* Based on a Cox regression model with terms age (5 cat.), sex, screening diabetes status (2 cat.), local screening eGFR (CKD-EPI) (5 cat.), local screening UACR (5 cat.), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

* Based on a Cox regression model with terms age (5 cat.), sex, screening diabetes status (2 cat.), local screening eGFR (CKD-EPI) (5 cat.), local screening UACR (5 cat.), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline to < 10, adjudicated renal death or a sustained decline of >=40% in eGFR from baseline.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

* Based on a Cox regression model with terms age (5 cat.), sex, screening diabetes status (2 cat.), local screening eGFR (CKD-EPI) (5 cat.), local screening UACR (5 cat.), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline to < 10, adjudicated renal death or a sustained decline of >=40% in eGFR from baseline.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

* Based on a Cox regression model with terms age (5 cat.), sex, screening diabetes status (2 cat.), local screening eGFR (CKD-EPI) (5 cat.), local screening UACR (5 cat.), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline to < 10, adjudicated renal death or a sustained decline of >=50% in eGFR from baseline.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

* Based on a Cox regression model with terms age (5 cat.), sex, screening diabetes status (2 cat.), local screening eGFR (CKD-EPI) (5 cat.), local screening UACR (5 cat.), region, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.137.
Adjudicated major cardiovascular events are defined as adjudicated CV death, adjudicated fatal or non-fatal myocardial infarction (excluding silent MIs), adjudicated stroke or adjudicated hospitalization for heart failure.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

* Based on an analysis of recurrent events accounting for terminal events using a joint frailty model with terms for age, local screening eGFR (CKD-EPI), log(local screening UACR), subgroup, screening diabetes status (2 cat.), sex, region, treatment and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n¹:Number of patients with recurrent event, n²:Number of recurrent events,
^Recurrent event rate, per 100 patient years at risk.
NC. = Not calculated.

Analyses are based on 1245.137.
** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.

N: Number of patients analysed, n: Number of patients with event.

Analyses are based on 1245.137.
****Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
Subjects without a baseline or post-baseline EQ-VAS score are not included in the analysis.

**R.1.2**

**R.1.2.1**

R.1.2.1 Adverse events overall

Table R.1.2.1: 1 Proportion of patients with any adverse event occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
Disease-related events are defined as all events from the SOC 'Cardiac Disorders' and the SOC 'Renal and urinary disorders'.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.1: 3 Proportion of patients with serious adverse events occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
Disease-related events are defined as all events from the SOC 'Cardiac Disorders' and the SOC 'Renal and urinary disorders'.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.1: 4 Proportion of patients with serious adverse events (excluding disease-related events) occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.2: 2 Frequency of patients with AEs leading to treatment discontinuation occurring up to the final follow-up visit by SOC and PT - TS

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Hypoglycaemic events (SMQ)$

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS

A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Pyelonephritis or Urosepsis (BIcMQ)

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Symptomatic dehydration (user-defined)

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Acute renal failure (SMQ)

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
$Only severe events are included. *** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Events indicative of ketoacidosis (BIcMQ)

^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Bone fracture events (BIcMQ)

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. $Only severe events are included. ***Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
^Events confirmed or unrefuted by adjudication are considered as an endpoint event.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the final follow-up visit, overall and by subgroup - TS
User-defined AE category: Hyperkalaemia (user-defined)

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 3305 | 126 | 3.8 | 3304 | 117 | 3.5 | 0.5580 | 0.93 (0.73, 1.19) | 0.93 (0.72, 1.20) | 0.00 (-0.01, 0.01) | |

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the final follow-up visit, overall and by subgroup - TS

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the final follow-up visit, overall and by subgroup - TS

| Overall | 3305 | 126 | 3.8 | 3304 | 117 | 3.5 | 0.5580 | 0.93 | (0.73, 1.19) | 0.93 (0.72, 1.20) | 0.00 (-0.01, 0.01) | |

Analyses are based on 1245.137.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

**R.1.2.5**

R.1.2.5 Adverse events on PT level

Table R.1.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the final follow-up visit, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Gout

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 3305 | 279 | 8.4 | 3304 | 239 | 7.2 | 0.0677 | 0.86 ( 0.73, 1.01) | 0.85 ( 0.71, 1.01) | -0.01 (-0.03, 0.00) | |

Analyses are based on 1245.137. SAEs and protocol pre-specified non-serious AEs included.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the final follow-up visit, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Dehydration

| Overall | 3305 | 50 | 1.5 | 3304 | 43 | 1.3 | 0.4657 | 0.86 ( 0.57, 1.29) | 0.86 ( 0.57, 1.29) | 0.00 (-0.01, 0.00) | |

Analyses are based on 1245.137.
If adjudicated, the resulting preferred terms are presented.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
*** Defined as use of an ACEi, ARB, ARNi or renin inhibitor.
MedDRA version: 20.1. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.1.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the final follow-up visit, overall and by subgroup - TS
System organ class: Infections and infestations
Preferred term: Urinary tract infection

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >= 40% in eGFR from baseline.

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >= 40% in eGFR from baseline.

**Figure R.2.1.1.2.1: 1**

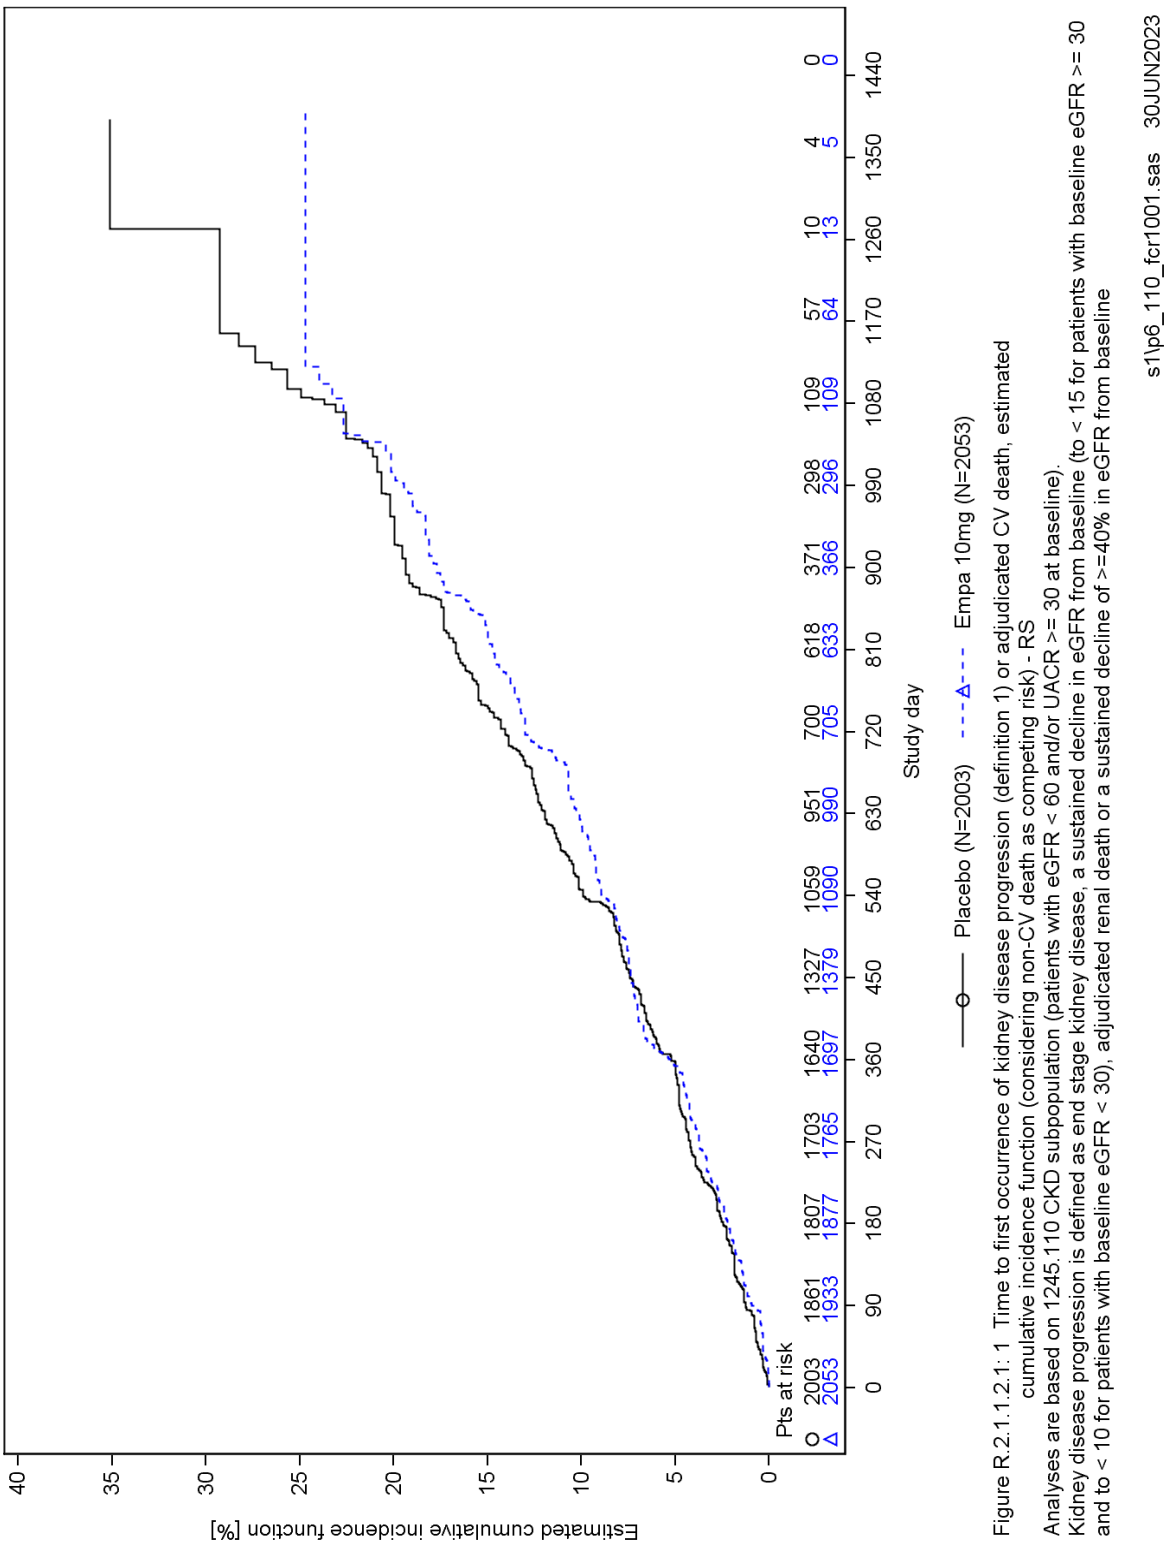

Figure R.2.1.1.2.1: 1 Time to first occurrence of kidney disease progression (definition 1) or adjudicated CV death, estimated cumulative incidence function (considering non-CV death as competing risk) - RS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >=40% in eGFR from baseline

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >= 50% in eGFR from baseline.

**Figure R.2.1.1.2.3: 1**

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
ESKD = End stage kidney disease is defined as chronic dialysis or renal transplant. A sustained decline in eGFR below defined threshold is defined as a sustained decline to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30.

Table R.2.1.1.2.9: 1 Cox Regression for time to first occurrence of ESKD, sustained decline in eGFR below defined threshold or adjudicated renal death until the end of planned treatment period overall and by subgroup - RS

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), baseline LVEF, region, baseline diabetes status, sex, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Adjudicated major cardiovascular events are defined as adjudicated CV death, adjudicated fatal or non-fatal myocardial infarction (excluding silent MIs), adjudicated stroke or adjudicated hospitalization for heart failure.

* Based on an analysis of recurrent events accounting for terminal events using a joint frailty model with terms for age, baseline eGFR (CKD-EPI), baseline LVEF, baseline diabetes status, subgroup, region, sex, treatment and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n¹:Number of patients with recurrent event, n²:Number of recurrent events,
^Recurrent event rate, per 100 patient years at risk.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).

**Figure R.2.1.1.3.7: 1**

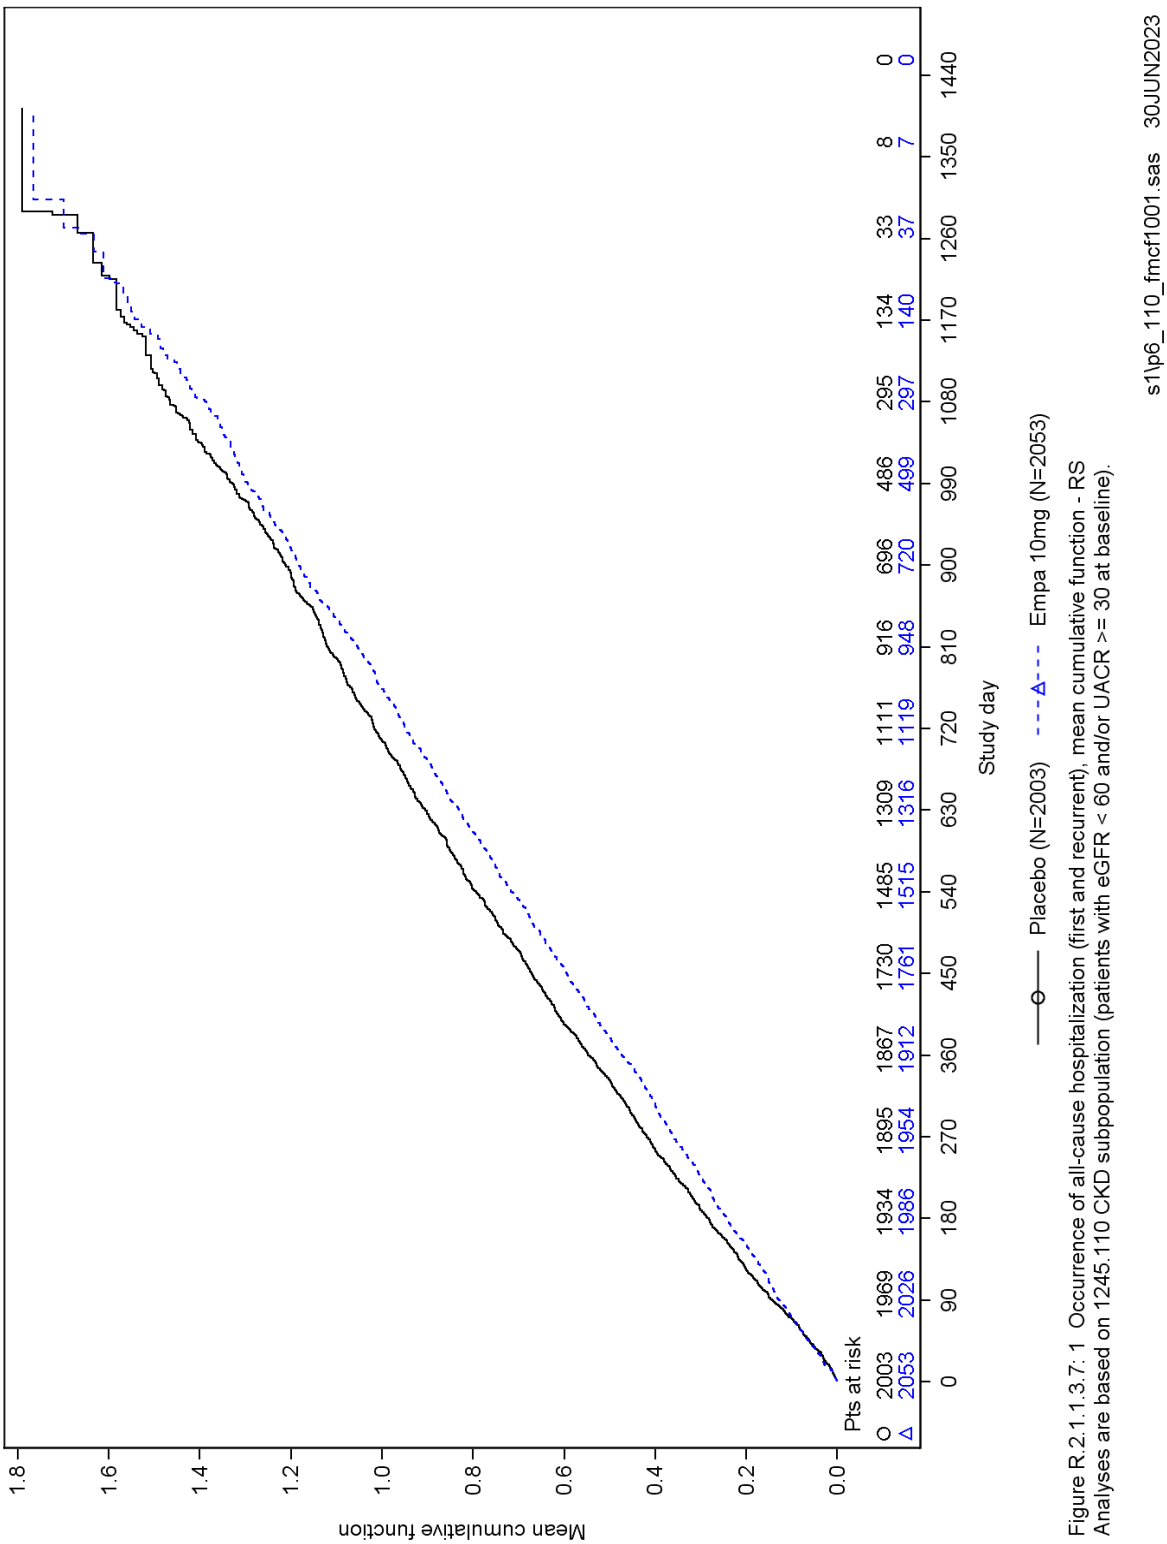

Figure R.2.1.1.3.7: 1 Occurrence of all-cause hospitalization (first and recurrent), mean cumulative function - RS
Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).

**Figure R.2.1.1.3.7: 2**

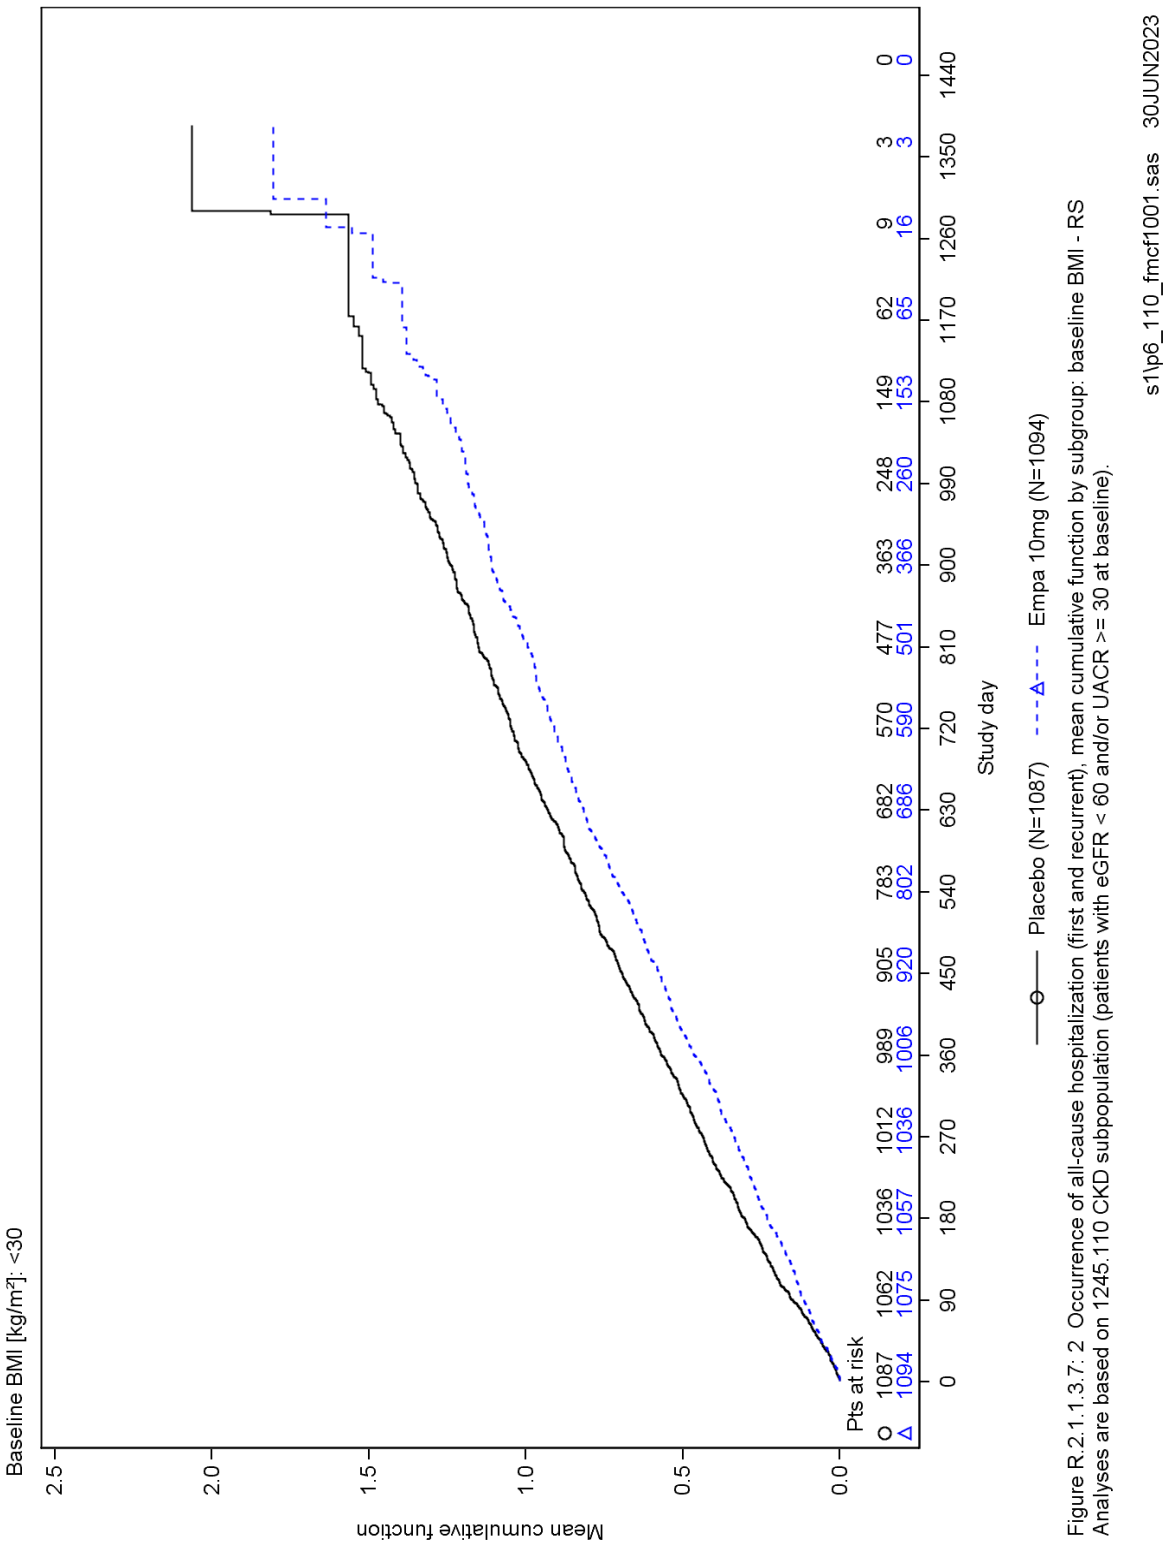

Figure R.2.1.1.3.7: 2 Occurrence of all-cause hospitalization (first and recurrent), mean cumulative function by subgroup: baseline BMI - RS
Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).

**Figure R.2.1.1.3.7: 2**

* Based on a log-linked Poisson model with robust estimate of variance^, ** p-value corresponds to the treatment by subgroup interaction term. *** Based on a logistic regression model^ showing Wald confidence intervals.
^ Models contain terms age, baseline eGFR (CKD-EPI), baseline LVEF, Baseline EQ-VAS score, treatment, region, baseline diabetes status, sex, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N: Number of patients analysed, n: Number of patients with event.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline)
Subjects without a baseline or post-baseline EQ-VAS score are not included in the analysis.
For discontinued subjects, last available value was used. For completing subjects, last value up to last treatment intake + 7 days was used.

* Based on a log-linked Poisson model with robust estimate of variance^, ** p-value corresponds to the treatment by subgroup interaction term. *** Based on a logistic regression model^ showing Wald confidence intervals.
^ Models contain terms age, baseline eGFR (CKD-EPI), baseline LVEF, Baseline KCCQ-OSS score, treatment, region, baseline diabetes status, sex, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N: Number of patients analysed, n: Number of patients with event.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline)
Subjects without a baseline or post-baseline KCCQ-OSS score are not included in the analysis.
For discontinued subjects, last available value was used. For completing subjects, last value up to last treatment intake + 7 days was used.

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.2: 2 Frequency of patients with AEs leading to treatment discontinuation occurring up to the end of the study by SOC and PT - TS

| System organ class/ Preferred term | Placebo N (%) | Placebo Time at risk (pt-yrs) | Placebo Rate /100 pt-yrs | Empa 10mg N (%) | Empa 10mg Time at risk (pt-yrs) | Empa 10mg Rate /100 pt-yrs |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Percentages are calculated using total number of patients per treatment as the denominator.
MedDRA version: 25.0

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Urinary tract infections (BIcMQ)

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 1 Proportion of patients with adverse events of special interest and other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 2 Proportion of patients with serious adverse events of special interest and serious other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: ^Severe hypoglycaemic events (investigator-defined)

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS
User-defined AE category: Genital infections (BIcMQ)

A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
^Severe hypoglycaemic events were defined as events requiring the assistance of another person to actively administer carbohydrate, glucagon or other resuscitative actions. Intensity of the event (mild/moderate/severe) was not considered in the definition.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.3: 3 Proportion of patients with severe adverse events of special interest and severe other specific AEs by user-defined category occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio | (95% CI) | Odds ratio | (95% CI) | Risk diff. | (95% CI) | p-value ** |
| Overall | 2001 | 151 | 7.5 | 2052 | 166 | 8.1 | 0.5194 | 1.07 | ( 0.87, 1.32) | 1.08 | ( 0.86, 1.36) | 0.01 | (-0.01, 0.02) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio | (95% CI) | Odds ratio | (95% CI) | Risk diff. | (95% CI) | p-value ** |
| Overall | 2001 | 79 | 3.9 | 2052 | 65 | 3.2 | 0.1797 | 0.80 | ( 0.58, 1.11) | 0.80 | ( 0.57, 1.11) | -0.01 | (-0.02, 0.00) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS
System organ class: Neoplasms benign, malignant and unspecified (incl cysts and polyps)

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.4: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on SOC level by SOC occurring up to the end of the study, overall and by subgroup - TS

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Infections and infestations
Preferred term: Pneumonia

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Atrial fibrillation

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hyperuricaemia

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hypokalaemia

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Metabolism and nutrition disorders
Preferred term: Hypomagnesaemia

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Renal failure

MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Injury, poisoning and procedural complications
Preferred term: Skin laceration

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 2001 | 18 | 0.9 | 2052 | 31 | 1.5 | 0.0751 | 1.68 ( 0.94, 2.99) | 1.69 ( 0.94, 3.03) | 0.01 ( 0.00, 0.01) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 1 Proportion of patients with any adverse event occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Blood and lymphatic system disorders
Preferred term: Thrombocytopenia

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS

|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 2001 | 115 | 5.7 | 2052 | 111 | 5.4 | 0.6394 | 0.94 ( 0.73, 1.21) | 0.94 ( 0.72, 1.23) | 0.00 (-0.02, 0.01) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Infections and infestations
Preferred term: COVID-19

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Renal and urinary disorders
Preferred term: Acute kidney injury

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 2 Proportion of patients with serious adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Nervous system disorders
Preferred term: Cerebrovascular accident

System organ class: Cardiac disorders
Preferred term: Acute myocardial infarction

| Subgroup | Placebo | | | Empa 10mg | | | Empa 10mg vs Placebo | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 2001 | 32 | 1.6 | 2052 | 29 | 1.4 | 0.6269 | 0.88 ( 0.54, 1.46) | 0.88 ( 0.53, 1.46) | 0.00 (-0.01, 0.01) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Cardiac disorders
Preferred term: Atrial fibrillation

| Category | N | n | % | N | n | % | p-value * | Risk ratio (95% CI) | Odds ratio (95% CI) | Risk diff. (95% CI) | p-value ** |
| Overall | 2001 | 24 | 1.2 | 2052 | 22 | 1.1 | 0.7021 | 0.89 ( 0.50, 1.59) | 0.89 ( 0.50, 1.60) | 0.00 (-0.01, 0.01) | |

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Vascular disorders
Preferred term: Hypotension

Analyses are based on 1245.110 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Table R.2.2.5: 3 Proportion of patients with severe adverse events occurring in at least 1% of the patients in either treatment arm in the overall population on PT level by SOC and PT occurring up to the end of the study, overall and by subgroup - TS
System organ class: Blood and lymphatic system disorders
Preferred term: Anaemia

**Figure R.3.1.1.2.1: 1**

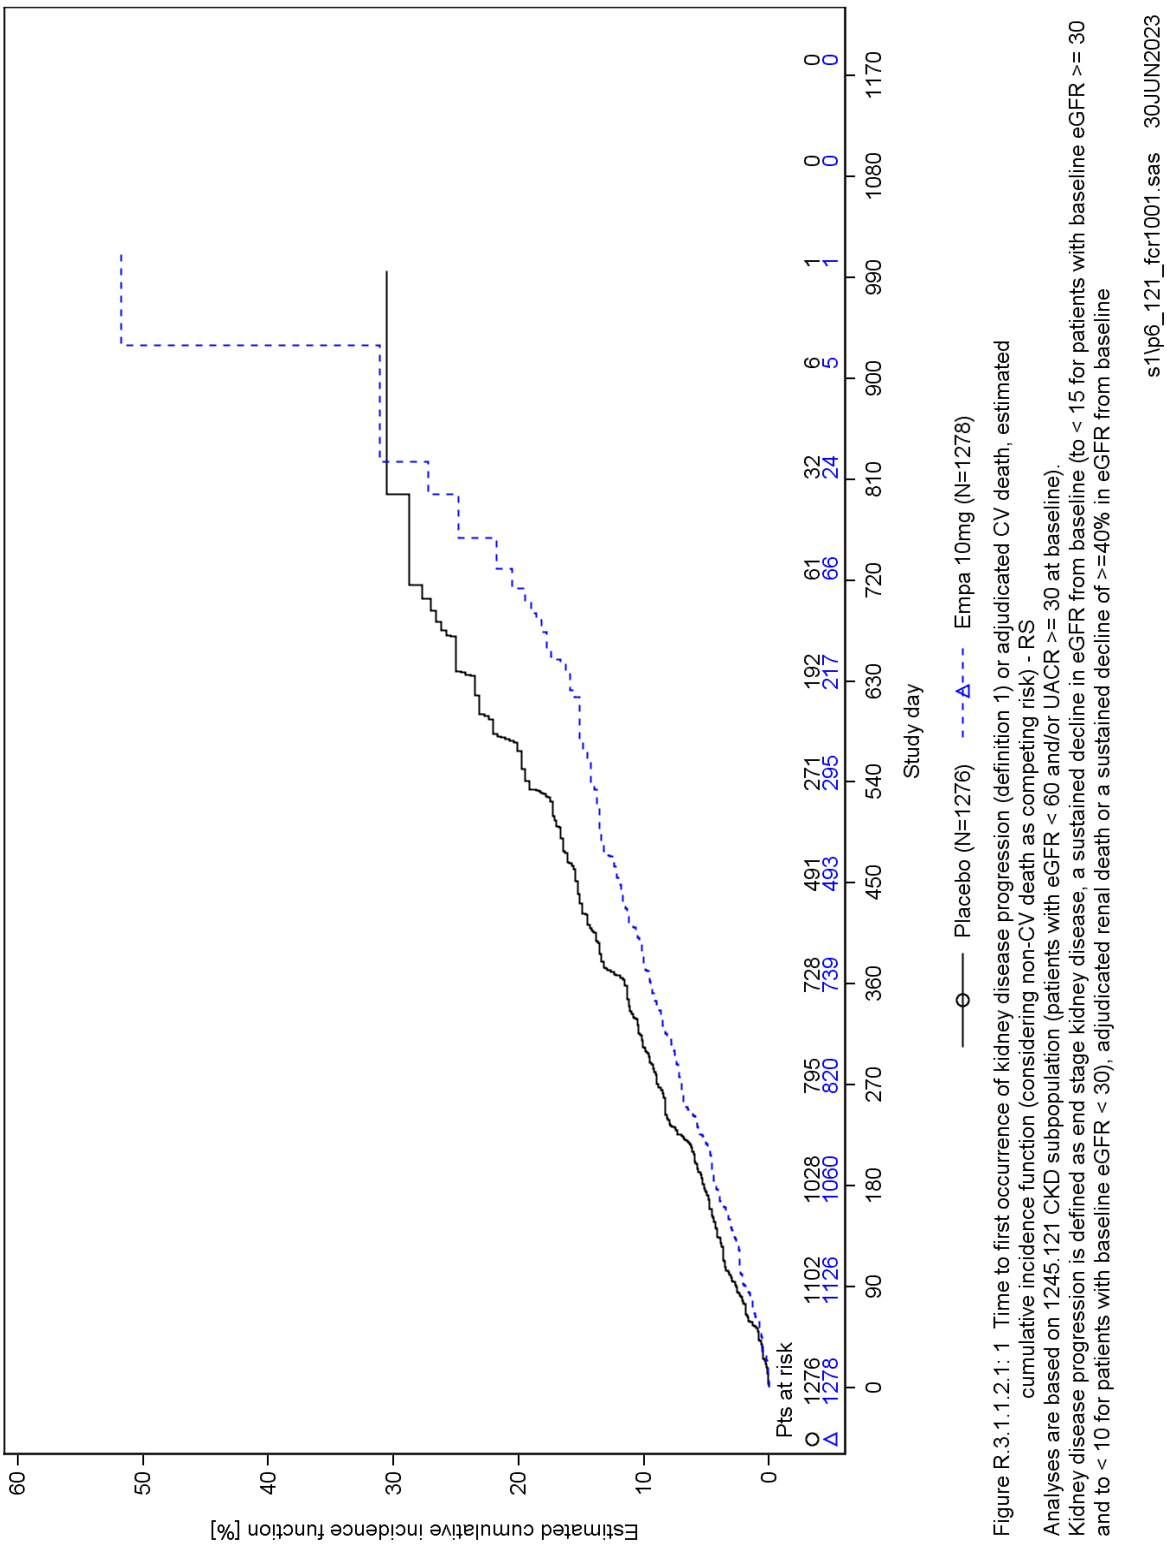

Figure R.3.1.1.2.1: 1 Time to first occurrence of kidney disease progression (definition 1) or adjudicated CV death, estimated cumulative incidence function (considering non-CV death as competing risk) - RS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).

Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >=40% in eGFR from baseline

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), region, baseline diabetes status, sex, baseline LVEF, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >= 50% in eGFR from baseline.

**Figure R.3.1.1.2.3: 1**

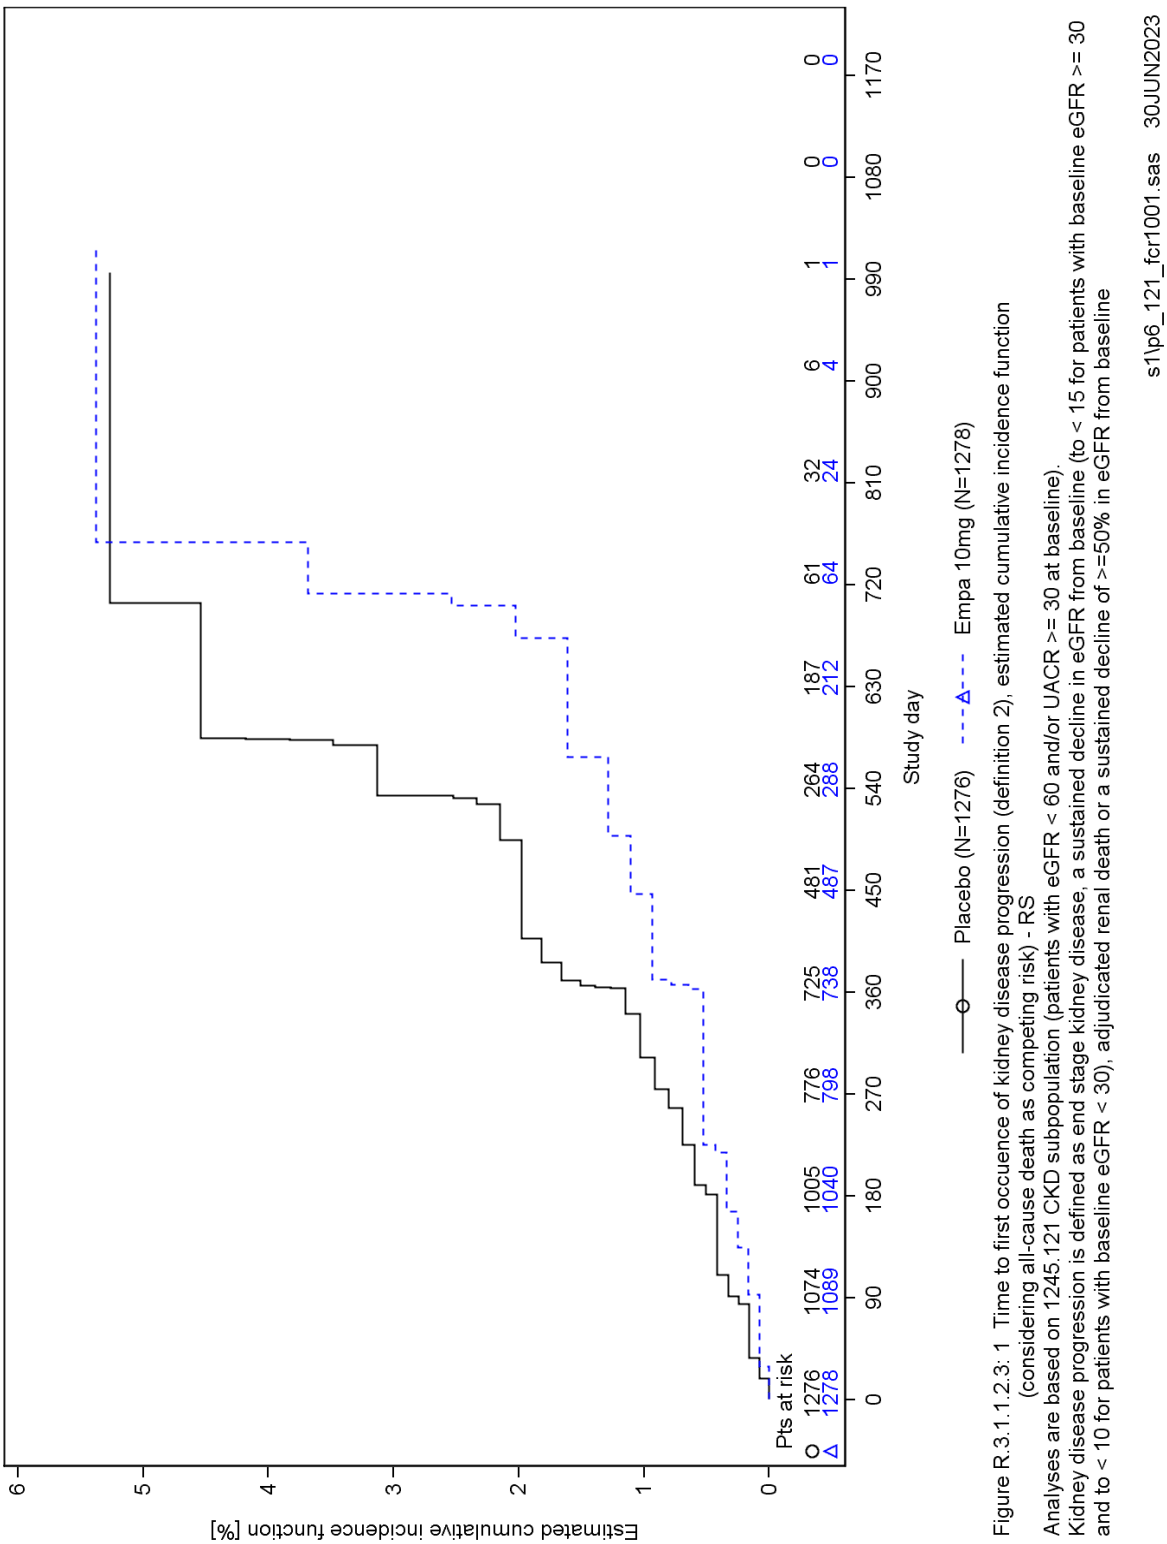

Figure R.3.1.1.2.3: 1 Time to first occuence of kidney disease progression (definition 2), estimated cumulative incidence function (considering all-cause death as competing risk) - RS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Kidney disease progression is defined as end stage kidney disease, a sustained decline in eGFR from baseline (to < 15 for patients with baseline eGFR >= 30 and to < 10 for patients with baseline eGFR < 30), adjudicated renal death or a sustained decline of >=50% in eGFR from baseline

* Based on a Cox regression model with terms age, baseline eGFR (CKD-EPI), region, baseline diabetes status, sex, baseline LVEF, treatment, subgroup and treatment by subgroup interaction. Covariate removed from model if also used as the subgroup.
N:Number of patients analysed, n:Number of patients with event, ^Incidence rate, events per 100 patient years at risk.

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Adjudicated major cardiovascular events are defined as adjudicated CV death, adjudicated fatal or non-fatal myocardial infarction (excluding silent MIs) adjudicated stroke or adjudicated hospitalization for heart failure.

**Figure R.3.1.1.3.1: 1**

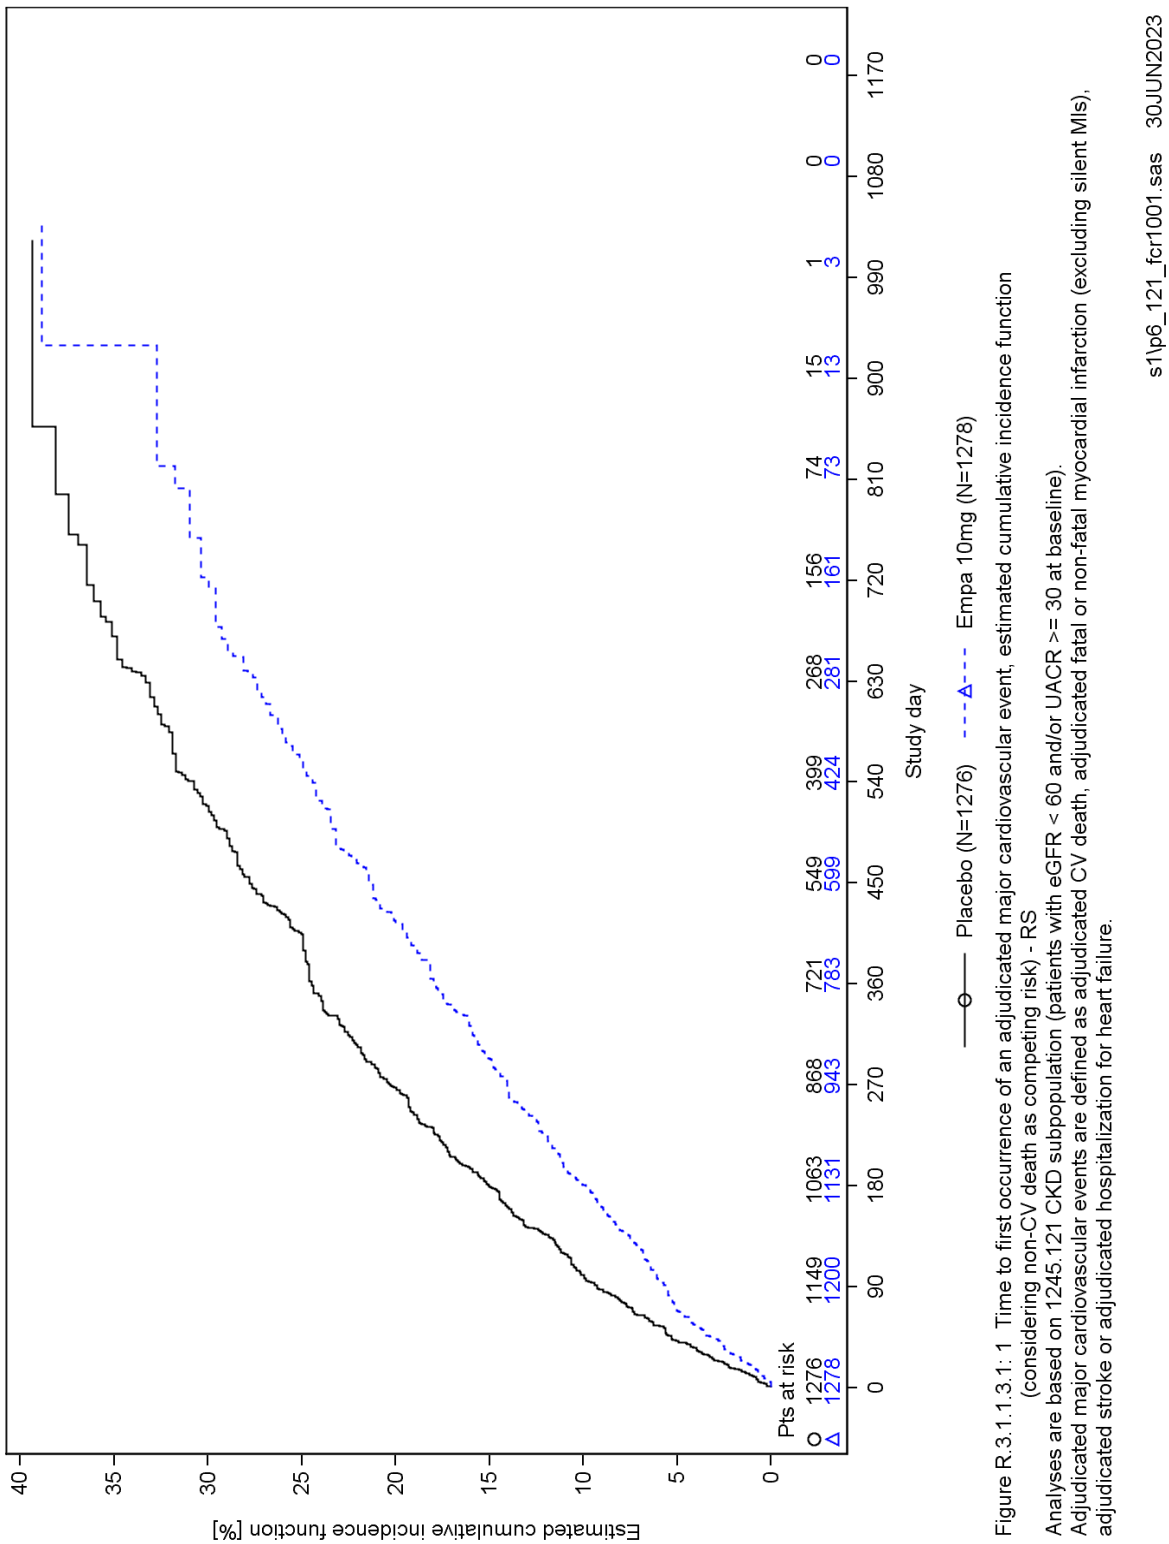

Figure R.3.1.1.3.1: 1 Time to first occurrence of an adjudicated major cardiovascular event, estimated cumulative incidence function (considering non-CV death as competing risk) - RS

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Adjudicated major cardiovascular events are defined as adjudicated CV death, adjudicated fatal or non-fatal myocardial infarction (excluding silent MIs), adjudicated stroke or adjudicated hospitalization for heart failure.

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).

Analyses are based on 1245.121 CKD subpopulation (patients with eGFR < 60 and/or UACR >= 30 at baseline).
Disease-related AEs are any of the following events: death due to any cause, Heart Failure Hospitalization, MI, stroke, TIA, serious atrial fibrillation, serious acute renal failure, and unstable angina.
A ratio less than one or risk difference less than zero indicates less risk for Empa 10mg.
A continuity correction by 0.5 is applied in case of any zero cells in contingency table.
For risk ratios, odds ratios and risk differences, asymptotic confidence limits are calculated.
MedDRA version: 25.0. * Chi-square test for treatment effect. ** Cochran´s-Q test for homogeneity of risk ratios (treatment by subgroup interaction).
