Heterogeneity:	Q=.	p=.	I^2=.		

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MMRM=Mixed Model Repeated Measures, N=number of subjects, SMD=standardized mean difference, SoC=standard of care.
Note: SMD is estimated by Hedges g. On study level this was derived by a MIXED Model with factors treatment group, region, eGFR category at screening, type of albuminuria at screening, CVD history, time, treatment*time, baseline value and baseline value*time as covariate.
For 'Total' the same model as for single studies including study as additional factor was applied using separate unstructured covariance patterns for each treatment group.
For FIDELIO-DKD and 'Total' Visits 5, 8, 11 were included in the model and for FIGARO-DKD additionally Visit 14.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights.

Note: For single studies the RR is estimated by a GLM with factor treatment group using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
Category 'Missing' was excluded from meta-analysis.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, EQ-5D=EuroQOL group 5-dimension, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care, VAS=Visual Analogue Scale.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
Category 'Missing' was excluded from meta-analysis.

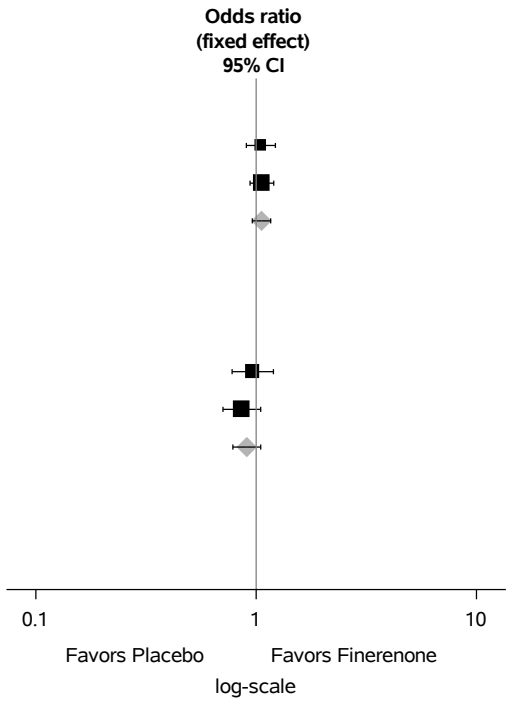
Subgroup Heterogeneity:	Q=2.98 (df=1)	p=0.0842	I^2=66.5%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, EQ-5D=EuroQOL group 5-dimension, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care, VAS=Visual Analogue Scale.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
Category 'Missing' was excluded from meta-analysis.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
Category 'Missing' was excluded from meta-analysis.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

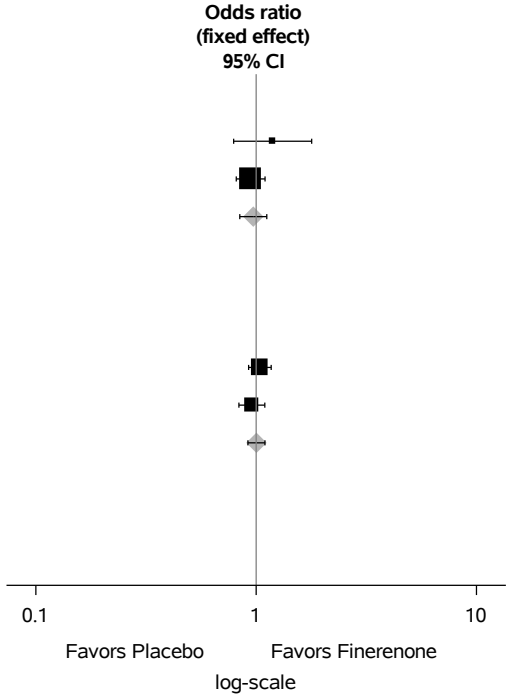
Subgroup Heterogeneity:	Q=0.15 (df=1)	p=0.6994	I^2=0.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For single studies the OR is estimated by a GLM with factor treatment group using a binomial distribution and logit as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

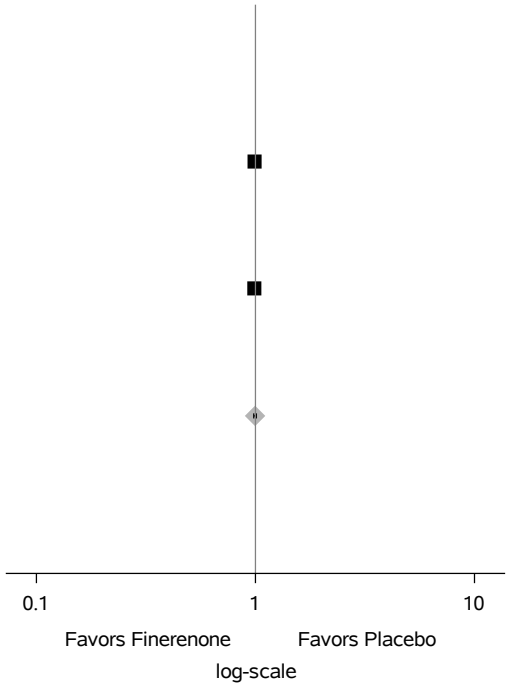
Total	5602 / 6510	5607 / 6489		1.00 [0.98,1.01]	Z=-0.57, p=0.5694
Heterogeneity:	Q=0.03 (df=1)	p=0.8534	I^2=0.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, RR=relative risk, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, PT=preferred term, RR=relative risk, SOC=system organ class, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, PT=preferred term, RR=relative risk, SOC=system organ class, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

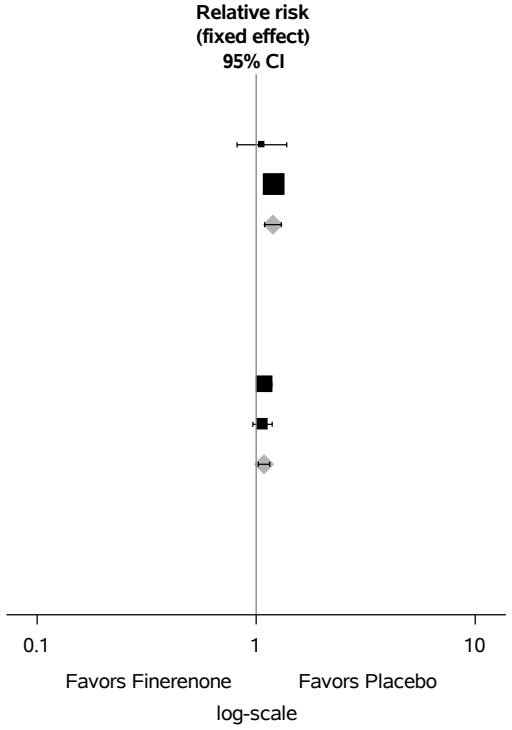
Heterogeneity:	Q=0.14 (df=1)	p=0.7081	I^2=0.0%		
Subgroup Heterogeneity:	Q=3.05 (df=1)	p=0.0806	I^2=67.2%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, PT=preferred term, RR=relative risk, SOC=system organ class, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

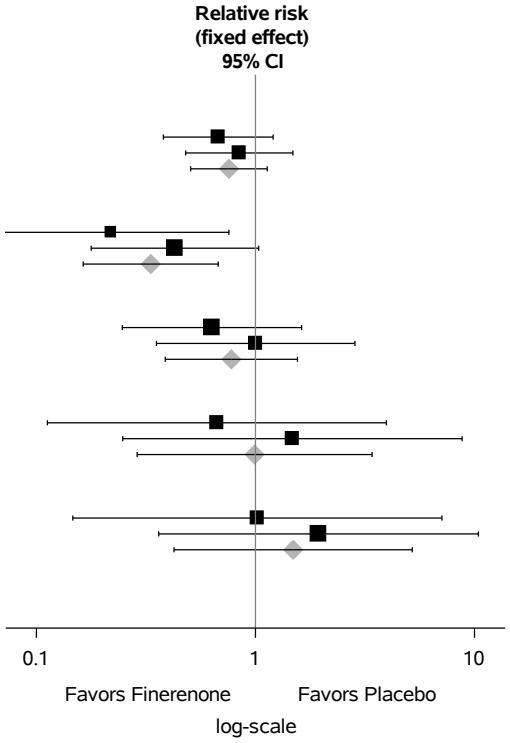
Heterogeneity:	Q=0.24 (df=1)	p=0.6230	I^2=0.0%		
Subgroup Heterogeneity:	Q=6.13 (df=4)	p=0.1894	I^2=34.8%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, PT=preferred term, RR=relative risk, SOC=system organ class, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

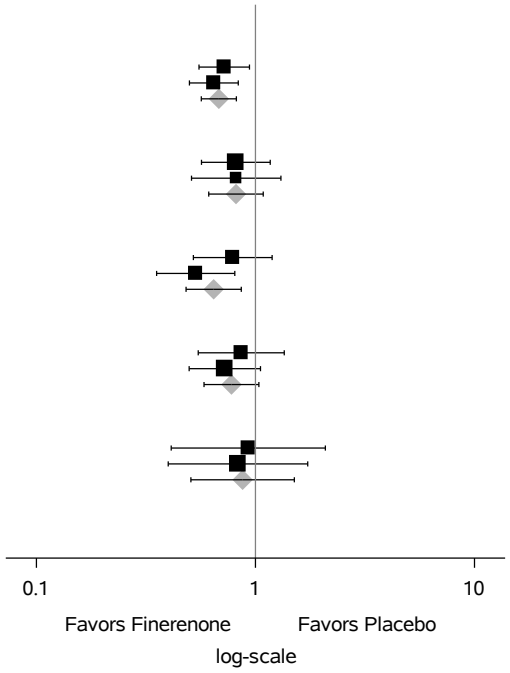
FIDELIO-DKD	10 / 99	11 / 101	45.0	0.93 [0.41,2.09]	
FIGARO-DKD	12 / 137	14 / 133	55.0	0.83 [0.40,1.73]	
Total	22 / 236	25 / 234		0.87 [0.51,1.50]	Z=-0.49, p=0.6263
Heterogeneity:	Q=0.04 (df=1)	p=0.8457	I^2=0.0%		
Subgroup Heterogeneity:	Q=2.39 (df=4)	p=0.6641	I^2=0.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDIGO=Kidney Disease: Improving Global Outcomes, PT=preferred term, RR=relative risk, SOC=system organ class, SoC=standard of care, TE(S)AE=treatment-emergent (serious) adverse event.
Note: For single studies the RR is estimated by a GLM with classification term for treatment using a binomial distribution and log as link function.
For 'Total' the same model as for single studies including study as additional factor was applied.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
