Test for treatment and subgroup interaction: 0.1739
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1739
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5577
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5006
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.5006
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1524
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.9617
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

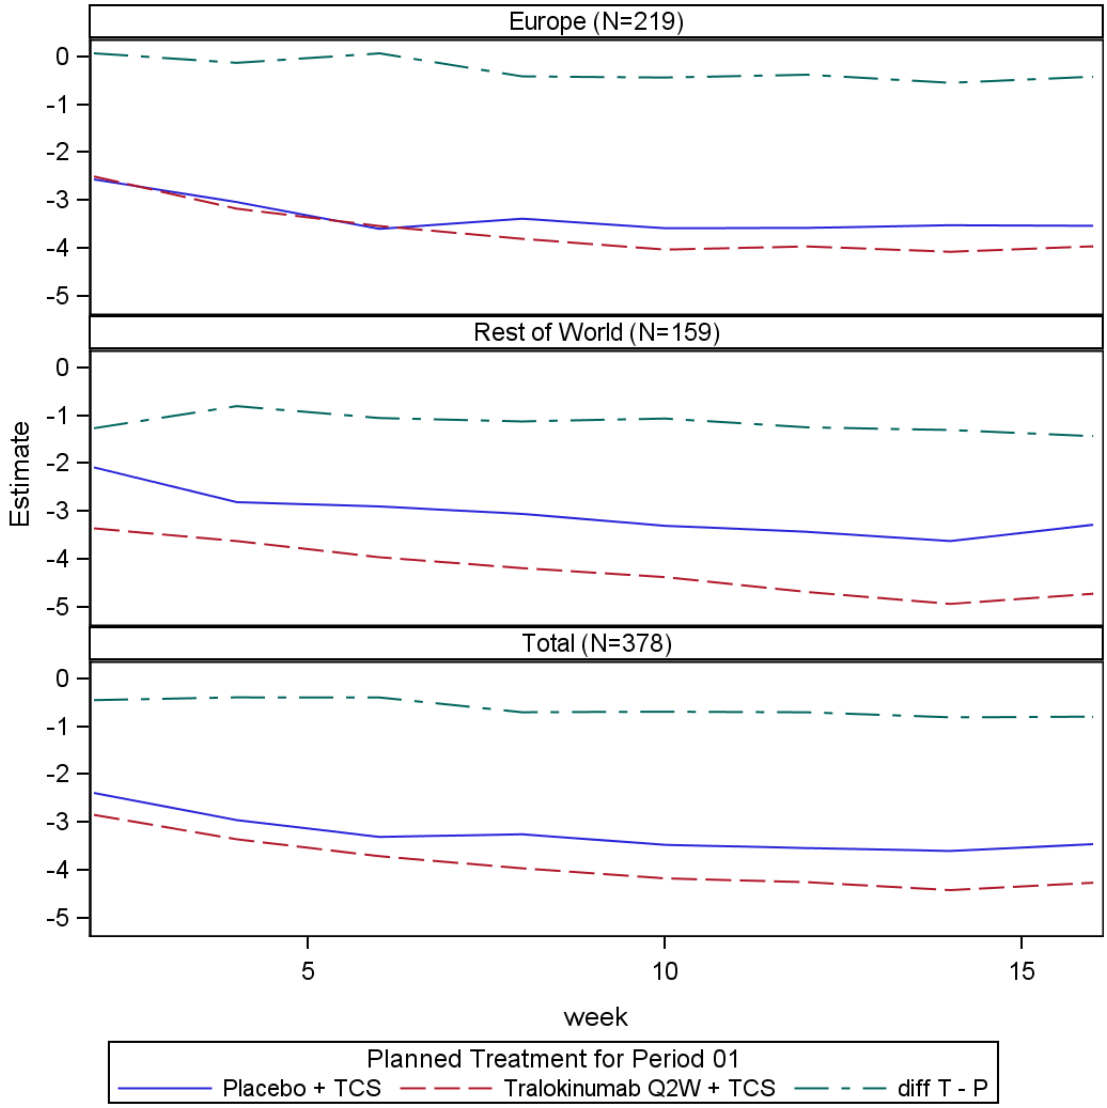
Figure 1.6.318.3.2: Total, Region, change in SCORAD (Sleep loss VAS component), Treatment policy estimand, LP0162-1339, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The number of subjects, percentage of subjects and number of events are summarised by preferred term and subgroup. All system organ class and preferred terms with a Chi-square treatment comparisons with p-values below 0.05 are included. Only subgroups with sufficient number of subjects and events are included.N: Number of exposed subjects, n: number of subjects with an event. %: percent of subjects with an event. rate/100PYE: number of events per 100 patient years of exposure. Q2W: Every 2 weeks. SOC: System organ class, PT: Preferred term. Chi-square test does not include continuity corrections or zero cell corrections. TEAE: Treatment emergent adverse events. The preferred term Dermatitis atopic and the higher level term: Pruritus NEC are excluded.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data at week 16 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Region + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline to EOT is analysed in a linear effects model including treatment, region and strata as fixed effects and baseline value as covariate.

Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1623
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0248
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0248
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5074
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1461
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.5754
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.7211
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7211
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8585
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.6572
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7685
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.4986
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.9010
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.9010
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.6483
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.6483
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.3728
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.0533
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

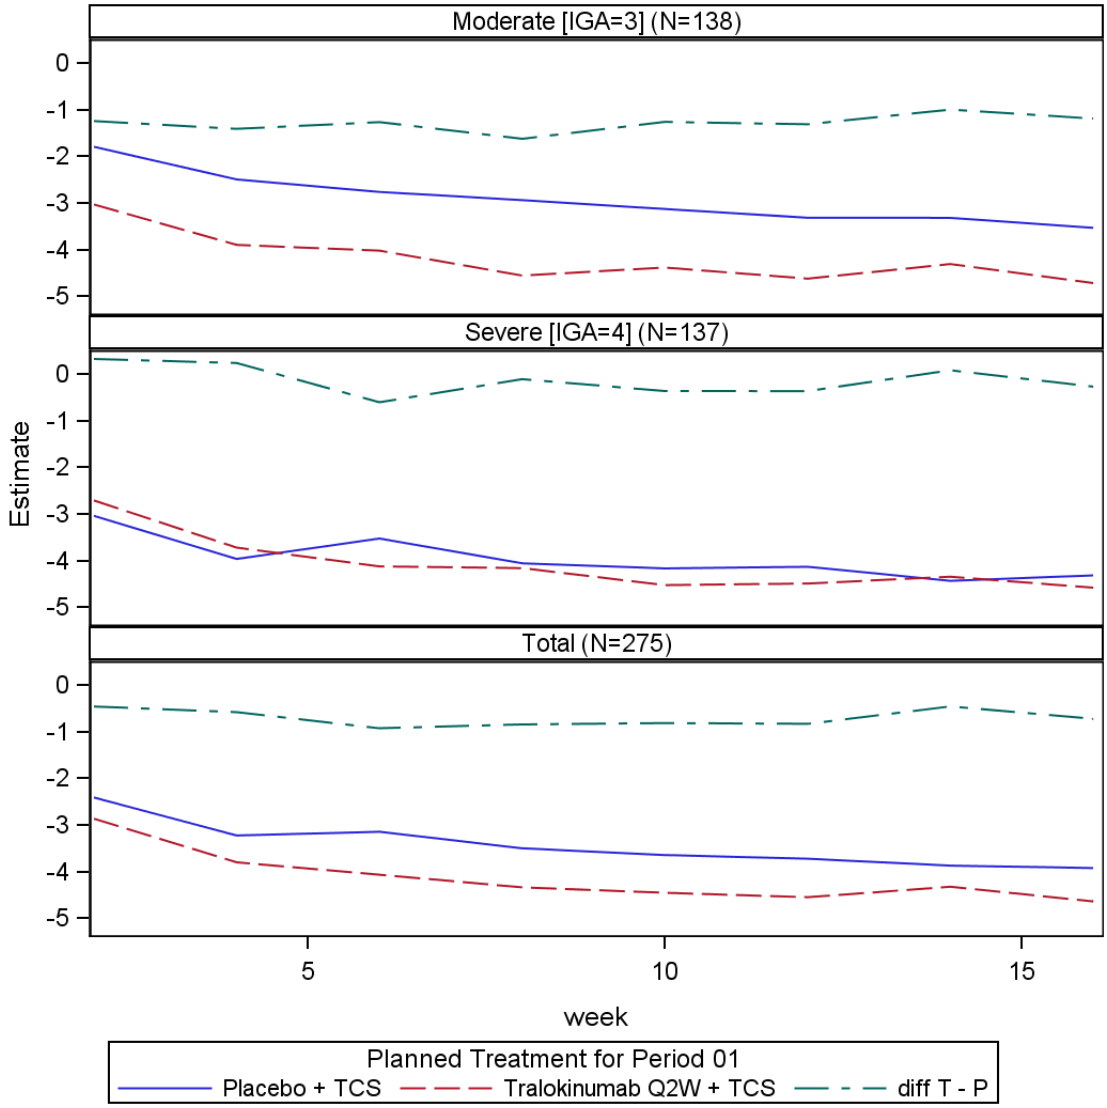
Figure 1.7.428.4.2: Total, Disease severity (IGA), change in SCORAD (Sleep loss VAS component), Treatment policy, LP0162-1346, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Test for treatment and subgroup interaction: 0.0660
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

Test for treatment and subgroup interaction: 0.9140
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8234
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

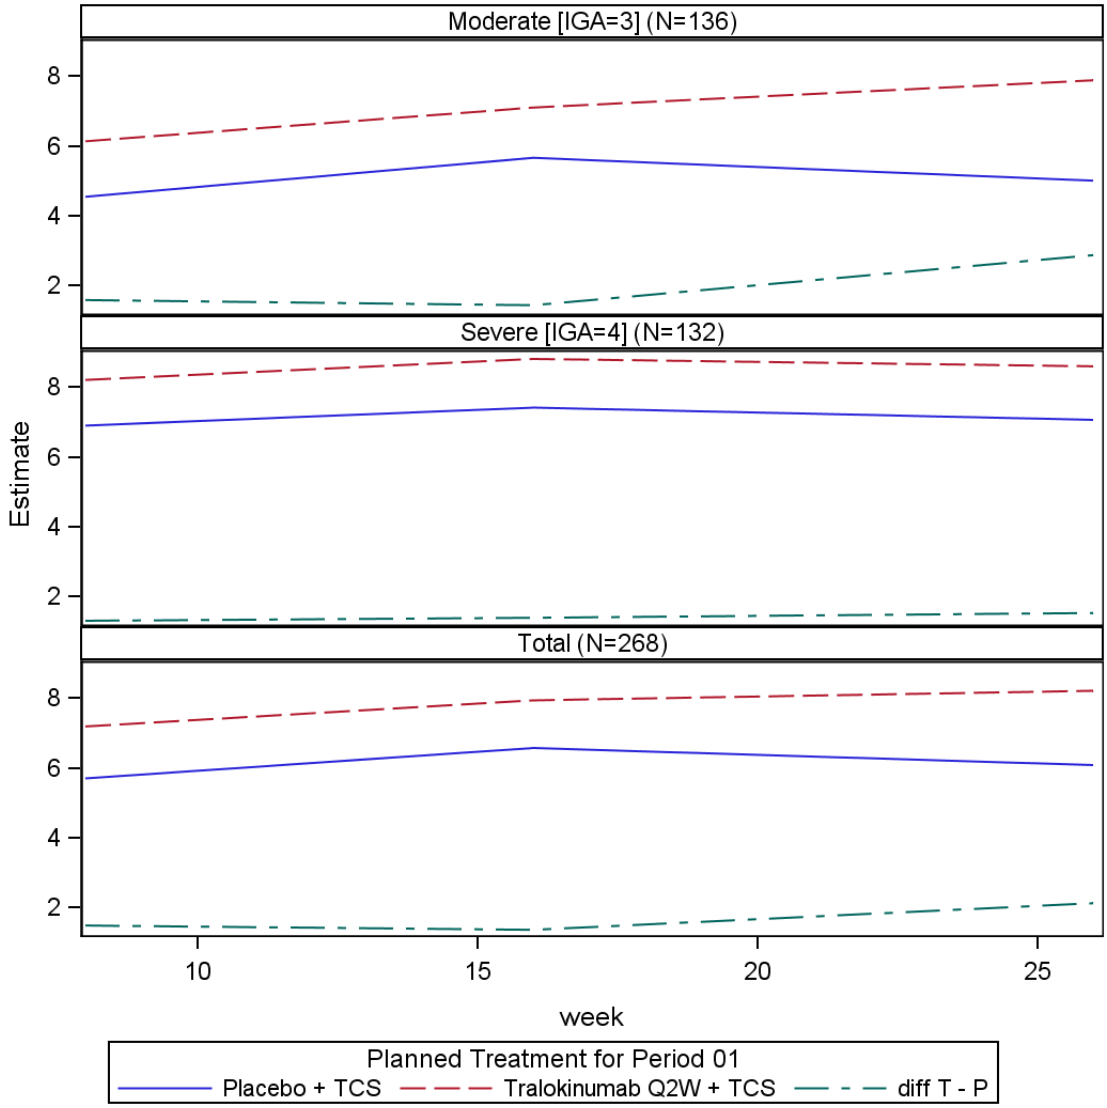
Figure 1.7.468.4.2: Total, Disease severity (IGA), change in SF-36 Physical Component Summary, Treatment policy, LP0162-1346, Week 26



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

Placebo + TCS	119	6 (5.0)					

Treatment policy estimand: Missing values at Week 16 imputed as non-responders. *: Cochran-Mantel-Haenszel test. The diff in %, relative risk, and OR are estimated in Cochran-Mantel-Haenszel analysis. Treatment policy estimand: Missing values at Week 16 imputed as non-responders. Stratification for Prior CSA use and baseline IGA.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7796
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data at week 16 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Prior CSA use + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.3533
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.3533
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5737
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

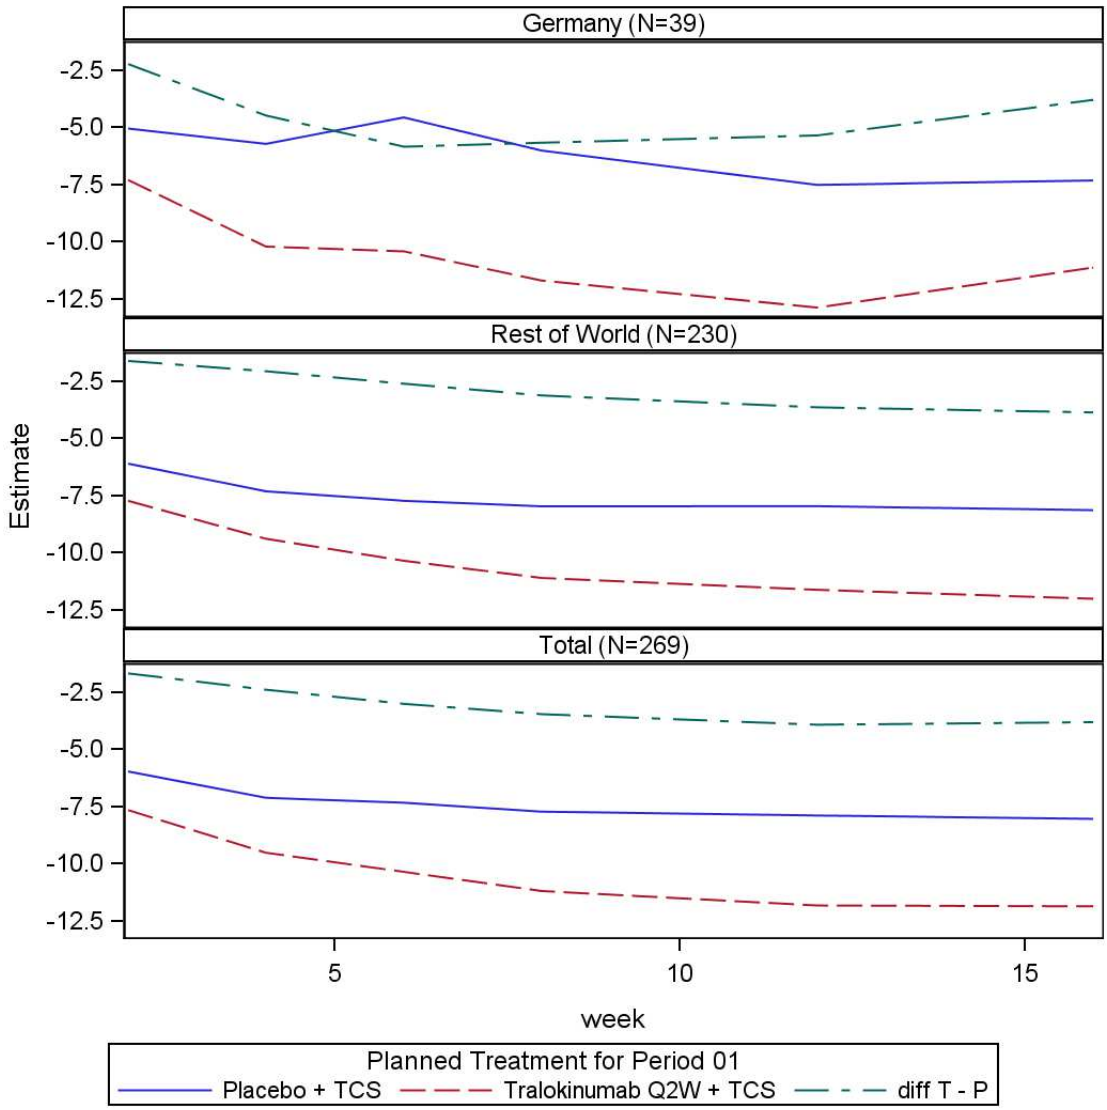
Figure 1.16.410.4.2: Total, Region, change in POEM, Treatment policy, LP0162-1346, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.9803
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8553
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8553
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7874
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.7874
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.8735
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

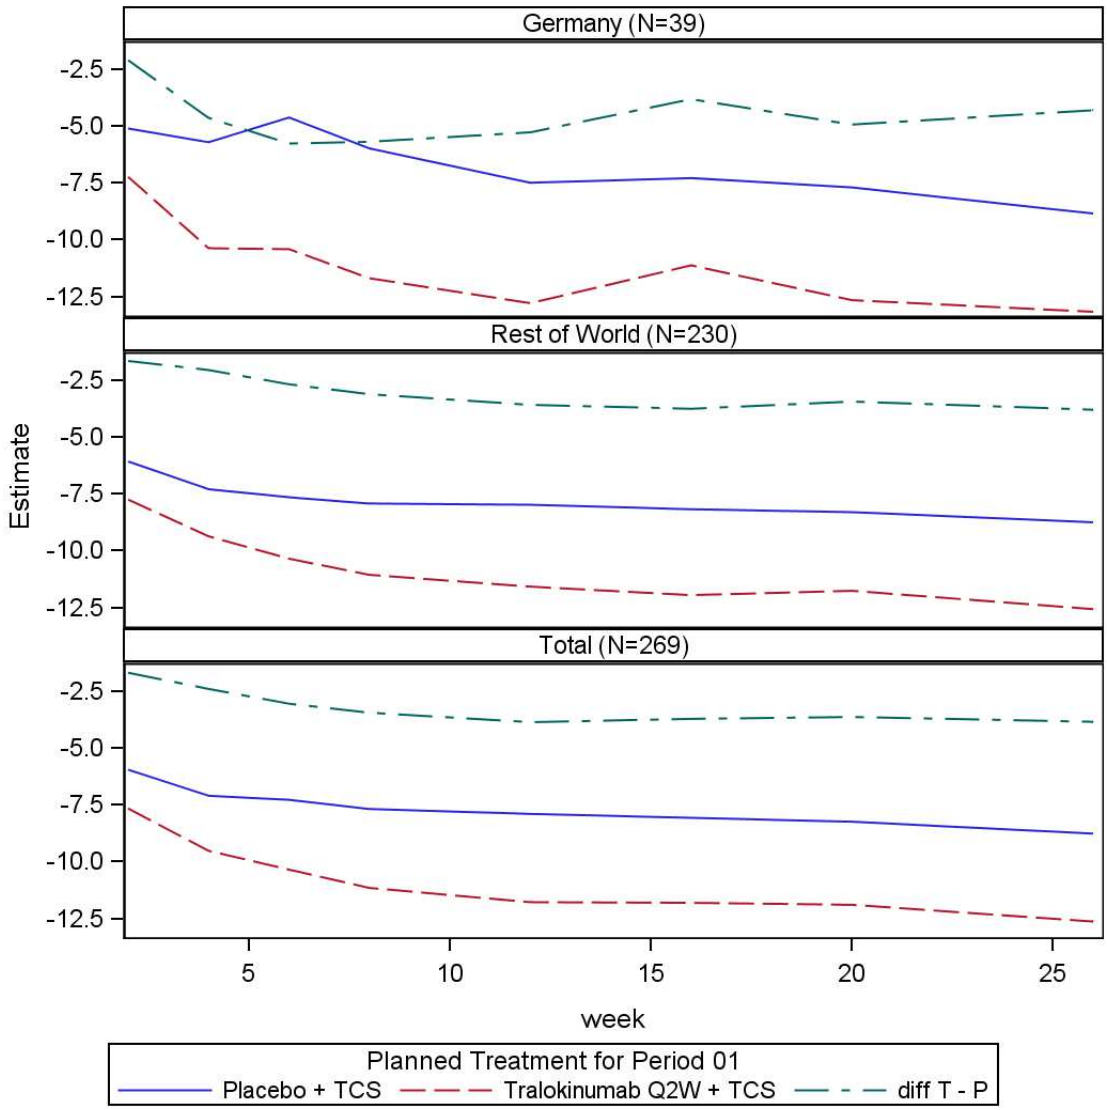
Figure 1.16.423.4.2: Total, Region, change in POEM, Treatment policy, LP0162-1346, Week 26



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8847
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1914
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data at week 26 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Prior CSA use + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7799
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.6152
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1048
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.9692
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8627
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8627
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0220
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0220
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.2260
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5437
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.2692
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Test for treatment and subgroup interaction: 0.0939
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0939
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.5689
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Test for treatment and subgroup interaction: 0.1240
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Model of Change in EASI = Treatment + Baseline + RDSCA + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

The number of subjects, percentage of subjects and number of events are summarised by preferred term and subgroup. All system organ class and preferred terms with a Chi-square treatment comparisons with p-values below 0.05 are included. Only subgroups with sufficient number of subjects and events are included.N: Number of exposed subjects, n: number of subjects with an event. %: percent of subjects with an event. rate/100PYE: number of events per 100 patient years of exposure. Q2W: Every 2 weeks. SOC: System organ class, PT: Preferred term. Chi-square test does not include continuity corrections or zero cell corrections. TEAESI: Treatment emergent adverse events of special interest
