Tralokinumab (Adtralza®)

LEO Pharma GmbH

Separater Anhang 4-G zu Modul 4 A

Behandlung von mittelschwerer bis schwerer atopischer Dermatitis bei Erwachsenen, die für eine kontinuierliche systemische Therapie in Frage kommen.

Stand: 14.07.2021

CONFIDENTIAL

4	1 (0.8%)	4 (1.6%)
5	1 (0.8%)	1 (0.4%)

Table 1.1.101.3.1.1: Total, Baseline characteristics of interest, LP0162-1339

	Placebo + TCS	Tralokinumab Q2W + TCS

Baseline characteristics are presented by randomized treatment and as total for the full analysis set. Numerical values are presented with mean and standard deviation. Categorical variables are presented with number of subjects and percentage of subjects. Q2W: Every 2 weeks. AD: Atopic Dermatitis. VAS: Visual Analogue Scale. Including subjects in the full analysis set. *Systemic immunosuppressants: Mycophenolate, Cyclosporine, Methotrexate, Azathioprine, Monoclonian antibody/Dupilumab. Including subjects in the full analysis set.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data at week 26 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Prior CSA use + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Table 1.1.434.4.1: Total, SCORAD 90, Treatment policy estimand, LP0162-1346, Week 26

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

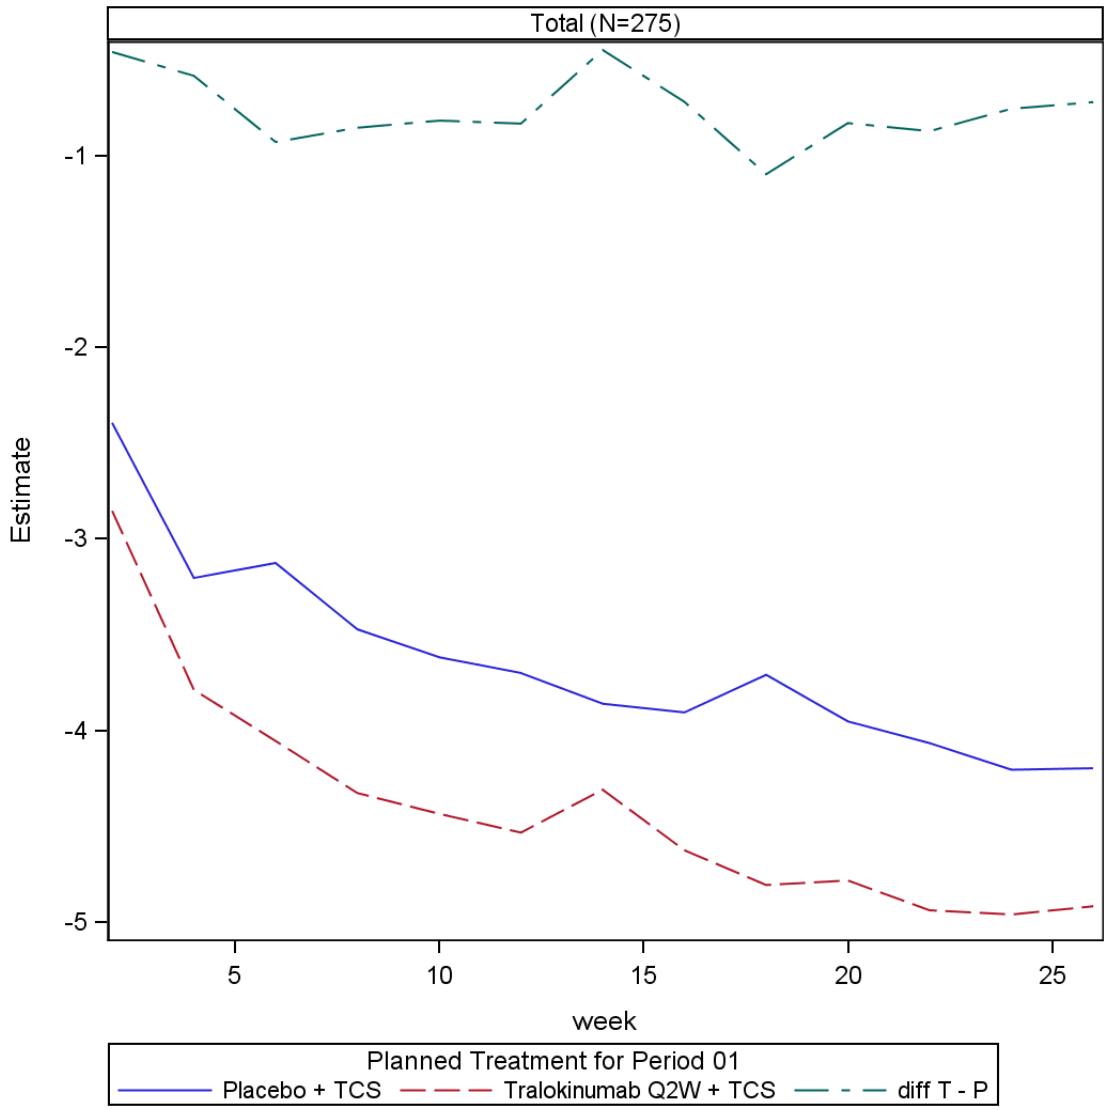
Figure 1.1.445.4.2: Total, change in SCORAD (Sleep loss VAS component), Treatment policy, LP0162-1346, Week 26



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction:
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Model of Change in EASI = Treatment + Baseline + RDSCA + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

EuroQoL 5-Dimension Health Questionnaire 5 Level (EQ-5D-5L) VAS		
Mean (sd)	58.0 (17.9)	60.3 (13.5)
EuroQoL 5-Dimension Health Questionnaire (EQ-5D) utility		
Mean (sd)	0.637 (0.27)	0.778 (0.15)
Patients that have tried systemic corticosteroids (%)		
No	3 (50.0%)	2 (33.3%)
Yes	3 (50.0%)	4 (66.7%)
Previous number of treatments with systemic immunosuppressants*		
0	2 (33.3%)	2 (33.3%)
1	3 (50.0%)	3 (50.0%)
2	1 (16.7%)	
3		1 (16.7%)

Baseline characteristics are presented by randomized treatment and as total for the full analysis set. Numerical values are presented with mean and standard deviation. Categorical variables are presented with number of subjects and percentage of subjects. Q2W: Every 2 weeks. AD: Atopic Dermatitis. VAS: Visual Analogue Scale. Including subjects in the full analysis set. *Systemic immunosuppressants: Mycophenolate, Cyclosporine, Methotrexate, Azathioprine, Monoclonian antibody/Dupilumab. Including subjects in the full analysis set.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7968
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.9993
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8723
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8731
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1947
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0016
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.2177
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.5644
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1693
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.1693
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

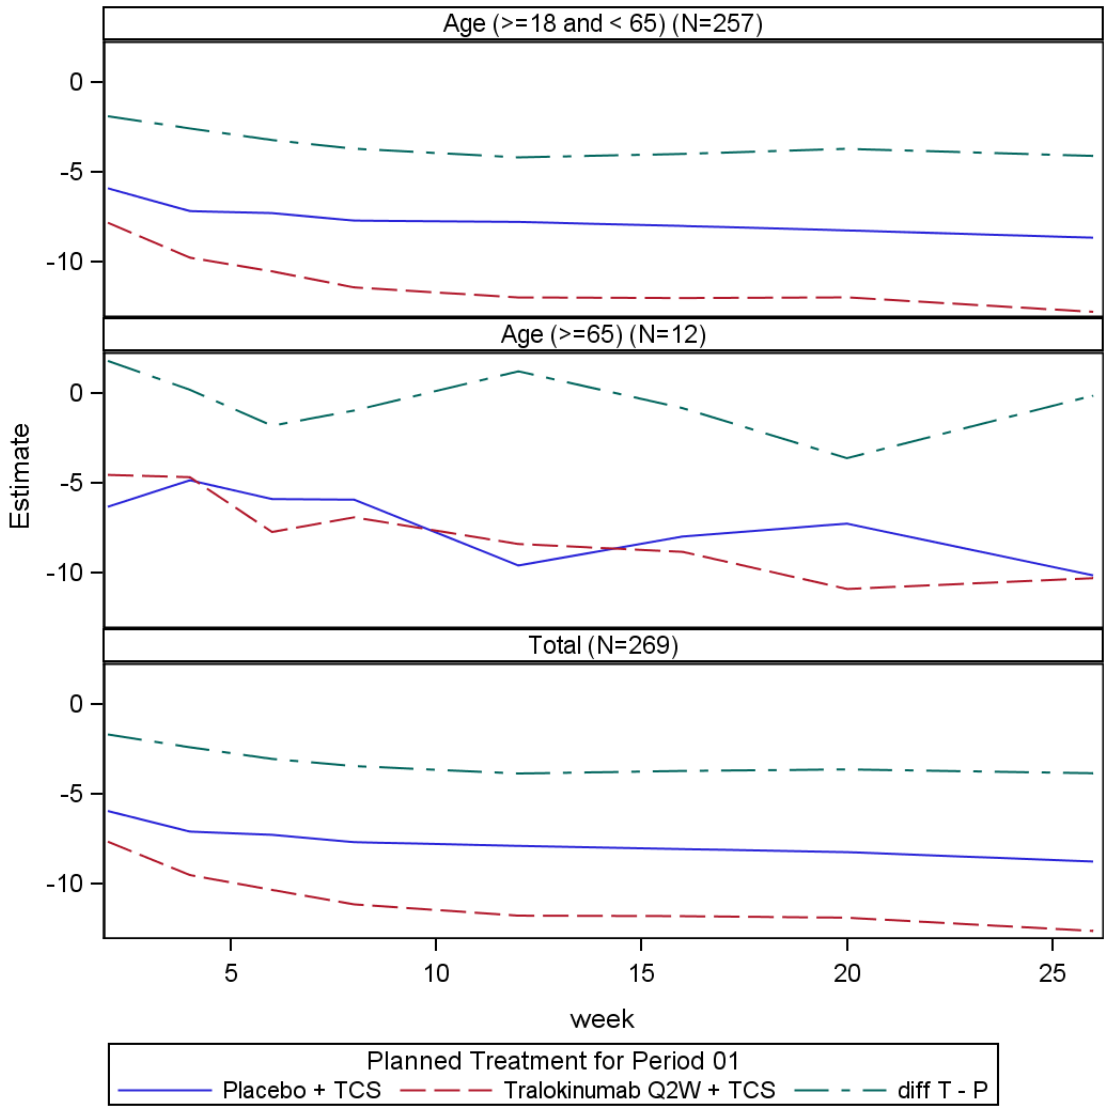
Figure 1.3.423.4.2: Total, Age group, change in POEM, Treatment policy, LP0162-1346, Week 26



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.0094
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

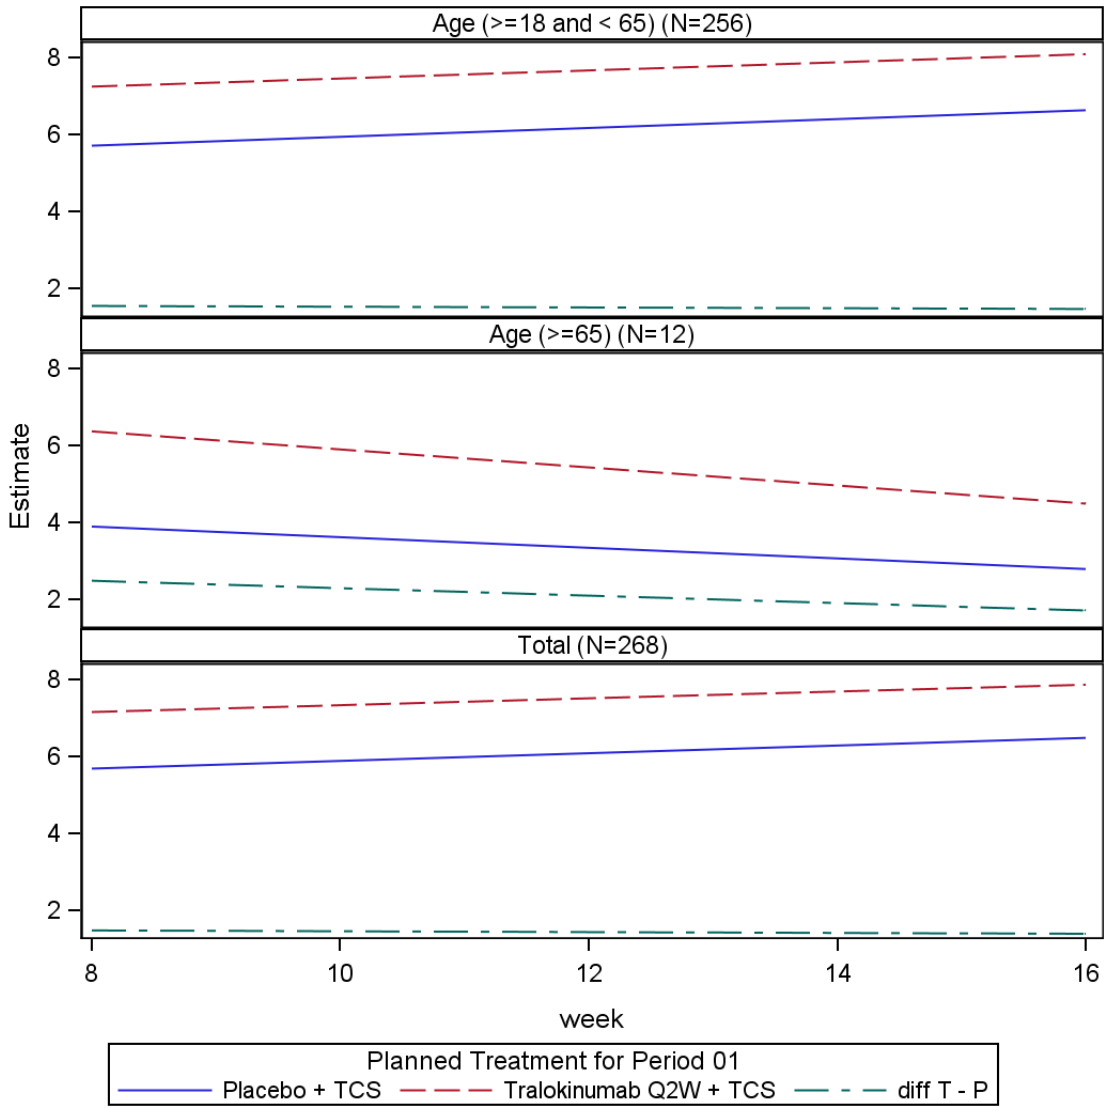
Figure 1.3.463.4.2: Total, Age group, change in SF-36 Physical Component Summary, Treatment policy, LP0162-1346, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8112
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

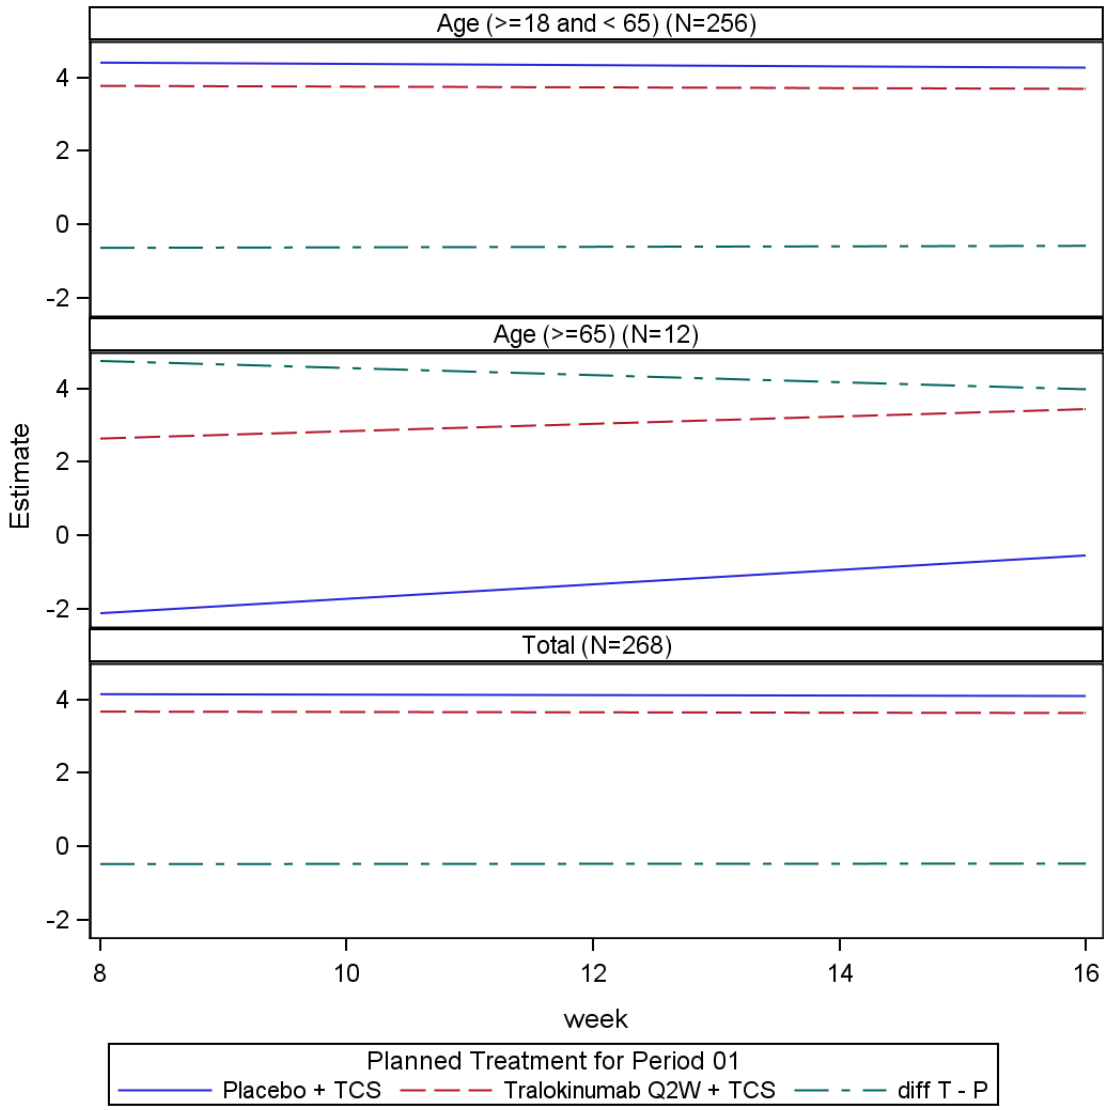
Figure 1.3.466.4.2: Total, Age group, change in SF-36 Mental Component Summary, Treatment policy, LP0162-1346, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Skin and subcutaneous tissue disorders
The number of subjects, percentage of subjects and number of events are summarised by preferred term and subgroup. All system organ class and preferred terms with a Chi-square treatment comparisons with p-values below 0.05 are included. Only subgroups with sufficient number of subjects and events are included.N: Number of exposed subjects, n: number of subjects with an event. %: percent of subjects with an event. rate/100PYE: number of events per 100 patient years of exposure. Q2W: Every 2 weeks. SOC: System organ class, PT: Preferred term. Chi-square test does not include continuity corrections or zero cell corrections. TEAESI: Treatment emergent adverse events of special interest

Severe [IGA=4]	30 (55.6%)	30 (52.6%)
Worst daily pruritus NRS (weekly average)		
Mean (sd)	7.7 (1.4)	7.6 (1.4)
Eczema-related sleep NRS (weekly average)		
Mean (sd)	6.9 (1.8)	6.7 (2.1)
Scoring Atopic Dermatitis (SCORAD)		
Mean (sd)	72.0 (13.9)	71.2 (11.9)
Dermatology Life Quality Index (DLQI)		
Mean (sd)	17.2 (6.6)	17.1 (6.8)
Hospital Anxiety and Depression Scale (HADS)		
Mean (sd)	13.9 (8.3)	11.3 (6.9)
EuroQoL 5-Dimension Health Questionnaire 5 Level (EQ-5D-5L) VAS		
Mean (sd)	48.5 (21.9)	56.9 (21.3)
EuroQoL 5-Dimension Health Questionnaire (EQ-5D) utility		
Mean (sd)	0.570 (0.26)	0.632 (0.22)
Patients that have tried systemic corticosteroids (%)		
No	21 (38.9%)	15 (26.3%)
Yes	33 (61.1%)	42 (73.7%)
Previous number of treatments with systemic immunosuppressants*		
0	10 (18.5%)	9 (15.8%)
1	34 (63.0%)	36 (63.2%)
2	8 (14.8%)	9 (15.8%)
3		2 (3.5%)
4	1 (1.9%)	1 (1.8%)
5	1 (1.9%)	

Baseline characteristics are presented by randomized treatment and as total for the full analysis set. Numerical values are presented with mean and standard deviation. Categorical variables are presented with number of subjects and percentage of subjects. Q2W: Every 2 weeks. AD: Atopic Dermatitis. VAS: Visual Analogue Scale. Including subjects in the full analysis set. *Systemic immunosuppressants: Mycophenolate, Cyclosporine, Methotrexate, Azathioprine, Monoclonian antibody/Dupilumab. Including subjects in the full analysis set.

Test for treatment and subgroup interaction: 0.0046
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

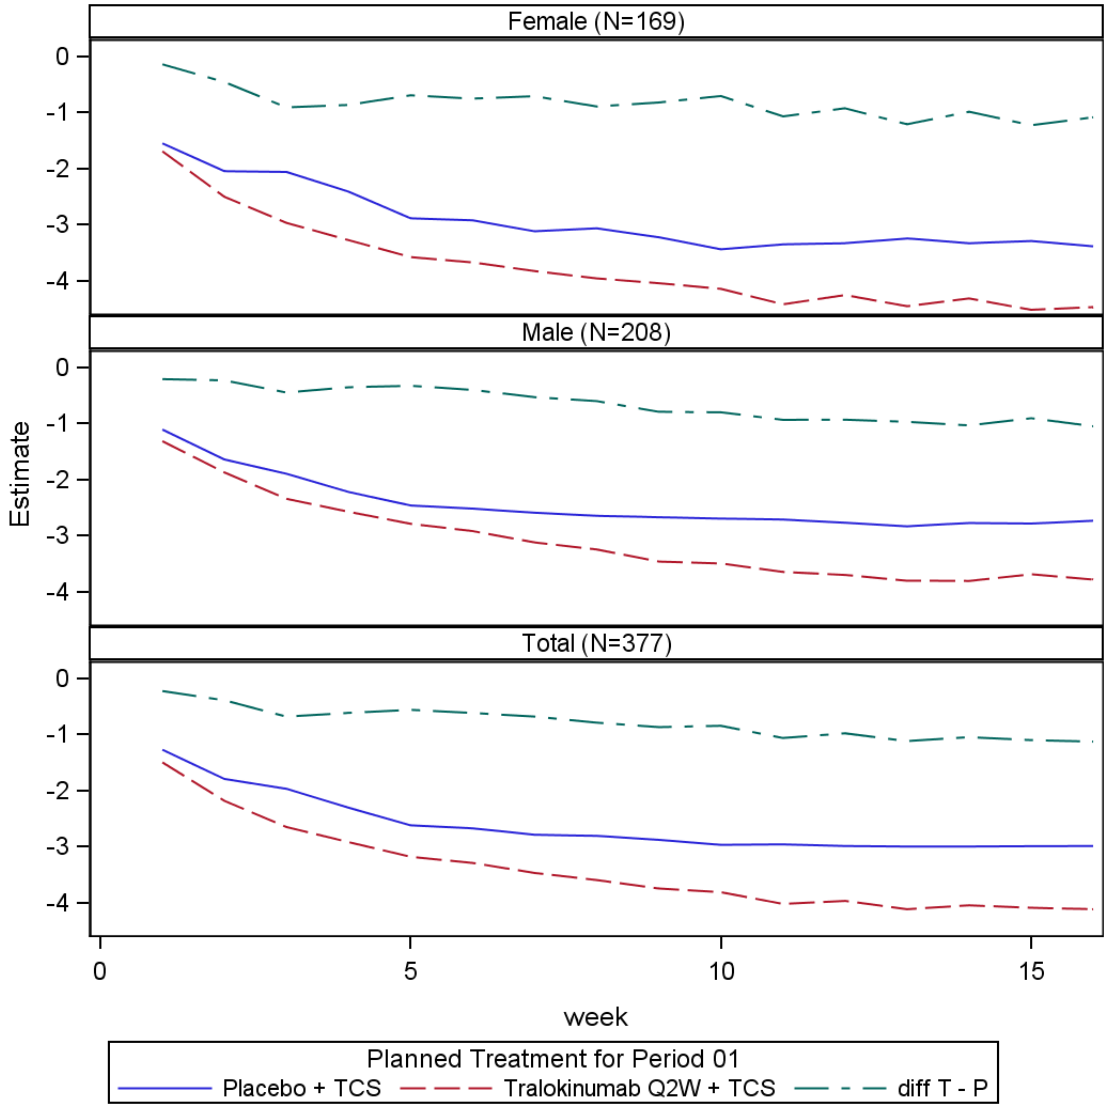
Figure 1.4.293.3.2: Total, Gender, change in Worst Daily Pruritus NRS (weekly average), Treatment policy estimand, LP0162-1339, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.3704
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0024
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0134
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.1666
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid region1 baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Region, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

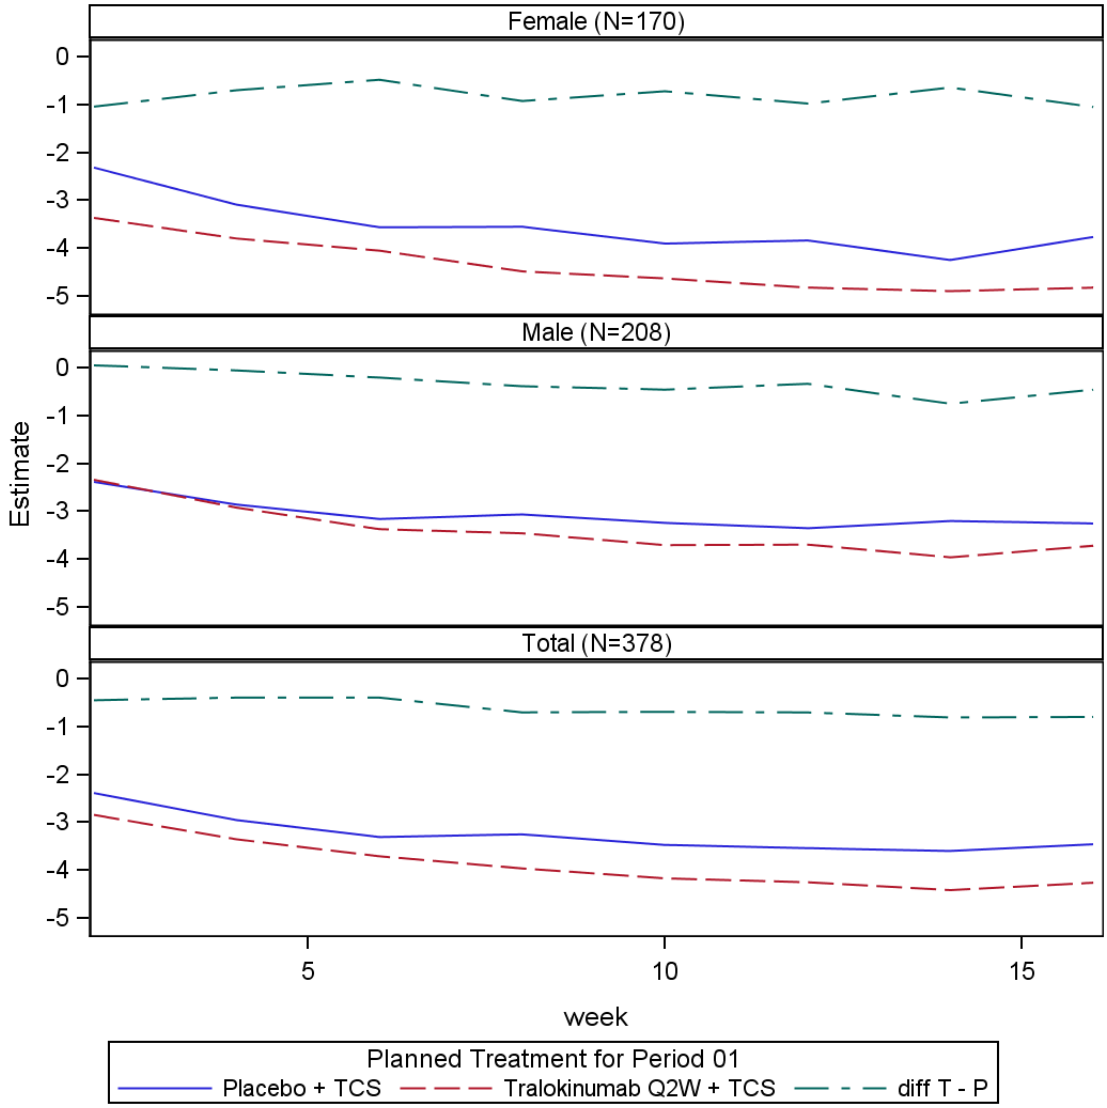
Figure 1.4.318.3.2: Total, Gender, change in SCORAD (Sleep loss VAS component), Treatment policy estimand, LP0162-1339, Week 16



Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Region + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0382
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data at week 26 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Prior CSA use + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Test for treatment and subgroup interaction: 0.0030
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0030
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8893
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.5243
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in EASI = Treatment*Week + [Baseline EASI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: <.0001
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: <.0001
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in NRS = Treatment*Week + [Baseline NRS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0885
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in SCORAD = Treatment*Week + [Baseline SCORAD]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.8136
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in DLQI = Treatment*Week + [Baseline DLQI]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

Test for treatment and subgroup interaction: 0.7845
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in POEM = Treatment*Week + [Baseline POEM]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.7975
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.0102
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data at week 26 is included as collected regardless of rescue medication or treatment discontinuation. Missing data are not imputed. Statistical model: value = Treatment + [Baseline value] + Prior CSA use + Baseline IGA. Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

Treatment effect is estimated as the least squares treatment difference using observed margins. Change from baseline is analysed in a linear effects model including treatment, Prior CSA use and IGA strata as fixed effects and baseline value as covariate.

SMD: Hedges' g (Least squares estimate normalized with common variance estimate of raw differences)
Test for treatment and subgroup interaction: 0.2905
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change in VAS = Treatment*Week + [Baseline VAS]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 2, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using an unrestricted covariance model.

Test for treatment and subgroup interaction: 0.0168
Interaction test: test for trt01p*week*subgroup in repeated model trt01p*week base*week studyid rdcsa baseiga trt01p*week*subgroup .
Data collected after permanent discontinuation of investigational medicinal product [IMP] or initiation of rescue medication is included. Repeated measurements model on post-baseline data: Change = Treatment*Week + [Baseline]*Week + Prior CSA use + Baseline IGA. In case of no post-baseline assessments before initiation of rescue medication, the Week 8, change is imputed as 0. The repeated measurements from baseline and up to analysis point are modelled in a mixed effects repeated measurement model. In case of no post-baseline assessments before initiation of rescue medication, the change to the first planned visit will be imputed as 0. N: Number of subjects, n: number of subjects with measurements at visit. Including Prior CSA use, baseline IGA, interaction between treatment and visit as fixed effects and interaction between baseline measurement and treatment as covariate. Repeated measures within subjects are modelled using a compound symmetry covariance model.

The number of subjects, percentage of subjects and number of events are summarised by preferred term and subgroup. All system organ class and preferred terms with a Chi-square treatment comparisons with p-values below 0.05 are included. Only subgroups with sufficient number of subjects and events are included.N: Number of exposed subjects, n: number of subjects with an event. %: percent of subjects with an event. rate/100PYE: number of events per 100 patient years of exposure. Q2W: Every 2 weeks. SOC: System organ class, PT: Preferred term. Chi-square test does not include continuity corrections or zero cell corrections. TEAE: Treatment emergent adverse events
