Deterioration probability (95% CI)[b]					

A higher score represents a better level of quality of life. Clinical meaningful improvement change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.

Deterioration probability (95% CI)[b]					

A higher score represents a better level of quality of life. Clinical meaningful improvement change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

Deterioration probability (95% CI)[b]					

A higher score represents a better level of quality of life. Clinical meaningful improvement change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.

Deterioration probability (95% CI)[b]					

A lower score represents a better level of quality of life. Clinical meaningful deterioration change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

P-value	-	0.6195		0.3876	
Deterioration probability (95% CI)[b]					

A lower score represents a better level of quality of life. Clinical meaningful deterioration change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

Hazard ratio (95% CI) vs Pd	-	1.34 (0.61 to 2.94)		0.66 (0.27 to 1.59)	
P-value	-	0.4614		0.3546	
Deterioration probability (95% CI)[b]					

A higher score represents a better level of quality of life. Clinical meaningful deterioration change from baseline less than or equal to -10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

Comparison vs. Pd							
Log-Rank test p-value[a] vs Pd	-	0.2883		0.1366		0.8890	

A lower score represents a better level of quality of life. Clinical meaningful deterioration change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

Comparison vs. Pd					
Log-Rank test p-value[a] vs Pd	-	0.3802		0.0955	
Hazard ratio (95% CI) vs Pd	-	0.74 (0.38 to 1.45)		0.48 (0.20 to 1.16)	
P-value	-	0.3820		0.1028	
Deterioration probability (95% CI)[b]					

A lower score represents a better level of quality of life. Clinical meaningful deterioration change from baseline greater than or equal to 10 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable

16.2.6.1.1.1 Efficacy response data
16.2.6.1.1.1.20 QLQ-MY20 - Time until permanent improvement by 15 pt in future perspective (LOCF) - ITT population

First permanent improvement 15 points Future perspective (%)	**Pd (N=153)**	**IPd (N=154)**
Number (%) of events	27 (17.6)	29 (18.8)
Number (%) of patients censored	126 (82.4)	125 (81.2)
Kaplan-Meier estimates of future perspective in months		
25% quantile (95% CI)	NC (8.411 to NC)	14.82 (9.232 to NC)
Median (95% CI)	NC (NC to NC)	NC (NC to NC)
75% quantile (95% CI)	NC (NC to NC)	NC (NC to NC)
Comparison vs. Pd		
Stratified[a] Log-Rank test p-value[b] vs Pd	-	0.7884
Stratified[a] Hazard ratio (95% CI) vs Pd	-	0.93 (0.55 to 1.57)
P-value	-	0.7880
Probability (95% CI)[c]		
2 Months	0.10 (0.060 to 0.158)	0.03 (0.009 to 0.062)
4 Months	0.13 (0.082 to 0.192)	0.09 (0.050 to 0.141)

A higher score represents a better level of quality of life. Clinical meaningful improvement change from baseline greater than or equal to 15 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] stratified on age (<75 years versus >=75 years) and Number of previous lines of therapy (2 or 3 versus > 3) according to IRT
[b] One-sided significance level is 0.025
[c] Estimated using the Kaplan-Meier method
NA/NC = Not Applicable / Not Calculable

16.2.6.3.1.5 Subgroup analyses by ethnic origin
16.2.6.3.1.5.4 EQ-5D - Time to first deterioration by 10 pt in EQ-5D VAS according to ethnic origin (LOCF) - ITT population

	Hispanic or Latino		Not Hispanic or Latino		
	Pd (N=3)	**IPd (N=4)**	**Pd (N=134)**	**IPd (N=130)**	**p-value of treatment-by-sub group interaction[c]**
Number (%) of events	1 (33.3)	0 (0.0)	73 (54.5)	86 (66.2)	0.9788
Number (%) of patients censored	2 (66.7)	4 (100.0)	61 (45.5)	44 (33.8)	
Kaplan-Meier estimates of EQ-5D VAS in months					
25% quantile (95% CI)	2.27 (2.267 to NC)	NC (NC to NC)	1.97 (1.610 to 2.366)	1.48 (1.051 to 1.906)	
Median (95% CI)	NC (2.267 to NC)	NC (NC to NC)	6.54 (3.778 to 11.532)	3.58 (2.661 to 5.717)	
75% quantile (95% CI)	NC (2.267 to NC)	NC (NC to NC)	NC (12.945 to NC)	13.86 (10.448 to NC)	
Comparison vs. Pd					
Log-Rank test p-value[a] vs Pd	-	0.1573		0.1124	
Hazard ratio (95% CI) vs Pd	-			1.29 (0.94 to 1.76)	
P-value	-	0.9990		0.1133	
Deterioration probability (95% CI)[b]					

A higher score represents a better level of quality of life. Clinical meaningful deterioration change from baseline less than or equal to -15 pt.
The last observation carried forward (LOCF) procedure was applied to impute missing data.
CI for Kaplan-Meier estimates are calculated with log-log transformation of survival function and methods of Brookmeyer and Crowley
[a] One-sided significance level is 0.025
[b] Estimated using the Kaplan-Meier method
[c] P-value for treatment-by-subgroup factor interaction are based on Cox proportional hazard model including treatment, subgroup variables, and the treatment-by-subgroup interaction as covariates.
NA/NC = Not Applicable / Not Calculable
