TABLE 5.1.1: Treatment Emergent Adverse Event (TEAE) - SOC Blood and lymphatic system disorders - Safety Population A: Favorable risk (IMDC prognostic risk score = 0)

| Parameter | Measure | Nivolumab + Cabozantinib | Sunitinib |
|---|---|---|---|
| Treatment Emergent Adverse Event (TEAE) - SOC Blood and lymphatic system disorders | | | |
| Total number of subjects | N | 74 | 71 |
| Number of subjects with events | N | 23 (31.1%) | 36 (50.7%) |
| Number of censored cases | N | 51 (68.9%) | 35 (49.3%) |
| Time to first event (Months) | Mean (SE) | 12.25 (0.67) | 11.71 (1.16) |
| | Q1 [95% CI] | 9.60 [1.87;NYR] | 1.40 [0.72;3.71] |
| | Median [95% CI] | NYR [NYR;NYR] | 11.04 [5.52;NYR] |
| | Q3 [95% CI] | NYR [NYR;NYR] | NYR [21.39;NYR] |
| | p-value (a) | 0.0046 | |
| Stratified Cox PH model | HR (b) | 0.47 [0.28;0.80] | |

a: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT.
b: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by factors defined above, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
NYR: (Median) Not Yet Reached.

| >= 75 | 8 | 1 (12.5%) | NYR [3.29;NYR] | 6 | 2 (33.3%) | NYR [1.22;NYR] | 0.40 [0.04;4.49] | 0.4459 | |
| **Geographic Region (IRT)** | | | | | | | | | |
| US/Canada/Western Europe/Northern Europe | 39 | 5 (12.8%) | NYR [NYR;NYR] | 37 | 10 (27.0%) | NYR [16.53;NYR] | 0.40 [0.13;1.16] | 0.0815 | 0.6812 |
| Rest of World (ROW) | 35 | 5 (14.3%) | NYR [22.11;NYR] | 34 | 8 (23.5%) | NYR [NYR;NYR] | 0.48 [0.16;1.47] | 0.1886 | |

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

| Not Reported | 0 | 0/0 | NC | 2 | 2 (100.0%) | NC | NC | NC | |

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

TABLE 5.11.1: Treatment Emergent Adverse Event (TEAE) - SOC Metabolism and nutrition disorders - Safety Population A: Favorable risk (IMDC prognostic risk score = 0)

| Parameter | Measure | Nivolumab + Cabozantinib | Sunitinib |
|---|---|---|---|
| Treatment Emergent Adverse Event (TEAE) - SOC Metabolism and nutrition disorders | | | |
| Total number of subjects | N | 74 | 71 |
| Number of subjects with events | N | 59 (79.7%) | 35 (49.3%) |
| Number of censored cases | N | 15 (20.3%) | 36 (50.7%) |
| Time to first event (Months) | Mean (SE) | 7.73 (0.84) | 10.36 (0.93) |
| | Q1 [95% CI] | 1.40 [0.53;1.91] | 1.40 [0.69;4.14] |
| | Median [95% CI] | 4.73 [2.33;8.90] | 16.56 [4.27;NYR] |
| | Q3 [95% CI] | 15.60 [9.23;NYR] | NYR [NYR;NYR] |
| | p-value (a) | 0.0078 | |
| Stratified Cox PH model | HR (b) | 1.76 [1.15;2.69] | |

a: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT.
b: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by factors defined above, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
NYR: (Median) Not Yet Reached.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

| Not Reported | 3 | 0 (0.0%) | NC | 0 | 0/0 | NC | NC | NC | |

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

| | p-value (a) | 0.0101 | |
| Stratified Cox PH model | HR (b) | 3.41 [1.26;9.19] | |

a: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT.
b: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by factors defined above, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
NYR: (Median) Not Yet Reached.

a: Number of patients in the Safety Population A: Favorable risk (IMDC prognostic risk score = 0).
b: Median and 95% CI were calculated using an unstratified product-limit estimator survival model.
c: The Hazard ratio was based on a Cox regression model (with treatment as the only covariate) stratified by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, and an unstratified model for subgroups, and was relative to the sunitinib group with <1 favoring the cabozantinib+nivolumab group.
d: P-value was based on a stratified log-rank test by PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, for the overall population, and unstratified for subgroups.
Subgroup analyses are only performed on SOC/PT for which the overall treatment was significant (Log Rank p-value <0.05) and if in at least one subgroup in one study arm 10 or more patients with event is presented
Subgroup analyses are only performed on the subjects for which the subgroup variable value is known and for which there are at least 10 subjects.
CI: Confidence Interval; NC: Not Calculated; NE: Not Estimable; NYR: (Median) Not Yet Reached; PT: Preferred Term; SOC: System Organ Class.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.7878 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| | | | 0.6207 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.9410 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.6565 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.2824 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.9011 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.5225 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **Yes** | | | | |
| Nr subjects used | n=10 | n=6 | | |
| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **Not Reported** | | | | |
| Nr subjects used | n=2 | n=1 | | |
| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.1792 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.1149 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.1690 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

| **MMRM subgroups interaction p-value** | | | 0.2439 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | 0.6931 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.7988 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.2638 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | . |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **Not Reported** | | | | |
| Nr subjects used | n=2 | n=1 | | |
| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.7462 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.1016 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| | | | 0.0852 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | 0.7377 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | 0.8520 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | 0.5396 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| Nr subjects used | [No Data] | n=2 | | |
| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.8876 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.2774 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| Nr subjects used | n=2 | n=1 | | |
| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| Nr subjects used | n=3 | [No Data] | | |
| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.4813 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.4214 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| | | | 0.2115 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.
Analysis Cut Off date: 10SEP2020

| **MMRM subgroups interaction p-value** | | | 0.4377 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

| **MMRM subgroups interaction p-value** | | | 0.7379 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | 0.6536 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| | | | 0.7403 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms reported values are change from baseline values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.3916 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| **MMRM subgroups interaction p-value** | | | | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

| Nr subjects used | n=3 | [No Data] | | |
| **MMRM subgroups interaction p-value** | | | | |
| | | | 0.2285 | |

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm.CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Error.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.

Notes:
Treatment arms reported values are actual values.
Differences between treatment arms are standardized differences using Hedge's G method.
CI: Confidence Interval; PRO: Patient-Reported Outcomes; SD: Standard Deviation.

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er

Notes:
Treatment arms values and treatment arm differenes are LS-means values for change from baseline values, from a MMRM model with the baseline PRO value, treatment arm, visit (week), the interaction between treatment and visit, and PD-L1 tumor expression (>= 1% versus < 1% or indeterminate) and region (US/Canada/W Europe/N Europe, ROW) as entered in the IRT, as fixed effects,and subject as random effect.
The MMRM model used all available PRO data from scheduled visits up to week 103, only using visits with data for both treatment arms and at least 10 subjects with data in each arm, and uses a Heterogenous Autoregressive (ARH(1)) covariance structure.
CI: Confidence Interval; LS: Least-Squares; MMRM: Mixed Model Repeated Measures; PRO: Patient-Reported Outcomes; SE: Standard Er
