Hauptdokumente

POPULATION: mFAS
 ENDPOINT: Hospitalization or all-cause death by day 29
 MODEL: Stratified analysis for overall; stratification factor = country
 STUDY: R10933-10987-COV-2067
 Template Dichotomous analysis (efficacy)

		Casirivimab/Imdevimab				Placebo				Casirivimab/Imdevimab vs. Placebo							Casirivimab/Imdevimab vs. Placebo					Placebo vs. Casirivimab/Imdevimab					
		Patients		Patients with Event		Patients		Patients with Event		Odds Ratio			Absolute Risk Difference				Relative Risk					Relative Risk					
Name	Level	n	%	n	%	n	%	n	%	Odds Ratio	Convergence Reason	95% Lower CI	95% Upper CI	Absolute Risk	Convergence Reason	95% Lower CI	95% Upper CI	Relative Risk	Convergence Reason	95% Lower CI	95% Upper CI	p-value	Interaction Test p-value (Relative Risk)	Relative Risk	Convergence Reason	95% Lower CI	95% Upper CI
All	n/a	736	100.0	7	1.0	748	100.0	24	3.2	0.29	Algorithm converged.	0.12	0.68	-2.257	Algorithm converged.	-3.70	-0.81	0.30	Algorithm converged.	0.13	0.68	0.0024		3.37	Algorithm converged.	1.46	7.78

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.
 Clinical cut-off: 18Feb2021

Program: t-eff-resp.sas, binaryl-excel.sas
 Output: t12-1-eff-resp-strat-tthos.xlsx, t12-1-eff-resp-strat-tthos.pdf

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

EXECUTIVE SUMMARY*

At the onset of the COVID-19 global emergency, there was limited understanding of what constituted disease progression in COVID-19 and how the symptoms experienced by patients manifested themselves and/or impacted their lives. With limited availability of data and of COVID-19 specific regulatory guidance, Regeneron embraced the Food and Drug Administration (FDA)'s Roadmap to Patient-Focused Outcomes Measurement in Clinical Trials (FDA, 2015) to characterize the COVID-19 patient experience that, in turn, would enable conceptualization of treatment benefit, and thus inform patient-centered outcome measures and endpoints in casirivimab+imdevimab clinical development studies. Further, while there were existing measures such as the InFLUenza Patient-Reported Outcome (FLUPRO), there was no fit-for-purpose disease-specific instrument for COVID-19 for use in Regeneron's target population. Consequently, Regeneron developed and validated a new patient-reported outcomes (PRO) electronic diary, specifically focused on symptoms to gain insight into symptoms evolution in ambulatory patients with COVID-19. This work was initiated several months prior to the release of the FDA COVID-19 guidance on Assessing Symptoms in Outpatient Adults and Adolescents (FDA, 2020a).

The Symptoms Evolution of COVID-19 Instrument (SE-C19) was developed initially based on the Centers for Disease Control and Prevention (CDC) COVID symptom list (CDC, 2021) and available published literature specific to patients with COVID-19 (Michelen et al., 2020). The SE-C19 includes a list of 23 symptoms: fever, chills, sore throat, cough, shortness of breath or difficulty breathing, nausea, vomiting, diarrhea, headache, red or watery eyes, body aches such as muscle pain and joint pain, loss of taste or smell, fatigue, loss of appetite, confusion, dizziness, pressure or tightness in chest, chest pain, stomach-ache, rash, sneezing, sputum/phlegm, and runny nose. The good measurement principles outlined in the FDA PRO Guidance (FDA, 2009) and the four methodological Patient-Focused Drug Development Guidances (FDA, 2018, 2019a, 2019b, 2020b) were applied during the further development and evaluation of the instrument.

The content validity of the instrument was primarily demonstrated through interviews with patients that included an open-ended portion (concept elicitation) about their experience with COVID-19, and also asking them to respond and comment on the items themselves (cognitive debriefing). The concept elicitation established that the 23 items covered the most important and relevant symptoms for patients, confirming that no additional items were needed to capture the patient's experience of COVID-19. The patient interviews also confirmed that patients understood and could complete the items (with the exception of 'sputum/phlegm', which was not clear to some patients). Interviews with clinicians confirmed the patient perspectives, further establishing content validity.

Psychometric analyses of the SE-C19 were conducted on the blinded data from the Phase 1/2 trial and confirmed in the Phase 3 trial. All analyses were prespecified in independent analysis plans and were finalized prior to the database lock of both trials. These analyses demonstrated generally acceptable levels of test-retest reliability for the individual SE-C19 items, good known groups validity, responsiveness.

SE-C19

The collective empirical evidence from patients/clinician interviews as well as classical and modern psychometrics analyses provided support for the SE-C19 and its scoring. More specifically: 1) The psychometric analyses evaluating the performance of individual items suggested the removal of four items from any endpoint construction: vomiting, confusion, rash, and sneezing; 2) the analysis of the distribution of items response over time, ability to detect change, and known groups comparison has provided empirical evidence to support the observation that some symptoms may resolve at a slower rate than others during the course of the COVID-19 illness. We found that cough, headache, and fatigue were persistent over time, even though they showed sensitivity to change. These results suggest that when developing a time-to-resolution endpoint, it is pertinent to consider the different time scales of the resolution of those symptoms. Thus, any resolution of cough, fatigue and headache symptoms in this context of use would be most appropriate if patients experience ‘none’ or at most ‘mild/moderate’ levels; 3) finally, the Rasch analysis suggested that subjects were not able to differentiate between mild and moderate symptoms and as a result a modified symptom severity rating scale that collapses the mild/moderate categories was found to be most appropriate;

In infectious disease a successful treatment outcome is a complete resolution of symptoms (e.g., FDA 2011 on treatment of flu). As such, an endpoint based on the SE-C19 defines patients into responders and non-responders, where responders exhibit resolution of a specific set of symptoms at a certain point in time. In study COV-2067, a key secondary endpoint was the time to sustained COVID-19 resolution of symptoms for at least 1 day, as measured by the SE-C19 in a trial-specific daily symptom diary. Time to COVID-19 resolution of symptoms was defined as time from randomization to the first day during which the subject scored ‘no symptom’ (score of 0) on 16 symptoms, and ‘mild/moderate’ (score of 1) or ‘no symptom’ (score of 0) on 3 symptoms.

It is Regeneron’s position that the SE-C19 is fit for purpose for use as the basis of the key secondary symptom endpoint for study COV-2067 and appropriate to support a PRO labeling claim based upon the significant and clinically meaningful results.

*This executive summary is an excerpt of the "Patient-Reported Outcomes (PRO) Evidence Dossier: The Symptoms Evolution of Covid-19 (SE-C19) Instrument"

Test for action based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for action based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for action based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.
 Clinical cut-off: 18Feb2021

Program: t-ae-raw.sas, binary1-excel18.sas

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < =5 in any treatment group, p-value es based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value es based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

ENDPOINT: Any AEs

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < 5 in any treatment group, p-value es based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

⚠ np < =5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs (excluding disease related events)

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs (excluding disease related events)

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs (excluding disease related events)

Model: Unstratified analysis

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If $np < 5$ in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <=5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RRR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <=5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs (excluding disease related events)

Model: Unstratified analysis

STUDY: R10933-10987-COV-2067

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < =5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RRR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < =5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <=5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any AEs (excluding disease related events)

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If $np < 5$ in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If $n_p < 5$ in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 # np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RRR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If $n_p < 5$ in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is unreliable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).
 * indicates convergence problem. Result is uninterpretable.
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 Clinical cut-off: 18Feb2021

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is uninterpretable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

¶ np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Clinical cut-off: 18Feb2021

POPULATION: SAFETY

ENDPOINT: Any SAEs (excluding disease related events)

Test for interaction based on RR (Log-binomial regression).

* indicates convergence problem. Result is unreliable.

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.

Test for interaction based on RR (Log-binomial regression).

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < =5 in any treatment group, p-value is based on Fisher Exact Test.

* indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).

Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.

95% CI for the relative risk use Farrington-Manning method.

If np < =5 in any treatment group, p-value is based on Fisher Exact Test.

* indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Risk factors for Severe COVID-19		
Age ≥ 50 years	565 (47.36%)	594 (49.83%)
Obesity, defined as BMI ≥ 30	705 (59.09%)	687 (57.63%)
Cardiovascular disease, including hypertension	418 (35.04%)	439 (36.83%)
Chronic lung disease, including asthma	209 (17.52%)	200 (16.78%)
Type 1 or type 2 diabetes mellitus	153 (12.82%)	144 (12.08%)
Chronic kidney disease, including those on dialysis	9 (0.75%)	11 (0.92%)
Chronic liver disease	5 (0.42%)	8 (0.67%)
Immunocompromised	17 (1.42%)	32 (2.68%)
Immunosuppressed	17 (1.42%)	32 (2.68%)
Taking Immunosuppressants	0 (0.00%)	0 (0.00%)

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np < =5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.

Test for interaction based on RR (Log-binomial regression).
 Treatment comparison values is derived on Cochran-Mantel-Haenszel (CMH) method.
 95% CI for the relative risk use Farrington-Manning method.
 If np <= 5 in any treatment group, p-value is based on Fisher Exact Test.
 * indicates convergence problem. Result is uninterpretable.
