[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; % proportion of number of subjects alive (i.e. response rate); EOT: end of treatment.

[a] Visit is based on the window rules specified in study SAP

[b] Subjects defined as alive at the respective timepoint if minimum(death date, data cutoff date) – randomization date + 1 >= study day corresponding to the opening of respective visit window. For EOT, 40 Day Follow-Up, and 3 Months Follow-Up visits, subjects that were ongoing on study treatment at data cutoff date are excluded as they are not eligible for this visit.

DE.T.4.1.1 - Treatment-emergent adverse events - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - safety analysis set

	T-DXd (N=371)	TPC (N=172)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	369 (99.5)	169 (98.3)	
Number of subjects censored, n (%)	2 (0.5)	3 (1.7)	
Median time to first event (months) [a]	0.1	0.1	
95% Confidence Interval	[NE, NE]	[0.1, 0.1]	
Stratified Cox proportional hazards model [b]			
Hazard Ratio			1.2098
95% Confidence Interval			[1.0005, 1.4628]
p-value			0.0494
Stratified log-rank p-value [c]			0.0504

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

Stratified Cox proportional hazards model [b] Hazard Ratio 95% Confidence Interval p-value			12.7480 [1.7448, 93.1395] 0.0121
Stratified log-rank p-value [c]			0.0012

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

DE.T.4.17.1 - Serious Adverse events of special interest - Adjudicated Interstitial lung disease/pneumonitis (ILD) - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - safety analysis set

	T-DXd (N=371)	TPC (N=172)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	16 (4.3)	1 (0.6)	
Number of subjects censored, n (%)	355 (95.7)	171 (99.4)	
Median time to first event (months) [a] 95% Confidence Interval	NE [NE, NE]	NE [NE, NE]	
Stratified Cox proportional hazards model [b] Hazard Ratio 95% Confidence Interval p-value			5.0501 [0.6570, 38.8197] 0.1197
Stratified log-rank p-value [c]			0.0845

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

DE.F.4.17.4 - Serious Adverse events of special interest - Adjudicated Interstitial lung disease/pneumonitis (ILD) - Kaplan-Meier plot - subgroup analysis - Destiny Breast 04 - DCO 11-Jan-2022 - safety analysis set

Patients still at risk:

	0	3	6	9	12	15	18	21	24	27	30	33
T-DXd (N = 334)	334	282	211	157	100	66	38	17	6	3	1	0
TPC (N = 159)	159	101	42	18	10	6	1	0	0	0	0	0

Hazard ratio (HR) is from unstratified Cox proportional hazards model and two-sided p-value is based on unstratified log-rank test. CI: confidence interval

Data source: DS8201-A-U303/restricted/rstrct\_eg/rstrct\_DCO\_20220111\_eg/rstrct\_eg\_valos/20220620\_heor\_AMNOG\_02/rstrct\_adam

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

Hazard Ratio			NE
95% Confidence Interval			[NE, NE]
p-value			0.9979
Stratified log-rank p-value [c]			0.5525

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

Stratified Cox proportional hazards model [b] Hazard Ratio 95% Confidence Interval p-value			NE [NE, NE] 0.9945
Stratified log-rank p-value [c]			0.1058

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors.

Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

DE.T.4.7.1 - Treatment-emergent adverse events by system organ class (SOC) and preferred term (PT) with incidence >= 10% in at least one arm - Time-to-event analysis - Destiny Breast 04 - DCO 11-Jan-2022 - safety analysis set

SOC: Vascular disorders; PT: Any PT

	T-DXd (N=371)	TPC (N=172)	Analysis T-DXd vs TPC
Number of subjects with events, n (%)	43 (11.6)	19 (11.0)	
Number of subjects censored, n (%)	328 (88.4)	153 (89.0)	
Median time to first event (months) [a] 95% Confidence Interval	NE [NE, NE]	NE [NE, NE]	
Stratified Cox proportional hazards model [b] Hazard Ratio 95% Confidence Interval p-value			0.7361 [0.4215, 1.2853] 0.2813
Stratified log-rank p-value [c]			0.2819

N: number of subjects in analysis set; %: proportion of number of subjects in analysis set; NE: not estimable

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from stratified Cox proportional hazards model with treatment as the only categorical variable in the model, stratified by the randomization stratification factors. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from stratified log-rank test using the same randomization stratification factors.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

[a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.

[b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.

[c] Two-sided p-value from unstratified log-rank test.

[d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; %: proportion of number of subjects in subgroup category; CI: confidence interval; NE: not estimable  
 [a] Median time to first event is from Kaplan-Meier estimate. Confidence Interval for median was computed using the Brookmeyer-Crowley method.  
 [b] Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the Wald test. p-value: two-sided p-value based on the Wald test.  
 [c] Two-sided p-value from unstratified log-rank test.  
 [d] Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the Wald test.
