Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.2: 2 Frequency of patients with AEs leading to treatment discontinuation occurring up to the end of the study by SOC and PT - TS

| System organ class/ Preferred term | Placebo N (%) | Placebo Time at risk (pt-yrs) | Placebo Rate /100 pt-yrs | Empa 10mg N (%) | Empa 10mg Time at risk (pt-yrs) | Empa 10mg Rate /100 pt-yrs |

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Events leading to lower limb amputation (investigator-defined)

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

| Overall | 1274 | 29 | 2.3 | 1278 | 25 | 2.0 | 0.5742 | 0.86 ( 0.51, 1.46) | 0.86 ( 0.50, 1.47) | 0.00 (-0.01, 0.01) | |

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.4: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Cardiac failure congestive

| Overall | 1274 | 50 | 3.9 | 1278 | 38 | 3.0 | 0.1879 | 0.76 ( 0.50, 1.15) | 0.75 ( 0.49, 1.15) | -0.01 (-0.02, 0.00) | |

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Infections and infestations
Preferred term: Influenza

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Haematuria

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Musculoskeletal and connective tissue disorders
Preferred term: Osteoarthritis

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Blood and lymphatic system disorders
Preferred term: Anaemia

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Cardiac failure

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Ventricular tachycardia

| Overall | 1274 | 36 | 2.8 | 1278 | 28 | 2.2 | 0.3051 | 0.78 | ( 0.48, 1.26) | 0.77 | ( 0.47, 1.27) | -0.01 (-0.02,0.01) | |

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.3.2.5: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: General disorders and administration site conditions
Preferred term: Death

Kidney disease progression is defined as continuous renal replacement therapy, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), renal death or a sustained decline of >= 40% in eGFR from baseline.

Figure R.4.1.1.2.9: 1 Time to first occurrence of continuous renal replacement therapy, sustained decline in eGFR below defined threshold or renal death, estimated cumulative incidence function (considering non-renal death as competing risk) - RS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Continuous renal replacement therapy is defined based on SSCMED and SSCWHO searches. A sustained decline in eGFR below defined threshold is defined as a sustained decline to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR <30.

* Based on a Cox regression model with terms age, sex, baseline BMI, baseline HbA1c, baseline eGFR (CKD-EPI), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Acute kidney injury is defined as events with the MedDRA Preferred Term "acute kidney injury".
MedDRA version: 18.0.

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Hypoglycaemic events (BIcMQ)

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Seriousness criteria of events was not assessed, therefore no serious Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Seriousness criteria of events was not assessed, therefore no serious Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Seriousness criteria of events was not assessed, therefore no serious Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Seriousness criteria of events was not assessed, therefore no serious Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Severity of events was not assessed, therefore no severe Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Severity of events was not assessed, therefore no severe Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Severity of events was not assessed, therefore no severe Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Severity of events was not assessed, therefore no severe Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg. A continuity correction by 0.5 is applied in case of any zero cells in contingency table. For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Lower Limb Amputation events were identified post-hoc from a list of reported terms. Severity of events was not assessed, therefore no severe Lower Limb Amputation events are presented.
$Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

**R.4.2.4**

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders

Table R.4.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS
System organ class: Eye disorders

| Subgroup Category | Placebo N | Placebo n | Placebo % | Empa 10mg N | Empa 10mg n | Empa 10mg % | Empa 10mg vs Placebo p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Overall | 1188 | 12 | 1.0 | 1171 | 17 | 1.5 | 0.3304 | 1.44 ( 0.69, 3.00) | 1.44 ( 0.69, 3.04) | 0.00 ( 0.00, 0.01) | |

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hyperglycaemia

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hyperkalaemia

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Gout

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hypokalaemia

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Gastrointestinal disorders
Preferred term: Constipation

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Gastrointestinal disorders
Preferred term: Gastritis

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Cardiac failure congestive

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** | |
| Overall | 1188 | 18 | 1.5 | 1171 | 10 | 0.9 | 0.1382 | 0.56 ( 0.26, 1.22) | 0.56 ( 0.26, 1.22) | -0.01 (-0.02, 0.00) | | |

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Bradycardia

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Renal failure

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Dysuria

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Renal cyst

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Investigations
Preferred term: Blood uric acid increased

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: General disorders and administration site conditions
Preferred term: Peripheral swelling

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Vascular disorders
Preferred term: Hypotension

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Respiratory, thoracic and mediastinal disorders
Preferred term: Oropharyngeal pain

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Blood and lymphatic system disorders
Preferred term: Eosinophilia

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Ear and labyrinth disorders
Preferred term: Vertigo

| Very high | 167 | 1 | 0.6 | 162 | 0 | 0 | 0.4915 | 0.34 ( 0.01, 8.37) | 0.34 ( 0.01, 8.45) | -0.01 (-0.02, 0.01) | |
| Baseline use of ACE-inhibitor, ARB or ARNi | | | | | | | | | | | 0.5060 |
| No | 205 | 2 | 1.0 | 211 | 1 | 0.5 | 0.5455 | 0.49 ( 0.04, 5.32) | 0.48 ( 0.04, 5.37) | -0.01 (-0.02, 0.01) | |
| Yes | 983 | 11 | 1.1 | 960 | 2 | 0.2 | 0.0138 | 0.19 ( 0.04, 0.84) | 0.18 ( 0.04, 0.83) | -0.01 (-0.02, 0.00) | |
| Baseline use of beta-blockers | | | | | | | | | | | 0.9137 |
| No | 422 | 4 | 0.9 | 408 | 1 | 0.2 | 0.1909 | 0.26 ( 0.03, 2.30) | 0.26 ( 0.03, 2.31) | -0.01 (-0.02, 0.00) | |
| Yes | 766 | 9 | 1.2 | 763 | 2 | 0.3 | 0.0347 | 0.22 ( 0.05, 1.03) | 0.22 ( 0.05, 1.03) | -0.01 (-0.02, 0.00) | |
| Baseline use of diuretics | | | | | | | | | | | |
| No | 629 | 6 | 1.0 | 589 | 2 | 0.3 | | | | | |
| Yes | 559 | 7 | 1.3 | 582 | 1 | 0.2 | | | | | |

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Respiratory, thoracic and mediastinal disorders
Preferred term: Dyspnoea

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 1188 | 12 | 1.0 | 1171 | 5 | 0.4 | 0.0941 | 0.42 ( 0.15, 1.20) | 0.42 ( 0.15, 1.20) | -0.01 (-0.01, 0.00) | |

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Musculoskeletal and connective tissue disorders
Preferred term: Osteoarthritis

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.4.2.5: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Acute kidney injury

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 1188 | 12 | 1.0 | 1171 | 7 | 0.6 | 0.2626 | 0.59 ( 0.23, 1.50) | 0.59 ( 0.23, 1.50) | 0.00 (-0.01, 0.00) | |

Analyses are based on 1245.25 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 18.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

**R.4.2.6**

R.4.2.6 Medical concepts for adverse events of special interest and other specific AEs

Listing R.4.2.6: 1 Preferred terms that define adverse events of special interest and other specific AE categories defined via BIcMQ, SMQs or user-defined searches

| Source | Group | Group code Scope | Preferred term code | Preferred term |
|---|---|---|---|---|
| All events of sub-BIcMQ 'Pyelonephritis', all events of PT 'Urosepsis' | Pylenophritis or Urosepsis (BIcMQ) | 0000000101 | 10023424 | Kidney infection |
| | | | 10034531 | Perinephric abscess |
| | | | 10037596 | Pyelonephritis |
| | | | 10037597 | Pyelonephritis acute |
| | | | 10037601 | Pyelonephritis chronic |
| | | | 10037603 | Pyelonephritis mycoplasmal |
| | | | 10037653 | Pyonephrosis |
| | | | 10038351 | Renal abscess |
| | | | 10048709 | Urosepsis |
| | | | 10049100 | Pyelocystitis |
| | | | 10058596 | Renal cyst infection |
| | | | 10059517 | Bacterial pyelonephritis |
| | | | 10065213 | Pyelonephritis viral |
| | | | 10065214 | Pyelonephritis fungal |
| | | | 10068822 | Emphysematous pyelonephritis |
| | | | 10074409 | Escherichia pyelonephritis |
| BIcMQ 'Bone fractures' | Bone fracture events (BIcMQ) | 0000000006 | 10000397 | Acetabulum fracture |
| | | | 10002544 | Ankle fracture |
| | | | 10009245 | Clavicle fracture |
| | | | 10010149 | Complicated fracture |
| | | | 10010214 | Compression fracture |

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, study, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >= 50% in eGFR from baseline.

R.5.1.1.2.7 Time to first occurrence of sustained decline of >= 57% in eGFR

**Figure R.5.1.1.2.7: 1**

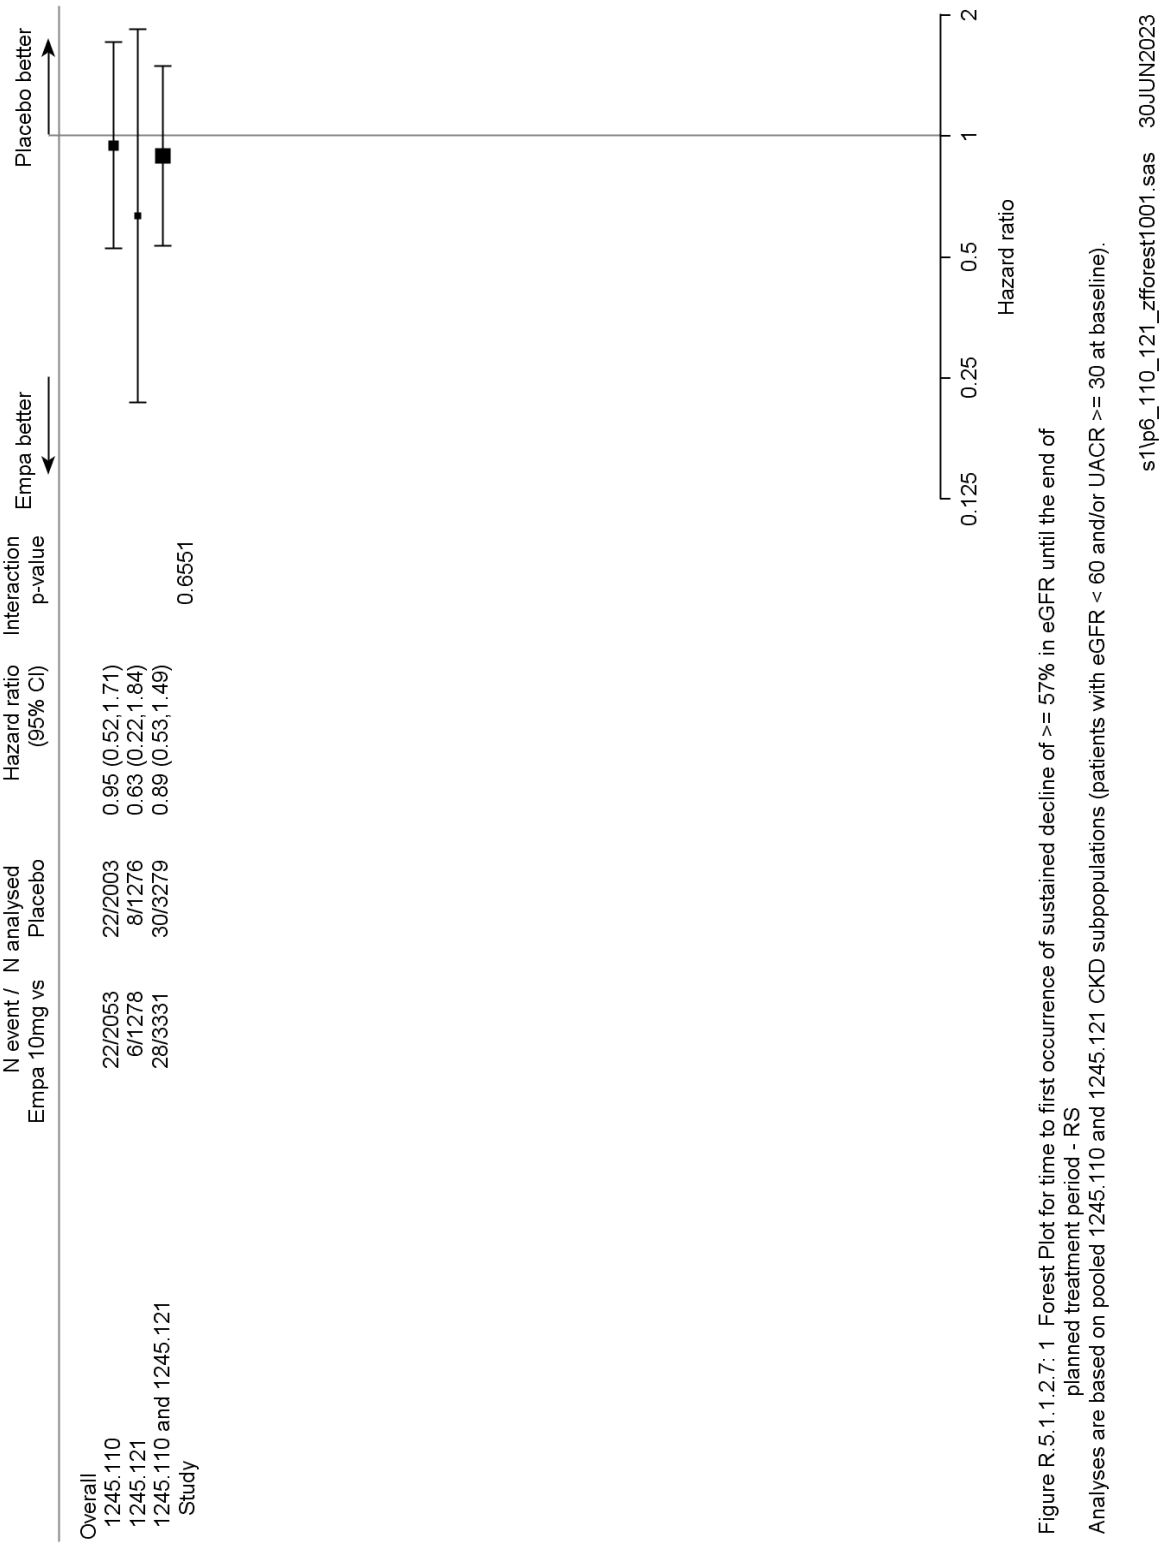

Figure R.5.1.1.2.7: 1 Forest Plot for time to first occurrence of sustained decline of >= 57% in eGFR until the end of planned treatment period - RS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).

Table R.5.1.1.2.7: 1 Cox Regression for time to first occurrence of sustained decline of >= 57% in eGFR until the end of planned treatment period overall - RS

| Subgroup Category | Placebo | | | | Empa 10mg | | | | Empa 10mg vs Placebo | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | N | n | % | Rate^ | N | n | % | Rate^ | HR* | (95% CI) | p-value | Interaction p-value |
| Overall | 3279 | 30 | 0.9 | 0.65 | 3331 | 28 | 0.8 | 0.59 | 0.89 | (0.53,1.49) | 0.6595 | |
| Study | | | | | | | | | | | | 0.6551 |

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, study, region, baseline diabetes status, sex, subgroup, treatment and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).

**Figure R.5.1.1.2.7: 2**

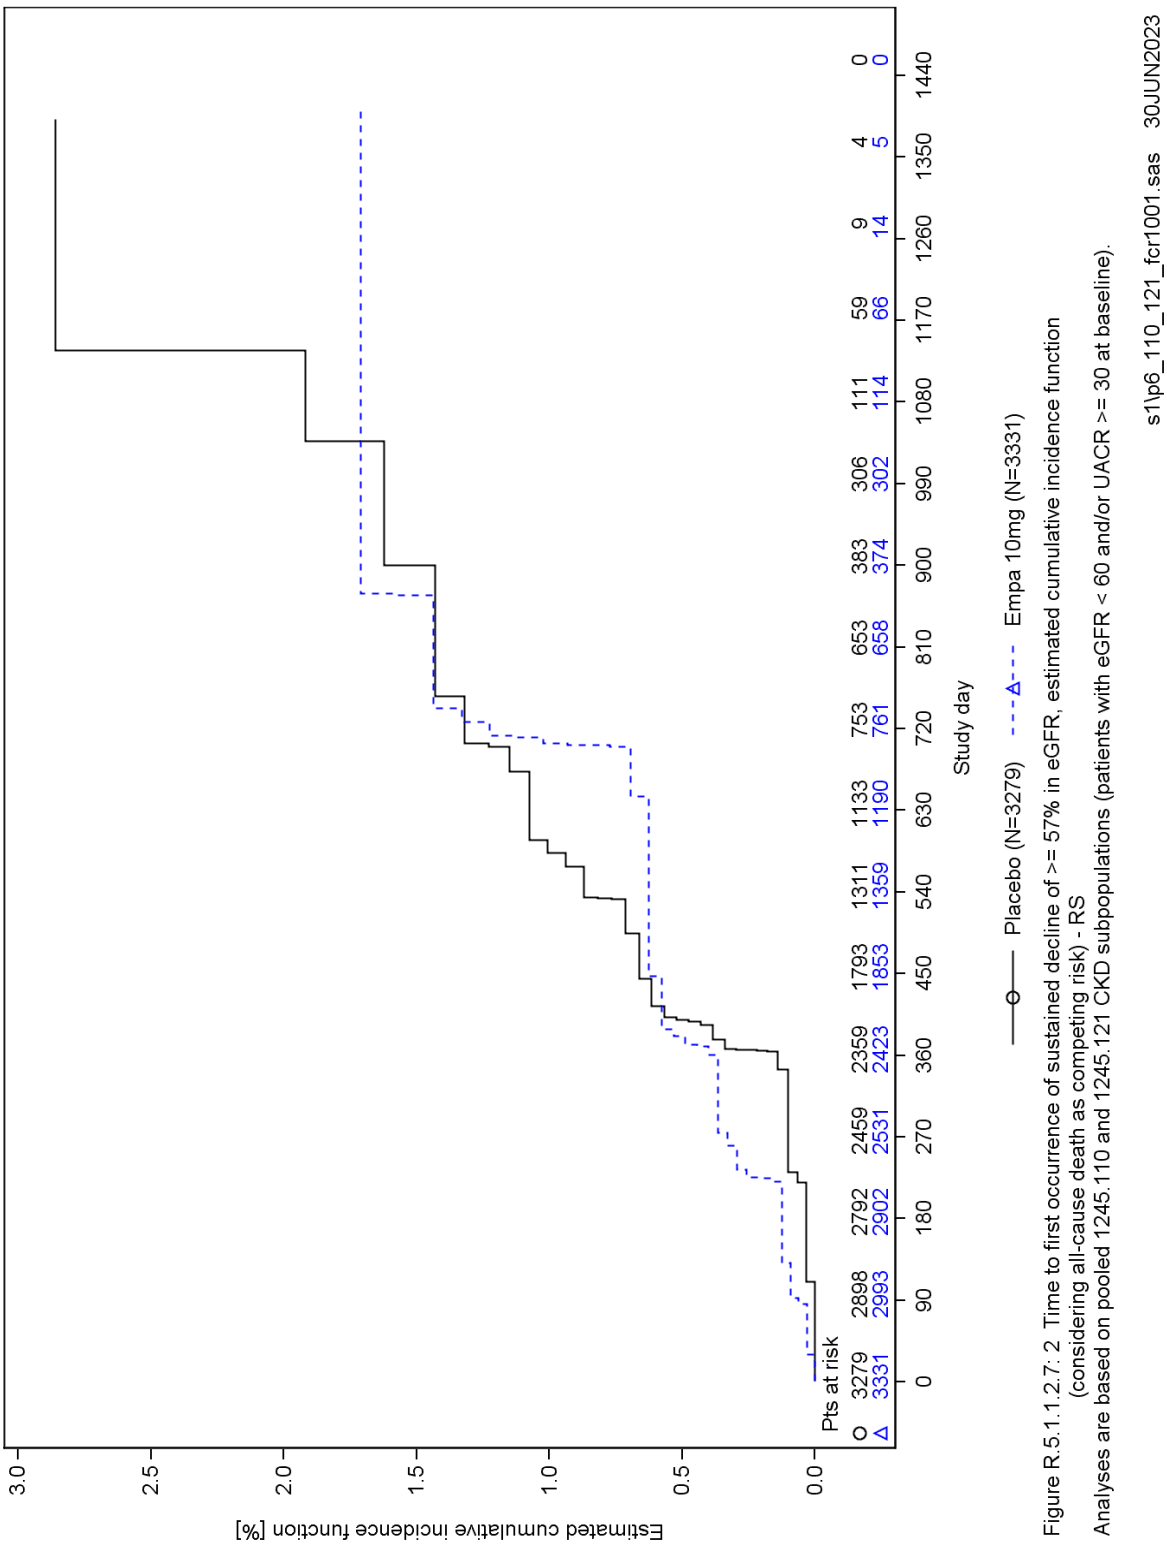

Figure R.5.1.1.2.7: 2 Time to first occurrence of sustained decline of >= 57% in eGFR, estimated cumulative incidence function (considering all-cause death as competing risk) - RS

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).

**R.5.1.1.2.8**

R.5.1.1.2.8 Time to ESKD

**Figure R.5.1.1.2.8: 1**

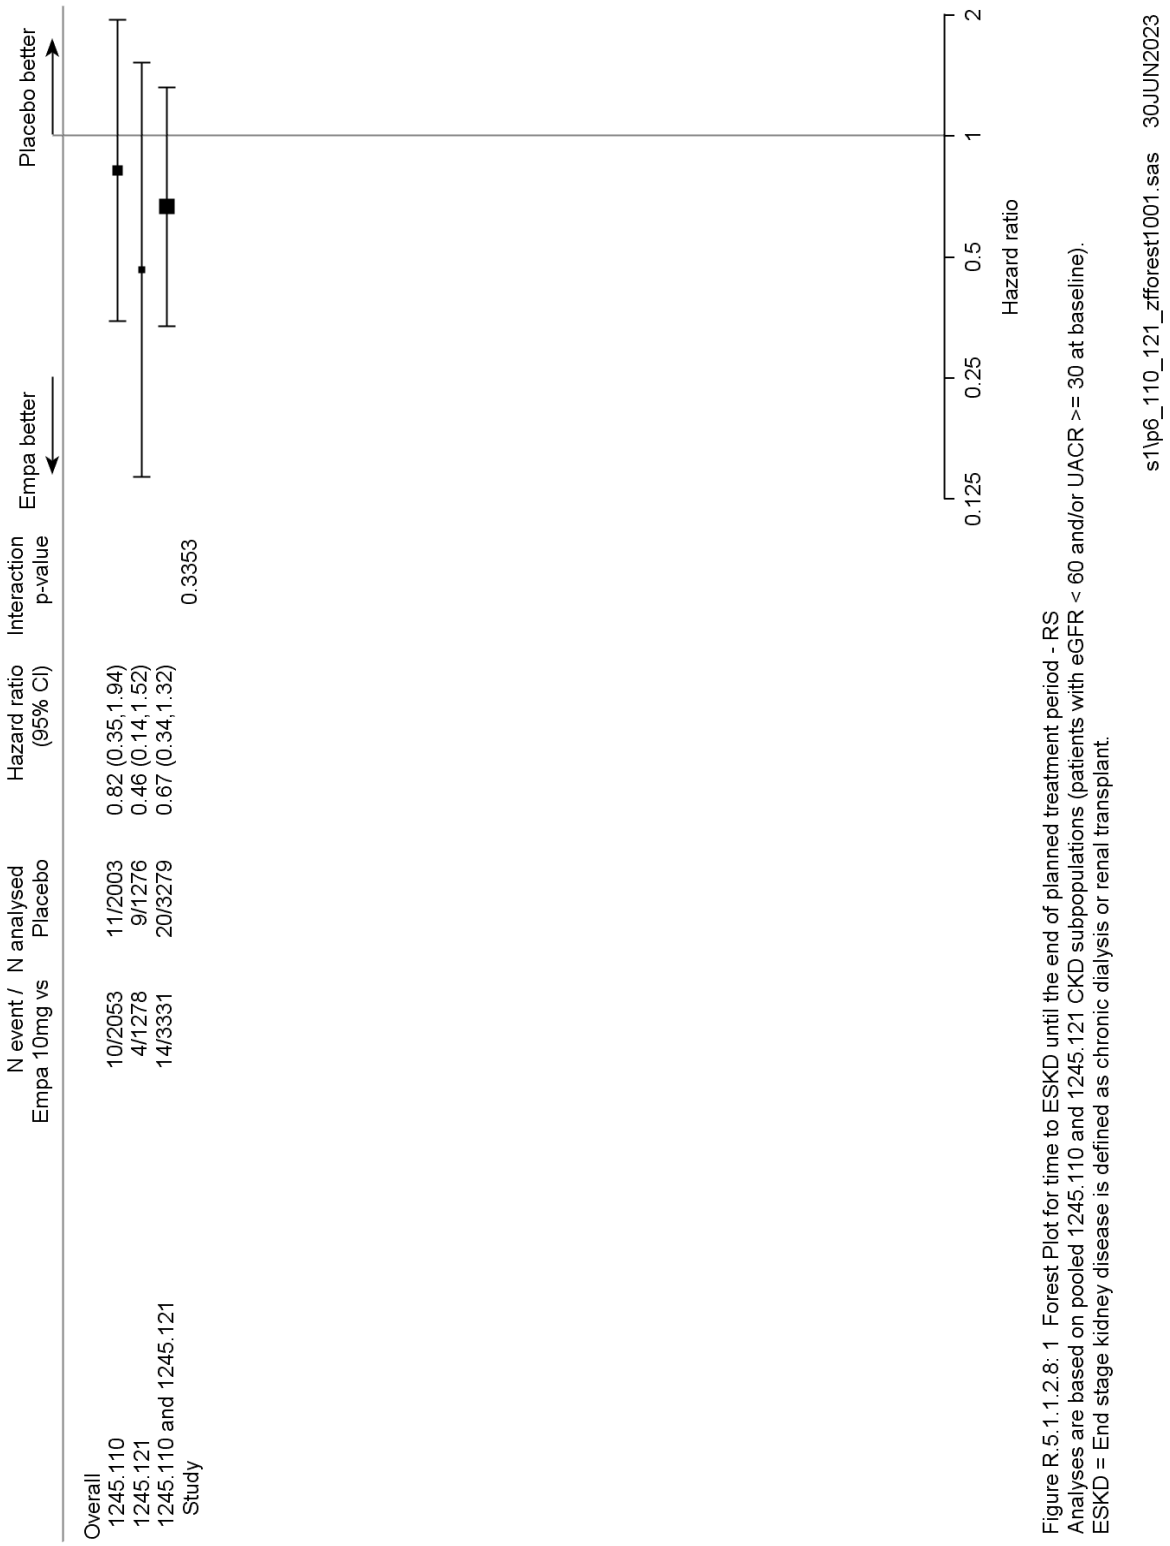

Figure R.5.1.1.2.8: 1 Forest Plot for time to ESKD until the end of planned treatment period - RS
Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).
ESKD = End stage kidney disease is defined as chronic dialysis or renal transplant.

Table R.5.1.1.2.8: 1 Cox Regression for time to ESKD until the end of planned treatment period overall - RS

| Subgroup Category | Placebo N | Placebo n | Placebo % | Placebo Rate^ | Empa 10mg N | Empa 10mg n | Empa 10mg % | Empa 10mg Rate^ | Empa 10mg vs Placebo HR* | (95% CI) | p-value | Interaction p-value |

* Based on an analysis of recurrent events accounting for terminal events using a joint frailty model with terms for age, baseline eGFR (CKD-EPI), baseline LVEF, baseline diabetes status, subgroup, region, sex, study, treatment and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n¹:Number of patients with recurrent event, n²:Number of recurrent events,
^Recurrent event rate, per 100 patient years at risk.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline).

Table R.5.1.2.1.3: 1 Responder analysis for KCCQ-OSS change from baseline to last value during planned treatment period <= -15 points (deterioration) overall and by subgroup - RS (OC-AD)

| Subgroup Category | Placebo N | Placebo n | Placebo % | Empa 10mg N | Empa 10mg n | Empa 10mg % | Empa 10mg vs Placebo: Risk ratio * | (95% CI) | p-value | Odds ratio *** | (95% CI) | p-value ** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Baseline use of diuretics | | | | | | | | | | | | 0.9061 |
| No | 261 | 37 | 14.2 | 291 | 35 | 12.0 | 0.85 | (0.55,1.30) | 0.4416 | 0.82 | (0.50,1.36) | |
| Yes | 2847 | 407 | 14.3 | 2894 | 357 | 12.3 | 0.87 | (0.76,0.99) | 0.0337 | 0.84 | (0.72,0.99) | |

* Based on a log-linked Poisson model with robust estimate of variance^, ** p-value corresponds to the treatment by subgroup interaction term. *** Based on a logistic regression model^ showing Wald confidence intervals.
^ Models contain terms age, baseline eGFR (CKD-EPI), baseline LVEF, Baseline KCCQ-OSS score, treatment, region, baseline diabetes status, sex, study, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N: Number of patients analysed, n: Number of patients with event.

Analyses are based on pooled 1245.110 and 1245.121 CKD subpopulations (patients with eGFR < 60 and/or UACR >= 30 at baseline)
Subjects without a baseline or post-baseline KCCQ-OSS score are not included in the analysis.
For discontinued subjects, last available value was used. For completing subjects, last value up to last treatment intake + 7 days was used.
