Dossier zur Nutzenbewertung gemäß § 35a SGB V

Tezepelumab (Tezspire®)

AstraZeneca GmbH

Modul 4 A – Anhang 4-G-9

Add-on-Erhaltungstherapie bei Erwachsenen und Jugendlichen ab 12 Jahren mit schwerem Asthma, das trotz hochdosierter inhalativer Kortikosteroide plus eines weiteren Arzneimittels zur Erhaltungstherapie unzureichend kontrolliert ist

Zusätzlicher Datenschnitt

Studie PATHWAY

RCT mit dem zu bewertenden Arzneimittel

Stand: 11.11.2022

Table PT2BA_IOOB0: Baseline age
DITT

	Treatment	N	n	Mean (SD)	Min	Q25	Q50	Q75	Max
Baseline age	Tezepelumab	137	137	52.7 (12.7)	21	46.0	55.0	61.0	75
	Placebo	138	138	52.3 (11.7)	20	45.0	54.0	61.0	74

Note: DITT = Dossier Intent-to-Treat Set.
N = total number of patients in analysis set. n = number evaluable values. SD = standard deviation. Q = quantile.
Results are presented in years.
Source Data: ASL, created on: 11AUG2022

Table PT2BAG1_IOOA0: Baseline age - categorical
DITT

		Tezepelumab		Placebo	
	Category	N	n (%)	N	n (%)
Baseline age - categorical	< 18 years	137	0 (0.0)	138	0 (0.0)
	18 to < 65 years	137	114 (83.2)	138	118 (85.5)

95% CI = 95% confidence interval coming from a negative binomial model. * = significant treatment effect.
A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

Note: DITT = Dossier Intent-to-Treat Set.
N = total number of patients in analysis set. nev = number of events. NE = not evaluable.
95% CI = 95% confidence interval coming from a negative binomial model. * = significant treatment effect.
A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

N = total number of patients in analysis set. nev = number of events. NE = not evaluable.
95% CI = 95% confidence interval coming from a negative binomial model. * = significant treatment effect.
A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

N = total number of patients in analysis set. nev = number of events. NE = not evaluable.
95% CI = 95% confidence interval coming from a negative binomial model. * = significant treatment effect.
A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

N = total number of patients in analysis set. nev = number of events. NE = not evaluable.
95% CI = 95% confidence interval coming from a negative binomial model. * = significant treatment effect.
A negative binomial model was applied per subgroup with factors treatment. The logarithm of time at risk (excluding time of exacerbations) was used as offset. No additional factors were considered to achieve robust results across all analyses.
To investigate interaction, the interaction effect is determined by the same model adding subgroup and subgroup*treatment interaction. i = significant interaction effect.

Note: DITTL = Dossier Label Intent-to-Treat Set.
N = total number of patients in analysis set. nev = number of patients with at least one event. NE = not evaluable.
95% CI = 95% confidence interval (median: Brookmeyer/Crowley hazard ratio: coming from Cox model).
A Cox proportional model was applied with a factor for treatment group and number of exacerbations in the previous year for each subgroup. * = significant treatment effect.
Interaction of subgroup with treatment is investigated with similar model by adding subgroup and interaction to the model.
i = significant interaction.

i = significant interaction effect. NE = not evaluable.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time and baseline as covariate. Only observed values are included into the model.
FEV1 Pre-BD = Forced expiratory volume in one second pre-bronchodilator measured in L. For investigation of heterogeneity, factors subgroup and interaction subgroup * treatment were added.

Note: DITTL = Dossier Label Intent-to-Treat Set.
N = total number of patients in analysis set. n = number of non-missing values. MMRM = Mixed Model Repeated Measures.
LS-Mean = Least square mean. SE = Standard error. 95% CI = 95% confidence interval. * = significant treatment effect.
A MMRM was applied with fixed factors for treatment, time, interaction treatment-by-time and baseline as covariate. Only observed values are included into the model. An unstructured covariance structure was used.
FEV1 Pre-BD = Forced expiratory volume in one second pre-bronchodilator measured in L.
