch zusammengefasst.

Die präsentierten Ergebnisse basieren auf den drei einarmigen Studien (STARTRK-1, STARTRK-2 und ALKA-372-001), denen ein in den wesentlichen Punkten übereinstimmender Prüfplan zugrunde lag.

Gepoolte Safety Evaluable Population

Für die gepoolte Safety Evaluable Population wurden zusätzlich pädiatrische Patienten aus der Studie STARTRK-NG eingeschlossen. Analysen zur Verträglichkeit von Entrectinib wurden für folgende Populationen durchgeführt:

NTRK-Adult: Patienten mit NTRKf+ NTRK-Inhibitor-naiven soliden Tumoren aus den Studien STARTRK-1, STARTRK-2 und ALKA-372-001, die mindestens eine Gabe Entrectinib erhielten. Alle Patienten in dieser Analysepopulation haben ein Alter von 18 Jahren oder älter.

ROS1 NSCLC-Adult: Alle ROS1+ NSCLC Patienten aus den Studien STARTRK-1, STARTRK-2 und ALKA-372-001, die mindestens eine Gabe Entrectinib erhielten. Alle Patienten in dieser Analysepopulation haben ein Alter von 18 Jahren oder älter.

Other-Adult: Alle Patienten aus den Studien STARTRK-1, STARTRK-2 und ALKA-372-001, die mit ROS1+ non-NSCLC, ALK+ Tumoren oder ohne Gen-Fusion identifiziert wurden

und mindestens eine Gabe Entrectinib erhielten. Alle Patienten in dieser Analysepopulation haben ein Alter von 18 Jahren oder älter.

Total-Adult: Alle Patienten aus den Populationen NTRK-Adult, ROS1 NSCLC-Adult und Other-Adult.

Pediatric: Alle Patienten aus der Studie STARTRK-NG, die mindestens eine Gabe Entrectinib erhielten.

Total: Die Gesamt Safety Evaluable Population bestehend aus allen Patienten aus den Populationen Total-Adult und Pediatric.

Die Ergebnisse sind auf den Versorgungskontext übertragbar (siehe 4.3.2.3.2.1). Dies gilt für alle Endpunkte.

Studiendesign und -methodik nach TREND

Studiendesign und -methodik für Studie ALKA-372-001

Tabelle 4-90 (Anhang): Studiendesign und -methodik für Studie ALKA-372-001

Item[a]	**Charakteristikum**	**Studieninformation**
Studienziel		
2	Wissenschaftlicher Hintergrund und Erläuterung der Rationale	Die anaplastische Lymphomkinase (ALK) ist eine Rezeptortyrosin-Kinase (RTK), deren physiologische Expression hauptsächlich auf neuronale Zellen während der Entwicklung beschränkt ist. Eine Überaktivierung der Kinase durch Mutation wurde ursprünglich beim anaplastischen großzelligen Lymphom (ALCL) beobachtet. Gentische Aberrationen unter Involvierung des ALK-Gens wurden auch bei einer Untergruppe von Patienten mit nicht-kleinzelligem Lungenkarzinom (NSCLC), bei familiären und sporadischen Neuroblastomen, bei inflammatorischen myofibroblastischen Tumoren (IMTs) und bei anderen Krebsarten (systemische Histiozytose, inflammatorischer Brustkrebs (IBC), Glioblastom und undifferenzierter anaplastischer Schilddrüsenkrebs) festgestellt (Protokoll). Entrectinib ist ein oral bioverfügbarer potenter niedermolekularer ATP-kompetitiver Inhibitor der Kinaseaktivität der ALK und zählt zu den Indazolen. Entrectinib weist eine Kreuzreaktivität mit Rezeptoren der TRK-Familie (TRKA/B/C) sowie mit ROS1 auf. Die Inhibition erfolgt bereits im niedrigen nanomolaren Bereich (Protokoll). Entrectinib zeigt eine starke antitumorale Aktivität in ALK-abhängigen Tumorzelllinien und in Xenograftmodellen von ALK-getriebenem ALCL und NSCLC. In präklinischen Experimenten hatte Entrectinib ein akzeptables Sicherheitsprofil. Entrectinib kann die Blut-Hirnschranke passieren (Protokoll). Die Studie ALKA-372-001 ist eine Phase I-Studie, in der die Sicherheit, Pharmakokinetik und Antitumoraktivität von Entrectinib bei Patienten mit fortgeschrittenen/metastasierten soliden TRKA/B/C-, ROS1- oder ALK-positiven Tumoren untersucht wurde.
Methoden		
3	Probanden / Patienten	
3a	• Eignungskriterien für Studienteilnehmer, einschließlich der Kriterien auf verschiedenen	**Einschlusskriterien:**

Item[a]	**Charakteristikum**	**Studieninformation**
	Ebenen des Rekrutierungsplans / Plan zur Stichprobennahme (Sampling Plan) (z. B. Städte, Kliniken, Patienten) • Rekrutierungsmethode (z. B. Überweisung, Selbstauswahl) einschließlich der Methode zur Stichprobennahme (Sampling Method), falls ein systematischer Plan zur Stichprobennahme verwendet wurde • Vorgehensweise bei der Rekrutierung • Setting der Datenerhebung und Orte, an denen die Daten erhoben wurden	1. Unterzeichnete und datierte Einverständniserklärung; 2. Histologisch oder zytologisch gesicherte Diagnose eines fortgeschrittenen oder metastasierten soliden Tumors, welcher eine genetische Veränderung von TRKA/B/C-, ROS1- oder ALK aufweist und für dessen Behandlung keine effektive Standardtherapie verfügbar ist, diese als unpassend betrachtet wird oder abgelehnt wird; 3. Tumorgewebe zur Analyse muss vorhanden sein; 4. Vorangehende Krebstherapien sind erlaubt, mit Ausnahme von TRK-, ROS1- oder ALK- (gilt nur für nicht-NSCLC Patienten) Inhibitoren bei Patienten mit den oben genannten molekularen Veränderungen. Zum Zeitpunkt des Behandlungsbeginns müssen mindestens vier Wochen seit der letzten Krebstherapie vergangen sein bzw. fünf Halbwertszeiten, wenn keinerlei Toxizität aufgetreten ist (bei Nitrosoharnstoffen, Mitomycin C oder liposomalem Doxorubicin sechs Wochen); 5. Vorangegangene Radiandereapie ist erlaubt, wenn sichergestellt ist, dass nicht mehr als 25% der Knochenmarkreserven bestrahlt wurden; 6. Patienten mit einer kontrollierten, asymptomatischen ZNS-Beteiligung können in die Studie eingeschlossen werden. Die Verwendung von Medikamenten zur Anfalls-Prophylaxe sind erlaubt, solange die Patienten nicht-enzyminduzierende Antiepileptika (non-EIAEDs) erhalten. Patienten, die keine Steroide benötigen oder Steroide in einer stabilen Dosierung (≤ 4 mg/Tag Dexamethason oder Äquivalent) für mindestens zwei Wochen benötigen, sind geeignet; 7. Auflösung von allen akuten toxischen Effekten (mit Ausnahme von Alopezie) vorangegangener Krebstherapien, d.h. NCI CTC (Version 4.03) Grad ≤ 1 oder Rückgang der Laborwerte zu den in

		Einschlusskriterium 11 definierten Werten zu Baseline; 8. ECOG Performance Status ≤ 2; 9. Alter ≥18 Jahre; 10. Lebenserwartung von mindestens drei Monaten; 11. Die Laborwerte zu Baseline müssen folgende Kriterien erfüllen: - Absolute Neutrophilenzahl ≥ 1.500/mm^3 (≥ 1,5 × 10^9/L) - Thrombozyten ≥ 100.000/mm^3 (≥ 100 × 10^9/L) - Hämoglobin > 9,0 g/dL - Serumkreatinin ≤ 1,5 × ULN oder Kreatinin Clearance > 60 mL/min - Gesamtbilirubin im Serum ≤ 1,5 × ULN - AST/ALT ≤ 2,5 × ULN (≤ 5 × ULN bei Lebermetastasen) - ALP ≤ 2,5 × ULN (≤ 5 × ULN bei Leber- und/oder Knochenmetastasen) - Amylase und Lipase unterhalb des ULN - Bei Frauen im gebärfähigen Alter ein negativer Schwangerschaftstest innerhalb von sieben Tagen vor Behandlungsbeginn; 12. Vereinbarung bei zeugungs- bzw. gebärfähigen Frauen oder Männern, über die gesamte Studiendauer und 90 Tage nach Beendigung der Studienbehandlung mindestens zwei effektive Verhütungsmethoden anzuwenden (hormonelle Verhütungsmethode, Barrieremethode zur Verhütung oder Abstinenz) 13. Fähigkeit, Kapseln oder Tabletten zu schlucken ohne diese zu öffnen oder zu zerkleinern; 14. Bereitschaft, geplante Visiten, Behandlungsplan, Laboruntersuchungen und andere Untersuchungen durchführen zu lassen. **Ausschlusskriterien:** Patienten, die folgende Ausschlusskriterien erfüllen, konnten nicht in die ALKA-372-001 eingeschlossen werden: 1. Aktuelle Teilnahme an einer weiteren klinischen Studie; 2. Eine derzeit aktive weitere maligne Erkrankung, ausgenommen adäquat behandelte Basalzell- oder Plattenepithelkarzinome und/oder kegelförmig biopsiertes Carcinoma in situ der Cervix uteri und/oder oberflächlicher Blasenkrebs. Patienten mit jeglicher anderen

		Krebserkrankung müssen seit fünf oder mehr Jahren erkrankungsfrei sein; 3. Große chirurgische Eingriffe, ausgenommen diagnostische Operationen, innerhalb der letzten vier Wochen vor Behandlungsbeginn; 4. Mindestens eine der folgenden Erkrankungen innerhalb der letzten sechs Monate: Myokardinfarkt, instabile Angina pectoris, Koronararterien-Bypass/peripherer arterieller Bypass, symptomatische Herzinsuffizienz, cerebrovaskulärer Infarkt oder transiente ischämische Attacke, Lungenembolie oder tiefe Venentrombose; 5. Krankengeschichte eines verlängerten QTc-Intervalls (wiederholtes Auftreten von QTc Intervall > 450 Millisekunden); 6. Krankengeschichte mit weiteren Risikofaktoren für Torsade de pointes (Herzinsuffizienz, Hypokaliämie, familiäres Auftreten eines Long-QT-Syndroms); 7. Schwangere oder stillende Frauen; 8. Bekannte aktive Infektionen (bakteriell, durch Pilze oder viral inkl. HIV-Infektion); 9. Aktive gastrointestinale Erkrankungen (z.B. Morbus Crohn, Colitis ulcerosa oder Kurzdarmsyndrom) oder andere Malabsorptionssyndrome, welche die Absorption von Medikamenten beeinflussen würden; 10. Dokumentiertes gastrointestinales Ulkus; 11. Bekannte interstitielle Lungenerkrankung oder interstitielle Fibrose; 12. Andere schwerwiegende akute oder chronische medizinische oder psychiatrische Zustände oder Abweichungen in Laborparametern, die das Risiko einer Studienteilnahme oder das Risiko der Einnahme der Studienmedikation erhöhen oder die Beurteilunge der Studiendaten beeinflussen könnten und welche nach Ansicht des Prüfarztes den Patienten als ungeeignet für die Studie einstufen würden oder welche laut Prüfarzt und/oder Sponsor die Studienziele gefährden würden. **Rekrutierung:** Nach dem Unterschreiben der Einverständniserklärung wurde der Patient mit einer Screening-Nummer registriert. Diese Nummer wurde zentral vom Sponsor zugewiesen. Nach Beendigung der Screening-Untersuchungen wurde dem Patienten, falls er geeignet war, eine Patientennummer zugewiesen, die er für die gesamte Studiendauer behielt. Für die Zuweisung der

Item[a]	**Charakteristikum**	**Studieninformation**
		Patienten auf ein Dosierungsschema und dem entsprechenden Dosierungslevel war der Sponsor verantwortlich. Die Rekrutierung erfolgte in den Studienzentren auf Basis der festgelegten Ein- und Ausschlusskriterien. **Datenerhebung und Orte, an denen die Daten erhoben wurden** Die Studie fand in 2 Zentren in Italien statt.
4	Intervention	
4a	Details der vorgesehenen Interventionen für jede Studiensituation, wie und wann sie verabreicht wurden, und zwar einschließlich: • Inhalt: was wurde gegeben? • Verabreichungsmethode: wie wurde der Inhalt gegeben? • Verabreichungseinheit: wie wurden die Patienten während der Verabreichung eingeteilt? • Verabreicher: wer verabreichte die Intervention? • Umfeld: wo wurde die Intervention verabreicht? • Expositionsmenge und -dauer: wie viele Sitzungen oder Episoden oder Ereignisse sollten verabreicht werden? Wie lange sollten sie dauern? • Zeitspanne: wie lange sollte die Verabreichung der Intervention bei jeder Einheit dauern? • Aktivitäten zur Erhöhung der Compliance oder Adhärenz (z. B. Anreize)	**Studiendauer**: Einschluss des ersten Patienten: 26.10.2012 Zum Datenschnitt vom 31.05.2018 lagen die Daten der Patienten vor, die bis 30.11.2017 in ALKA-372-001 eingeschlossen wurden. Der letzte Patient wurde am 20.03.2018 eingeschlossen. **Arzneimittelverabreichung und Zeitspanne der Verabreichung** Entrectinib wurde als 50 mg, 100 mg und 200 mg Kapseln vom Sponsor zur Verfügung gestellt. Die Anzahl der benötigten Kapseln wurde vom Prüfarzt je Behandlungszyklus abgezählt. Der Patient bekam die Medikation ausschließlich für den aktuellen Behandlungszyklus und erst nachdem sichergestellt wurde, dass er das Behandlungsschema vollständig verstanden hatte. Die Studienmedikation wurde von den Patienten selbst zu Hause eingenommen. Alle Patienten führten ein Tagebuch, in welchem die Entrectinib-Dosierungen dokumentiert wurden. Hier waren auch Informationen zur Verabreichung der Studienmedikation sowie Anweisungen für den Fall, dass Medikamente unbeabsichtigt verschüttet wurde, hinterlegt. Adäquate Dokumentation von Empfang, Verbrauch, Rückgabe, Verlust oder anderer Verwendung der Studienmedikation musste gewährleistet sein. Ein spezielles Formular des Sponsors zur Dokumentation der Prüfmedikation oder die elektronische Dokumentation der Apotheke am Studienzentrum konnten hierfür verwendet werden. Informationen zur Bereitstellung und Verwendung der Studienmedikation an jeden einzelnen Patienten wurde bereitgestellt, vom Prüfarzt (oder dem Apotheker bzw. dem Beauftragten zur

		Verteilunge der Studienmedikation) unterschrieben und vom Monitor gesammelt. Am Ende der Studie wurde auf Anweisung des Sponsors die Medikation vor Ort vernichtet. Hier wurden entsprechende Standardprozeduren der teilnehmenden Institutionen angewendet oder die Medikation wurde zu einem Medikationsdepot zur Vernichtung weitergeleitet. Alternativ konnte alle unverbrauchte Studienmedikation nach entsprechender Verifikation durch den Monitor an den Sponsor zurückgeschickt werden. Die Vernichtung und/oder der Rückversand der Studienmedikation wurde entsprechend dokumentiert. **Dosierungspläne** Für die ALKA-372-001 wurden drei unterschiedliche Dosierungspläne untersucht. <u>Dosierungsplan A:</u> Für drei Wochen nimmt der Patient 4 Tage Entrectinib in der individuellen Dosierung, gefolgt von einer dreitägigen Pause. Nach drei Wochen folgt eine 7-tägige Pause, die den vierwöchigen Behandlungszyklus abschließt. Startdosis ist 100 mg/m2 KOF/Tag, die Einnahme erfolgt nüchtern ein- oder zweimal täglich. <u>Dosierungsplan B:</u> Für vier Wochen nimmt der Patient täglich Entrectinib in der individuellen Dosierung. Startdosis 200 mg/m2 KOF/Tag, die Einnahme erfolgt nach einer Mahlzeit ein oder zweimal täglich. <u>Dosierungsplan C:</u> Für vier Wochen nimmt der Patient 4 Tage Entrectinib in der individuellen Dosierung, gefolgt von einer dreitägigen Pause. Startdosis ist 400 mg/m2 KOF/Tag, die Einnahme erfolgt nach einer Mahlzeit ein- oder zweimal täglich. **Dosiseskalation** Die initiale Dosiseskalation von Dosierungsplan A beinhaltete ein beschleunigtes Titriationsdesign, bei dem eine 100%-Dosiseskalation je Kohorte vorgesehen war. Diese schnelle Eskalationsphase wurde eingeführt, um die Anzahl der Patienten mit einem niedrigen Medikationslevel und damit einer niedrigeren Wahrscheinlichkeit auf einen Behandlung-Nutzen zu reduzieren. Dies wurde fortgeführt, bis bei einem Patienten im ersten Behandlungszyklus eine medikationsbezogene DLT oder bei zwei Patienten in jeglicher Dosierung eine

		medikationsbezogene Non-DLT mit CTCAE Grad ≥ 2 während des ersten Behandlungszyklus auftrat. Neben den genannten Toxizitäten folgte die Dosiseskalation einem modifizierten Fibonacci-Schema (50, 40 or 33% Schritte). Nachdem jede Kohorte die Behandlung abgeschlossen hatte, wurden die verfügbaren Daten zu Sicherheit und Pharmakokinetik geprüft und die Dosiseskalation zwischen Prüfarzt und Sponsor beschlossen. In beiden Eskalationsphasen begannen mindestens drei Patienten in jedem Dosislevel. • Wenn bei 0/3 Patienten im ersten Behandlungszyklus keine DLT auftraten, startete die nächste Kohorte ein Dosislevel höher • Wenn bei 1/3 Patienten im ersten Behandlungszyklus DLT auftraten, starten weitere drei Patienten mit diesem Dosislevel; wenn bei 1/6 Patienten im ersten Behandlungszyklus DLT auftraten, startete die nächste Kohorte ein Dosislevel höher • Wenn bei ≥2/3 oder ≥2/6 Patienten im ersten Behandlungszyklus DLT auftraten, galt die MTD als erreicht. Zur Definition der MTD wurden drei weitere Patienten auf das vorangegangene Dosislevel oder sechs Patienten auf ein mittleres Dosislevel gesetzt. Nur ein Dosislevel pro Dosierungsplan war für den Einschluss zur gleichen Zeit geöffnet. Es war geplant, dass die ersten zwei Patienten jeder Kohorte mit einem Abstand von zwei Wochen starten. Sollten beim ersten Patienten im Rahmen des ersten Behandlungszyklus keine DLT auftreten, konnte der dritte Patient jederzeit eingeschlossen werden. Sind beim ersten Patienten DLT aufgetreten, konnte der dritte Patient erst starten, wenn beim zweiten Patienten kein DLT im ersten Behandlungszyklus aufgetreten sind. Wenn eine Kohorte um drei weitere Patienten ergänzt wurde, begannen diese ihre Behandlung nach dem gleichen Schema. Der dritte oder sechste Patient jeder Kohorte musste für einen Behandlungszyklus beobachtet werden, bevor weitere Patienten auf eine höhere Dosis gesetzt werden konnten. Wenn ein Patient weniger als 75% des ersten Behandlungszyklus abgeschlossen hat, musste ein weiterer Patient auf dem gleichen Dosislevel eingeschlossen werden. **Compliance**

Item[a]	**Charakteristikum**	**Studieninformation**
		Verwendete Studienmedikation, die Anzahl der Behandlungszyklen, aktuelle und gesamt verbrauchte Dosis, Dosismodifikationen, Dosierungsverzögerungen und Dosisunterbrechungen sowie alle Abweichungen zur geplanten Einnahme wurden über den Zeitraum der Studie dokumentiert und zusammengefasst.
5	Zielsetzungen	
5a	• Spezifische Studienziele und Hypothesen	**Primäres Studienziel** Bestimmung der dosis-limitierenden Toxizität (DLT) im ersten Behandlungszyklus und der maximal verträglichen Dosis (MTD) von Entrectinib in einer oralen Formulierung in verschiedenen Behandlungsschemata bei Patienten mit fortgeschrittenen/metastasierten soliden Tumoren mit TrkA, TrkB, TrkC-, ROS1- oder ALK-Genumlagerung anhand der: • DLTs im ersten Behandlungszyklus • MTD **Sekundäre Studienziele** Die Definition des Sicherheits-Profils von Entrectinib charakterisiert durch Typ, Schweregrad (nach NCI CTCAE Version 4.03), Timing und der Kausalität von Studienbehandlung und UE/abnormer Laborparameter im ersten und folgenden Behandlungszyklen. Die Evaluation der Pharmakokinetik von Entrectinib im Plasma, definiert durch die Plasmakonzentration von Entrectinib zu unterschiedlichen Zeitpunkten nach Dosierung und der zugehörigen Bewertung von C_{max}, t_{max}, $t_{1/2,z}$, AUC_{daily} und $AUC_{tlast.}$ Die Dokumentation der Anti-Tumor-Aktivität von Entrectinib anhand des objektiven Tumoransprechens gemäß der RECIST v1.1. **Hypothesen** Da es sich um eine Phase I Studie (First in human) handelt, wurden keine Hypothesen generiert.
6	Zielkriterien	

Item[a]	**Charakteristikum**	**Studieninformation**
6a	• Klar definierte primäre und sekundäre Wirksamkeitsmessgrößen • Methoden zur Datenerhebung und Methoden zur Verbesserung der Qualität von Messungen • Informationen über validierte Instrumente wie z. B. psychometrische und biometrische Eigenschaften von Selbsterhebungsinstrumenten	**Analyse der primären Wirksamkeits-Endpunkte** **Dosis-limitierende Toxizität (DLT) im ersten Behandlungszyklus und maximal verträgliche Dosis (MTD)** Alle Toxizitäten wurden nach der NCI CTCAE Version 4.03 bewertet. Im Rahmen dieser Studie war eine DLT definiert als eines der nachfolgend aufgeführten Ereignisse, für die ein Zusammenhang mit Entrectinib nicht vollständig ausgeschlossen werden kann: • Hemotologische Toxizität o Neutropenie Grad 4, die länger als 7 Tage anhält o Febrile Neutropenie o Neutropenische Infektion ≥ Grad 3 o Thrombozytopenie Grad 4 o Thrombozytopenie Grad 3, die länger als 7 Tage andauert oder mit einer Blutung ≥ Grad 2 zusammenhängt • Übelkeit/Übergeben o Nausea ≥ Grad 3 trotz optimierter antiemetischer Therapie • Diarrhoe o Diarrhoe ≥ Grad 3 trotz optimierter Behandlung des Ereignisses • ZNS-Toxizität o ≥ Grad 2, die der Studienmedikation zugerechnet werden kann und eine Veränderung von mindestens 2 CTCAE-Graden seit Studienbeginn • Andere nicht-hämatologische Toxizitäten o Toxizitäten ≥ Grad 3, die der Studienmedikation zugerechnet werden können und eine Veränderung von mindestens 2 CTCAE-Graden seit Studienbeginn o Asymptomatische Laborveränderungen (mit Ausnahme der Leber- und Nierenwerte) die erfolgreich supplementiert werden konnten, wurden nicht als DLT gewertet; eine asymptomatische Grad 4 Lipase/Amylase wurde als DLT gewertet • Keine vollständige Genesung von dem Ereignis (mit Ausnahme Alopezie) o Keine vollständige Erholung von Toxizitäten auf ein Level von ≤ Grad 1 oder auf Werte zu Studienbeginn (wenn ein Grad von 2 zu

		Studienbeginn erlaubt war) nach einer Verzögerung des nächsten Behandlungszyklus um maximal 14 Tage o Für die Dosispläne A, B und C ein Nicht-beenden des ersten Behandlungszyklus aufgrund von Toxizitäten mit Entrectinib-Bezug mit mind. 75% der geplanten Dosen Wenn eine DLT allein auf einem Laborwert basierte, musste mindestens ein wiederholter Wert innerhalb von 24h erhoben werden um die DLT zu bestätigen. MTD ist definiert als das Dosislevel, bei welchem 0/6 oder 1/6 Patienten im ersten Behandlungszyklus eine DLT und 2/3 oder 2/6 Patienten unter der nächsthöheren Dosierung ebenfalls eine DLT erfahren. Wenn eine Dosierung als sicher bewertet wurde, wurden weitere Patienten eingeschlossen (insgesamt 15 Patienten, inkl. der bereits behandelten) und ihre Verträglichkeitsprofile wurden für die Definition der MTD evaluiert. Die MTD war die höchste Dosis, bei der weniger als 33% der Patienten im Rahmen des ersten Behandlungszyklus DLTs erfuhren. Diese Dosis konnte ebenso die RP2D für die weitere Studie sein. Jeder Dosisplan konnte eine andere RP2D haben. **Analyse der sekundären Wirksamkeits-Endpunkte** **Objektives Ansprechen des Tumors** **Erhebung des Tumorstatus** Vor Behandlungsstart war ein CT des gesamten Körpers sowie des Gehirns verpflichtend, mit Ausnahme von Glioblastoma-Patienten: hier war nur ein MRT des Gehirn**s** akzeptiert. Mit dem sechsten Protokoll-Amendment mussten alle bildgebenden Tumorbewertungen (CT oder MRT) des Thorax und des Abdomen innerhalb von vier Wochen vor Behandlungsbeginn erfolgen. Durch die Häufigkeit von Hirnmetastasen wurde für Patienten mit NSCLC im Rahmen des Screenings ein Gehirn-Scan erstellt. Bei Patienten mit Knochenmetastasen war ein Knochenscan innerhalb von vier Wochen vor Behandlungsbeginn erforderlich. Während der Behandlung wurde die Tumorbewertung zu jedem geraden Zyklus durchgeführt (d.h. am Ende von Zyklus 2, 4, 6 etc.) oder wenn eine klinische Verschlechterung festgestellt wurde und bei Beendigung der Behandlung (sofern mehr als 4 Wochen seit der letzten Bildgebung

		vergangen sind). Mit dem sechsten Protokoll-Amendment wurde der Bewertungszeitpunkt auf das Ende von Zyklus 1 und anschließend alle 8 Wochen festgelegt. Für Patienten mit 12 oder mehr Zyklen war eine Bildgebung nur noch alle 12 Wochen erforderlich. Alle Scans wurden vor Ort eingelesen und das Tumoransprechen nach RECIST v1.1 evaluiert. CT-Scans waren die bevorzugte Methode zur Messung von Läsionen, aber auch MRT wurde akzeptiert (mit Ausnahme bei Lungen-Läsionen). Die jeweilige Methode und Technik zur Bewertung wurde über den gesamten Studienzeitraum beibehalten. Bildgestützte Bewertung war gegenüber der klinischen Bewertung die bevorzugte Methode, um den Antitumor Effekt der Behandlung zu messen. Für Patienten mit einer Tumoransprache (Gesamtansprechen oder partielles Ansprechen) erfolgte die Bestätigung des Ansprechens nach nicht weniger als vier Wochen, nachdem die Kriterien des Tumoransprechens zum ersten Mal erreicht wurden. Darauffolgend wurde die nächste onkologische Bewertung am Ende jedes zweiten Zyklus zur Bestätigung wiederholt. Bei Patienten, die die Studie aus anderen Gründen als Progression beendet haben, wurde das Tumoransprechen zum Absetzen der Medikation wiederholt. Für diese Patienten erfolgte eine reguläre Tumorbewertung alle 8 Wochen im Rahmen des Follow-Up bis zur Progression oder bis eine neue Antitumor-Therapie begonnen wurde. Alle Patientenakten und Scans wurden zur Source-Verifizierung bereitgestellt. **Unabhängiges Bewertungsgremium (BICR):** Mit dem achten Protokoll-Amendment wurde die Möglichkeit einer unabhängigen Bewertung aller Scans auf Anfrage eingerichtet. Die Scans wurden an ein unabhängiges Labor für Bildgebung übermittelt. Dort fand die unabhängige Überprüfung des Tumoransprechens und der Krankheitsprogression während der Studie statt. **Evaluationskriterien für das Ansprechen bei soliden Tumoren** Für die Messung und Definition der Tumorveränderung wurden standardmäßig die Kriterien nach RECIST v1.1 verwendet. Zu Studienbeginn wurden die

Tumorläsionen vom Prüfarzt als messbar oder nicht messbar kategorisiert.

Maximal wurden insgesamt 5 messbare Läsionen (maximal 2 Läsionen pro Organ) als Zielläsionen bewertet und waren so repräsentativ für alle betroffenen Organe. Diese Zielläsionen wurden zu Studienbeginn identifiziert und zu jedem festgelegten Zeitpunkt gemessen und dokumentiert.

Alle anderen Läsionen wurden als Nicht-Zielläsionen zu Studienbeginn festgelegt und dokumentiert. Hier waren keine Messungen sondern nur eine Bewertung als „vorhanden“, „abwesend“ oder, in seltenen Fällen, „eindeutige Progression“ notwendig.

Waren Ziel- und Nicht-Zielläsionen vorhanden, so wurde die individuelle Bewertung separat dokumentiert. Die Gesamtbewertung des Ansprechens beinhaltete alle in der Tabelle aufgeführten Parameter:

Zielläsion	**Nicht-Zielläsion**	**Neue Läsionen**	**Gesamt-ansprechen**
CR	CR	Nein	CR
CR	Kein CR oder PD	Nein	PR
CR	Nicht evaluiert	Nein	PR
PR	Keine PD oder nicht alle evaluiert	Nein	PR
SD	Keine PD oder nicht alle evaluiert	Nein	SD
Nicht alle evaluiert	Keine PD	Nein	NE
PD	Jedes Ansprechen	Ja oder Nein	PD
Jedes Ansprechen	PD	Ja oder Nein	PD
Jedes Ansprechen	Jedes Ansprechen	Ja	PD

CR: totales Ansprechen; PD: Krankheitsprogression; PR: partielles Ansprechen; SD: stabile Erkrankung; NE: nicht bewertbar;

Um den Status eines PR oder CR zu erhalten, musste die Veränderung der Tumormessung bei Patienten mit einem Ansprechen nach mehr als vier Wochen nach den ersten Zeichen des Ansprechens durch eine weitere Bildgebung und Messung bestätigt werden.

Im Falle einer stabilen Erkrankung mussten die SD-Kriterien mindestens einmal nach Studieneinschluss innerhalb von mindestens acht Wochen erfüllt sein.

Hinweis:

Die Dauer des Ansprechens (DOR), Dauer der stabilen Erkrankung (SD), progressionsfreies Überleben und

Item[a]	**Charakteristikum**	**Studieninformation**
		Gesamtüberleben waren keine Wirksamkeitsendpunkte dieser Studie. Individuelle Evaluationen und zusammenfassende Auswertungen für behandelte und analysierbare Patienten waren als explorative Analysen geplant. **Bestes Gesamtansprechen** Bestes Gesamtansprechen (BOR, best overall response) ist das beste Gesamtansprechen, das zwischen Behandlungsbeginn bis zum Behandlungsende dokumentiert wurde. Das BOR eines jeden Patienten hängt ab von den Veränderungen der Zielläsionen und Nicht-Zielläsionen sowie vom Auftreten neuer Läsionen. Im Falle einer stabilen Erkrankung mussten die SD-Kriterien nach mindestens 8 Wochen nach Studieneintritt erfüllt worden sein. Die genauen Kriterien für die Bewertung finden sich im Studienbericht der ALKA-372-001 Seite 40. Eine allgemeine Verschlechterung des Gesundheitszustands, die einen Abbruch der Behandlung erforderlich machte, jedoch ohne Hinweis auf eine Krankheitsprogression, wurde als „systematische Verschlechterung“ bewertet. Auch nach Beendigung der Behandlung sollte alles versucht werden, eine mögliche objektive Progression zu dokumentieren. Eine systematische Verschlechterung war keine Beschreibung eines objektiven Ansprechens, aber ein Grund zum Beenden der Therapie. Das objektive Ansprechen dieser Patienten wurde über die Bewertung der Zielläsionen und Nicht-Zielläsionen bestimmt. **Analyse der Sicherheitsendpunkte** **Unerwünschte Ereignisse** Für jeden Patienten wurden UE dokumentiert. Die Beobachtung von UE begann mit der ersten Einnahme von Entrectinib und wurde fortgesetzt bis zum telefonischen Follow-Up-Kontakt 30 Tage nach der letzten Einnahme von Entrectinib. Alle UE, die bei der Behandlung auftraten, wurden nach NCI CTCAE v4.03 eingestuft und mit dem Medical Dictionary for Regulatory Activities (MedDRA Version 17.0) kodiert. Weitere Endpunkte umfassen Elektrokardiogramme, Pharmakokinetik, Pharmakodynamik und Tumormarker.

Item[a]	**Charakteristikum**	**Studieninformation**
7	Fallzahl	
7a	• Wie wurden die Fallzahlen bestimmt?	Es wurde eine gesamte Patientenzahl von etwa N=70 vorauskalkuliert. Da im Studiendesign für die Identifikation der MTD sequentielle Dosis-Eskalations-Stufen vorgesehen waren, konnte die Anzahl von eingeschlossenen und behandelten Patienten von der vorausberechneten Anzahl abweichen. Relevant hierfür war die beobachtete Toxizität und der darauf resultierende Einfluss auf die Kohortengröße und die Anzahl untersuchter Dosislevel.
7b	• Falls notwendig, Beschreibung von Zwischenanalysen und Kriterien für einen vorzeitigen Studienabbruch	Es wurden keine Zwischenanalysen vorab geplant. **Kriterien für einen vorzeitigen Studienabbruch:** - Progression zu jeglichem Zeitpunkt, außer es gibt angemessene Evidenz für einen klinischen Benefit, der das Fortführen der Behandlung begründet (in Rücksprache mit dem Sponsor - Nicht vertretbare Toxizitäten - Veränderung des medizinischen Status des Patienten (inkl. Schwangerschaft), so dass der Prüfarzt/Sponsor eine Beeinträchtigung der Sicherheit des Patienten befürchtet oder ein Beenden der Behandlung im besten Sinne des Patienten ist. - Rücknahme der Einverständniserklärung - Der Patient weigert sich, die Studienbehandlung fortzuführen - Fehlende Compliance des Patienten mit den Anforderungen aus dem Studienprotokoll - Der Patient ist nicht mehr erreichbar (Lost-to-Follow-up)
8	Zuweisungsmethode • Zuweisungseinheit (die Einheit, die der Studienbedingung zugewiesen wird, wie z. B. Person, Gruppe, Gemeinde) • Methode der Zuweisung von Einheiten zu Studienbedingungen, einschließlich Details über etwaige Restriktion (z. B. Blockbildung, Stratifikation, Minimierung) • Einbeziehung von Aspekten, um potenzielle Verzerrung durch Nichtrandomisierung zu minimieren (z. B. Matching)	**Zuweisung** Nicht zutreffend. Die Studie ist nicht randomisiert.
9	Verblindung	
9a	• Waren a) die Probanden / Patienten und / oder b) diejenigen, die die Intervention / Behandlung durchführten, und / oder c) diejenigen, die die Zielgrößen beurteilten, verblindet oder nicht	**Verblindung** Nicht zutreffend. Einarmige Phase I-Studie

Item[a]	**Charakteristikum**	**Studieninformation**
	verblindet, wie wurde die Verblindung vorgenommen?	
10	Analyseeinheit • Bezeichnung der kleinsten Einheit, die analysiert wird, um Wirkungen der Intervention zu beurteilen (z. B. Person, Gruppe, Gemeinde) • Wenn sich die Analyseneinheit von der Zuweisungseinheit unterscheidet, ist die verwendete Analysenmethode anzugeben, die dies berücksichtigt (z. B. Adjustierung der Standardfehlerschätzungen um den Designeffekt oder durch Verwendung einer Multilevel-Analyse)	Die Analysen wurden für jeden vorab festgelegten Dosierungsplan (A, B und C) durchgeführt.
11	Statistische Methoden	
11a	• Statistische Methoden zur Bewertung der primären und sekundären Zielkriterien einschließlich komplexer Methoden für korrelierte Daten	**Grundsätzliche statistische Methoden** Für alle Variablen wurden zusammenfassende Tabellen nach Dosierungsplan, Dosierungsansatz, zugewiesenem Dosierungslevel und Studienabschnitt/Visite mittels deskriptiver Statistik dargestellt. Stetige Variablen wurden mittels N, Mittelwert, Standardabweichung, Median, Minimum und Maximum dargestellt. Für alle kategorialen Variablen wurden absolute und relative Werte jeder Kategorie dargestellt. Die Häufigkeit fehlender Werte wurde nur dargestellt, wenn diese >0 für mindestens eine Behandlungsgruppe waren. Es wurden keine formalen Signifikanztests für die primäre Analyse durchgeführt. Für ausgewählte Wirksamkeitsparameter wurden 95%-Konfidenzintervalle berechnet. UE und Laborparameter wurden nach NCI CTCAE (Version 4.03) erfasst und mithilfe des Medical Dictionary for Regulatory Activities (MedDRA; version 15.1) kodiert. Die Antitumoraktivität von Entrectinib wurde über das vom Prüfarzt bestimmte objektive Ansprechen nach RECIST v1.1 bewertet. Vorangegangene Medikamente und Begleitmedikation wurde nach der WHO-DRL vom März 2014 kodiert. **Analyse der Wirksamkeitsendpunkte** Das objektive Tumoransprechen war ein sekundärer Endpunkt dieser Studie. Das Tumoransprechen basiert auf der standardmäßigen Bewertung des Prüfarztes von Zielläsionen, Nicht-Zielläsionen und

Item[a]	**Charakteristikum**	**Studieninformation**
		neuer Läsionen über die Kriterien von RECIST v1.1. Die Objektive Ansprechrate und die Rate des besten Ansprechens wurde für behandelte und auswertbare Patienten berechnet. Die Summe der Durchmesser der Zielläsionen, die prozentuale Veränderung seit Studienbeginn und seit der niedrigsten vorangegangenen Summe (d.h. des Nadirs) wurden berechnet. Zur graphischen Darstellung der besten prozentualen Veränderung der Durchmesser-Summe von Zielläsionen seit Studienbeginn wurden für jeden behandelten und auswertbaren Patienten Wasserfall-Plots erstellt. **Time-to-Event-Analysen** Dauer SD, PFS und OS: Berechnung vom ersten Tag der Einnahme von Entrectinib bis zum Datum des entsprechenden Events in Monaten. **DOR** wurde für alle Patienten mit einem Ansprechen (CR oder PR) berechnet als Zeit vom ersten Ansprechens bis zum Progress oder Tod in Monaten. Patienten, die nicht während der Studie verstarben, wurden für den Endpunkt **OS** zu dem Datum, an dem sie wissentlich noch am Leben waren, zensiert. Für andere Endpunkte wurden Patienten, bei denen nicht das entsprechende Ereignis aufgetreten ist, zum Zeitpunkt ihrer letzten Tumorbewertung zensiert. Patienten ohne Tumorbewertung nach der ersten Einnahme von Entrectinib wurden zu Tag 1 zensiert. Alle Time-to-Event Endpunkte wurden mithilfe der Kaplan-Meier-Methode analysiert und die zugehörigen Kaplan-Meier-Kurven für DOR, PFS und OS für behandelte und auswertbare Patienten erstellt. Wenn die Möglichkeit bestand, wurde die mediane Überlebenszeit zusammen mit den 25%- und 75%-Perzentilen, sowie dem 95%-KI dargestellt. Zusätzlich wurden die absoluten und relativen Häufigkeiten der Patienten mit Ereignis oder der zensierten Patienten dargestellt.
11b	• Verwendete statistische Methoden für zusätzliche Analysen, wie z. B. Subgruppenanalysen und adjustierte Analysen • Methoden zur Imputation fehlender Daten • Falls verwendet: Verwendete statistische Software oder Programme	Subgruppenanalysen waren nicht geplant. **Fehlende Daten** • Wenn im Rahmen der Erhebung demographischer und krankheitsbezogener Daten die Angabe auf eine JA/NEIN Frage fehlte, wurde die Antwort auf Ja gesetzt, wenn auf dem entsprechenden Formular

Item[a]	**Charakteristikum**	**Studieninformation**
		mindestens ein Hinweis auf das Vorliegen der entsprechenden Daten vermerkt war. • Wurde ein Labortest zu einem Zyklus mit fehlender Behandlung oder fehlendem Datum berichtet, so wurde dieser dem letzten Zyklus mit valider Behandlung und Datum zugeteilt.
Resultate		
12	Patientenfluss	
12a	• Patientenfluss durch jede Studienphase: Rekrutierung, Zuweisung, Allokation und Interventionsexposition, Nachbeobachtung, Analyse (Diagramm siehe unten)	
12b	• Rekrutierung: die Anzahl der Teilnehmer, die auf ihre Eignung gescreent werden, sich als geeignet oder nicht geeignet erweisen, nicht in die Studie aufgenommen und in die Studie aufgenommen werden • Zuweisung: die Anzahl der Teilnehmer, die einer Studienbedingung zugewiesen wurden • Allokation und Interventionsexposition: die Anzahl der Teilnehmer, die jeder Studienbedingung zugewiesen werden, und die Anzahl der Teilnehmer, die jede Intervention erhielten • Nachbeobachtung: die Anzahl der Teilnehmer, die das Follow-up abschlossen oder das Follow-up nicht abschlossen (lost to follow-up), aufgeschlüsselt nach Studienbedingungen • Analyse: die Anzahl der Teilnehmer, die in die Hauptanalyse einbezogen oder ausgeschlossen wurden, aufgeschlüsselt nach Studienbedingungen • Beschreibung von Abweichungen vom Prüfplan der Studie unter Angabe von Gründen	Zwischen 10.10.2012 und 30.11.2017 wurden 141 Patienten gescreent, um an ALKA-372-001 teilzunehmen; davon wurden 58 Patienten eingeschlossen. Somit wurden 83 Patienten nicht in die Studie aufgenommen. Die Gründe hierfür waren wie folgt: - Fehlende klinische Eignung (z.B. Hirnmetastasen, abnormale Laborwerte, klinische Verschlechterung) N=14 - Fehlende Eignung aufgrund der molekularen Analyse N=67 - Entschluss des Patienten N=1 - Keine Informationen vorhanden N=1 Von den 58 eingeschlossenen Patienten erhielten 57 Patienten mindestens eine Dosis Entrectinib. In der Studie wurden drei unterschiedliche Dosierungspläne untersucht. Zunächst war geplant, nur Dosierungsplan A zu prüfen, mit dem Protokoll-Amendment Nr. 3 vom 05. Dezember 2013 wurden die Dosierungspläne B und C ergänzt. Mit der Initiierung von Amendment 3 wurden keine weiteren Patienten in den Dosierungsplan A eingeschlossen. Da für einen Patienten eine höhere Dosierung analog zu Dosierungsschema A aufgrund des erwarteten klinischen Nutzens durch den Prüfarzt als sinnvoll erachtet wurde, wurde dieser Patient in den Dosierungsplan C mit einer Dosis von 400 mg/m2 KOF eingeschlossen. Die Patienten wurden in zwei verschiedenen Zentren in Italien rekrutiert. Von den 57 Patienten, die mit Entrectinib behandelt wurden, wurden 19 nach Dosierungsplan A behandelt, 32 nach

Item[a]	**Charakteristikum**	**Studieninformation**
		Dosierungsplan B und 6 nach Dosierungsplan C. Zum Clincal cut-off date (31. Mai 2018) wurden 2 von 58 Patienten (3,4 %) weiterhin mit Entrectinib behandelt.
13	Aufnahme / Rekrutierung	
13a	• Nähere Angaben über den Zeitraum der Studienaufnahme der Probanden / Patienten und der Nachbeobachtung	Die Ergebnisse des Interimsdatenschnitts vom 31.05.2018 beinhalten die Daten vom 26.10.2012 (first patient enrolled) bis zum CCOD am 31.05.2018 für Patienten, die bis zum 30.11.2017 eingeschlossen wurden. **Nachbeobachtung** Es war ein regulärer Follow-Up bis 28 Tage nach Behandlungsende vorgesehen. Bestimmte Ereignisse sollten auch über diesen Zeitraum hinaus beobachtet werden: • Alle SUE mit den Outcomes „not recovered“ oder „unknown“ zum Ende des Berichtszeitraums. • Alle UE, für die ein Kausalzusammenhang mit Entrectinib dokumentiert wurde mit den Outcomes „not recovered“ oder „unknown“ zum Ende des Berichtszeitraums. Diese Ereignisse sollten bis zum endgültigen Auflösen weiterverfolgt werden bzw. bis der Prüfarzt die Ereignisse als „chonisch“ oder „stabil“ bewertet. Weiter sollte jede unerwartete schwerwiegende Nebenwirkung und jeder Todesfall auch nach dem Berichtszeitraum an den Sponsor weitergeleitet werden, wenn dieses/dieser möglicherweise im Zusammenhang mit Entrectinib steht.
13b	• Informationen, warum die Studie endete oder beendet wurde	Die Studie läuft noch

Studiendesign und -methodik für Studie STARTRK-1

Tabelle 4-91 (Anhang): Studiendesign und -methodik für Studie STARTRK-1

Item[a]	**Charakteristikum**	**Studieninformation**
Studienziel		
2	Wissenschaftlicher Hintergrund und Erläuterung der Rationale	Entrectinib ist ein oral bioverfügbarer Inhibitor der Tropomyosin-Rezeptor-Kinasen TRKA (codiert durch das NTRK1), TRKB (codiert durch das NTRK2), TRKC (codiert durch das NTRK3), des ROS Protoonkogen-Tyrosinproteinkinase 1 (ROS1, codiert durch das Gen ROS1) und der anaplastischen Lymphomkinase (ALK, codiert durch das Gen ALK) mit IC_{50}-Werten im niedrigen nanomolaren Bereich. Molekulare Veränderungen dieser Zielstrukturen finden sich bei verschiedenen Tumorarten, darunter nicht-kleinzelliges Lungenkarzinom (NSCLC), Dickdarmkrebs (CRC), papilläres Schilddrüsenkarzinom, Bauchspeicheldrüsenkrebs und Neuroblastom. Genetische Veränderungen können durch Next Generation Sequencing (NGS), quantitative Polymerase-Kettenreaktion (qPCR), Fluoreszenz-in-Situ-Hybridisierung (FISH) und/oder Immunhistochemie (IHC) nachgewiesen werden (Protokoll). Die Erstanwendung am Menschen von Entrectinib fand im Rahmen der Studie ALKA-372-001 mit Durchführung in Italien statt. STARTK-1 ist eine Phase I-Studie, in der die Sicherheit und Wirksamkeit von Entrectinib bei erwachsenen Patienten mit einem lokal fortgeschrittenen oder metastasierten soliden Tumor untersucht wird. Die Studie wurde in zwei Abschnitten durchgeführt. Im Dosiseskalations-Abschnitt sollten die dosis-limitierenden Toxizität (DLT) im ersten Behandlungszyklus, die maximal verträgliche Dosis (MTD) und/oder eine biologisch effektive und empfohlene Phase II-Dosierung (RP2D) bestimmt werden. In diesem Abschnitt wurden vorzugsweise Patienten mit soliden Tumoren, die molekulare Veränderungen in NTRK1/2/3, ROS1 oder ALK aufwiesen, eingeschlossen. Dies war allerdings kein Einschlusskriterium. Im Dosisexpansions-Abschnitt sollte die Antitumoraktivität von Entrectinib bei Patienten, die RP2D erhalten, weiter untersucht werden. In diesem Abschnitt mussten die Patienten bestimmte molekulare Veränderungen in NTRK1/2/3, ROS1 oder ALK haben, die entweder lokal oder zentral identifiziert wurden (Protokoll).

Item[a]	**Charakteristikum**	**Studieninformation**
Methoden		
3	Probanden / Patienten	
3a	• Eignungskriterien für Studienteilnehmer, einschließlich der Kriterien auf verschiedenen Ebenen des Rekrutierungsplans / Plan zur Stichprobennahme (Sampling Plan) (z. B. Städte, Kliniken, Patienten) • Rekrutierungsmethode (z. B. Überweisung, Selbstauswahl) einschließlich der Methode zur Stichprobennahme (Sampling Method), falls ein systematischer Plan zur Stichprobennahme verwendet wurde • Vorgehensweise bei der Rekrutierung • Setting der Datenerhebung und Orte, an denen die Daten erhoben wurden	**Einschlusskriterien:** 1. Bereitschaft und Fähigkeit, eine vom „Institutional Review Board“ (IRB)/von der unabhängigen Ethikkommission genehmigte schriftliche Einverständniserklärung abzugeben. 2. Histologisch oder zytologisch gesicherte Diagnose eines rezidivierten oder refraktären lokal fortgeschrittenen oder metastasierten soliden Tumors, für den keine alternative effektive Standradtherapie verfügbar ist oder der für eine Standardtherapie als nicht geeignet oder intolerant betrachtet wird. **Dosiseskalations-Abschnitt**: Der Fokus liegt auf dem Einschluss von Patienten mit soliden Tumoren, die eine molekulare NTRK1/2/3-, ROS1- oder ALK-Veränderung aufweisen; dies ist jedoch kein Einschlusskriterium. **Dosisexpansions-Abschnitt**: Patienten mit lokal fortgeschrittenen oder metastasierten soliden Tumoren, die folgende molekulare Veränderungen aufweisen: • NTRK-Genumlagerung (Fusionen), die vorher mit anderen TRK Inhibitoren behandelt wurden; • ALK-Genumlagerung mit 1198 Resistenz-SNP • ALK^{ATI} • NTRK/ROS/ALK Überexpression > 6 (via RNA) • Aktivierende Spleißvarianten • Andere molekulare Veränderungen, die aufgrund ihrer biologischen Rationale und nach Diskussion mit dem Sponsor interessant sind. Anmerkung: Wenn bei einer Untergruppe von 6 Patienten mit der gleichen molekularen Veränderung kein Ansprechen erkennbar ist, ist diese molekulare Veränderung nicht länger von klinischem Interesse und der Einschluss in diese Kategorie wird beendet. 3. Analysierbares Tumorgewebe wird für den Dosiseskalations-Abschnitt nicht benötigt, ist aber im Dosisexpansions-Abschnitt gewünscht (falls klinisch möglich). Nur nicht-ZNS-Läsionen können erneut biopsiert werden. Sie dürfen nur ein

		minimales Risiko für den Patienten darstellen (z. B. perkutane Biopsie). 4. Vorhandensein messbarer Tumorläsion/en nach RECIST-Kriterien (Version 1.1, v1.1) 5. Vorangehende Krebstherapien sind erlaubt, einschließlich Crizotinib, Ceritinib und Arzneimittel in der klinischen Erprobung. Zum Behandlungsbeginn müssen vorangehende zytotoxische Chemotherapien seit mindestens 2 bis 4 Wochen beendet sein (mind. 6 Wochen bei Nitrosoharnstoff, Mitomycin C und liposomalem Doxorubicin). Bei fehlender Toxizität müssen 7 Tage nach Abschluss einer nicht-zytotoxischen Chemotherapie vergangen sein. Mindestens 4 Wochen müssen nach Abschluss einer Antikörper-gerichteten Therapie vergangen sein. 6. Nach einer vorhergehender Strahlentherapie müssen mindestens 14 Tage vergangen sein. Zwischen einer Gesamtbestrahlung des Gehirns und dem Beginn der Therapie mit Entrectinib müssen ebenfalls mindestens 14 Tage liegen. Eine stereotaktische Radiochirurgie muss mindestens 7 Tage zurückliegen. 7. Patienten mit asymptomatischer, kontrollierter ZNS-Beteiligung können in die Studie eingeschlossen werden. Die Gabe einer Anfallsprophylaxe/Antikonvulsiva-Therapie ist erlaubt, sofern die Patienten keine Enzym-induzierenden Antiepileptika (nicht-EIAEDs) einnehmen. Bei Patienten, die mit Enzym-induzierenden Antiepileptika (EIAEDs) vorbehandelt sind, müssen diese mindestens 2 Wochen vor Beginn der Therapie mit Entrectinib abgesetzt werden. Wenn Patienten eine anti-konvulsive Therapie benötigen, kann ein CYP3A4 nicht-Enzym-induzierendes Antiepileptikum wie Levetiracetam, Valproinsäure, Gabapentin, Topiramat oder Lacosamid verwendet werden. Erlaubte Antiepilektika sind dem Studienprotokoll zu entnehmen. Moderate Induktoren von CYP3A, CYP3A4 oder CYP3A4/5, wie Dexamethason oder andere Glukokortikoide, können nach Ermessen des Prüfarztes verwendet werden. Die Dosis einer benötigten Kortikosteroidtherapie muss zwei Wochen vor Beginn der Therapie mit Entrectinib stabil oder reduziert (≤ 8 mg/Tag Dexamethason oder Äquivalent) worden sein. 8. Auflösung von allen akuten toxischen Effekten (mit Ausnahme von Alopezie) vorangegangener Krebstherapien, d.h. NCI CTC (Version 4.03) Grad ≤ 1 oder Rückgang der Laborwerte zu den in

		Einschlusskriterium 11 definierten Werten zu Baseline; 9. ECOG Performance Status ≤ 2 10. Erwachsene Patienten (Alter ≥18 Jahre) 11. Lebenserwartung von mindestens drei Monaten; 12 Die Laborwerte zu Baseline müssen folgende Kriterien erfüllen: - Absolute Neutrophilenzahl ≥ 1.500/mm^3 (≥ 1,5 × 10^9/L) - Thrombozyten ≥ 100.000/mm^3 (≥ 100 × 10^9/L) - Hämoglobin > 9,0 g/dL (Transfusionen sind erlaubt) - Serumkreatinin innerhalb normaler Werte - Kreatinin Clearance > 40 mL/min - Gesamtbilirubin im Serum ≤ 1,5 × ULN - AST/ALT ≤ 2,5 × ULN (≤ 5 × ULN bei Lebermetastasen) - ALP ≤ 2.5 × ULN (≤ 5 × ULN bei Leber- und/oder Knochenmetastasen) - Normale Calcium-, Magnesium- und Kalium-Werte oder ≤ CTCAE Grad 1, mit oder ohne Supplementierung - Bei Frauen im gebärfähigen Alter ein negativer Schwangerschaftstest innerhalb von sieben Tagen vor Behandlungsbeginn 13. Frauen im gebärfähigen Alter müssen beim Screening einen negativen Serum-Schwangerschaftstest nachweisen, dürfen nicht stillen oder während der Studie schwanger werden. Frauen im gebärfähigen Alter müssen der Vereinbarung zustimmen, vor Studienbeginn, über die gesamte Studiendauer und 90 Tage nach Beendigung der Studienbehandlung mindestens zwei effektive Verhütungsmethoden anzuwenden (hormonelle Verhütungsmethoden, Barrieremethode zur Verhütung oder Abstinenz). Männer mit Partnerinnen im gebärfähigen Alter haben Vorsicht zu tragen, von Screening bis 90 Tage nach Beendigung der Studienbehandlung kein Kind zu zeugen und entsprechende Verhütungsmethoden (Barrieremethode zur Verhütung, Vasektomie oder Abstinenz) anzuwenden. 14. Fähigkeit, Kapseln mit Entrectinib zu schlucken ohne diese zu öffnen oder zu zerkleinern. 15. Bereitschaft, geplante Visiten, Behandlungsplan, Laboruntersuchungen und andere Untersuchungen durchführen zu lassen. **Ausschlusskriterien:**

		Patienten, die folgende Ausschlusskriterien erfüllen, werden aus STARTRK-1 ausgeschlossen: 1. Aktuelle Teilnahme an einer weiteren klinischen Studie. 2. Vorherige Behandlung mit Entrectinib. 3. Vorherige Krebserkrankung, die eine Behandlung innerhalb der letzten 3 Jahre erforderte (mit Ausnahme von Plattenepithel- oder Basalzellkarzinoma der Haut sowie jedes andere Carcinoma in situ, das vollständig entfernt wurde). 4. Unvollständige Genesung von einer vorangegangenen Operation. 5. Eine der folgenden Erkrankungen während der letzten 6 Monate: Myokardinfarkt, instabile Angina pectoris, Koronararterien-Bypass/peripherer arterieller Bypass, symptomatische Herzinsuffizienz, cerebrovaskulärer Infarkt oder transiente ischämische Attacke, Schlaganfall, symptomatische Bradykardie oder unkontrollierte Arrhythmien mit der Indikation zur medikamentösen Intervention. 6. Krankengeschichte eines nicht pharmakologisch induzierten verlängerten QTc-Intervalls (wiederholtes Auftreten von QTc-Intervall > 450 Millisekunden); 7. Krankengeschichte mit weiteren Risikofaktoren für Torsade de pointes (z.B. Long-QT-Syndrom in der Familiengeschichte). 8. Periphere Neuropathie ≥ Grad 2. 9. Bekannte aktive Infektionen (bakteriell, durch Pilze oder viral inkl. HIV-Infektion); 10. Gastrointestinale Erkrankungen (z.B. Morbus Crohn, Colitis ulcerosa, Kurzdarmsyndrom) oder andere Malabsorptionsstörungen, welche die Absorption von Entrectinib beeinflussen würden. 11. Bekannte interstitielle Lungenerkrankungen, interstitielle Fibrose oder Krankengeschichte einer Tyrosinkinase-Inhibitor-induzierten Pneumonitis. 12. Andere schwerwiegende akute oder chronische medizinische oder psychiatrische Zustände oder Abweichungen in Laborparametern, die das Risiko einer Studienteilnahme oder das Risiko der Einnahme der Studienmedikation erhöhen oder die Beurteilunge der Studiendaten beeinflussen könnten, und welche nach Ansicht des Prüfarztes den Patienten als ungeeignet für die Studie einstufen würden oder welche laut Prüfarzt und/oder Sponsor die Studienziele gefährden würden.

Item[a]	**Charakteristikum**	**Studieninformation**
		Rekrutierung: Sobald die Eignung des Patienten bestätigt wurde, kann der Patient in die Studie eingeschlossen werden. Der Prüfarzt füllt ein Antragsformular zum Studieneinschluss mit allen erforderlichen Informationen aus und übermittelt dieses an den Sponsor. Die Unterschrift des Prüfarztes auf dem Antragsformular zum Studieneinschluss bestätigt, dass der Patienten alle Auswahlkriterien erfüllt und für die Studie geeignet ist. Die Bestätigung für den Studieneinschluss wird dem Prüfarzt innerhalb eines Arbeitstages zugesandt. Nach dem Erhalt dieser Bestätigung, muss die Behandlung innerhalb von 1-3 Tagen initiiert werden. Der Sponsor ist verantwortlich für die Zuweisung des Patienten zur jeweiligen Dosisstufe. Die Studie umfasst zwei Abschnitte: Dosiseskalation und Dosisexpansion. **Datenerhebung und Orte, an denen die Daten erhoben wurden** Die Studie fand bis zum aktuellen Datenschnitt (31.05.2018) in 11 Zentren in 3 Ländern weltweit statt (Spanien, Südkorea, USA).
4	Intervention	
4a	Details der vorgesehenen Interventionen für jede Studiensituation, wie und wann sie verabreicht wurden, und zwar einschließlich: • Inhalt: was wurde gegeben? • Verabreichungsmethode: wie wurde der Inhalt gegeben? • Verabreichungseinheit: wie wurden die Patienten während der Verabreichung eingeteilt? • Verabreicher: wer verabreichte die Intervention? • Umfeld: wo wurde die Intervention verabreicht? • Expositionsmenge und -dauer: wie viele Sitzungen oder Episoden oder Ereignisse sollten verabreicht werden? Wie lange sollten sie dauern? • Zeitspanne: wie lange sollte die Verabreichung der Intervention bei jeder Einheit dauern? • Aktivitäten zur Erhöhung der Compliance oder Adhärenz (z. B. Anreize)	**Studiendauer:** Einschluss des ersten Patienten: 30.07.2014 Zum Datenschnitt vom 31.05.2018 lagen die Daten der Patienten vor, die bis zum 30.11.2017 in die STARTRK-1 eingeschlossen wurden. Bis zum 30.11.2017 wurden noch keine Patienten im Dosisexpansions-Abschnitt eingeschlossen. Die Studie rekrutiert weiter. **Arzneimittelverabreichung und Zeitspanne der Verabreichung** Entrectinib wird in zwei Formulierungen (F1 und F2A) für diese Studie verwendet. Die erste Formulierung (F1) umfasst Kapseln à 50 mg, 100 mg und 200 mg. Die zweite Formulierung (F2A) umfasst Kapseln à 200 mg. Dosiseskalations-Abschnitt: Im Dosiseskalations-Abschnitt wird die entsprechende Menge an Entrectinib in Abhängigkeit von der Körperoberfläche des einzelnen Patienten oder als Fixdosis oral

		verabreicht. Entrectinib wird von den Patienten selbst zu Hause eingenommen. Die Behandlungszyklen jeder Dosierungskohorte sind 28 Tage (Patienten, die zwischen der Protokollversion 2 (26.03.2014) und 4 (08.10.2014) eingeschlossen wurden, hatten einen ersten Behandlungszyklus von 42 Tagen, jeder folgende Behandlungszyklus betrug 28 Tage). Die Dosiseskalation wird fortgeführt bis die Dosis-limitierende Toxizität (DLT) bei 2 von 3 oder 2 von 6 Patienten im ersten Behandlungszyklus beobachtet wurde. Beim Auftreten der DLT bei 2 von 3 Patienten wird der Studieneinschluss in die Kohorte gestoppt. Die DLT wurde definiert als Auftreten eines UE innerhalb des ersten Behandlungszyklus, welches die vorher festgelegten Kriterien von Interesse erfüllt, einen bestimmten Schweregrad hat (im Allgemeinen ≥ Grad 3) und für das ein kausaler Zusammenhang mit Entrectinib nicht ausgeschlossen werden kann. Wenn der Patient sich nicht innerhalb von 28 Tagen nach Auftreten des UE von diesem erholen kann, sind die Kriterien für eine DLT ebenfalls erfüllt. Die Einstufung der DLTs erfolgte gemäß den NCI CTCAE-Kriterien (v4.03). Im Rahmen der Dosiseskalation wurde ein 3+3 Einschlussschema angewendet. Die Startdosis beträgt 100 mg/m2 KOF, einmal täglich. Die Einnahme erfolgt innerhalb von 60 Minuten nach einer Mahlzeit. Die Dosiseskalation begann mit einer beschleunigten Phase, in der die Dosis bei aufeinanderfolgenden Kohorten solange verdoppelt wurde, bis bei einem Patienten eine DLT im ersten Zyklus beobachtet wurde, oder bei 2 Patienten im ersten Zyklus UE auftraten, die zumindest möglicherweise mit Entrectinib in Zusammenhang standen, jedoch nicht als DLTs angesehen wurden. Sobald dieser vorgegebene Toxizitätsgrad erreicht wurde, sollte die Eskalation dem modifizierten Fibonacci-Schema folgen (50%-, 40%-, 33%-Steigerungen). Die maximal verträgliche Dosis (MTD) ist die Dosis, bei der eine DLT während des ersten Behandlungszyklus auftritt bei 0 von 6 oder 1 von 6 Patienten und bei mindestens 2/3 oder 2/6 Patienten in der nächsthöheren Dosisstufe. Eine Dosisreduktion ist bei medikamentenbedingten Toxizitäten zulässig. Alle Dosisreduktionen basieren auf der schwersten Toxizität, die für das mit der

Item[a]	**Charakteristikum**	**Studieninformation**
		Prüfsubstanz in Zusammenhang stehende Ereignis beobachtet wurde. Bei Toxizitäten, die möglicherweise mit Entrectinib in Zusammenhang stehen und die nicht leicht zu behandeln sind und die für den Patienten nicht tolerierbar sind, oder bei UE, die nach Einschätzung des Prüfarztes nicht akzeptabel sind, wird die Behandlung mit der Studienmedikation unterbrochen, bis der Schweregrad des UEs ≤1 ist. Wenn die Studienmedikation unterbrochen wird, sollte bei Wiederaufnahme der Studienmedikation eine Dosisreduktion erfolgen. Eine intraindividuelle Dosisreduktion um eine Dosisstufe und, falls erforderlich, zwei Dosisstufen ist je nach Art und Schwere der Toxizität zulässig. Patienten, bei denen aufgrund der behandlungsbedingten Toxizität mehr als 2 Reduktionen erforderlich sind, können von der Teilnahme an der Studie ausgeschlossen werden. Die Behandlung mit Entrectinib wird für maximal 28 Tage unterbrochen, um eine ausreichende Erholung von jeglicher Toxizität zu ermöglichen, wenn der Patient nach Einschätzung des Prüfarztes noch immer einen klinischen Nutzen hat. Die Bestimmung der RP2D erfolgt auf der Grundlage der verfügbaren Daten zur Sicherheit, Verträglichkeit, PK und PD aus den verschiedenen geprüften Dosisstufen und Schemata. Dosisexpansions-Abschnitt: Alle Patienten im Dosisexpansions-Abschnitt dieser Studie erhalten Entrectinib in der RP2D. Die RP2D wurde als Fixdosis von 600 mg einmal täglich über 28 aufeinander folgende Tage in sich wiederholenden 4-wöchigen Zyklen festgelegt. Wie für den Dosiseskalations-Abschnitt beschrieben, sind Dosisreduktionen im Dosisexpansions-Abschnitt zulässig. **Compliance** Patienten im Dosiseskalations-Abschnitt dokumentieren die tägliche Dosierung in einem papierbasierten Patiententagebuch. Zu jeder Visite bringen die Patienten das Tagebuch zum Studienzentrum mit, wo die Compliance beurteilt wird. Darüber hinaus wurden die Patienten aufgefordert, bei jeder Visite nicht benutze Studienmedikation zurückzugeben. Patienten im Dosisexpansions-Abschnitt sollen bei der Dokumentation der täglichen Dosierung und Compliance wie im Dosiseskalations-Abschnitt vorgehen.

Item[a]	**Charakteristikum**	**Studieninformation**
5	Zielsetzungen	
5a	• Spezifische Studienziele und Hypothesen	**Primäre Studienziele** <u>Dosiseskalations-Abschnitt:</u> Bestimmung der dosis-limitierenden Toxizität (DLT) im ersten Behandlungszyklus, der maximal verträglichen Dosis (MTD) und einer biologisch effektiven und empfohlenen Phase II-Dosierung (RP2D) von Entrectinib in einer oralen Formulierung. • DLTs im ersten Behandlungszyklus • MTD • RP2D <u>Dosisexpansions-Abschnitt:</u> Beurteilunge der Wirksamkeit von Entrectinib anhand der Objektiven Ansprechrate (ORR, objective response rate) definiert als der Anteil aller Patienten mit einem vollständigen (CR) oder partiellen Ansprechen (PR). **Sekundäre Studienziele** <u>Dosiseskalations-Abschnitt:</u> • Erfassung des Sicherheitsprofils von Entrectinib. • Pharmakokinetik von Entrectinib (und seinen potenziellen Metaboliten) im Blutplasma • Erfassung der Antitumor-Aktivität von Entrectinib • Erfassung von Untersuchungsmethoden zum Erkennen von molekularen Veränderungen und die Identifikation von angemessenen analytischen Schwellen-werten und anderen relevanten Biomarker-Parametern, mit denen sich die Antitumor-Aktivität von Entrectinib vorhersagen lässt • Erfassung der Pharmakodynamik von Entrectinib in molekularen Zielen des Tumors und Surrogat-Gewebe <u>Dosisexpansions-Abschnitt:</u> • Erfassung des PFS • OS • Krankheitskontrollrate (Disease Control Rate) • Erfassung der Dauer des Ansprechens (DOR, Duration of response) • Erfassung des intrakraniellen Tumoransprechens bei Patienten mit einer ZNS-Beteiligung • Erfassung des Sicherheitsprofils von Entrectinib. • Erfassung von Untersuchungsmethoden zum Erkennen von molekularen

Item[a]	**Charakteristikum**	**Studieninformation**
		Veränderungen und die Identifikation von angemessenen analytischen Schwellen-werten und anderen relevanten Biomarker-Parametern, mit denen sich die Antitumor-Aktivität von Entrectinib vorhersagen lässt • Erfassung der Pharmakodynamik von Entrectinib in molekularen Zielen des Tumors und Surrogat-Gewebe • Pharmakokinetik von Entrectinib (und seinen potenziellen Metaboliten) im Blutplasma **Hypothesen** Für diese Phase I-Studie wurden keine Hypothesen generiert.
6	Zielkriterien	
6a	• Klar definierte primäre und sekundäre Wirksamkeitsmessgrößen • Methoden zur Datenerhebung und Methoden zur Verbesserung der Qualität von Messungen • Informationen über validierte Instrumente wie z. B. psychometrische und biometrische Eigenschaften von Selbsterhebungsinstrumenten	**Dosislimitierende Toxizität (DLT)** Der primäre Endpunkt ist die DLT im Zyklus 1. Basierend auf der DLT werden die MTD und RP2D hergeleitet. Zur Klassifizierung der DLTs werden die NCI CTCAE v4.03 herangezogen. Eine DLT ist dadurch definiert, dass eines der im Studienprotokoll (S. 12, Table. Dose Limiting Toxicity) aufgeführten Ereignisse innerhalb des ersten Zyklus auftritt und ein kausaler Zusammenhang mit Entrectinib nicht ausgeschlossen werden kann. Für die Auswertung der DLT werden alle Patienten herangezogen, bei denen nach der Einnahme von mindestens einer Dosis Entrectinib eine DLT aufgetreten ist oder bei denen nach mindestens 80% der für den ersten Zyklus geplanten Dosen Entrectinib keine DLT aufgetreten ist. Patienten, die keines dieser Kriterien erfüllen und die Studie vor der vollständigen Erfassung von DLTs beendet haben, werden ersetzt, außer es gibt bereits drei auswertbare Patienten ohne DLTs. **Maximal tolerierte Dosis (MTD)** Die MTD ist definiert als das Dosislevel, bei welchem 0/6 oder 1/6 Patienten im ersten Behandlungszyklus eine DLT und 2/3 oder 2/6 Patienten unter der nächsthöheren Dosierung ebenfalls eine DLT erfahren. Die MTD ist damit die höchste Dosis, bei der weniger als 33% der Patienten im Rahmen des ersten Behandlungszyklus DLTs erfuhren. **Empfohlene Dosis für Phase II (RP2D)** Die RP2D basiert auf allen verfügbaren Daten zu Sicherheit, Toleranz, Pharmakokinetik und Pharmakodynamik

		aller Dosislevel und Dosispläne, die getestet wurden. **Erhebung sekundärer Endpunkte** • Erfassung des Sicherheitsprofils von Entrectinib. Dieses ist charakterisiert durch die Art der UE, Schweregrad nach NCI CTCAE v4.03, Zeitraum und Zusammenhang mit der Studienmedikation, sowie durch EKG und Laborauffälligkeiten im ersten und den folgenden Zyklen. • Pharmakokinetik von Entrectinib (und seinen potenziellen Metaboliten) im Blutplasma gemessen mithilfe der Parameter C_{max}, t_{max}, $t_{1/2}$, AUC_{daily} und AUC_{last} • Das objektive Tumoransprechen wird via RECIST v1.1 bewertet und ist definiert als der Anteil der Patienten mit bestätigtem komplettem Ansprechen (CR, complete response) oder partiellem Ansprechen (PR, partial response) nach RECIST v1.1. Ein bestätigtes Ansprechen ist definiert als Ansprechen, das auf wiederholten Bildgebungen über ≥ 4 Wochen nach der initialen Dokumentation anhält. • PFS ist definiert als die Zeit zwischen erster Dosis Entrectinib bis zu einer Progression oder Tod jeglicher Ursache. Die genauen Zensierungsregeln dieses Endpunkts sind im SAP dargestellt. • OS ist definiert als die Zeit von der ersten Dosis Entrectinib bis zum Datum des Todes aufgrund jeglicher Ursache. Patienten, die im Laufe der Studie nicht versterben, werden zum letzten bekannten Zeitpunkt ihres Lebens zensiert. Zusätzliche Zensierungsregeln werden im SAP dargestellt. • Klinische Benefitrate (CBR, Clinical Benefit Rate) ist der Anteil Patienten, die eines der folgenden Kriterien erfüllen: CR oder PR, Stabile Erkrankung (SD, stable disease) für mindestens 6 Monate (±14 Tage) nach der ersten Dosis Entrectinib, erhoben via RECIST v1.1. • Dauer des Ansprechens (DOR, duration of response) wird nur für Responder gemessen vom Zeitpunkt des ersten objektiven Ansprechens (CR oder PR) bis zur ersten dokumentierten Progression des Tumors oder Datum des Todes durch Progression. Dieser Endpunkt wird nur bei Patienten mit einem Ansprechen erhoben. Die genauen Zensierungsregeln dieses Endpunkts sind im SAP dargestellt. **Erhebung des Tumorstatus**

		Die Bildgebung umfasst einen CT- oder MRT-Scan von Thorax und Abdomen und muss innerhalb von 30 Tagen vor der ersten Einnahme von Entrectinib erfolgen. Aufgrund des häufigen Auftretens von Hirnmetastasen ist bei allen NSCLC-Patienten im Rahmen des Screening eine Bildgebung des Gehirns durchzuführen. Der Tumorstatus wird zu folgenden Zeitpunkten erhoben: Screening, Ende von Zyklus 1, anschließend alle 8 Wochen (d.h. am Ende von Zyklus 3, 5, 7 etc. oder wann immer eine klinische Verschlechterung festgestellt wird) und bei Beendigung der Behandlung (sofern mehr als 4 Wochen seit der letzten Bildgebung vergangen sind). Für jede Bildgebung ist ein Zeitfenster von bis zu 7 Tagen gegeben. Abweichend von den Protokollvorgaben kann jederzeit nach Ermessen des Prüfarztes eine Bildgebung erfolgen. Die zu Beginn gewählte Methode der Bildgebung soll über den gesamten Studienzeitraum beibehalten werden. Bei Patienten mit einem CR oder PR muss die Bestätigung dieses Ansprechens nach mehr als vier Wochen nach dem ersten Feststellen eines Ansprechens erfolgen. Nach der Bestätigung des Ansprechens sind radiologische Bewertungen zum Ende jedes zweiten Zyklus durchzuführen. Patienten mit einer stabilen Erkrankung müssen die Kriterien für ein SD mindestens acht Wochen nach der ersten Einnahme von Entrectinib erfüllen. Das Tumoransprechen soll zum Ende der Behandlung mit Entrectinib noch einmal erfasst werden, sofern mehr als 4 Wochen seit der letzten Bildgebung vergangen sind. Wenn ein Patient die Studie aus einem anderen Grund als Progression abgebrochen hat, soll das Zentrum versuchen, eine Einwilligung des Patienten für ein Fortsetzen der Tumorbewertung alle 8 Wochen einzuholen. Diese sollte bis zur Progression oder dem Start einer neuen Behandlung fortgeführt werden. **Kriterien zur Bewertung des Tumoransprechens** Die Bewertung und Messungen der Tumore erfolgt nach den „Response Evaluation Criteria in Solid Tumors“ (RECIST) in der Version 1.1. Diese publizierten Regeln definieren die Entwicklung von Tumoren bei Krebspatienten im Rahmen einer Behandlung (Ansprechen, Stabilisierung, Progress). RECIST wird als Standardmethode für die Tumormessung und eine objektive Bewertung von Änderungen in der Tumorgröße in klinischen Studien mit

		erwachsenen Krebspatienten verwendet (Eisenhauer 2019). Das Tumoransprechen basiert in der STARTRK-1 auf der Bewertung des Prüfarztes von Zielläsionen, nicht-Zielläsionen und neuen Läsionen gemäß den Kriterien aus Tabelle 1 (für messbare Läsionen) und Tabelle 2 (für nicht-messbare Läsionen) der Publikation zu RECIST v1.1 (Eisenhauer 2019). Die Bestätigung eines CR oder PR erfolgt analog zu den Kriterien aus Tabelle 3 derselben Publikation (Eisenhauer 2019). Es ist nicht mehr als eine fehlende Messung des initialen Ansprechens und der Bestätigung des Ansprechens erlaubt. Bei Patienten, die nicht die Kriterien für ein CR oder PR erreichen, jedoch die Kriterien für eine stabile Erkrankung (SD) mindestens einmal nach 35 oder mehr Tagen nach Start der Behandlung erreichen, wird als bestes Gesamtansprechen SD erfasst. Sind die Kriterien für eine SD erfüllt und ist die minimal erforderliche Zeitdauer nicht erreicht, hängt das Gesamtansprechen des Patienten von den nachfolgenden Bewertungen ab. Gibt es keine nachfolgenden Bewertungen, so ist das beste Ansprechen nicht bewertbar. Auswertbare Patienten ohne valide Bewertungen des Tumoransprechens nach Studienbeginn werden als Non-Responder erfasst. Für Zielläsionen wird die Summe der Durchmesser sowie deren prozentuale Veränderung seit Studienbeginn und seit dem niedrigsten gemessenen Durchmesser berechnet. **Unabhängiges Bewertungsgremium (BICR):** Alle Scans werden an ein unabhängiges Labor für Bildgebung übermittelt. Dort findet die unabhängige Überprüfung des Tumoransprechens und der Krankheitsprogression statt. **Bewertung der Sicherheit und Verträglichkeit** **Unerwünschte Ereignisse (UE)** Von jedem Patienten werden die Daten zu UE gesammelt. Die Fragestellung an den Patienten sollte neutral erfolgen (z.B. Hat sich seit Ihrem letzten Besuch Ihr Gesundheitszustand verändert?). Die Beobachtung von UE startet mit der ersten Einnahme von Entrectinib und wird bis zum telefonischen Follow-Up 30 Tage nach der letzten Einnahme von Entrectinib fortgeführt.

		Alle UE werden bewertet nach Art des UEs, Schweregrad nach NCI CTCAE v4.03, Zeitraum und Zusammenhang mit der Studienmedikation, sowie durch EKG und Laborauffälligkeiten im ersten und den folgenden Zyklen **Klinische Laborergebnisse** Normbereiche werden verwendet, um Werte außerhalb des Normbereichs zu identifizieren. Abweichende Laborergebnisse werden gemäß NCI CTCAE v4.0 bewertet. Es werden beschreibende Statistiken für den jeweils schlechtesten Wert (Häufigkeiten und Prozent auf Basis von Patienten, nicht Ereignissen) nach NCI-CTCAE-Grad für folgende Parameter dargestellt: • Prävalenz der hämatologischen, biochemischen und Gerinnungstoxizität; Dabei wird der letzte verfügbare Wert vor Beginn der Studienmedikation herangezogen. • Inzidenzrate der behandlungsbezogenen der hämatologischen, biochemischen und Gerinnungstoxizität; Patienten mit Beobachtungen nach Beginn der Studienmedikation, die im Einnahmezeitraum der Studienmedikation Toxizitäten berichtet haben. • Veränderung des schlechtesten Grads von hämatologischen, biochemischen und Gerinnungstoxizitäten seit Studienbeginn (Schlechtester Grad unter Studienmedikation abzüglich Wert zu Studienbeginn). • Inzidenzraten behandlungsbezogener niedriger oder erhöhter Laborabweichungen. Zusätzlich werden zusammenfassende Statistiken für Laborwerte und Veränderungen seit Studienbeginn je Visite gezeigt. Für die Darstellung der Veränderung seit Studienbeginn in Kategorien werden, basierend auf Labor Normwerten, Shift-Tabellen gezeigt. Die Inzidenzraten von Toxizitäten mit NCI-CTCAE Grad 3 und 4 werden zusammenfassend je Zyklus für folgende Werte dargestellt: Hämoglobin, Leukozytenzahl, absolute Neutrophilenzahl, absolute Lymphozyten, Thrombozyten und weitere biochemische und Gerinnungsparameter (mit NCI-CTCAE-Grad). Für diese Auswertungen basieren die prozentualen Werte jeweils auf den im Zyklus behandelten Patienten. **„Time to Event“ -Analysen**

Item[a]	**Charakteristikum**	**Studieninformation**
		Für PFS, OS und DOR werden der Median und die 25% und 75% Percentile unter Verwendung der Kaplan-Meier-Methode geschätzt. Die zugehörigen 95% -KI werden je Dosislevel und für die gesamte Analysepopulation dargestellt. Für jeden „Time to Event"-Endpunkt wird die entsprechende Kaplan-Meier-Kurve für das gesamte Analyseset erstellt. **Analyse kategorialer Daten** Kategoriale Endpunkte dieser Studie sind das objektive Tumoransprechen, die objektive Ansprechrate (ORR) und die CBR. Alle kategorialen Daten werden zusammenfassend dargestellt als absolute und relative Häufigkeiten. Als Nenner zur Berechnung der Ansprechraten werden alle Patienten des jeweiligen Analysesets verwendet. Weitere Endpunkte umfassen Elektrokardiogramme, Pharmakokinetik, Pharmakodynamik und Tumormarker.
7	Fallzahl	
7a	• Wie wurden die Fallzahlen bestimmt?	Der **Dosiseskalations-Abschnitt** der Studie ist als Phase I-Studie mit Sicherheit und Verträglichkeit als primäre Zielparameter konzipiert. Es wurde keine Berechnung zur statistischen Power durchgeführt. Für den **Dosisexpansions-Abschnitt** wurden in etwa 50 Patienten angestrebt. Die Dosisexpansion stellt einen nach Signalen suchenden, exploratorischen Studienteil dar, in welchem Patienten eingeschlossen werden mit verschiedenen molekularen Veränderungen in einem der folgenden Gene: NTRK1, NTRK2, NTRK3, ROS1, ALK, NGF, BDNF, NTF3, NTF4 und NGFR. Für jeden einzelnen Typ molekularer Veränderungen werden die Patienten nach einem „Simon's two-stage" (minimax) Design eingeschlossen: In der ersten Stufe werden 6 Patienten eingeschlossen. Wenn kein objektives Ansprechen bei diesen 6 Patienten erkennbar ist, wird diese spezielle molekulare Veränderung nicht weiterverfolgt. Wenn mindestens ein objektives Ansprechen bei den 6 Patienten beobachtet wurde, wird diese Gruppe auf insgesamt 14 Patienten erweitert. Wenn bei diesen 14 Patienten bei mindestens 5 Patienten ein objektives Ansprechen beobachtet wird, ist eine weitere Untersuchung von Entrectinib bei dieser Gruppe gerechtfertigt.

Item[a]	**Charakteristikum**	**Studieninformation**
		Diese Regelung ergibt eine Power von 90%, mit einem einseitigen Alpha von 0,046 die Nullhypothese (Responserate <15%) im Vergleich zu einer alternativen Hypothese (>50%) abzulehnen.
7b	• Falls notwendig, Beschreibung von Zwischenanalysen und Kriterien für einen vorzeitigen Studienabbruch	**Zwischenanalysen** Es waren keine formalen Zwischenanalysen vorab geplant. Der aktuelle CSR zeigt jedoch einen Datenschnitt vor Studienende. Diese Daten wurden im Rahmen einer integrierten Analyse von Entrectinib zur Unterstützung der Zulassung verwendet. **Kriterien für einen vorzeitigen Studienabbruch** Studienabbruch durch den Patienten zu jedem beliebigen Zeitpunkt durch: • Widerruf der Einverständniserklärung • Progression der Erkrankung • Nicht akzeptable Toxizitäten durch Entrectinib • Unerwünschtes Ereignis • Lost-to-Follow-Up • Schwangerschaft • Fehlende Compliance bei der Einnahme der Studienmedikation oder den Studienabläufen. • Protokollverletzungen • Andere Stellt der Prüfarzt im Laufe der Studie fest, dass die sichere Teilnahme eines Patienten an der Studie durch eine Änderung seines medizinischen Status, die nicht mit dem Protokollanforderungen konform ist (z.B. Ein-/Ausschlusskritierien, Schwangerschaft), nicht länger möglich ist, so muss dieser Patient die Studienbehandlung beenden. Eine vorzeitige Beendigung der Studie kann durch Behörden, IRB/IEC, Sicherheitsprobleme oder durch eine Entscheidung des Sponsors erfolgen.
8	Zuweisungsmethode • Zuweisungseinheit (die Einheit, die der Studienbedingung zugewiesen wird, wie z. B. Person, Gruppe, Gemeinde) • Methode der Zuweisung von Einheiten zu Studienbedingungen, einschließlich Details über etwaige Restriktion (z. B. Blockbildung, Stratifikation, Minimierung) • Einbeziehung von Aspekten, um potenzielle Verzerrung durch Nichtrandomisierung zu minimieren (z. B. Matching)	**Zuweisung** Nicht zutreffend. Es handelt sich um eine einarmige Phase I-Studie.
9	Verblindung	
9a	• Waren a) die Probanden / Patienten und / oder b) diejenigen, die die Intervention / Behandlung durchführten, und / oder c) diejenigen, die die Zielgrößen beurteilten, verblindet oder nicht	**Verblindung** Nicht zutreffend. Es handelt sich um ein offenes Studiendesign.

Item[a]	**Charakteristikum**	**Studieninformation**
	verblindet, wie wurde die Verblindung vorgenommen?	
10	Analyseeinheit • Bezeichnung der kleinsten Einheit, die analysiert wird, um Wirkungen der Intervention zu beurteilen (z. B. Person, Gruppe, Gemeinde) • Wenn sich die Analyseneinheit von der Zuweisungseinheit unterscheidet, ist die verwendete Analysenmethode anzugeben, die dies berücksichtigt (z. B. Adjustierung der Standardfehlerschätzungen um den Designeffekt oder durch Verwendung einer Multilevel-Analyse)	Die Analysen wurden für jede getestete Dosierung und Formulierung (100 mg/m2 KOF [F1], 200 mg/m2 KOF [F1], 400 mg/m2 KOF [F1], 800 mg [F1], 600-800 mg [BSA F1], 600 mg [F1], 600 mg [F2A]) durchgeführt.
11	Statistische Methoden	
11a	• Statistische Methoden zur Bewertung der primären und sekundären Zielkriterien einschließlich komplexer Methoden für korrelierte Daten	**Grundsätzliche statistische Annahmen** Alle Variablen werden je Dosierung mithilfe deskriptiver Statistik dargestellt. Für metrische Daten werden Anzahl, Anzahl fehlender Werte, Mittelwert, Standardabweichung, Minimum, Quartile, Median und Maximum berechnet. Für kategoriale Daten werden Häufigkeitstabellen erstellt mit den absoluten und relativen Werten jeder Kategorie. Zur Berechnung von Prozenten wird die Patientenzahl des jeweils angewendeten Analysesets als Nenner verwendet. Wenn es mindestens einen fehlenden Wert in der jeweiligen Behandlungsgruppe gibt, wird die Kategorie „Missing“ gezeigt. Der Baseline-Wert ist definiert als der letzte beobachtete Wert vor Beginn der Studienbehandlung. Allgemein (falls nicht anders im Protokoll definiert) werden Werte, die an Tag 1 im Zyklus 1 erhoben wurden als „vor Beginn der Studienbehandlung“ betrachtet. Zeitspannen (in Tagen) werden als „Enddatum – Startdatum + 1“ berechnet. Solang nicht anders definiert werden alle Zeitspannen von Baseline-Daten, Patientenhistorie und Wirksamkeitsdaten in Monaten angegeben. Um Zeitspannen von Tagen auf Monate umzurechnen, wird die Anzahl der Tage durch 30,4375 geteilt. In dieser Studie wird kein formaler Test auf Signifikanz durchgeführt. Für ausgewählte Wirksamkeitsparameter (z.B. Objektive Ansprechrate) werden, wenn möglich, 95%-KI berechnet.
11b	• Verwendete statistische Methoden für zusätzliche Analysen, wie z. B. Subgruppenanalysen und adjustierte Analysen • Methoden zur Imputation fehlender Daten • Falls verwendet: Verwendete statistische Software oder Programme	Für die STRTRK-1 waren keine Subgruppenanalysen geplant. **Fehlende Daten**

Item[a]	**Charakteristikum**	**Studieninformation**
		Soweit nicht anders vermerkt, werden fehlende Daten nicht imputiert, außer für teilweise fehlende Datumsangaben. Unvollständige Datumsangaben für UE und Begleitmedikation werden wie folgt gehandhabt: • Wenn das Startdatum vollständig fehlt oder der Beginn im gleichen Jahr ist (wenn nur das Startjahr verfügbar ist) oder der Beginn des UE im gleichen Monat oder Jahr (falls der Tag fehlt) des Behandlungsstarts liegt, wird das Startdatum des UEs durch Start der Behandlung und Abklingdatum des UEs ersetzt, je nachdem welches den früheren Zeitpunkt darstellt. • In allen anderen Fällen wird ein fehlender Tag oder Monate mit einer 1 ersetzt. • Unvollständige Enddaten werden durch den letzten Tag des Monats ersetzt (falls nur der Tag fehlt), solange das Enddatum nicht später als der Todeszeitpunkt des Patienten ist. In diesem Fall wird der Todeszeitpunkt als Enddatum imputiert. • In allen anderen Fällen wird das Enddatum nicht imputiert. Unvollständige oder fehlende Datumsangaben zur Studienbehandlung werden wie folgt gehandhabt: • Wenn das Startdatum vollständig fehlt wurde angenommen, dass die erste Einnahme von Entrectinib zum Datum der ersten messbaren PK-Konzentration erfolgte. Wenn keine Daten zur PK-Konzentration verfügbar sind, wird das Entsorgungsdatum der Studienmedikation als Startdatum von Entrectinib verwendet. • Wenn das Enddatum der Behandlung fehlt oder unvollständig ist, wird das Enddatum des eCRFs zum Behandlungsende verwendet. Ist hier kein vollständiges Datum dokumentiert, wurde das Enddatum über das letzte Entsorgungsdatum und der letzten PK-Konzentration hergeleitet. Für die Imputation von fehlenden Angaben des Starts von Folgetherapien / Krankheitsverläufen wird der 15. des Monats eingesetzt, falls Jahr und Monat angegeben sind. In allen anderen Fällen von fehlenden oder unvollständigen Daten wird nicht imputiert, sofern nicht anders angegeben.
Resultate		

Item[a]	**Charakteristikum**	**Studieninformation**
12	Patientenfluss	
12a	• Patientenfluss durch jede Studienphase: Rekrutierung, Zuweisung, Allokation und Interventionsexposition, Nachbeobachtung, Analyse (Diagramm siehe unten)	
12b	• Rekrutierung: die Anzahl der Teilnehmer, die auf ihre Eignung gescreent werden, sich als geeignet oder nicht geeignet erweisen, nicht in die Studie aufgenommen und in die Studie aufgenommen werden • Zuweisung: die Anzahl der Teilnehmer, die einer Studienbedingung zugewiesen wurden • Allokation und Interventionsexposition: die Anzahl der Teilnehmer, die jeder Studienbedingung zugewiesen werden, und die Anzahl der Teilnehmer, die jede Intervention erhielten • Nachbeobachtung: die Anzahl der Teilnehmer, die das Follow-up abschlossen oder das Follow-up nicht abschlossen (lost to follow-up), aufgeschlüsselt nach Studienbedingungen • Analyse: die Anzahl der Teilnehmer, die in die Hauptanalyse einbezogen oder ausgeschlossen wurden, aufgeschlüsselt nach Studienbedingungen • Beschreibung von Abweichungen vom Prüfplan der Studie unter Angabe von Gründen	Es wurden 93 Patienten gescreent, um an der STARTRK-1 teilzunehmen. Während der Screeningphase wurden 17 Patienten als nicht geeignet identifiziert. 76 Patienten wurden eingeschlossen und mit Entrectinib behandelt (erhielten mindestens eine Dosis). Alle Patienten, die in die Dosis-Gruppen 100, 200, und 400 mg/m2 KOF, 800 mg und 600-800 mg (nach BSA) eingeschlossen wurden, brachen die Studienbehandlung ab. In den Gruppen 600 mg [F1] und 600 mg [F2A] brachen 85,0% bzw. 95,5% die Einnahme der Studienmedikation ab. Der Großteil der Patienten (63,2%) beendete die Studienmedikation aufgrund einer Progression der Erkrankung. Weitere Gründe waren: UE, Tod, Entscheidung des Patienten und klinische Progression oder die Entscheidung des Arztes. Grund für den Abbruch der Studie war bei einem Großteil der Patienten der Beginn einer neuen Anti-Neoplastischen Therapie (34,2%), Tod (22,4%) oder Abbruch auf Wunsch des Patienten (25,0%). Die Patienten wurden in 11 verschiedenen Zentren in 3 verschiedenen Ländern rekrutiert (Südkorea, Spanien, USA). Von den 76 Patienten, die mit Entrectinib im Rahmen des Dosiseskalations-Abschnitts behandelt wurden, wurden 5 in die 100 mg/m2 KOF [F1]-Population, 5 in die 200 mg/m2 KOF [F1]-Population, 10 in die 400 mg/m2 KOF [F1]-Population, 9 in die 800 mg [F1]]-Population, 5 in die 600-800 mg [BSA F1]]-Population, 22 in die 600 mg [F1]]-Population und 20 in die 600 mg [F2A]]-Population eingeschlossen. Zum Clincal cut-off date (31.05.2018) erhielten insgesamt 4 Patienten die Studienmedikation (600 mg [F1]: n=1; 600 mg [F2A]: n=3).
13	Aufnahme / Rekrutierung	
13a	• Nähere Angaben über den Zeitraum der Studienaufnahme der Probanden / Patienten und der Nachbeobachtung	Die Ergebnisse des Interimsdatenschnitts vom 31.05.2018 beinhalten die Daten vom 16.11.2015 (first patient enrolled) bis zum Datenschnitt am 31.05.2018 für Patienten, die bis zum 30.11.2017 eingeschlossen wurden.

Item[a]	**Charakteristikum**	**Studieninformation**
		Nachbeobachtung Die Zentren sollen jeden Patienten etwa 30 Tage nach der letzten Einnahme von Entrectinib telefonisch kontaktieren. Ziel dieses Safety-Follow-up ist die Nachverfolgung von bestehenden UE sowie die Erfassung neuer behandlungsbezogener UE, neuer Medikationen oder Änderungen der bestehenden Medikation seit der letzten Erhebung. Alle neuen Informationen aus diesem Follow-up-Telefonat müssen im CRF entsprechend dokumentiert werden. Zusätzlich soll jeder Patient nach Studienabbruch in einem dreimonatigen Rhythmus bis zum Tod, Loss-to-Follow-Up, Start einer neuen Krebstherapie oder Rücknahme der Einverständniserklärung telefonisch kontaktiert werden, um Progression und Überlebensstatus zu erfassen.
13b	• Informationen, warum die Studie endete oder beendet wurde	Nicht zu treffend. Studie läuft.
a: nach TREND 2004.		

Stellen Sie für jede Studie den Patientenfluss in einem Flow-Chart gemäß CONSORT dar.

Studiendesign und -methodik für Studie STARTRK-NG

Tabelle 4-92 (Anhang): Studiendesign und -methodik für Studie STARTRK-NG

Item[a]	**Charakteristikum**	**Studieninformation**
Studienziel		
2	Wissenschaftlicher Hintergrund und Erläuterung der Rationale	Aktivierte Rezeptortyrosin-Kinasen (RTKs) wie die Rezeptoren der TRK-Familie (TRKA [codiert durch das Gen NTRK1], TRKB [codiert durch das Gen NTRK2] und TRKC [codiert durch das Gen NTRK3]) spielen eine zentrale Rolle bei der Entstehung vieler Tumore im Kindes- und Erwachsenenalter. TRKB wird zusammen mit seinem Liganden „Gehirn-Derived Neurotrophic Factor“ (BDNF) exprimiert. Dieser autokrine Signalweg führt zu Invasion, Angiogenese und Arzneimittelresistenz. Mutationen in oder Translokationen mit TRK-Genen wurden beim Neuroblastomen nicht gefunden. Jedoch besteht bei 50-60 % der Hochrisiko-Neuroblastome eine autokrine Aktivierung des TRKB/BDNF-Signalwegs, was diesen zu einem der attraktivsten Ziele für biologische Tumortherapiestrategien macht. Das Blockieren von TRKB führt zu Apoptose und einer erhöhten Empfindlichkeit gegenüber Chemotherapie. Darüber hinaus weisen viele weitere Krebserkrankungen bei Kindern und Erwachsenen, einschließlich Medulloblastome, gliale Tumore und Sarkome, Fusionen (Umlagerungen) oder eine aberrante Expression der NTRK-Gene auf. TRKB scheint ein besonders vielversprechender Ansatzpunkt in der Krebstherapie zu sein, da dieser Rezeptor bei Tumoren besonders häufig aktiviert ist. Jedoch kann sich von Tumortyp zu Tumortyp unterscheiden, welche Mitglieder der TRK-Familie jeweils aktiviert sind. Daher wäre ein pan-TRK-Inhibitor, d.h. ein Inhibitor aller Mitglieder der TRK-Familie, für viele unterschiedliche Krebserkrankungen bei Kindern und Erwachsenen von Nutzen (Protokoll). Entrectinib ist ein potenter Inhibitor von TRKA, TRKB, TRKC, ROS1 (codiert durch das Gen ROS1) und ALK (codiert durch das Gen ALK). Die Studie STARTK-NG ist eine fünfteilige Dosiseskalationsstudie mit pädiatrischen Patienten mit rezidivierten oder refraktären soliden Tumoren und primären ZNS-Tumoren mit oder ohne TRK-, ROS1- oder ALK-Fusionen (Protokoll).
Methoden		
3	Probanden / Patienten	
3a	• Eignungskriterien für Studienteilnehmer, einschließlich der Kriterien auf verschiedenen Ebenen des Rekrutierungsplans / Plan zur Stichprobennahme (Sampling Plan) (z. B. Städte, Kliniken, Patienten) • Rekrutierungsmethode (z. B. Überweisung, Selbstauswahl) einschließlich der Methode zur Stichprobennahme (Sampling	**Einschlusskriterien:** Jeder Patient muss alle der folgenden Einschlusskriterien erfüllen, um für die Studienteilnahme zugelassen zu werden: 1. Schriftliche Einwilligungserklärung: Eine unterschriebene Einwilligungserklärung und/oder Zustimmung zur Studienteilnahme wird gemäß den institutionellen Richtlinien eingeholt 2. Fähigkeit, Kapseln zu schlucken *Hinweis: In Phase Ib können Patienten ≥ 2 Jahre und < 22 Jahre, die keine Kapseln schlucken können, sowie*

	Method), falls ein systematischer Plan zur Stichprobennahme verwendet wurde • Vorgehensweise bei der Rekrutierung • Setting der Datenerhebung und Orte, an denen die Daten erhoben wurden	*alle Patienten, die ansonsten alle anderen Zulassungskriterien erfüllen, nach Absprache mit dem Sponsor in Teil E aufgenommen werden, in dem Entrectinib über alternative Dosierungstechniken verabreicht wird* 3. Körperoberfläche (BSA, body surface area): Die Patienten in den Teilen A, B, C und D müssen zum Zeitpunkt der Studienaufnahme eine Körperoberfläche von ≥ 0,45 m2 KOF haben 4. Krankheitsstatus: Teil A und D: Patienten müssen eine messbare oder auswertbare Krankheit, wie in Anlage 5 definiert [RECIST v1.1, Protokoll], haben Teil B: Patienten müssen messbare oder auswertbare Krankheiten, wie in Anlage 6 definiert [RANO, Protokoll], haben Teil C: Patienten müssen eine messbare oder auswertbare Krankheit haben, wie in Anlage 5 definiert [RECIST v1.1 ± Curie Scale, Protokoll] Teil E: Patienten müssen eine messbare oder auswertbare Krankheit haben und werden gemäß Tumortyp, wie in Anhang 5 [RECIST v1.1 ± Curie Scale, Protokoll] oder Anhang 6 [RANO, Protokoll] definiert, bewertet 5. Tumortyp (Nachweis der Molekülveränderungen durch ein „Clinical Laboratory Improvement Amendments“ (CLIA)-zertifiziertes oder gleichwertig akkreditiertes diagnostisches Labor): **Teil A:** Rezidivierte oder refraktäre extrakranielle solide Tumore **Teil A (Expansion):** Rezidivierte oder refraktäre extrakranielle solide Tumore, die keine Neuroblastome sind, mit NTRK1/2/3-, ROS1- oder ALK-Molekülveränderungen, die keine Genfusionen sind **Teil B:** Rezidivierte oder refraktäre primäre Gehirntumore mit NTRK1/2/3-, ROS1- oder ALK-Molekülveränderungen, einschließlich Genfusionen; Genfusionen sind definiert als diejenigen Molekülveränderungen, die zur Expression eines Fusionsproteins mit einer funktionellen TRKA/B/C-, ROS1- oder ALK-Kinase-Domäne führen, ohne dass gleichzeitig eine zweite Treibermutation (z. B. EGFR, KRAS) vorliegt, bestimmt durch eine beliebige Nukleinsäure-basierte diagnostische Testmethode, z. B. NGS, Sanger, RT-PCR, NanoString, EdgeSeq. **Teil C:** Rezidivierte oder refraktäre Neuroblastome **Teil D**: Rezidivierte oder refraktäre extrakranielle solide Tumore, die keine Neuroblastome sind, mit NTRK1/2/3-, ROS1- oder ALK-Genfusionen; Genfusionen sind definiert als diejenigen Molekülveränderungen, die zur Expression eines Fusionsproteins mit einer funktionellen TRKA/B/C-, ROS1- oder ALK-Kinase-Domäne führen, ohne dass gleichzeitig eine zweite Treibermutation (z. B. EGFR, KRAS) vorliegt, bestimmt durch eine beliebige Nukleinsäure-basierte diagnostische Testmethode, z. B. NGS, Sanger, RT-PCR, NanoString, EdgeSeq. **Teil E**: Jeder Patient, der für die Teile A (Expansion), B, C oder D geeignet ist (Alter ≥ 2 Jahre und < 22 Jahre)

		und keine Kapseln schlucken kann, sowie alle Patienten < 2 Jahre. 6. Histologische/molekulare Diagnostik der Malignität bei Erstdiagnose oder zum Zeitpunkt des Rezidivs 7. Archiviertes Tumorgewebe, das bei Erstdiagnose oder vorzugsweise zum Zeitpunkt des Rezidivs entnommen wurde 8. Alter: männlich oder weiblich ≥ 2 Jahre und < 22 Jahre; Patienten < 2 Jahre können in Teil E aufgenommen werden (alternative Dosierungstechniken) 9. Leistungsstatus: Lansky- oder Karnofsky-Score ≥ 60 % und voraussichtliche verbleibende Lebensdauer von mindestens 4 Wochen *Hinweis: Neurologische Defizite bei Patienten mit ZNS-Tumoren müssen mindestens 7 Tage vor Einschluss in die Studie relativ stabil gewesen sein. Patienten, die aufgrund von Lähmungen nicht gehen können, aber im Rollstuhl sitzen, werden zum Zweck der Leistungsbewertung als gehfähig betrachtet.* 10. Vorangehende Therapie: Rezidivierter oder refraktärer Tumor nach einer kurativen Erstlinientherapie, oder fehlende Verfügbarkeit anderer potenziell kurativer Therapiemöglichkeiten. Die Patienten müssen sich vor der Aufnahme in die Studie von den akuten toxischen Wirkungen aller vorheriger Chemotherapien, Immuntherapien oder Strahlentherapien erholt haben. a. <u>Zytotoxische Chemotherapie oder andere Krebsmedikamente, die bekanntermaßen myelosuppressiv wirken:</u> • ≥ 21 Tage nach der letzten Gabe einer zytotoxischen oder myelosuppressiven Chemotherapie (42 Tage, falls vorher Nitrosoharnstoffe verabreicht wurde). b. <u>Krebsmedikamente, ohne bekannte myelosuppressive Wirkung (z. B. nicht mit einer reduzierten Thrombozytenzahl oder reduzierten absoluten Zahl neutrophiler Granulozyten (ANC, absolute neutrophil count) assoziiert):</u> • ≥ 7 Tage nach der letzten Gabe des Medikaments. c. <u>Antikörper</u>: • ≥ 21 Tage nach der letzten Gabe. d. <u>Hämatopoetische Wachstumsfaktoren</u>: • ≥ 14 Tage nach der letzten Gabe eines langwirksamen Wachstumsfaktors (z. B. Neulasta) oder 7 Tage nach der letzten Gabe eines kurzwirksamen Wachstumsfaktors. e. <u>Stammzellinfusionen (mit oder ohne Ganzkörperbestrahlung (TBI, total body irradiation):</u> • Allogene (nicht-autologe) Knochenmark- oder Stammzelltransplantation oder jegliche Stammzellinfusion einschließlich Spenderlymphozyteninfusion (donor lymphocyte infusion, DLI) oder Boost-Infusion: ≥ 84 Tage nach der Infusion und kein Nachweis

von Spender-gegen-Wirt-Krankheit (graft-versus-host-disease, GVHD).

- Autologe Stammzellinfusion einschließlich Boost-Infusion: ≥ 42 Tage.

f. Zelltherapie: ≥ 42 Tage nach Abschluss einer beliebigen Art von Zelltherapie (z. B. modifizierte T-Zellen, NK-Zellen, dendritische Zellen usw.)

g. XRT/perkutane Bestrahlung: ≥ 14 Tage nach lokaler XRT (kleiner Port); ≥ 150 Tage nach TBI, kraniospinaler XRT oder bei Bestrahlung ≥ 50 % des Beckens; ≥ 42 Tage, wenn andere starke Bestrahlung des Knochenmarks.

h. Radiandereapeutika (z. B. radiomarkierter Antikörper, 131I-MIBG): ≥ 42 Tage nach systemisch verabreichten Radiandereapeutika.

11. Organfunktion

Adäquate Knochenmarkfunktion:

Teil A (alle), B (alle), C (unbekannt oder ohne dokumentierte Tumorinfiltration des Knochenmarks bei der Aufnahme) und D (alle):

- ANC ≥ 1.000/µl;
- Thrombozytenzahl ≥ 75.000/µl (ohne Transfusion);
- Hämoglobin ≥ 8 g/dl („Common Toxicity Criteria Adverse Event" (CTCAE)-Term Anämie, Transfusion zulässig)

Teil C (mit dokumentierter Tumorinfiltration des Knochenmarks bei der Aufnahme)

- ANC ≥ 750/µl;
- Keine bekannte Unverträglichkeit von Thrombozyten-Transfusionen
- Hämoglobin ≥ 8 g/dl (CTCAE-Term Anämie, Transfusion zulässig)

Adäquate Leberfunktion:

- ALT < 3 × obere Normwertgrenze (ULN, upper limit of normal; ULN für Protokoll: 45 U/l);
- Bilirubin < 1,5 × ULN

Adäquate Nierenfunktion:

- Serumkreatinin normal für Alter und Geschlecht:

Alter (in Jahren)	Maximum Serumkreatinin (mg/dl)	
	männlich	weiblich
2 bis < 6	0,8	0,8
6 bis < 10	1,0	1,0
10 bis < 13	1,2	1,2
13 bis < 16	1,5	1,4
> 16	1,7	1,4

Die Grenzwerte für Kreatinin in dieser Tabelle wurden von der Schwartz-Formel zur Schätzung der GFR abgeleitet [Schwartz GJ. J Pediatr 106:522-6, 1985

		utilizing child length and stature data published by the Centers for Disease Control and Prevention (CDC).] Adäquate Herzfunktion: • EKG mit QTc ≤ 480 ms Adäquate neurologische Funktion: • Periphere motorische oder sensorische Neuropathie Grad ≤ 2, sofern kein Zusammenhang mit dem Tumor oder voroperativen Eingriffen besteht 12. Frauen im gebärfähigen Alter müssen innerhalb von 14 Tagen vor der ersten Entrectinib-Dosis einen negativen Serum-Schwangerschaftstest nachweisen und dürfen während der Studienteilnahme weder stillen noch beabsichtigen, schwanger zu werden. Frauen und Männer mit Partnern im gebärfähigen Alter müssen zustimmen, während der Studie eine Schwangerschaft zu vermeiden. Darüber hinaus müssen sie der Verwendung von mindestens zwei wirksamen Verhütungsmethoden (hormonelle Methode, Barrieremethode zur Empfängnisverhütung oder Abstinenz) vor Eintritt in die Studie, für die Dauer der Studie und in den 90 Tagen nach dem Ende der Behandlung mit der Studienmedikation zustimmen. 13. Bereitschaft und Fähigkeit, geplante Visiten, Behandlungsplan, Laboruntersuchungen und andere Untersuchungsverfahren einzuhalten bzw. durchführen zu lassen **Ausschlusskriterien:** Patienten, die folgende Einschlusskriterien erfüllen, werden aus STARTRK-NG ausgeschlossen: 1. Aktuelle Teilnahme an einer weiteren klinischen Studie 2. Bekanntes angeborenes Long-QT-Syndrom 3. Bekannte aktive Infektionen (Bakterien, Pilze oder Viren) 4. Erhalt von Enzym-induzierenden Antiepileptika (EIAEDs) während der letzten 14 Tage (siehe Abschnitt 6.1.7.2, Tabelle 6, Protokoll) 5. Alle Patienten der Phase Ib: Vortherapie mit einem zugelassenen oder in der klinischen Prüfung befindlichen TRK-, ROS1- oder ALK-Inhibitor 6. Nur Teil C: Patienten mit Neuroblastom ausschließlicher Erkrankung des Knochenmarkraums 7. Unvollständige Genesung von den akuten Auswirkungen einer Operation vor der Behandlung 8. Aktive gastrointestinale Krankheit (z. B. Morbus Crohn, Colitis Ulcerosa oder Kurzdarm-Syndrom) oder andere Malabsorptionssyndrome, die die Arzneimittelresorption beeinflussen könnten 9. Andere schwerwiegende akute oder chronische medizinische oder psychiatrische Zustände oder Abweichungen in Laborparametern, die das Risiko einer Studienteilnahme oder das Risiko der Einnahme der Studienmedikation erhöhen oder die Beurteilunge der Studiendaten beeinflussen könnten und welche nach Ansicht des Prüfarztes den Patienten als ungeeignet für

		die Studie einstufen würden oder welche laut Prüfarzt und/oder Sponsor die Studienziele gefährden würden. **Rekrutierung:** Screening: Es gibt einen Screening-Zeitraum von bis zu 14 Tagen, um die Eignung der Patienten anhand der definierten Einschluss- und Ausschlusskriterien der Studie zu bewerten. Folgendes muss vor der Aufnahme der Patienten in die Studie abgeschlossen sein: • Die zustimmende Bewertung durch das „Institutional Review Board“ (IRB)/die unabhängige Ethikkommission muss vor der Aufnahme der Patienten eingeholt werden • Die Einverständniserklärung muss vor der Aufnahme eingeholt werden • Die Beurteilunge des Krankheitsstatus zu Baseline muss innerhalb von 14 Tagen vor der Aufnahme erfolgen • Untersuchungen, die im Rahmen der Standardversorgung vor der Einwilligungserklärung durchgeführt wurden UND die obigen Anforderungen erfüllen, können für das Screening herangezogen werden und müssen nicht wiederholt werden. • Der verantwortliche Prüfarzt muss die ausgefüllte Checkliste zur Eignung des Patienten unterschreiben und datieren • Die Dosierung wird zum Zeitpunkt der Aufnahme zugewiesen. • Die Patienten müssen mit der Therapie gemäß Protokoll innerhalb von 5 Kalendertagen nach der Aufnahme beginnen. **Datenerhebung und Orte, an denen die Daten erhoben wurden** Die Studie findet in 8 Zentren in den USA statt
4	Intervention	
4a	Details der vorgesehenen Interventionen für jede Studiensituation, wie und wann sie verabreicht wurden, und zwar einschließlich: • Inhalt: was wurde gegeben? • Verabreichungsmethode: wie wurde der Inhalt gegeben? • Verabreichungseinheit: wie wurden die Patienten während der Verabreichung eingeteilt? • Verabreicher: wer verabreichte die Intervention? • Umfeld: wo wurde die Intervention verabreicht? • Expositionsmenge und -dauer: wie viele Sitzungen oder Episoden oder Ereignisse sollten verabreicht werden? Wie lange sollten sie dauern?	**Studiendauer** Einschluss des ersten Patienten: 02.05.2016 Zum Datenschnitt vom 31.05.2018 lagen die Daten der Patienten vor, die bis zum 30.11.2017 in STARTRK-NG Phase I/II eingeschlossen wurden. Die Studie rekrutiert weiter. **Studiendesign** Es handelt sich um eine fünfteilige, multizentrische, offene Phase I/II-Dosiseskalationsstudie mit pädiatrischen Patienten mit rezidivierten oder refraktären extrakraniellen soliden Tumoren (Phase I; Teil A), mit zusätzlichen Expansions-Kohorten (Phase Ib) bei Patienten mit primärem Gehirntumoren mit NTRK1/2/3-, ROS1- oder ALK- Molekülveränderungen (Teil B), Neuroblastomen (Teil C) und anderen extrakraniellen soliden Tumoren, die keine Neuroblastome sind, mit NTRK1/2/3-, ROS1- oder ALK- Genfusionen (Teil D).

	• Zeitspanne: wie lange sollte die Verabreichung der Intervention bei jeder Einheit dauern? • Aktivitäten zur Erhöhung der Compliance oder Adhärenz (z. B. Anreize)	Darüber hinaus werden in einer explorativen Kohorte (Teil E) Patienten eingeschlossen, die ansonsten geeignet sind, aber keine Kapseln schlucken können. **Arzneimittelverabreichung und Zeitspanne der Verabreichung** **Phase I Teil A** (Dosiseskalation) bestimmt die maximal verträgliche Dosis (MTD, maximum tolerated dose) oder die empfohlene Phase 2 Dosis (RP2D, recommended phase 2 dose), die Pharmakokinetik (PK) und das Sicherheitsprofil von Entrectinib bei Kindern und Jugendlichen mit rezidivierten oder refraktären extrakraniellen soliden Tumoren. Entrectinib wird einmal täglich in wiederholten 4-Wochen-Zyklen oral mit der Nahrung verabreicht. Die Anfangsdosis in Teil A beträgt 250 mg/m2 KOF (ca. 63 % des auf der Körperoberfläche (BSA) basierenden RP2D-Wertes für Erwachsene von 400 mg/m2 KOF) in einer kontinuierlichen Dosierung. Es werden bis zu vier Dosisstufen bewertet. Bei einzelnen Teilnehmern sind bis zu 2 Dosisreduktionen aufgrund behandlungsassoziierte Toxizität zulässig. Während der Dosissteigerung wird ein „3 + 3“ Rekrutierungsschema durchgeführt. Die RP2D wird aus der dosislimitierenden Toxizität (DLT, dose-limiting toxicity) ermittelt, die aus klinischen Beobachtungen und Laborbemessungen im ersten Behandlungszyklus (28 Tage) stammt. Die Patienten können hinsichtlich des primären Endpunkts in Teil A bewertet werden, wenn sie das Arzneimittel aufgrund von Toxizität während Zyklus 1 abbrechen oder zu irgendeinem Zeitpunkt während Zyklus 1 DLT auftritt. Patienten, bei denen keine DLT auftritt, gelten als auswertbar hinsichtlich Toxizität, wenn sie mindestens 75 % der verordneten Dosis während Zyklus 1 (≥ 21 von 28 Dosen) erhalten haben. Patienten, die die Behandlung mit Entrectinib aufgrund einer progressiven Erkrankung (PD, progressive disease) oder aus anderen Gründen, die nicht mit der Toxizität zusammenhängen, absetzen, werden ersetzt, wenn sie im Zyklus 1 nicht 75 % der verordneten Dosis erhalten haben. Die Patienten erhalten zusätzliche Zyklen von Entrectinib, vorausgesetzt die Toxizität aus dem vorherigen Zyklus kann auf Grad ≤ 2 heruntergestuft werden und es gibt keinen Hinweis auf eine Krankheitsprogression. Die RP2D basiert auf einer Gesamtbeurteilunge von Entrectinib aus Teil A. Diese Beurteilunge umfasst das Sicherheitsprofil, das PK-Profil und alle klinischen Nachweise für die Wirksamkeit. Die RP2D kann basierend auf dieser Beurteilunge als kleiner oder gleich der MTD bestimmt werden. Darüber hinaus kann die RP2D auch vor der Festlegung einer MTD bestimmt werden, wenn eine angemessene Exposition oder klinische Nachweisen einer Aktivität in hinreichend gezeigt werden können. Die MTD ist definiert als das Dosisniveau unmittelbar unter dem Dosisniveau, bei dem bei ≥ 2 Patienten aus einer Kohorte von 3 bis 6 Patienten eine DLT auftritt. Bis zu 9 Patienten zwischen ≥ 2 und < 22 Jahren werden mit

		der MTD behandelt, darunter mindestens 3 von 9 Patienten < 12 Jahre und mindestens 3 von 9 Patienten ab 12 Jahren. Bei Kohorten, bei denen 3 oder mehr Patienten mindestens 75 % der verordneten Dosis erhalten, gilt die MTD als überschritten, wenn bei > 33 % der Patienten bei einer bestimmten Dosis eine DLT während der ersten 28 Tage der Arzneimittelgabe auftritt (Zyklus 1). Dosissteigerungen beim gleichen Patienten sind nur nach Festlegung der RP2D zulässig. Bei einzelnen Patienten, die eine Dosierung unterhalb der festgelegten RP2D erhalten, kann je nach Verträglichkeit alle zwei Zyklen die Dosierung um eine Dosisstufe bis Erreichen der RP2D eskaliert werden. Toxizität und DLT nach Zyklus 1 (Dosis bei Einschluss in die Studie) werden erfasst und bei der Bestimmung der RP2D berücksichtigt, aber nicht zur Bestimmung der MTD verwendet. Wenn der RP2D festgelegt ist, können sich Patienten, die über der RP2D behandelt werden, dafür entscheiden, ihre Dosis auf die RP2D zu deeskalieren, oder sie können die Dosisstufe beibehalten, wenn für sie die Behandlung verträglich ist. **Während der Phase Ib wird mit den Teilen B, C, D und E gleichzeitig begonnen, nachdem die RP2D in Teil A bestimmt wurde.** Die Patienten in den Teilen B, C und D erhalten Entrectinib mit der in Teil A bestimmten RP2D. Darüber hinaus werden weiterhin in Teil A (Expansion) Patienten aufgenommen mit rezidivierten oder refraktären extrakraniellen soliden Tumoren, die keine Neuroblastome sind, mit NTRK1/2/3-, ROS1- oder ALK-Molekülveränderungen, die keine Genfusionen sind und sich somit nicht für Teil D eignen. In **Teil B (Primäre Gehirntumore-Expansionskohorte)** wird die intrakranielle Tumorantwort (nach RANO; Anhang 6, Protokoll) bei Kindern und Jugendlichen mit rezidivierten oder refraktären primären ZNS-Tumoren mit NTRK1/2/3-, ROS1- oder ALK-Molekülveränderungen einschließlich Genfusionen untersucht. In **Teil C (Neuroblastom-Expansionskohorte)** wird die Tumorantwort (objektive Ansprechrate) bei Kindern und Jugendlichen mit rezidiviertem oder refraktärem Neuroblastom untersucht. In **Teil D (Genfusion-Expansionskohorte)** wird die Tumorantwort bei Kindern und Jugendlichen mit rezidivierten oder refraktären extrakraniellen soliden Tumoren, die keine Neuroblastome sind, mit NTRK1/2/3-, ROS1- oder ALK-Genfusionen untersucht. **Teil E (Explorative Kohorte):** Eine zusätzliche Kohorte ermöglicht die Aufnahme von Patienten im Alter von ≥ 2 Jahren und < 22 Jahren, die keine Kapseln schlucken können, sowie von allen Patienten < 2 Jahren, die ansonsten alle anderen Eignungskriterien für Teil A (Expansion) erfüllen. Patienten, die für die Teile B, C oder D in Frage kämen, können nach Absprache mit dem Sponsor aufgenommen werden. Die Patienten erhalten den Inhalt von Entrectinib-Kapseln entweder oral vermischt mit flüssiger oder weicher Nahrung (ihrem Alter entsprechend) oder durch enterale Ernährung. Alle

		Patienten in Teil E werden zunächst mit einer Dosisstufe behandelt, die um eine Stufe kleiner ist als die in Teil A festgelegte pädiatrische RP2D-Dosis (Dosisdeeskalation). Während des Zyklus 1 wird überwacht, ob eine DLT bei den Patienten auftritt. Abhängig von der aus den PK-Analysen ermittelten Exposition kann die tägliche Dosis für diese Patienten auf die pädiatrische RP2D eskaliert werden. **Compliance** Vor jedem Zyklus werden die Patienten gebeten, nicht benötigte Studienmedikation zurückzugeben. Die Anzahl übrig gebliebener Kapseln wird dokumentiert und die Patiententagebücher bei jeder klinischen Visite überprüft. Nicht-therapietreue Patienten können aus der Studie ausgeschlossen werden. Fehlende Therapietreue ist dabei definiert als eine Rate < 75 % der verschriebenen Dosis pro Zyklus (< 21 von 28 Dosierungen) bei Ausbleiben einer DLT.
5	Zielsetzungen	
5a	• Spezifische Studienziele und Hypothesen	**Primäres Studienziel** Bestimmung der maximal verträglichen Dosis (MTD) oder der empfohlenen Phase 2 Dosis (RP2D) von Entrectinib bei pädiatrischen Patienten (Kindern und Jugendlichen) mit rezidivierten der refraktären soliden Tumoren (Phase I, Teil A). **Sekundäre Studienziele** 1. Beschreibung des Sicherheitsprofils von Entrectinib anhand von unerwünschten Ereignissen (UE), Schweregrad, Zeitpunkt und Zusammenhang mit Entrectinib-Behandlung, sowie Auffälligkeiten beim Elektrokardiogramm (EKG) und Labor im ersten und nachfolgenden Behandlungszyklus 2. Charakterisierung der Pharmakokinetik (PK) von Entrectinib im Plasma 3. Bestimmung der objektiven Ansprechrate (ORR, objective response rate), der Dauer des Ansprechens (DOR, duration of response), der Zeit bis zum Ansprechen (TTR, time to response), der klinischen Benefitrate (CBR, clinical benefit rate) und des progressionsfreien Überlebens (PFS, progression free survival) bei allen Patienten in den Teilen A (Expansion), C und D, die Entrectinib mit RP2D erhalten, ermittelt durch RECIST v1.1 und gegebenenfalls Curie-Skala 4. Bestimmung von intrakraniellem Tumoransprechen, ZNS-PFS (CNS-PFS, CNS progression free survival) bei Patienten mit messbarer ZNS-Beteiligung in den Teilen B und D, die Entrectinib mit RP2D erhalten, via „Response Assessment in Neuro-Oncology“ (RANO)-Kriterien oder „Response Assessment in Neuro-Oncology Gehirn Metastases“ (RANO-BM)-Kriterien **Explorative Studienziele** 1. Identifikation molekularer Veränderungen der Gene, die für TRKA, TRKB, TRKC oder deren verwandte Liganden oder Co-Rezeptoren (NGF, BDNF, Neurotrophin 1/2/3, p75), ROS1 oder ALK codieren, im

		Tumorgewebe bei Beginn der Therapie (bei Rezidiv, falls vorhanden, jedoch bei Diagnose, wenn kein Rezidivtumor vorhanden ist) und zum Zeitpunkt der Progression. 2. Durchführung eines In-vitro-Bioassays mit dem Plasma der Patienten vor und 4 Stunden nach Verabreichung der ersten Dosis und im Kumulationsgleichgewicht, sowie Beurteilunge der Hemmung der TRKB-Autophosphorylierung als Antwort auf den Liganden von SY5Y-TRKB-Zellen 3. Bestimmung potenzieller zielabhängiger (TRKB) und/oder unabhängiger Mechanismen (Downstream-Effektoren) der Arzneimittelresistenz bei Patienten mit Neuroblastom, die Anzeichen für ein Fortschreiten der Erkrankung aufweisen und sich einer Biopsie unterzogen haben oder sich während der Studie einer Biopsie unterziehen können 4. Ermittlunge von möglichen Unterschieden hinsichtlich der klinisch-pathologischen Präsentation und hinsichtlich des Ansprechens auf Entrectinib zwischen den verschiedenen Tumortypen mit NTRK1/2/3-, ROS1- und ALK-Genfusionen
6	Zielkriterien	
6a	• Klar definierte primäre und sekundäre Wirksamkeitsmessgrößen • Methoden zur Datenerhebung und Methoden zur Verbesserung der Qualität von Messungen • Informationen über validierte Instrumente wie z. B. psychometrische und biometrische Eigenschaften von Selbsterhebungsinstrumenten	**Erhebung des Tumorstatus** Teile A und E: Der Tumorstatus wird zu folgenden Zeitpunkten erhoben: • Screening • Am Ende von Zyklus 2, 4 und 6 • Alle 3 Zyklen × 2 (d. h. nach den Zyklen 9 und 12) • Alle 4 Zyklen × 3 (d. h. nach den Zyklen 16, 20 und 24) • Danach alle 6 Zyklen Teile B, C und D: Der Tumorstatus wird beim Screening und danach alle 8 Wochen erhoben, beginnend mit dem Ende von Zyklus 2. Die Erhebung des Tumorstatus kann Magnetresonanztomographie (MRT)- oder Computertomographie (CT)-Scans, MIBG, +/- Knochenmarkaspirate und Biopsien umfassen, abhängig von den geeigneten Bildgebungsmodalitäten für die primäre Malignität. **Unabhängiges Bewertungsgremium (BICR, Blinded Independent Central Review):** Alle Scans werden an ein unabhängiges Labor für Bildgebung übermittelt. Dort findet die unabhängige Überprüfung des Tumoransprechens und der Krankheitsprogression während der Studie gemäß der „Imaging Review Charter" statt. **Erhebung und Analyse des primären Endpunkts** **Dosislimitierende Toxizität (DLT)** DLTs wurden während des ersten Behandlungszyklus (d.h. 28 Tage) evaluiert; die RP2D war abhängig von den DLT, die im Rahmen der Beobachtung von klinischen

		und Laborparametern auftraten. DLT ist definiert als der absolute und relative Anteil von Patienten in Phase I (Teil A, Dosissteigerung), die im Rahmen des ersten Behandlungszyklus mindestens ein DLT erfahren haben. **Analyse des primären Endpunkts** **Objektives Ansprechen (ORR, objective response rate)** ORR bewertet durch das BICR via RECIST v1.1 ist der primäre Endpunkt der Studie. Die Analyse wird in jedem Basket durchgeführt, der eine Patientenpopulation mit soliden Tumoren enthält, die NTRK1/2/3-, ROS1-, oder ALK-Genumlagerungen aufweisen. ORR ist definiert als der Anteil der Patienten mit bestätigtem kompletten Ansprechen (CR, complete response) oder partiellem Ansprechen (PR, partial response). Ein bestätigtes Ansprechen ist definiert als Ansprechen, das auf wiederholten Bildgebungen über ≥ 4 Wochen nach der initialen Dokumentation anhält. Patienten mit einem solchen bestätigten objektiven Ansprechen (CR oder PR) werden "Responder" genannt. Non-Responder werden wie folgt definiert: • Patienten ohne bestätigtes objektives Ansprechen • Patienten ohne Erhebung des post-Baseline-Tumorstatus • Patienten, die mindestens eine Dosis Entrectinib erhalten haben, aber die Behandlung aufgrund jeglichen Grundes abbrachen, bevor eine Erhebung des Ansprechens nach Baseline durchgeführt werden konnte ORR wird dargestellt als der Anteil von Respondern inklusive des zugehörigen 2-seitigen 95 % Clopper-Pearson-Konfidenzintervalls (KI). **Analyse der sekundären Endpunkte** **Klinische Benefitrate (CBR, Clinical Benefit Rate)** ist der Anteil Patienten, die eines der folgenden Kriterien erfüllen: CR oder PR **Stabile Erkrankung (SD, stable disease)** für mindestens 6 Monate nach der ersten Dosis Entrectinib, erhoben via RECIST v1.1. **Dauer des Ansprechens (DOR, duration of response)** wird nur für Responder gemessen vom Zeitpunkt des ersten objektiven Ansprechens (CR oder PR) bis zur ersten dokumentierten radiologischen Progression gemäß RECIST v1.1 oder Datum des Todes, je nachdem was zuerst eintritt. DOR wird zensiert am Tag der letzten Erhebung des Tumorstatus vor dem Beginn einer Folgetherapie bei Patienten ohne Progression, die 30 Tage nach letzter Dosis der Studienmedikation am Leben sind. **Zeit bis zum Ansprechen (Time to Response, TTR):** TTR ist definiert als die Zeit von der ersten Entrectinib-Dosis bis zur Dokumentation des ersten objektiven Ansprechens (entweder CR oder PR), bewertet mit RECIST v1.1. Bei Patienten, bei denen kein Ansprechen erzielt wird, wird das Datum der letzten Tumorbewertung

		nach Studienbeginn oder der Tod als Zensurdatum verwendet. **Progressionsfreies Überleben (Progression-Free Survival, PFS)** ist definiert als die Zeit zwischen erster Dosis Entrectinib bis zum ersten radiologischen Nachweis einer Progression oder Tod durch jegliche Ursache, je nachdem was zuerst eintritt. PFS-Daten von Patienten ohne Progression oder Tod werden zum Datum der letzten Erhebung des Tumorstatus zensiert (oder, sofern kein Tumorstatus nach der Baseline-Visite erhoben wurde, zum Datum der ersten Dosis der Studienmedikation). Zur Schätzung des mittleren PFS wird die Kaplan-Meier-Methode verwendet. **Gesamtüberleben (OS, Overall Survival):** OS ist definiert als die Zeit von der ersten Entrectinib-Dosis bis zum Todesdatum aus jeglichem Grund. Patienten, die zum Zeitpunkt der Analyse am Leben waren, werden an dem letzten bekannten Datum, an dem sie am Leben waren, zensiert. Zusätzliche Zensierungsregeln werden im SAP dargestellt. ORR und CBR werden mithilfe deskriptiver Statistiken zusammengefasst. DOR und TTR werden für einzelne Patienten aufgelistet, die ein objektives Ansprechen erzielt hatten. In Phase Ib der Studie umfassen die für Teil A (Erweiterung), C und D geplanten Analysen der sekundären Wirksamkeitsendpunkte ORR, DOR, TTR, CBR und PFS. Die für die Teile B und D (Patienten mit messbarer primärer oder sekundärer ZNS-Erkrankung zu Studienbeginn) geplanten Wirksamkeitsendpunktanalysen umfassen: intrakranielle Tumoransprechrate und ZNS-PFS. Für alle Teile ist eine OS-Analyse geplant. Weitere Informationen finden sich in Abschnitt 12.4 des Studienprotokolls. **Pharmakokinetische Analyse (PK)** PK-Analysen basieren auf der auswertbaren PK-Population. PK-Daten für Entrectinib und seinen aktiven Hauptmetaboliten M5 werden von PK-auswertbaren Patienten gesammelt. Die folgenden PK-Parameter für Entrectinib und M5-Metaboliten werden direkt aus den Plasmakonzentrations- / Zeitprofilen für jeden Patienten bezogen oder gegebenenfalls mithilfe der Non-Compartmental Analysis (NCA) geschätzt: • C_{max}: Maximal beobachtete Plasmakonzentration • T_{max}: Zeit bis zur maximal beobachteten Plasmakonzentration • T_{last}: Zeit bis zur letzten messbaren Plasmakonzentration • AUC_{last}: Fläche unter der Plasmakonzentrations-Zeit-Kurve (AUC) vom Zeitpunkt 0 bis zum letzten Zeitpunkt mit messbarer Plasmakonzentration • AUC_{0-24}: Fläche unter der Plasma-Konzentrations-Zeit-Kurve vom Zeitpunkt 0 bis 24 Stunden nach der Verabreichung

		• AUC_{0-6}: Fläche unter der Plasmakonzentrations-Zeit-Kurve vom Zeitpunkt 0 bis 6 Stunden nach der Verabreichung • C_{trough}: Durch Plasma-Talspiegel-Konzentration (Trough plasma) vor der Dosierung (pre-Dosis) PK-Parameter werden durch Standard-NCA-Methoden unter Verwendung von Phoenix WinNonlin v.6.4 (Pharsight Corporation) bestimmt. Die tatsächlichen Probenzeiten werden für alle Analysen verwendet. Nennzeiten werden verwendet, um den Mittelwert zu melden. Konzentrationen, die als unter der Bestimmungsgrenze angegeben werden, werden auf Null gesetzt, wenn sie vor der ersten nachweisbaren Konzentration auftreten, andernfalls werden sie als "fehlend" eingestuft. Die AUC wird unter Verwendung der linear-linearen Trapezregel (linear-linear trapezoidal rule) und der tatsächlichen Probeentnahmezeiten (mit Ausnahme der auf Null gesetzten Vordosis) berechnet. Die PK-Parameter und Plasmakonzentrationen von Entrectinib und M5 zu jedem nominalen Zeitpunkt werden in Auflistungen dargestellt und mittels deskriptiver Statistiken zusammengefasst einschließlich Mittelwert, Standardabweichung (SD), Minimum, Median, Maximum, Variationskoeffizient (CV), geometrische Mittelwerte und CV des geometrischen Mittels. **Biomarker-Analyse** Ab Phase I wird, sofern verfügbar, der Genfusionsstatus in den Tumorproben für jeden Patienten aufgelistet und innerhalb der Grundmerkmale der Erkrankung zusammengefasst. Zum Zeitpunkt der Primäranalyse werden keine zusätzlichen Biomarker-Analysen durchgeführt. **Sicherheitsanalyse** Der primäre Endpunkt sind DLTs bei Kindern, Jugendlichen und jungen erwachsenen Patienten mit rezidivierten oder refraktären soliden Tumoren. Die DLTs werden während des ersten Zyklus (d. H. 28 Tage) bewertet. Die RP2D wird aus der DLT bestimmt, die aus klinischen Beobachtungen und Laborbeobachtungen im ersten Behandlungszyklus abgeleitet wurde. Zu den sekundären Sicherheitsendpunkten für diese Studie gehören UE (einschließlich SUE), Todesfälle, Laborparameter, Vitalzeichenmessungen, EKG und andere anwendbare Sicherheitsparameter. **Dosislimitierende Toxizität** Die Anzahl und der Anteil der Patienten in Phase I (Teil A, Dosissteigerung), bei denen im ersten Zyklus mindestens eine DLT auftritt, wird zusammengefasst. **Unerwünschte Ereignisse (UE)** Alle während des Berichtszeitraums gemeldeten UE (ab dem Zeitpunkt, zu dem der Patient die erste Entrectinib-Dosis eingenommen hat bis 30 Tage nach der letzten Entrectinib-Dosis) werden als behandlungsassoziierte unerwünschte Ereignisse (treatment-emergent AEs, TEAEs) eingestuft.

		Zur Kodierung der UE wird Version 19.0 des Medical Dictionary for Regulatory Activities (MedDRA) verwendet. Der Schweregrad der UE wird anhand des NCI-CTCAE, v.4.03, eingestuft. Die periphere motorische und sensorische Neuropathie wird nach den pädiatrischen Einstufungskriterien (pediatric specific grading criteria) eingestuft. UE, die nicht speziell im NCI-CTCAE aufgeführt sind, werden gemäß der in Abschnitt 9.1.5 des Protokolls angegebenen Bewertungsskala bewertet. Der Zusammenhang einer UE mit Prüfpräparat wird vom Prüfer gemäß den im Protokoll aufgeführten Kriterien bewertet. UE werden nach Ausmaß (seriousness), Schweregrad (severity) und Zusammenhang zur Studienbehandlung erfasst. Ebenso erfasst werden UE, die zum Tod führen, UE, die zum Absetzen des Studienmedikaments führen und UE, die zu Dosisanpassung führen. Die UE-Daten werden anhand von MedDRA preferred terms (PT) in Häufigkeitstabellen dargestellt. Für jede Dosisstufe und für Gesamtheit der Patienten werden die Inzidenzraten von Nebenwirkungen nach System Organ Class (SOC) und PT dargestellt. **Todesfälle** Todesfälle aufgrund der Krankheitsprogression werden nicht als SUE angesehen. Der Tod wird als Outcome und nicht als bestimmtes Ereignis angesehen. Das Ereignis oder der Zustand, der das tödliche Outcome verursacht oder dazu beigetragen hat, wird als UE erhoben. Die Häufigkeit der Todesfälle wird nach Dosis und nach dem Zeitraum seit Absetzen der Behandlung zusammengefasst. **Labordaten** Labortestergebnisse werden konvertiert und in standardisierten Einheiten angegeben. Normbereiche werden verwendet, um Werte zu identifizieren, die niedrig, normal oder hoch waren, und die Laborergebnisse für Hämatologie und Chemie werden ebenfalls gemäß NCI-CTCAE v.4.03 eingestuft. Für jeden im NCI-CTCAE-System enthaltenen Laborparameter wird die Inzidenz von Anomalien durch den schlechtesten CTCAE-Grad zusammengefasst, der für jeden Patienten während des Behandlungszeitraums erreicht wird. Änderungen des Schweregrads im Vergleich zum Ausgangswert werden bewertet und in Shift-Tabellen dargestellt. **Elektrokardiogramme** Während der Studie werden EKG-Parameter wie ventrikuläre Frequenz und Standard-EKG-Intervalle PR, QT und QRS gemessen. Die QTc werden nach der Formel von Fridericia oder Bazett bestimmt. Der maximale post-Baseline QTc-Anstieg nach Kategorie wird in einer Shift-Tabelle dargestellt. **Vitalfunktionen** Abnormitäten der Vitalfunktionen (Temperatur, Blutdruck [systolisch und diastolisch], Atemfrequenz, Herzfrequenz) nach Studienbeginn werden erfasst. **Sonstige Sicherheitsanalysen**

		Gewicht und Body-Mass-Index Die maximale Gewichtszunahme oder -abnahme nach Studienbeginn wird nach NCI-CTCAE v.4.03 eingestuft und entsprechend dargestellt. Die Veränderung vom Baseline- BMI bis zum maximalen post-Baseline-Wert wird dargestellt. **Karnofsky/Lansky Performance Score** Die Veränderung des Baseline-Karnofsky/Lansky performance scores zum maximalen post-Baseline -Wert wird ebenfalls dargestellt. **Entrectinib Exposition** Die Entrectinib-Exposition, die Therapietreue (treatment compliance) und die Dosisanpassungen werden nach Dosisstufen zusammengefasst und in folgenden Parametern dargestellt: • Behandlungsdauer (Tage) • Anzahl der versäumten Dosen • Die kumulative Gesamtdosis (mg) • Dosisintensität (mg / Tag), definiert als kumulative Dosis geteilt durch die Anzahl der geplanten Tage in den abgeschlossenen Behandlungszyklen • Relative Dosisintensität (%), definiert als Dosisintensität geteilt durch die geplante Tagesdosis und ausgedrückt als Prozentsatz Die Anzahl der Probanden mit mindestens einer Dosisanpassung wird stratifiziert nach Gründen dargestellt. **Demografie und Grunderkrankung** Demografische und andere Basismerkmale werden nach Dosisgruppen und für alle Patienten zusammengefasst. **Anamnese** Begleiterkrankungen, die zum Zeitpunkt der Einwilligung nach Aufklärung und vor der ersten Entrectinib-Dosis bestehen, werden mit der MedDRA-Version 19.0 kodiert und nach SOC und PT dargestellt. **Vorangegangene und nachfolgende Krebstherapien** Frühere Krebstherapien / Medikamente werden unter Verwendung des Drug Dictionary der Weltgesundheitsorganisation (WHO), Version 01MAR2016, kodiert und nach Anatomic Therapeutic Chemical (ATC) -2nd Level und PT dargestellt. Frühere Operationen werden mit MedDRA Version 19.0 codiert und nach SOC und PT dargestellt. **Frühere und begleitende Therapien und Medikamente** Medikamente und Therapien werden mit dem WHO Drug Dictionary, Version 01MAR2016, kodiert und nach ATC-2.Stufe und PT dargestellt.
7	Fallzahl	
7a	• Wie wurden die Fallzahlen bestimmt?	**Phase I (Teil A)** Die Stichprobengröße in Teil A (Dosissteigerung) basiert auf den Anforderungen für das 3 + 3-Design von ungefähr 6-30 Probanden. **Für Teil B (Primäre Gehirntumore; Genfusionen) und Teil D (Nicht-Neuroblastom-extrakranielle solide**

		Tumore mit NTRK1/2/3-, ROS1- oder ALK-Genfusionen) Für die Teile B (Genfusionen) und D werden die Probanden in einem 2-stufigen sequenziellen Test eingeschlossen, um festzustellen, ob Entrectinib eine ausreichende Antikrebsaktivität aufweist und um die weitere Entwicklung für spezifische Patientenpopulationen mit verschieden Tumortyp- und Genfusionskombinationen zu rechtfertigen. Für jeden Basket wird eine wahre Ansprechrate von ≤ 20 % als unzureichend angenommen, um die Studie fortzuführen. Während eine wahre Ansprechrate von ≥ 40 % als ausreichend betrachtet wird. Auf Basis sequenziellen Testens mit einer mindestens 80%igen Power und einseitigem Alpha von 0,025 wird die erste Testphase pro Basket gestartet. Hier werden 13 Patienten pro Basket eingeschlossen. Ab dem 4. Patienten mit Ansprechen gilt die erste Testphase und der Basket als erfolgreich. Falls es zu weniger als 4 Patienten mit Ansprechen in der ersten Phase kommt, wird die Rekrutierung in diesem Basket geschlossen. Bei Erfolg der ersten Phase werden 49 weitere Patienten eingeschlossen. • Wenn in einem Basket der 14. Patient mit Ansprechen beobachtet wird, gilt in diesem Basket der primäre Endpunkt als erreicht (eine Ansprechrate von ≤ 20 % als widerlegt) • Falls alle 49 Patienten eingeschlossen werden und 13 Wochen nach Tag 1 Zyklus 1 weniger als 14 Patienten ein Ansprechen zeigen, gilt der primäre Endpunkt als nicht erreicht Bei einer wahren Ansprechrate von 20 % liegt die Wahrscheinlichkeit, die Rekrutierung bereits in der ersten Phase zu stoppen, bei 75 %. Gleichzeitig liegt die Wahrscheinlichkeit, die Rekrutierung bei einer wahren Ansprechrate von 40 % in der ersten Phase zu stoppen, bei 17 %. **Teil C** Das Simon's two-stage design wird angewendet, um ein Wirksamkeitssignal zu identifizieren. Stufe 1 - Einschreibung von 13 bewertbaren Patienten. Wenn es keine Patienten mit Ansprechen gibt, wird die Rekrutierung für Teil C gestoppt, da keine Beweise für die Wirksamkeit vorliegen. Wenn es einen oder mehrere Patienten mit Ansprechen gibt, kann die Rekrutierung mit Stufe 2 fortgesetzt werden. Stufe 2 – Einschreibung von 7 zusätzlichen Patienten für insgesamt 20 auswertbare Probanden. Bei 2 oder weniger Patienten mit Ansprechen zeigt sich keine ausreichende Evidenz für die Wirksamkeit. Bei 3 oder mehr Patienten mit Ansprechen gibt es ausreichende Evidenz für die Wirksamkeit, um eine weitere Studie zu rechtfertigen. Dieses Design hat eine 90%ige Power (alpha = 0.074), um die Nullhypothese, einer Responserate < 5 % im Vergleich zur alternativen Hypothese mit einer Responserate > 25 % abzulehnen. Die erwartete Stichprobengröße beträgt 14.82 und die

		Wahrscheinlichkeit einer vorzeitigen Beendigung beträgt 0.599. **Teil A (Expansion), Teil B (Nicht-Genfusionen), Teil E** Diese Kohorten werden explorativ ausgewertet und können hinsichtlich ihrer Wirksamkeit nicht beurteilt werden. Sie tragen hauptsächlich zur Beurteilunge von Sicherheit und PK bei. **Explorations- / Korrelationsstudien** **Plasma-Hemmungstest:** Die prozentuale Änderung der TRKB-Phosphorylierung bei jeder Dosisstufe (vom Vordosiszyklus 1 Tag 1 bis 4 Stunden nach der Dosis 1 [C_{max}]; vom Vordosiszyklus 1 Tag 1 bis zum Vordosiszyklus 1 Tag 15) [Steady State]) wird mittels deskriptiver Statistik (Quartile / Bereich) zusammengefasst und die mittlere / mittlere prozentuale Änderung der TRKB-Phosphorylierung grafisch dargestellt. Die Menge an TRKB-Phosphorylierung bei jeder Dosisstufe im Steady-State wird ebenfalls mittels deskriptiver Statistiken dargestellt.
7b	• Falls notwendig, Beschreibung von Zwischenanalysen und Kriterien für einen vorzeitigen Studienabbruch	
8	Zuweisungsmethode • Zuweisungseinheit (die Einheit, die der Studienbedingung zugewiesen wird, wie z. B. Person, Gruppe, Gemeinde) • Methode der Zuweisung von Einheiten zu Studienbedingungen, einschließlich Details über etwaige Restriktion (z. B. Blockbildung, Stratifikation, Minimierung) • Einbeziehung von Aspekten, um potenzielle Verzerrung durch Nichtrandomisierung zu minimieren (z. B. Matching)	**Zuweisung** Nichtzutreffend aufgrund des Studiendesigns
9	Verblindung	
9a	• Waren a) die Probanden / Patienten und / oder b) diejenigen, die die Intervention / Behandlung durchführten, und / oder c) diejenigen, die die Zielgrößen beurteilten, verblindet oder nicht verblindet, wie wurde die Verblindung vorgenommen?	**Verblindung** Nicht zutreffend: offene Studie
10	Analyseeinheit • Bezeichnung der kleinsten Einheit, die analysiert wird, um Wirkungen der Intervention zu beurteilen (z. B. Person, Gruppe, Gemeinde) • Wenn sich die Analyseneinheit von der Zuweisungseinheit unterscheidet, ist die verwendete Analysenmethode anzugeben, die dies berücksichtigt (z. B. Adjustierung der Standardfehlerschätzungen um den	

	Designeffekt oder durch Verwendung einer Multilevel-Analyse)	
11	Statistische Methoden	
11a	• Statistische Methoden zur Bewertung der primären und sekundären Zielkriterien einschließlich komplexer Methoden für korrelierte Daten	Es war kein formaler statistischer Hypothesentest für Phase I (Teil A) geplant. Wirksamkeits-, PK- und Sicherheitsdaten wurden unter Verwendung deskriptiver Statistiken zusammengefasst. Für Time-to-Event Analysen sind Kaplan-Meier Analysen geplant.
11b	• Verwendete statistische Methoden für zusätzliche Analysen, wie z. B. Subgruppenanalysen und adjustierte Analysen • Methoden zur Imputation fehlender Daten • Falls verwendet: Verwendete statistische Software oder Programme	
Resultate		
12	Patientenfluss	
12a	• Patientenfluss durch jede Studienphase: Rekrutierung, Zuweisung, Allokation und Interventionsexposition, Nachbeobachtung, Analyse (Diagramm siehe unten)	
12b	• Rekrutierung: die Anzahl der Teilnehmer, die auf ihre Eignung gescreent werden, sich als geeignet oder nicht geeignet erweisen, nicht in die Studie aufgenommen und in die Studie aufgenommen werden • Zuweisung: die Anzahl der Teilnehmer, die einer Studienbedingung zugewiesen wurden • Allokation und Interventionsexposition: die Anzahl der Teilnehmer, die jeder Studienbedingung zugewiesen werden, und die Anzahl der Teilnehmer, die jede Intervention erhielten • Nachbeobachtung: die Anzahl der Teilnehmer, die das Follow-up abschlossen oder das Follow-up nicht abschlossen (lost to follow-up), aufgeschlüsselt nach Studienbedingungen • Analyse: die Anzahl der Teilnehmer, die in die Hauptanalyse einbezogen oder ausgeschlossen wurden, aufgeschlüsselt nach Studienbedingungen • Beschreibung von Abweichungen vom Prüfplan der Studie unter Angabe von Gründen	Insgesamt 17 Patienten wurden während des Phase I-Teils der Studie zwischen 02.05.2016 und 30.11.2017 gescreent, ein Patient brach das Screening ab. Der Grund für die Beendigung des Screenings war der Widerruf der Einwilligung (Hinweis: Die Daten für den Abbruch des Screenings wurden nicht validiert). Insgesamt 16 Patienten wurden an acht Standorten in den USA in den Phase I-Teil (Dosissteigerung) der Studie eingeschlossen. Die Anzahl der Patienten, die bei jeder Dosisstufe eingeschlossen wurden, war wie folgt: drei Patienten mit 250 mg/m²; drei Patienten mit 400 mg/m2 KOF; sieben Patienten mit 550 mg/m2 KOF; und drei Patienten mit 750 mg/m2 KOF. Zum Zeitpunkt des klinischen Datenschnitts (31.05.2018) wurden insgesamt sieben Patienten (43,8 %) aus der Studie ausgeschlossen. Drei Patienten (18,8 %) blieben in der Studienbehandlung und fünf Patienten (31,3 %) befanden sich im survival follow-up. Der häufigste Grund für die Beendigung der Studie war der Tod, der für fünf Patienten (31,3 %) berichtet wurde, die zuvor eine Progression der Krankheit aufwiesen. Bei einem dieser Patienten spiegelte sich der Studienabbruch aufgrund eines Todesfalls zum Zeitpunkt des klinischen Datenschnitts nicht in der klinischen Datenbank wider. Die anderen drei Patienten (18,8 %) brachen die Studie aus „anderen“ Gründen ab, im Speziellen: „Patient begann mit einer anderen Chemotherapie“, „Patient begann mit einer Strahlentherapie“ und „Patient begann mit einer neuen Behandlung“. Diese drei Patienten hatten die Behandlung aufgrund von Krankheitsprogression bereits vor Beendigung der Studie abgebrochen.

		Insgesamt 13 Patienten (81,3 %) hatten die medikamentöse Behandlung der Studie abgebrochen. Der häufigste Grund für den Abbruch der Behandlung war Krankheitsprogression, berichtet bei 12 Patienten (75%). Der andere Patient brach die Behandlung aufgrund eines Widerrufs der Einwilligung ab.
13	Aufnahme / Rekrutierung	
13a	• Nähere Angaben über den Zeitraum der Studienaufnahme der Probanden / Patienten und der Nachbeobachtung	Die Ergebnisse des klinischen Datenschnitts vom 31.05.2018 beinhalten die Daten vom 02.05.2017 (first patient enrolled) bis zum 31.05.2018 für Patienten, die bis zum 30.11.2017 (Enrollment cut-off) eingeschlossen wurden. Nachbeobachtung Patienten, die die Behandlung abbrachen werden in die Überlebens-Nachbeobachtungsphase eingeschlossen und verbleiben bis zum Tod in der Studie, loss to follow up oder Entzug der Einverständniserklärung (Infored Consent), je nach dem was zuerst eintritt.
13b	• Informationen, warum die Studie endete oder beendet wurde	Es handelt sich um eine laufende Studie.
a: nach TREND 2004.
