

# Dossier zur Nutzenbewertung gemäß § 35a SGB V

*Trastuzumab-Deruxtecan (Enhertu®)*

Daiichi Sankyo Deutschland GmbH

## Modul 4 A

*Erwachsene Patienten mit inoperablem oder metastasiertem HER2-low Brustkrebs, die bereits eine Chemotherapie in der metastasierten Situation erhalten haben*

Medizinischer Nutzen und  
medizinischer Zusatznutzen,  
Patientengruppen mit therapeutisch  
bedeutsamem Zusatznutzen

 Statistical analyses for AMNOG (HTA Germany)

Page 1 of 1  
 Final

DE.T.1.1.1 - Overall survival - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	149 (39.9)	90 (48.9)	
Number of subjects censored, n (%)	224 (60.1)	94 (51.1)	
Median time to first event (months) [a]	23.4	16.8	
95% Confidence Interval	[20.0, 24.8]	[14.5, 20.0]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.6408
95% Confidence Interval			[0.4903, 0.8375]
p-value			0.0011
Stratified log-rank p-value [c]			0.0010

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

DE.T.2.1.1 - Progression-free survival based on BICR - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	243 (65.1)	127 (69.0)	
Number of subjects censored, n (%)	130 (34.9)	57 (31.0)	
Median time to first event (months) [a]	9.9	5.1	
95% Confidence Interval	[9.0, 11.3]	[4.2, 6.8]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.5014
95% Confidence Interval			[0.4013, 0.6265]
p-value			<0.0001
Stratified log-rank p-value [c]			<0.0001

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

Number of subjects with events, n (%)	195 (52.3)	30 (16.3)	
95% CI [a]	(47.1, 57.4)	(11.3, 22.5)	
Odds ratio (95% CI) [b]			5.62 (3.62, 8.74)
Relative risk (95% CI) [b]			3.21 (2.28, 4.51)
Absolute risk reduction (95% CI) [b]			35.97 (28.21, 43.74)
p-value [c]			<0.0001

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set

[a] Based on Clopper-Pearson method for single proportion.

[b] Derived using the Cochran-Mantel-Haenszel method. Absolute risk reduction is presented on percentage point scale.

[c] Two-sided p-value based on the Cochran-Mantel-Haenszel test adjusted for randomization stratification factors.

N: number of subjects in analysis set; Nsub: number of number of subjects in subgroup category; %: proportion of subjects in subgroup category; OR: odds ratio; RR: risk ratio; ARR: absolute risk reduction (presented on percentage point scale).

[a] Based on Clopper-Pearson method for single proportion.

[b] Derived using the Cochran-Mantel-Haenszel method. Absolute risk reduction is presented on percentage point scale.

[c] Two-sided p-value derived from unstratified Cochran-Mantel-Haenszel test

[d] Two-sided p-value from Cochran's Q test for heterogeneity of relative risk.

Hazard Ratio			2.9392
95% Confidence Interval			[1.9948, 4.3309]
p-value			<0.0001
Stratified log-rank p-value [c]			<0.0001

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects with response in analysis set; Nsub: number of subjects with response in subgroup category; %: proportion of number of subjects with response in analysis set; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

DE.T.2.10.1 - Time to first hospitalization - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	90 (24.1)	33 (17.9)	
Number of subjects censored, n (%)	283 (75.9)	151 (82.1)	
Median time to first event (months) [a]	NE	NE	
95% Confidence Interval	[24.4, NE]	[9.3, NE]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.7716
95% Confidence Interval			[0.5108, 1.1657]
p-value			0.2181
Stratified log-rank p-value [c]			0.2168

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	144 (38.6)	60 (32.6)	
Number of subjects censored, n (%)	229 (61.4)	124 (67.4)	
Median time to first event (months) [a]	16.4	8.4	
95% Confidence Interval	[11.1, NE]	[6.1, NE]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.8075
95% Confidence Interval			[0.5939, 1.0978]
p-value			0.1724
Stratified log-rank p-value [c]			0.1692

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

EQ-5D-5L VAS

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	104 (27.9)	47 (25.5)	
Number of subjects censored, n (%)	269 (72.1)	137 (74.5)	
Median time to first event (months) [a]	21.7	17.3	
95% Confidence Interval	[18.1, NE]	[8.4, NE]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.6098
95% Confidence Interval			[0.4267, 0.8713]
p-value			0.0066
Stratified log-rank p-value [c]			0.0058

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

DE.F.3.3.1 - EQ-5D-5L VAS - Mean change from baseline plot - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Number of subjects is number of subjects with an observation at the visit (i.e. scale score calculable for the visit). Error bars represent the 95% confidence interval for the mean value. A high score for EORTC-QLQ-C30 global health status represents a low/unhealthy level of functioning; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 symptom scale/item represents a high level of symptomology/problems; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 functional scale represents a low/unhealthy level of functioning A high score for the EQ-5D-5L VAS represents a low/unhealthy level of functioning;

DE.T.3.4.1 - EQ-5D-5L VAS - Mixed Model for Repeated Measurement - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

EQ-5D-5L VAS\*

Parameter	n[a]	Estimate [b]	Standard Error	P-value
Intercept		-5.11	2.370	0.0315
Treatment				
T-DXd	346	-1.11	1.500	0.4588
TPC	162	0		
Time of Visit		0.01	0.004	0.0002
Treatment*Time of Visit		-0.01	0.004	0.0726

A negative estimate denotes an improvement in health status in terms of the scale/item being evaluated.

[a] n is the number of subjects included in the model in each treatment group.

[b] Estimates obtained from a mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment-by-time of visit interaction as well as the intercept as random effect.

\* Unstructured covariance matrix was used to model the correlation within subject; † AR(1) covariance structure used to model correlation within subjects; ‡ Compound symmetry covariance structure used to model correlation within subjects

Data source: DS8201-A-U303/restricted/rstrct\_eg/rstrct\_DCO\_20220111\_eg/rstrct\_eg\_valos/20220620\_heor\_AMNOG\_02/rstrct\_adam

DE.F.3.4.2 - EQ-5D-5L VAS - Plot of least-square means of repeated measures analysis of change from baseline - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Least square mean (LSM) estimates of trastuzumab deruxtecan versus comparator and their 95% CI are calculated using a restricted maximum likelihood (REML) based mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment by time of visit interaction as well as the intercept as random effect. A high score for global health status represents a low quality of life (change of direction from raw score); a high score for a functional scale represents a low/unhealthy level of functioning; a high score for a symptom scale/item represents a high level of symptomology/problems.

\* Unstructured covariance matrix was used to model the correlation within subject. † AR(1) covariance structure used to model correlation within subjects. ‡ Compound symmetry covariance structure used to model correlation within subjects

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

#### Global Health Status

	T-DXd (N=373)	TPC (N=184)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	160 (42.9)	77 (41.8)	
Number of subjects censored, n (%)	213 (57.1)	107 (58.2)	
Median time to first event (months) [a]	14.4	8.4	
95% Confidence Interval	[9.8, 18.4]	[5.9, 10.8]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			0.6851
95% Confidence Interval			[0.5174, 0.9073]
p-value			0.0083
Stratified log-rank p-value [c]			0.0078

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

DE.F.3.7.1 - EORTC QLQ-C30 - Mean change from baseline plot - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Number of subjects is number of subjects with an observation at the visit (i.e. scale score calculable for the visit). Error bars represent the 95% confidence interval for the mean value. A high score for EORTC-QLQ-C30 global health status represents a low/unhealthy level of functioning; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 symptom scale/item represents a high level of symptomology/problems; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 functional scale represents a low/unhealthy level of functioning A high score for the EQ-5D-5L VAS represents a low/unhealthy level of functioning;

DE.F.3.7.1 - EORTC QLQ-C30 - Mean change from baseline plot - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Number of subjects is number of subjects with an observation at the visit (i.e. scale score calculable for the visit). Error bars represent the 95% confidence interval for the mean value. A high score for EORTC-QLQ-C30 global health status represents a low/unhealthy level of functioning; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 symptom scale/item represents a high level of symptomology/problems; a high score for a EORTC-QLQ-C30 and EORTC-QLQ-BR45 functional scale represents a low/unhealthy level of functioning A high score for the EQ-5D-5L VAS represents a low/unhealthy level of functioning;

Time of Visit		0.00	0.006	0.4619
Treatment*Time of Visit		0.00	0.007	0.9737

A negative estimate denotes an improvement in health status in terms of the scale/item being evaluated.

[a] n is the number of subjects included in the model in each treatment group.

[b] Estimates obtained from a mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment-by-time of visit interaction as well as the intercept as random effect.

\* Unstructured covariance matrix was used to model the correlation within subject; † AR(1) covariance structure used to model correlation within subjects; ‡ Compound symmetry covariance structure used to model correlation within subjects

DE.F.3.8.2 - EORTC QLQ-C30 - Plot of least-square means of repeated measures analysis of change from baseline - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Least square mean (LSM) estimates of trastuzumab deruxtecan versus comparator and their 95% CI are calculated using a restricted maximum likelihood (REML) based mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment by time of visit interaction as well as the intercept as random effect. A high score for global health status represents a low quality of life (change of direction from raw score); a high score for a functional scale represents a low/unhealthy level of functioning; a high score for a symptom scale/item represents a high level of symptomology/problems.

DE.F.3.8.2 - EORTC QLQ-C30 - Plot of least-square means of repeated measures analysis of change from baseline - Destiny Breast 04 - DCO 11-Jan-2022 - full analysis set

Least square mean (LSM) estimates of trastuzumab deruxtecan versus comparator and their 95% CI are calculated using a restricted maximum likelihood (REML) based mixed model including terms for treatment, the randomization stratification factors, time of visit (days), and treatment by time of visit interaction as well as the intercept as random effect. A high score for global health status represents a low quality of life (change of direction from raw score); a high score for a functional scale represents a low/unhealthy level of functioning; a high score for a symptom scale/item represents a high level of symptomology/problems.

\* Unstructured covariance matrix was used to model the correlation within subject. † AR(1) covariance structure used to model correlation within subjects. ‡ Compound symmetry covariance structure used to model correlation within subjects

Data source: DS8201-A-U303/restricted/rstrct\_eg/rstrct\_DCO\_20220111\_eg/rstrct\_eg\_valos/20220620\_heor\_AMNOG\_02/rstrct\_adam

Stratified log-rank p-value [c]			<0.0001

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.
