* Based on a log-linked Poisson model with robust estimate of variance^, ** p-value corresponds to the treatment by subgroup interaction term. *** Based on a logistic regression model^ showing Wald confidence intervals.
^ Models contain terms age, baseline eGFR (CKD-EPI), baseline LVEF, Baseline KCCQ-OSS score, treatment, region, baseline diabetes status, sex, study, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N: Number of patients analysed, n: Number of patients with event.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline)
Subjects without a baseline or post-baseline KCCQ-OSS score are not included in the analysis.
For discontinued subjects, last available value was used. For completing subjects, last value up to last treatment intake + 7 days was used.

Table R.5.1.2.1.3: 2 Responder analysis for KCCQ-OSS change from baseline to last value during planned treatment period >= 15 points (improvement) overall and by subgroup - RS (OC-AD)

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

**Figure R.5.2.1: 2**

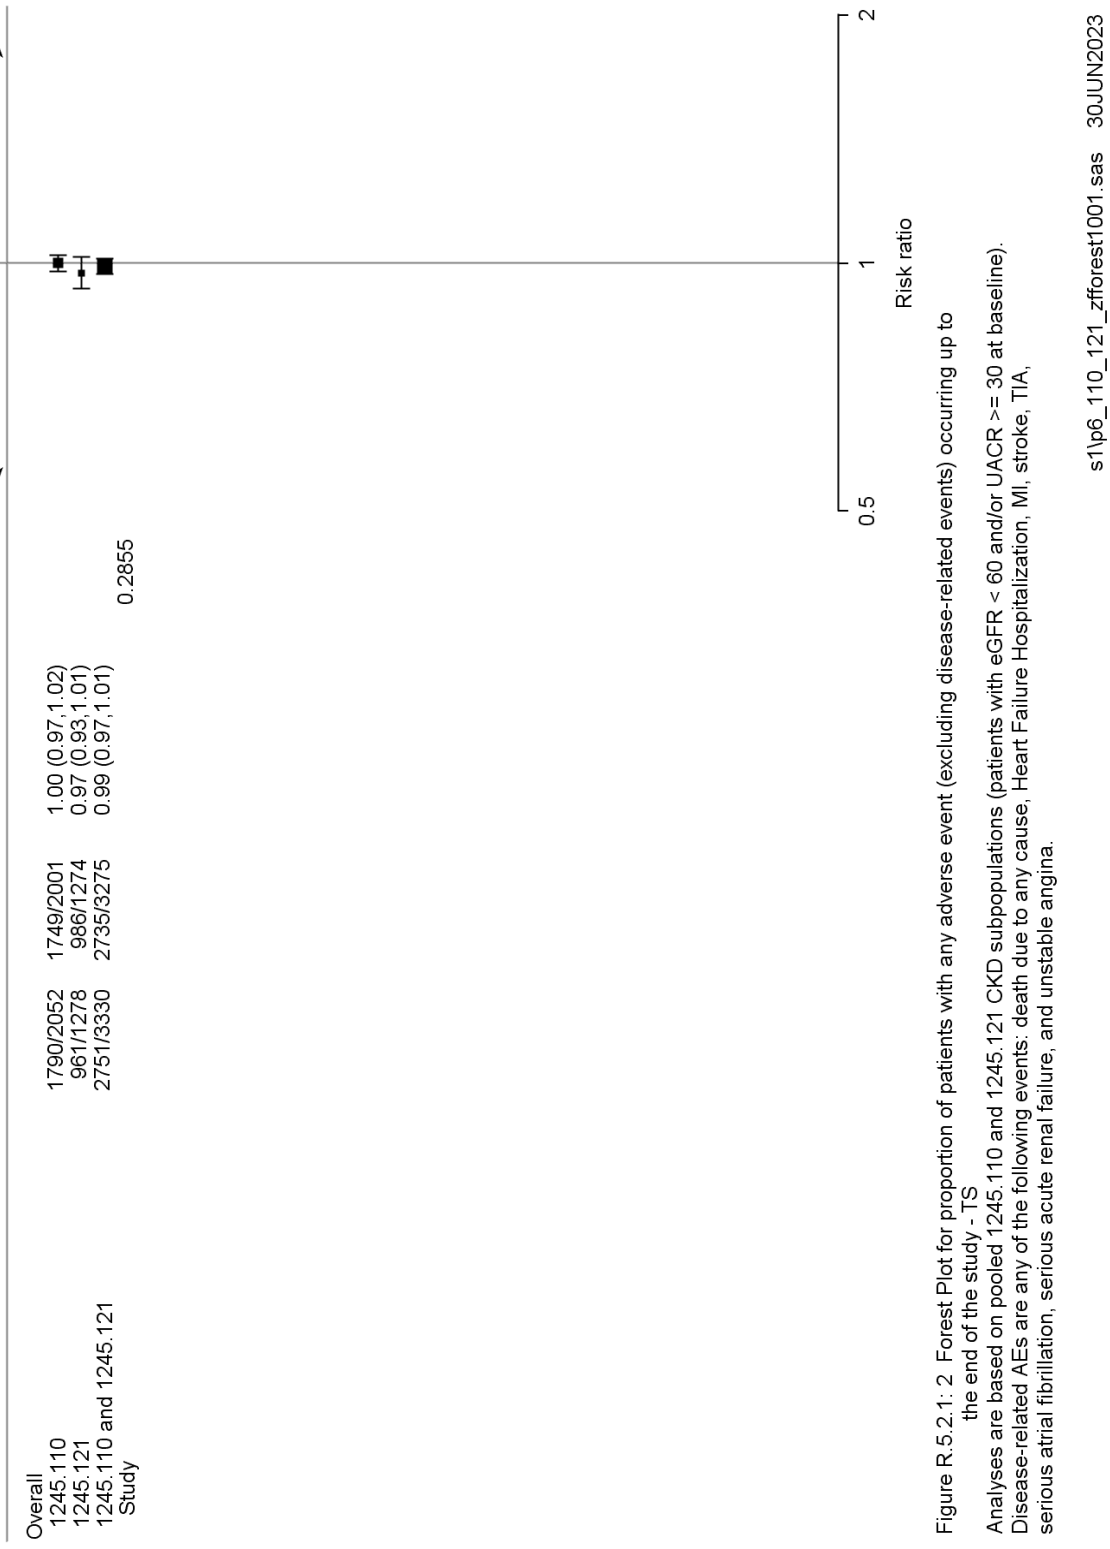

Figure R.5.2.1: 2 Forest Plot for proportion of patients with any adverse event (excluding disease-related events) occurring up to the end of the study - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.1: 4 Proportion of patients with serious adverse events (excluding disease-related events) occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Percentages are calculated using total number of patients per treatment as the denominator.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Events leading to lower limb amputation (investigator-defined)

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Volume depletion events (BIcMQ)

| Subgroup Category | Placebo N | Placebo n | Placebo % | Empa 10mg N | Empa 10mg n | Empa 10mg % | Empa 10mg vs Placebo p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Baseline use of diuretics | | | | | | | | | | | 0.9577 |
| No | 275 | 20 | 7.3 | 307 | 25 | 8.1 | 0.7025 | 1.12 ( 0.64, 1.96) | 1.13 (0.61, 2.07) | 0.01 (-0.03, 0.05) | |
| Yes | 3000 | 371 | 12.4 | 3023 | 424 | 14.0 | 0.0580 | 1.13 (<1.00, 1.29) | 1.16 (1.00, 1.34) | 0.02 ( 0.00, 0.03) | |

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Table R.5.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Hypoglycaemic events (SMQ)

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Table R.5.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study. ^ Not analysed because of zero events within at least one study, either overall or within subgroup.

**R.5.2.4**

Table R.5.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

| Overall | 3275 | 76 | 2.3 | 3330 | 60 | 1.8 | 0.1360 | 0.78 ( 0.55, 1.08) | 0.77 (0.55, 1.09) | -0.01 (-0.01, 0.00) | |

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.4: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.4: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

| Overall | 3275 | 254 | 7.8 | 3330 | 226 | 6.8 | 0.1223 | 0.87 ( 0.73, 1.04) | 0.86 ( 0.72, 1.04) | -0.01 (-0.02, 0.00) | |

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Cardiac failure congestive

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hyperkalaemia

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Type 2 diabetes mellitus

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hypomagnesaemia

| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 3275 | 40 | 1.2 | 3330 | 34 | 1.0 | 0.4388 | 0.84 ( 0.53, 1.32) | 0.83 ( 0.53, 1.32) | 0.00 (-0.01, 0.00) | |

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Gastrointestinal disorders
Preferred term: Diarrhoea

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Injury, poisoning and procedural complications
Preferred term: Skin laceration

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Blood and lymphatic system disorders
Preferred term: Anaemia

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Cardiac failure

Table R.5.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Acute myocardial infarction

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio | (95% CI) | Odds ratio | (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 3275 | 63 | 1.9 | 3330 | 65 | 2.0 | 0.9479 | 1.01 | ( 0.72, 1.43) | 1.01 | ( 0.71, 1.44) | 0.00 (-0.01, 0.01) | |

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Ventricular tachycardia

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
MedDRA version: 25.0. * CMH Test for general association for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction). Risk ratios, odds ratios, risk differences and p-values are adjusted for study.

Table R.5.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Infections and infestations
Preferred term: COVID-19
