N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

#### Global Health Status

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	160 (42.9)	77 (41.8)	
Number of subjects censored, n (%)	213 (57.1)	107 (58.2)	
Median time to first event (months) [a]	14.4	8.4	
95% Confidence Interval	[9.8, 18.4]	[5.9, 10.8]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.6851
95% Confidence Interval			[0.5174, 0.9073]
p-value			0.0083
Stratified log-rank p-value [c]			0.0078

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

Functional Scales/Body Image

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	152 (40.8)	84 (45.7)	
Number of subjects censored, n (%)	221 (59.2)	100 (54.3)	
Median time to first event (months) [a]	13.8	5.1	
95% Confidence Interval	[9.7, NE]	[3.0, 9.8]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.6386
95% Confidence Interval			[0.4863, 0.8385]
p-value			0.0012
Stratified log-rank p-value [c]			0.0011

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

DE.T.3.10.1 - EORTC QLQ-BR45 - Definitive deterioration - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Functional Scales/Body Image

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	116 (31.1)	67 (36.4)	
Number of subjects censored, n (%)	257 (68.9)	117 (63.6)	
Median time to first event (months) [a]	20.1	9.5	
95% Confidence Interval	[16.3, NE]	[5.9, NE]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.5769
95% Confidence Interval			[0.4224, 0.7879]
p-value			0.0005
Stratified log-rank p-value [c]			0.0004

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

DE.F.3.11.1 - EORTC QLQ-BR45 - Mean change from baseline plot - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Number of subjects is number of subjects with an observation at the visit (i.e. scale score calculable for the visit). Error bars represent the 95% confidence interval for the mean value. A high score for EORTC-QLQ-C30 global health status represents a low/unhealthy level of functioning; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 symptom scale/item represents a high level of symptomology/problems; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 functional scale represents a low/unhealthy level of functioning A high score for the EQ-5D-5L VAS represents a low/unhealthy level of functioning;

DE.F.3.12.2 - EORTC QLQ-BR45 - Plot of least-square means of repeated measures analysis of change from baseline - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Least square mean (LSM) estimates of trastuzumab deruxtecan versus comparator and their 95% CI are calculated using a restricted maximum likelihood (REML) based mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment by time of visit interaction as well as the intercept as random effect. A high score for global health status represents a low quality of life (change of direction from raw score); a high score for a functional scale represents a low/unhealthy level of functioning; a high score for a symptom scale/item represents a high level of symptomology/problems.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.
