Abbreviations: CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; iPTH: intact parathyroid hormone; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from lnRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; iPTH: Parathyroid Hormone intact; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.

Abbreviations: CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; iPTH: intact parathyroid hormone; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.

95% CI	[-1.44, 0.54]		[-1.25, 0.80]		[-1.11, 0.33]	

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; iPTH: Parathyroid Hormone intact; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn’t meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: 25 D: 25-Hydroxyvitamin D; ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn’t meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: 25D: 25-Hydroxyvitamin D; CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: 25 D: 25-Hydroxyvitamin D; ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.

Abbreviations: 25D: 25-Hydroxyvitamin D; CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.

Abbreviations: CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; iPTH: intact parathyroid hormone; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.

Abbreviations: 25D: 25-Hydroxyvitamin D; CI: Confidence Interval; EAP: efficacy assessment phase; ER: Extended Release; ET: End of Treatment; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no responder in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk>1, Odds Ratio>1 and Risk Difference>0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.

Nachberechnungsdokument

Subgruppenanalysen - Sicherheitsendpunkte Sicherheits-relevante sHPT-assoziierte Parameter (ITT-Population)

Folgende Daten werden für die ITT-Population

- Absolute Veränderung des Kalzium-Spiegels (mg/dl) im Serum
- Absolute Veränderung des Phosphat-Spiegels (mg/dl) im Serum
- Absolute Veränderung des FGF-23-Spiegels (pg/ml) im Serum
- Absolute Veränderung der eGFR (ml/min/1,73 m^2)
- Absolute Veränderung der Albuminausscheidung (g/g Kreatinin) im Urin

für folgende Subgruppen dargestellt:

- Alter
- Geschlecht
- Gewicht
- Abstammung
- CKD-Stadium zu Baseline
- Schwere des sHPT zu Baseline
- Dosierung
- Einnahme von Vitamin D-Supplementen zu Baseline
- 25(OH)D-Spiegel im Serum zu Baseline

p-value	0.1548		0.1789		0.0479	
Hedges' g	0.36		0.38		0.40	
95% CI	[-0.14, 0.86]		[-0.16, 0.92]		[0.04, 0.77]	

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; ITT: Intention-To-Treat; LS: Least Square; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; ITT: Intention-To-Treat; LS: Least Square; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; ITT: Intention-To-Treat; LS: Least Square; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; ITT: Intention-To-Treat; LS: Least Square; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
25 D: 25-Hydroxyvitamin D.

Nachberechnungsdokument

Subgruppenanalyse - Sicherheitsendpunkte Sicherheits-relevante sHPT-assoziierte Parameter (PP-Population)

Folgende Daten werden für die PP-Population

- Absolute Veränderung des Kalzium-Spiegels (mg/dl) im Serum
- Absolute Veränderung des Phosphat-Spiegels (mg/dl) im Serum
- Absolute Veränderung des FGF-23-Spiegels (pg/ml) im Serum
- Absolute Veränderung der eGFR (ml/min/1,73 m^2)
- Absolute Veränderung der Albuminausscheidung (g/g Kreatinin) im Urin

für folgende Subgruppen dargestellt:

- Alter
- Geschlecht
- Gewicht
- Abstammung
- CKD-Stadium zu Baseline
- Schwere des sHPT zu Baseline
- Dosierung
- Einnahme von Vitamin D-Supplementen zu Baseline
- 25(OH)D-Spiegel im Serum zu Baseline

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
CKD: Chronic Kidney Disease
Source: Listing 14.8.1
Baseline: Baseline is defined as the last non-missing measurement prior to the start of study drug; Change from baseline : Visit 13-Baseline

Mean (SD)	3.9 (0.62)	3.9 (0.58)	4.0 (0.71)	3.8 (0.54)	4.0 (0.67)	3.9 (0.56)

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; EAP: Efficacy Assessment Phase; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn’t meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: ANCOVA: Analysis of Covariance; CI: Confidence Interval; Diff: Difference; ER: Extended Release; ET: End of Treatment; LS: Least Square; PP: Per-Protocol; SD: Standard Deviation; SEM: Standard Error of the Mean.
Statistical methods: The LS mean and LS mean difference of change from baseline are estimated from ANCOVA model that includes study, treatment and study-by-treatment interaction as fixed effects and baseline value as a covariate. The subgroup interaction p-value is calculated from Hedges' g using the fixed-effect model.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Nachberechnungsdokument

Subgruppenanalysen zu den Sicherheitsendpunkten (Unerwünschte Ereignisse (ITT-Population))

Folgende Daten werden für die ITT-Population:

- Gesamtraten
  - Jegliche UE
  - SUE
  - UE, die zum Therapieabbruch führten
  - UE, die zum Studienabbruch führten
  - UE, die zum Tod führten
  - UE nach Schweregrad (mild, moderat, schwer)
- Detailanalysen
  - UE (unabhängig vom Schweregrad) nach SOC und PT, die bei mindestens 10 % der Patienten in einem Behandlungsarm aufgetreten sind
  - SUE nach SOC und PT, die bei mindestens 5 % der Patienten in einem Behandlungsarm aufgetreten sind
  - Schwere UE nach SOC und PT, die bei mindestens 5 % der Patienten in einem Behandlungsarm aufgetreten sind
  - UE (unabhängig vom Schweregrad) nach SOC und PT, die bei mindestens zehn Patienten und bei mindestens 1 % der Patienten in einem Behandlungsarm aufgetreten sind
  - UE von besonderem Interesse (akutes Nierenversagen, Herzerkrankung
  - UE ohne erkrankungsbezogene Ereignisse

für folgende Subgruppen dargestellt:

- Alter
- Geschlecht
- Gewicht
- Abstammung
- CKD-Stadium zu Baseline
- Schwere des sHPT zu Baseline
- Dosierung
- Einnahme von Vitamin D-Supplementen zu Baseline
- 25(OH)D-Spiegel im Serum zu Baseline

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

RD [95%-CI]; p-value	0.05 [-0.03, 0.12], 0.2506		-0.07 [-0.21, 0.07], 0.3234		-0.01 [-0.08, 0.07], 0.8710	

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: ER: Extended Release; ITT: Intention-To-Treat; PT: Preferred Term; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.
S:/Departmental Shares/R&D/BIOMETRICS/Relypsa/BioStat/$Biometric/rayaldee_opko/amnog_b/pgm/s6_ttlpth/T12_4_4_1_1_m_soc_ae10pct_ttlpth.sas using SAS 9.4

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema. In AE severity analysis, a subject is only counted once with the maximum severity.
In AE severity analysis, a subject is only counted once with the maximum severity. Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema. In AE severity analysis, a subject is only counted once with the maximum severity.
In AE severity analysis, a subject is only counted once with the maximum severity. Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Table 12.4.8.1.2.s7
Summary of SAE Occurring ≥ 5 % in One Arm by PT
ITT Population
Subgroup: 1.Dose 30 ug vs 2.Dose 60 ug

No data satisfy criteria

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SAE: Serious Adverse Event; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: ADR: Adverse Drug Reaction; CI: Confidence Interval; ER: Extended Release; ITT: Intention-To-Treat; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk.
ADR includes any preferred term which contains Blood calcium increased, Hypercalcaemia, Blood phosphorus increased, Hyperphosphataemia, Constipation, Nausea, Diarrhoea, Abdominal discomfort, Abdominal pain upper, Dry mouth, Vomiting, Asthenia, Dizziness, Dizziness postural or Headache.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.

Nachberechnungsdokument

Subgruppenanalysen zu den Sicherheitsendpunkten (Unerwünschte Ereignisse (PP-Population))

Folgende Daten werden für die PP-Population:

- Gesamtraten
  - Jegliche UE
  - SUE
  - UE, die zum Therapieabbruch führten
  - UE, die zum Studienabbruch führten
  - UE, die zum Tod führten
  - UE nach Schweregrad (mild, moderat, schwer)
- Detailanalysen
  - UE (unabhängig vom Schweregrad) nach SOC und PT, die bei mindestens 10 % der Patienten in einem Behandlungsarm aufgetreten sind
  - SUE nach SOC und PT, die bei mindestens 5 % der Patienten in einem Behandlungsarm aufgetreten sind
  - Schwere UE nach SOC und PT, die bei mindestens 5 % der Patienten in einem Behandlungsarm aufgetreten sind
  - UE (unabhängig vom Schweregrad) nach SOC und PT, die bei mindestens zehn Patienten und bei mindestens 1 % der Patienten in einem Behandlungsarm aufgetreten sind
  - UE von besonderem Interesse (akutes Nierenversagen, Herzerkrankung
  - UE ohne erkrankungsbezogene Ereignisse
  - UE nach SOC und PT, die zum Abbruch führten

für folgende Subgruppen dargestellt:

- Alter
- Geschlecht
- Gewicht
- Abstammung
- CKD-Stadium zu Baseline
- Schwere des sHPT zu Baseline
- Dosierung
- Einnahme von Vitamin D-Supplementen zu Baseline
- 25(OH)D-Spiegel im Serum zu Baseline

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: ADR: Adverse Drug Reaction; CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk.
ADR includes any preferred term which contains Blood calcium increased, Hypercalcaemia, Blood phosphorus increased, Hyperphosphataemia, Constipation, Nausea, Diarrhoea, Abdominal discomfort, Abdominal pain upper, Dry mouth, Vomiting, Asthenia, Dizziness, Dizziness postural or Headache.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SAE: Serious Adverse Event; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.
S:/Departmental Shares/R&D/BIOMETRICS/Relypsa/BioStat/$Biometric/rayaldee_opko/amnog_b/pgm/s5_ckd_pp/T12_4_4_1_1_m_soc_ae10pct_ckd_pp.sas using SAS 9.4

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: ADR: Adverse Drug Reaction; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk.
ADR includes any preferred term which contains Blood calcium increased, Hypercalcaemia, Blood phosphorus increased, Hyperphosphataemia, Constipation, Nausea, Diarrhoea, Abdominal discomfort, Abdominal pain upper, Dry mouth, Vomiting, Asthenia, Dizziness, Dizziness postural or Headache.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
CKD: Chronic Kidney Disease
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from lnRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from lnRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.
S:/Departmental Shares/R&D/BIOMETRICS/Relypsa/BioStat/$Biometric/rayaldee_opko/amnog_b/pgm/s6_ttlpth_pp/T12_4_4_1_2_m_soc_ae1pct_ttlpth_pp.sas using SAS 9.4

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity. Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: ADR: Adverse Drug Reaction; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk.
ADR includes any preferred term which contains Blood calcium increased, Hypercalcaemia, Blood phosphorus increased, Hyperphosphataemia, Constipation, Nausea, Diarrhoea, Abdominal discomfort, Abdominal pain upper, Dry mouth, Vomiting, Asthenia, Dizziness, Dizziness postural or Headache.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
PTH: Parathyroid Hormone; 1st Tertile: Baseline PTH< 113.7 pg/mL; 2nd Tertile: 113.7<=Baseline PTH<153.7 pg/mL; 3rd Tertile: Baseline PTH>=153.7 pg/mL.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).

Abbreviations: CI: Confidence Interval; ER: Extended Release; OR: Odds Ratio; PP: Per-Protocol; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PP: Per-Protocol; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Only subjects who received actual treatment in Period 2 (after Week 12) are included in the analysis. Subjects who received ER-Calcifediol are classified into the dose group based on the treatment which they received (actual dose). Subjects who received placebo but met the uptitration criteria are classified into the dose group of 60 ug (expected dose); subjects who received placebo but didn't meet the uptitration criteria are classified into the dose group of 30 ug (expected dose).
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: AE: Adverse Event; CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SAE: Serious Adverse Event; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; OR: Odds Ratio; RD: Risk Difference; RR: Relative Risk; SOC: System Organ Class; TEAE: Treatment Emergent Adverse Event.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.

RD [95%-CI]; p-value	-0.06 [-0.21, 0.09], 0.4383		-0.03 [-0.13, 0.07], 0.5142		-0.05 [-0.14, 0.05], 0.3252	

Abbreviations: CI: Confidence Interval; ER: Extended Release; PP: Per-Protocol; MedDRA: Medical Dictionary for Regulatory Activities; OR: Odds Ratio; PT: Preferred Term; RD: Risk Difference; RR: Relative Risk; SMQ: Standardised MedDRA Queries (SMQs). SMQ of acute renal failure includes any preferred term which contains Azotaemia, Blood creatinine increased, Proteinuria, Renal failure or Renal impairment; SMQ of cardiac failure includes any preferred terms which contains Acute pulmonary oedema, Cardiac failure, Cardiac failure acute, Cardiac failure congestive, Cardiomegaly, Oedema, Oedema peripheral, Orthopnoea or Pulmonary oedema.
In AE severity analysis, a subject is only counted once with the maximum severity.
Statistical methods: The meta-analysis was conducted by pooled individual patient data without adjustment. If there is no event in one treatment group, 0.5 is added for calculation. The 95% CI is calculated by the Wald method. The subgroup interaction p-value is calculated from InRR using the fixed-effect model. Estimates of Relative Risk<1, Odds Ratio<1 and Risk Difference<0 are in favor of ER-Calcifediol.
25 D: 25-Hydroxyvitamin D.
Source: Listing 14.6.1
Note: Adverse Events were coded using MedDRA Dictionary version 15.0 or higher. TEAEs are defined as all AEs, regardless of relationship to Study Drug, which occur during or after treatment.
N (%): Percentage is based on randomized sample size as denominator. Subjects are counted only once for each SOC and Preferred Term.
