Dokumentvorlage, Version vom 16.12.2021

Dossier zur Nutzenbewertung gemäß § 35a SGB V

Finerenon (KERENDIA®)

Bayer Vital GmbH

Modul 4B, Anhang 4-I

Erwachsene mit chronischer Nierenerkrankung (Stadium 1 und 2 mit Albuminurie) und Diabetes mellitus Typ II

Medizinischer Nutzen und medizinischer Zusatznutzen, Patientengruppen mit therapeutisch bedeutsamem Zusatznutzen

Stand: 22.02.2023

Inhaltsverzeichnis

Table of contents

4.2 Disposition

Table 4.2 / 1: Subject disposition (all enrolled Fidelio - Subpopulation B: screening eGFR >= 60 ml/min/1.73m²)

Disposition	BAY 94-8862	Placebo	Total
Number of subjects			
Enrolled			13911
Screening failures			8177
Randomized	217	223	440
GCP VIOLATIONS	6	2	8
Full analysis set	211 (100.0%)	221 (100.0%)	432 (100.0%)
Study drug never administered	1 (0.5%)	0	1 (0.2%)
Treated	210 (99.5%)	221 (100.0%)	431 (99.8%)
Did not complete study	0	1 (0.5%)	1 (0.2%)
WITHDRAWN CONSENT	0	1 (0.5%)	1 (0.2%)
LOST TO FOLLOW-UP	0	0	0
Completed study	211 (100.0%)	220 (99.5%)	431 (99.8%)

Number of subjects enrolled is the number of subjects who signed informed consent, including subjects who switched from study 16244 to study 17530.
The subject is considered as having completed the study if there is a contact with the subject after the EOS notification or if the subject died. Contact with the subject can be actual visits, phone contacts, or information available from public records, etc.
Lost to follow-up includes all study non-completers who have not withdrawn consent. This definition does not necessarily meet the reasons for non-completion of the specified study epochs.
Number of enrolled subjects and screen failures refer to the full study population.

Table B2.0.5: Summary of Treatment Duration - Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone (N= 210)	Placebo (N= 221)	Total (N= 431)
Treatment duration (months)			
n	210	221	431
Mean	32.6	31.0	31.8
SD	11.42	12.66	12.08
Median	34.3	32.8	33.2
Q1-Q3	28.3 - 40.7	26.8 - 40.2	27.6 - 40.7
Range	0.33 - 50.37	0.59 - 49.54	0.33 - 50.37

Abbreviations: eGFR=estimated glomerular filtration rate, N=number of subjects, n=number of subjects with non-missing values in category, Q1=first quartile, Q3=third quartile, SD=standard deviation.
Note: Treatment duration is defined as the time from start of study drug to permanent stop of study drug (in months).

Table B2.1.1: Effect Measures of Proportion of Subjects with TEAEs
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=210)	Placebo (N=221)	Total (N=431)
Number of subjects at risk		210 (100.0%)	221 (100.0%)	431 (100.0%)
Number of subjects with events		181 (86.2%)	178 (80.5%)	359 (83.3%)
Number of subjects without events		29 (13.8%)	43 (19.5%)	72 (16.7%)
Odds Ratio [a]				
OR, 95% CI	1.508 [0.901, 2.522]			
p-value	0.1177			
Relative Risk [b]				
RR, 95% CI	1.070 [0.983, 1.164]			
p-value	0.1157			
Risk Difference [c]				
RD, 95% CI	0.056 [-0.014, 0.126]			
p-value	0.1139			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.2: Effect Measures of Proportion of Subjects with TEAEs Excluding Progression-Related Events
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=210)	Placebo (N=221)	Total (N=431)
Number of subjects at risk		210 (100.0%)	221 (100.0%)	431 (100.0%)
Number of subjects with events		176 (83.8%)	177 (80.1%)	353 (81.9%)
Number of subjects without events		34 (16.2%)	44 (19.9%)	78 (18.1%)
Odds Ratio [a]				
OR, 95% CI	1.287 [0.785, 2.108]			
p-value	0.3169			
Relative Risk [b]				
RR, 95% CI	1.046 [0.958, 1.143]			
p-value	0.3155			
Risk Difference [c]				
RD, 95% CI	0.037 [-0.035, 0.110]			
p-value	0.3146			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.3: Effect Measures of Proportion of Subjects with TESAEs
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

p-value	0.0030			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, PT=preferred term, RD=risk difference, RR=relative risk, SOC=system organ class, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Completed study	2324 (99.9%)	2298 (99.7%)	4622 (99.8%)

Number of subjects enrolled is the number of subjects who signed informed consent, including subjects who switched from study 16244 to study 17530.
The subject is considered as having completed the study if there is a contact with the subject after the EOS notification or if the subject died. Contact with the subject can be actual visits, phone contacts, or information available from public records, etc.
Lost to follow-up includes all study non-completers who have not withdrawn consent. This definition does not necessarily meet the reasons for non-completion of the specified study epochs.
Number of enrolled subjects and screen failures refer to the full study population.

Table of contents

1.1.1 Study duration

Table 1.1.1 / 1: Study duration (full analysis set - Figaro - Subpopulation B: screening eGFR >= 60 ml/min/1.73m²)

		BAY 94-8862 (N=2327)	Placebo (N=2304)	Total (N=4631)
Study duration (months)	n	2327	2304	4631
	Nmiss	0	0	0
	Mean	39.984	39.683	39.834
	SD	11.792	11.984	11.888
	Min	0.95	0.03	0.03
	Median	39.786	39.425	39.622
	Max	61.01	61.63	61.63

Study duration is defined as time from randomization to the EOS visit (or to last contact date if no EOS visit took place).

Table B2.0.5: Summary of Treatment Duration - Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Treatment duration (months)			
n	2326	2302	4628
Mean	35.7	35.4	35.6
SD	14.48	14.40	14.44
Median	35.8	35.6	35.7
Q1-Q3	27.2 - 46.9	26.8 - 47.0	27.0 - 46.9
Range	0.03 - 61.01	0.20 - 61.37	0.03 - 61.37

Abbreviations: eGFR=estimated glomerular filtration rate, N=number of subjects, n=number of subjects with non-missing values in category, Q1=first quartile, Q3=third quartile, SD=standard deviation.
Note: Treatment duration is defined as the time from start of study drug to permanent stop of study drug (in months).

Table B2.1.1: Effect Measures of Proportion of Subjects with TEAEs
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		1939 (83.4%)	1937 (84.1%)	3876 (83.8%)
Number of subjects without events		387 (16.6%)	365 (15.9%)	752 (16.2%)
Odds Ratio [a]				
OR, 95% CI	0.944 [0.808, 1.104]			
p-value	0.4708			
Relative Risk [b]				
RR, 95% CI	0.991 [0.966, 1.016]			
p-value	0.4707			
Risk Difference [c]				
RD, 95% CI	-0.008 [-0.029, 0.013]			
p-value	0.4707			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.2: Effect Measures of Proportion of Subjects with TEAEs Excluding Progression-Related Events
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		1926 (82.8%)	1924 (83.6%)	3850 (83.2%)
Number of subjects without events		400 (17.2%)	378 (16.4%)	778 (16.8%)
Odds Ratio [a]				
OR, 95% CI	0.946 [0.811, 1.104]			
p-value	0.4801			
Relative Risk [b]				
RR, 95% CI	0.991 [0.965, 1.017]			
p-value	0.4800			
Risk Difference [c]				
RD, 95% CI	-0.008 [-0.029, 0.014]			
p-value	0.4800			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.3: Effect Measures of Proportion of Subjects with TESAEs
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		666 (28.6%)	704 (30.6%)	1370 (29.6%)
Number of subjects without events		1660 (71.4%)	1598 (69.4%)	3258 (70.4%)
Odds Ratio [a]				
OR, 95% CI	0.911 [0.803, 1.033]			
p-value	0.1464			
Relative Risk [b]				
RR, 95% CI	0.936 [0.857, 1.023]			
p-value	0.1465			
Risk Difference [c]				
RD, 95% CI	-0.019 [-0.046, 0.007]			
p-value	0.1463			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.4: Effect Measures of Proportion of Subjects with TESAEs Excluding Progression-Related Events
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		661 (28.4%)	696 (30.2%)	1357 (29.3%)
Number of subjects without events		1665 (71.6%)	1606 (69.8%)	3271 (70.7%)
Odds Ratio [a]				
OR, 95% CI	0.916 [0.807, 1.040]			
p-value	0.1747			
Relative Risk [b]				
RR, 95% CI	0.940 [0.859, 1.028]			
p-value	0.1748			
Risk Difference [c]				
RD, 95% CI	-0.018 [-0.044, 0.008]			
p-value	0.1746			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.5: Effect Measures of Proportion of Subjects with Severe TEAEs
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		349 (15.0%)	410 (17.8%)	759 (16.4%)
Number of subjects without events		1977 (85.0%)	1892 (82.2%)	3869 (83.6%)
Odds Ratio [a]				
OR, 95% CI	0.815 [0.697, 0.952]			
p-value	0.0100			
Relative Risk [b]				
RR, 95% CI	0.842 [0.739, 0.960]			
p-value	0.0101			
Risk Difference [c]				
RD, 95% CI	-0.028 [-0.049, -0.007]			
p-value	0.0099			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, RD=risk difference, RR=relative risk, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.6: Effect Measures of Proportion of Subjects with Severe TEAEs Excluding Progression-Related Events
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)

Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

	Finerenone vs. Placebo	Finerenone (N=2326)	Placebo (N=2302)	Total (N=4628)
Number of subjects at risk		2326 (100.0%)	2302 (100.0%)	4628 (100.0%)
Number of subjects with events		96 (4.1%)	117 (5.1%)	213 (4.6%)
Number of subjects without events		2230 (95.9%)	2185 (94.9%)	4415 (95.4%)
Odds Ratio [a]				
OR, 95% CI	0.804 [0.610, 1.060]			
p-value	0.1216			
Relative Risk [b]				
RR, 95% CI	0.812 [0.624, 1.057]			
p-value	0.1217			
Risk Difference [c]				
RD, 95% CI	-0.010 [-0.022, 0.003]			
p-value	0.1211			

Abbreviations: CI=confidence interval, CVD=cardiovascular disease, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, N=number of subjects, OR=odds ratio, PT=preferred term, RD=risk difference, RR=relative risk, SOC=system organ class, TE(S)AE=treatment-emergent (serious) adverse event.
Note: Results shown in the second column based on GLMs with classification term for treatment. The GLMs were fitted by SAS PROC GENMOD with different link-functions and/or distributions.
[a] Estimated by a GLM with binomial distribution and logit as link function, [b] Estimated by a GLM with binomial distribution and log as link function.
[c] Estimated by a GLM with binomial distribution and identity as link function. RD = absolute risk of Finerenone - absolute risk of Placebo.
Wald chi-square p-values are presented.
* = model had convergence issues.

Table B2.1.167: Effect Measures of Proportion of Subjects with Severe TEAEs - Pneumonia (PT with Incidence >=1%)
Safety Analysis Set - Screening eGFR >= 60 ml/min/1.73m2

Completed study	2535 (99.9%)	2518 (99.7%)	5053 (99.8%)

Number of subjects enrolled is the number of subjects who signed informed consent, including subjects who switched from study 16244 to study 17530.
The subject is considered as having completed the study if there is a contact with the subject after the EOS notification or if the subject died. Contact with the subject can be actual visits, phone contacts, or information available from public records, etc.
Lost to follow-up includes all study non-completers who have not withdrawn consent. This definition does not necessarily meet the reasons for non-completion of the specified study epochs.
Number of enrolled subjects and screen failures refer to the full study population.

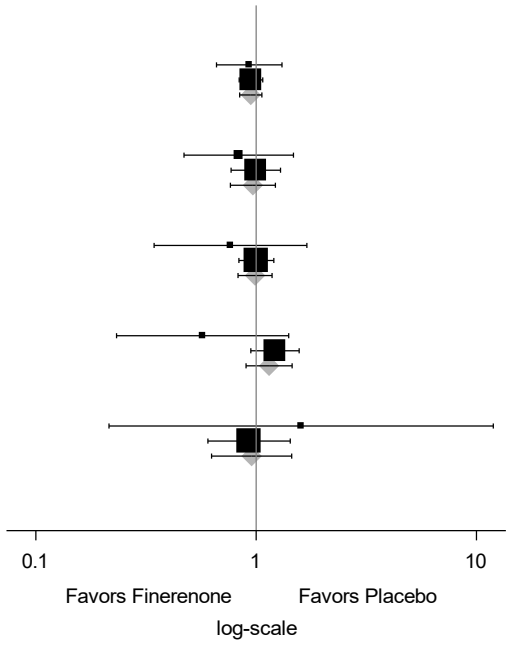
Subgroup Heterogeneity:	Q=2.01 (df=4)	p=0.7339	I^2=0.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, EQ-5D=EuroQOL group 5-dimension, GLM=generalized linear model, MID=minimal important difference, N=number of subjects, RR=relative risk, SoC=standard of care, VAS=Visual Analogue Scale.
Note: For 'Total' the RR is estimated by a GLM with factors treatment group and study using a binomial distribution and log as link function.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.

Subgroup Study	Finerenone + SoC Events / Total	Placebo + SoC Events / Total	Weight (%)	Odds ratio (fixed effect) 95% CI	Overall treatment effect
Overall					
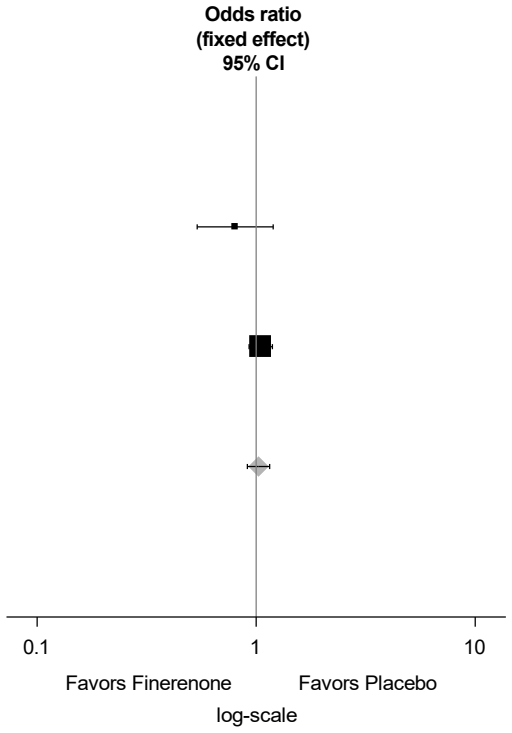
FIDELIO-DKD	68 / 211	82 / 221	8.6	0.80 [0.54,1.20]	
FIGARO-DKD	786 / 2327	753 / 2304	91.4	1.05 [0.93,1.19]	
Total	854 / 2538	835 / 2525		1.02 [0.91,1.15]	Z=0.41, p=0.6809
Heterogeneity:	Q=1.59 (df=1)	p=0.2076	I^2=37.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For 'Total' the OR is estimated by a GLM with factors treatment group, region, type of albuminuria at screening, CVD history and study using a binomial distribution and log as link function.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights.

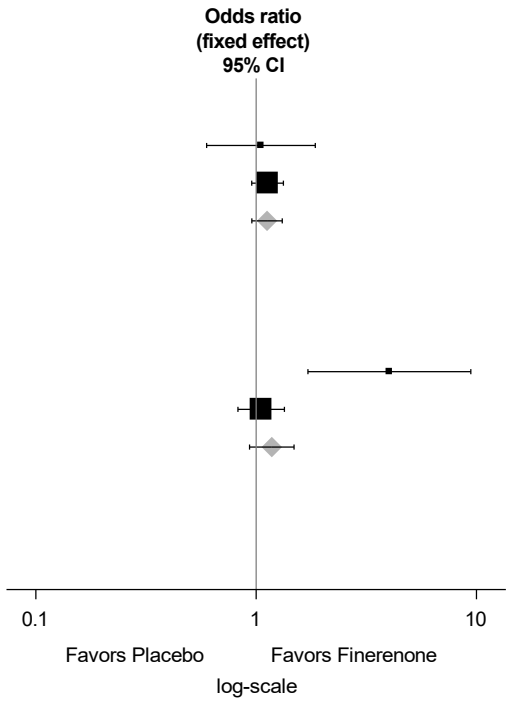
Total	209 / 774	175 / 731		1.18 [0.93,1.49]	Z=1.38, p=0.1688
Heterogeneity:	Q=8.81 (df=1)	p=0.0030	I^2=88.6%		
Subgroup Heterogeneity:	Q=0.12 (df=1)	p=0.7297	I^2=0.0%		



Abbreviations: CI=confidence interval, CVD=cardiovascular disease, DF=degrees of freedom, eGFR=estimated glomerular filtration rate, GLM=generalized linear model, KDQoL=Kidney Disease Quality of Life, MID=minimal important difference, N=number of subjects, OR=odds ratio, SoC=standard of care.
Note: For 'Total' the OR is estimated by a GLM with factors treatment group and study using a binomial distribution and logit as link function.
Analysis is based on all post-baseline assessments available for this parameter.
The heterogeneity between studies was analyzed using Cochrane's Q statistic with inverse variance weights. The same method was applied to assess the heterogeneity between subgroups.
Category 'Missing' was excluded from meta-analysis.

Figure B3.3.8.7: KDQoL-36 - Forestplot for Odds Ratio of Proportion of Subjects with at least one Improvement of Physical Component Summary of at least MID=8 by Age Group (years)
Full Analysis Set - Screening eGFR >= 60 ml/min/1.73m2
