Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

| 36 months | NE (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

| 36 months | NE (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Nausea / Vomiting - 10 pts sustained improvement

| | Cemiplimab (N=161) | Chemotherapy (N=137) |
|---|---|---|
| Patients with event, n (%) | 22 (13.7%) | 12 (8.8%) |
| Censored Patients, n (%) | 139 (86.3%) | 125 (91.2%) |
| Median (95% CI), (Months) [a] | 6.97 (2.07, 25.53) | NE (2.83, NE) |
| Unstratified log-rank test 2-sided p-value [b] | 0.5972 | |
| HR (95% CI) [c] | 1.212 (0.590, 2.489) | |
| HR P-Value [c] | 0.6006 | |
| Heterogeneity p-value [d] | 0.1901 | |
| Estimated Event-Free Probability, %(95% CI)[a] | | |
| 6 months | 51.5 (33.9, 66.6) | 53.3 (31.2, 71.2) |
| 12 months | 42.5 (24.6, 59.4) | NE (NE, NE) |
| 18 months | 35.5 (17.0, 54.5) | NE (NE, NE) |
| 24 months | 35.5 (17.0, 54.5) | NE (NE, NE) |
| 30 months | 0.0 (NE, NE) | NE (NE, NE) |
| 36 months | 0.0 (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

Histology: Adenocarcinoma/adenosquamous
Diarhoea - 10 pts sustained improvement

| | Cemiplimab (N=35) | Chemotherapy (N=46) |
|---|---|---|
| Patients with event, n (%) | 3 (8.6%) | 5 (10.9%) |
| Censored Patients, n (%) | 32 (91.4%) | 41 (89.1%) |
| Median (95% CI), (Months) [a] | 6.11 (1.45, NE) | 1.54 (1.45, 6.24) |
| Unstratified log-rank test 2-sided p-value [b] | 0.3717 | |
| HR (95% CI) [c] | 0.554 (0.130, 2.354) | |
| HR P-Value [c] | 0.4232 | |
| Heterogeneity p-value [d] | 0.3343 | |
| Estimated Event-Free Probability, %(95% CI)[a] | | |
| 6 months | 60.0 (12.6, 88.2) | 20.0 (0.8, 58.2) |
| 12 months | 30.0 (1.2, 71.9) | 0.0 (NE, NE) |
| 18 months | NE (NE, NE) | 0.0 (NE, NE) |
| 24 months | NE (NE, NE) | 0.0 (NE, NE) |
| 30 months | NE (NE, NE) | 0.0 (NE, NE) |
| 36 months | NE (NE, NE) | 0.0 (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

| 36 months | NE (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained improvement means those with consecutive achievement of 10 points improvement till the last assessment. For all 10 points improvement included in sustained improvement, the date of first 10 points improvement is used in the calculation of time. Time is defined as (date of first 10 points sustained improvement - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:21, yingyuan.lin)

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:51, yingyuan.lin)

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

| 36 months | NE (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

| 36 months | NE (NE, NE) | NE (NE, NE) |

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Program: /home/yingyuan.lin/sasdata/Data/Development/MA/R2810/R2810-ONC/MA/HTA-Germany-1676/Analysis_MA/Programs/t-tte-subgroup-sub-no-pdl1.sas (23JAN23:12:00:51, yingyuan.lin)

[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12

Data cut-off as of Jan 4th, 2021.
[a] Based on Kaplan-Meier method.
[b] Two-sided p-value is from unstratified log-rank test.
[c] Based on unstratified proportional hazards model (cemiplimab vs chemotherapy).
[d] Heterogeneity p-values are based on type 3 test of proportional hazards model with treatment, subgroup, treatment-by-subgroup as fixed factors.
Post baseline score is imputed using LOCF, then sustained deterioration means those with consecutive achievement of 10 points deterioration till the last assessment. For all 10 points deterioration included in sustained deterioration, the date of first 10 points deterioration is used in the calculation of time. Time is defined as (date of first 10 points sustained deterioration - Date of Randomization +1)/ 365.25*12
