LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV and baseline height z-score. For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, and treatment and stratum interaction.

Missing sitting height and standing height at Week 52 will be imputed by applying the baseline AGV for sitting height and standing height to the last available sitting/standing height assessment. Based on this imputed sitting height and standing height at Week 52, the upper:lower body segment ratio will be calculated. See SAP for additional imputation details.

Table 14.2.3.11.1
Analysis of Covariance of Upper to Lower Body Segment Ratio at Week 52 by Baseline Height Z-score for BMN111-301
Analysis Population: Full Analysis Set

Baseline Height Z-score Upper to Lower Body Segment Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Change from baseline		
n	10	15
Mean (SD)	-0.01 (0.06)	-0.04 (0.07)
Median	0.02	-0.04
25th, 75th Percentile	-0.04, 0.03	-0.10, 0.04
Min, Max	-0.2, 0.1	-0.2, 0.1
LS mean change from baseline (95% CI)	0.03 (-0.02, 0.09)	-0.03 (-0.07, 0.01)
Difference in LS mean change from baseline (95% CI) ^a		-0.07 (-0.13, -0.01)
P-value ^b		0.0275

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV and baseline height z-score. For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, and treatment and height z-score interaction.

Missing sitting height and standing height at Week 52 will be imputed by applying the baseline AGV for sitting height and standing height to the last available sitting/standing height assessment. Based on this imputed sitting height and standing height at Week 52, the upper:lower body segment ratio will be calculated. See SAP for additional imputation details.

Table 14.2.3.12.1
Analysis of Covariance of Upper to Lower Body Segment Ratio at Week 52 by Baseline AGV Category for BMN111-301
Analysis Population: Full Analysis Set

Baseline AGV Upper to Lower Body Segment Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Change from baseline		
n	19	19
Mean (SD)	-0.05 (0.09)	0.02 (0.16)
Median	-0.04	0.01
25th, 75th Percentile	-0.12, 0.02	-0.08, 0.07
Min, Max	-0.2, 0.1	-0.2, 0.6
LS mean change from baseline (95% CI)	-0.06 (-0.14, 0.03)	0.02 (-0.09, 0.12)
Difference in LS mean change from baseline (95% CI) ^a		0.07 (-0.03, 0.17)
P-value ^b		0.1770

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV and baseline height z-score. For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, and treatment and AGV interaction.

Missing sitting height and standing height at Week 52 will be imputed by applying the baseline AGV for sitting height and standing height to the last available sitting/standing height assessment. Based on this imputed sitting height and standing height at Week 52, the upper:lower body segment ratio will be calculated. See SAP for additional imputation details.

Analysis of Covariance of Upper to Lower Body Segment Ratio at Week 52 by Ethnicity for BMN111-301
Analysis Population: Full Analysis Set

Ethnicity Upper to Lower Body Segment Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Change from baseline		
n	20	15
Mean (SD)	-0.03 (0.07)	0.01 (0.16)
Median	0.00	-0.03
25th, 75th Percentile	-0.07, 0.03	-0.07, 0.04
Min, Max	-0.2, 0.0	-0.1, 0.6
LS mean change from baseline (95% CI)	-0.03 (-0.11, 0.05)	0.02 (-0.06, 0.09)
Difference in LS mean change from baseline (95% CI) ^a		0.05 (-0.05, 0.14)
P-value ^b		0.3035

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV and baseline height z-score. For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, and treatment and ethnicity interaction.

Missing sitting height and standing height at Week 52 will be imputed by applying the baseline AGV for sitting height and standing height to the last available sitting/standing height assessment. Based on this imputed sitting height and standing height at Week 52, the upper:lower body segment ratio will be calculated. See SAP for additional imputation details.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV and baseline height z-score. For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, and treatment and region interaction.

Missing sitting height and standing height at Week 52 will be imputed by applying the baseline AGV for sitting height and standing height to the last available sitting/standing height assessment. Based on this imputed sitting height and standing height at Week 52, the upper:lower body segment ratio will be calculated. See SAP for additional imputation details.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper arm length to lower arm length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper arm length to lower arm length ratio, and treatment and age interaction.

Missing assessments at week 52 were not imputed.

Difference in LS mean change from baseline (95% CI) ^a		-0.01 (-0.06, 0.05)
P-value ^b		0.8342

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper arm length to lower arm length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper arm length to lower arm length ratio, and treatment and stratum interaction.

Missing assessments at week 52 were not imputed.

SMD (95% CI) ^c		-0.18 (-1.10, 0.74)

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper arm length to lower arm length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper arm length to lower arm length ratio, and treatment and height z-score interaction.

Missing assessments at week 52 were not imputed.

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper arm length to lower arm length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper arm length to lower arm length ratio, and treatment and AGV interaction.

Missing assessments at week 52 were not imputed.

Analysis of Covariance of Upper Arm Length to Lower Arm (Forearm) Length Ratio at Week 52 by Region for BMN111-301
Analysis Population: Full Analysis Set

Upper Arm Length to Lower Arm (Forearm) Length Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Change from baseline		
n	26	27
Mean (SD)	0.01 (0.07)	-0.03 (0.07)
Median	0.01	-0.03
25th, 75th Percentile	-0.05, 0.06	-0.10, 0.02
Min, Max	-0.1, 0.1	-0.2, 0.1
LS mean change from baseline (95% CI)	0.00 (-0.05, 0.04)	-0.03 (-0.07, 0.00)
Difference in LS mean change from baseline (95% CI) ^a		-0.03 (-0.07, 0.01)
P-value ^b		0.1724

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper arm length to lower arm length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper arm length to lower arm length ratio, and treatment and region interaction.

Missing assessments at week 52 were not imputed.

Table 14.2.5.7.1
Analysis of Covariance of Upper Leg Length (Thigh) to Knee to Heel Length Ratio at Week 52 by Sex for BMN111-301
Analysis Population: Full Analysis Set

Upper Leg Length (Thigh) to Knee to Heel Length Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
SMD (95% CI) ^c		-0.22 (-0.72, 0.29)

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to knee to heel length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to knee to heel length ratio, and treatment and sex interaction.

Missing assessments at week 52 were not imputed.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to knee to heel length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to knee to heel length ratio, and treatment and stratum interaction.

Missing assessments at week 52 were not imputed.

LS mean change from baseline (95% CI)	0.04 (0.00, 0.08)	0.02 (-0.01, 0.05)
Difference in LS mean change from baseline (95% CI) ^a		-0.02 (-0.06, 0.02)
P-value ^b		0.3406

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to knee to heel length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to knee to heel length ratio, and treatment and height z-score interaction.

Missing assessments at week 52 were not imputed.

Table 14.2.5.12.1
 Analysis of Covariance of Upper Leg Length (Thigh) to Knee to Heel Length Ratio at Week 52 by Baseline AGV Category for BMN111-301
 Analysis Population: Full Analysis Set

Upper Leg Length (Thigh) to Knee to Heel Length Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
SMD (95% CI) ^c		0.11 (-0.54, 0.76)
P-value for interaction term, treatment * [Baseline AGV]		0.6958

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to knee to heel length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to knee to heel length ratio, and treatment and AGV interaction.

Missing assessments at week 52 were not imputed.

Difference in LS mean change from baseline (95% CI) ^a		0.04 (-0.06, 0.14)
P-value ^b		0.4647

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to tibial leg length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to tibial leg length ratio, and treatment and tanner stage interaction.

Missing assessments at week 52 were not imputed.

SMD (95% CI) ^c		0.37 (-0.81, 1.53)
P-value for interaction term, treatment * [Strata]		0.2941

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to tibial leg length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to tibial leg length ratio, and treatment and stratum interaction.

Missing assessments at week 52 were not imputed.

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to tibial leg length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to tibial leg length ratio, and treatment and AGV interaction.

Missing assessments at week 52 were not imputed.

Table 14.2.6.13.1
Analysis of Covariance of Upper Leg Length (Thigh) to Tibial Length Ratio at Week 52 by Ethnicity for BMN111-301
Analysis Population: Full Analysis Set

Upper Leg Length (Thigh) to Tibial Leg Length Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Change from baseline		
n	20	14
Mean (SD)	0.01 (0.09)	-0.02 (0.13)
Median	0.00	0.01
25th, 75th Percentile	-0.04, 0.06	-0.14, 0.09
Min, Max	-0.2, 0.2	-0.3, 0.2
LS mean change from baseline (95% CI)	0.00 (-0.07, 0.07)	-0.01 (-0.09, 0.07)
Difference in LS mean change from baseline (95% CI) ^a		-0.01 (-0.10, 0.08)
P-value ^b		0.8012

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to tibial leg length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to tibial leg length ratio, and treatment and ethnicity interaction.

Missing assessments at week 52 were not imputed.

Table 14.2.6.14.1
 Analysis of Covariance of Upper Leg Length (Thigh) to Tibial Length Ratio at Week 52 by Region for BMN111-301
 Analysis Population: Full Analysis Set

Upper Leg Length (Thigh) to Tibial Leg Length Ratio	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
SMD (95% CI) ^c		0.02 (-0.83, 0.88)
P-value for interaction term, treatment * [Region]		0.9665

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline upper leg length to tibial leg length ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline upper leg length to tibial leg length ratio, and treatment and region interaction.

Missing assessments at week 52 were not imputed.

Difference in LS mean change from baseline (95% CI) ^a		-0.02 (-0.06, 0.02)
P-value ^b		0.2614

NE, Not estimable.

^a Difference is 15ug/kg BMN 111 minus placebo. ^b Two-sided p-value.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline arm span to standing height ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline arm span to standing height ratio, and treatment and stratum interaction.

Missing assessments at week 52 were not imputed.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline arm span to standing height ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline arm span to standing height ratio, and treatment and height z-score interaction.

Missing assessments at week 52 were not imputed.

^c SMD (standardized mean difference) is an effect size measure similar to hedges g; however, this SMD is based on a least squares mean from a general linear model. The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

LS means and difference in LS means were obtained from an analysis of covariance model. For the by-stratum analysis, model terms included stratum defined by sex and Tanner stage, treatment, baseline age, baseline AGV, baseline height z-score, and baseline arm span to standing height ratio.

For the overall analysis, which includes the interaction-term, model terms include baseline age, baseline AGV, baseline height z-score, baseline arm span to standing height ratio, and treatment and region interaction.

Missing assessments at week 52 were not imputed.

Analysis Population: Full Analysis Set

Baseline AGV Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
25th, 75th Percentile	65.84, 90.00	55.00, 85.00
Min, Max	31.7, 100.0	31.7, 91.7
Change from baseline to Week 26 ^a		
n	16	11
Mean (SD)	5.63 (11.17)	3.18 (17.02)
Median	2.50	6.67
25th, 75th Percentile	-2.50, 12.51	-6.66, 18.34
Min, Max	-11.7, 28.3	-30.0, 25.0
Week 52		
n	18	12
Mean (SD)	74.26 (17.82)	72.64 (15.07)
Median	76.67	78.33

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Psychosocial summary score is the mean score (sum of items scored/number of items answered in the emotional, social and school functioning domains).

Week 52		
n	18	18
Mean (SD)	72.85 (19.37)	72.50 (16.83)
Median	75.00	67.50

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

School functioning score is the mean score (sum of items scored/number of items answered in school functioning domain).

25th, 75th Percentile	-5.00, 10.00	-25.00, 10.00
Min, Max	-30.0, 25.0	-55.0, 30.0
Difference in change from baseline (95%CI)		-5.79 (-22.21, 10.62)
P-value ^b		0.4659
Hedges'g (95% CI) ^c		-0.29 (-1.00, 0.42)
P-value for interaction term, treatment * [Ethnicity]		0.3779

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

School functioning score is the mean score (sum of items scored/number of items answered in school functioning domain).

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Total score is the mean score (sum of all items/number of items answered on all scales).

Self-Reported Pediatric Quality of Life Inventory (PedsQL) Over Time by Age at Baseline: Physical Health Summary Score for BMN111-301
Analysis Population: Full Analysis Set

Age at Baseline Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
>= 5 to < 8		
Self-Reported PedsQL : Physical Health Summary Score		
Week 26		
n	5	4
Mean (SD)	52.50 (21.12)	80.47 (12.85)
Median	40.63	79.69
25th, 75th Percentile	37.50, 68.75	71.88, 89.07
Min, Max	34.4, 81.3	65.6, 96.9
Week 52		
n	8	8
Mean (SD)	58.60 (12.47)	80.86 (14.98)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Physical health summary score is the mean score (sum of items scored/number of items answered in physical functioning domain).

Mean (SD)	-2.83 (12.43)	6.81 (14.62)
Median	0.00	0.00
25th, 75th Percentile	-12.50, 6.25	-3.13, 19.42
Min, Max	-21.9, 18.8	-9.4, 31.3
Difference in change from baseline (95%CI)		9.63 (-3.48, 22.74)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Physical health summary score is the mean score (sum of items scored/number of items answered in physical functioning domain).

Mean (SD)	-1.56 (16.01)	4.73 (19.77)
Median	-2.14	3.33
25th, 75th Percentile	-5.00, 8.33	-10.00, 23.33
Min, Max	-41.7, 25.0	-26.7, 36.7
Difference in change from baseline (95%CI)		6.29 (-9.71, 22.29)
P-value ^b		0.4216

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Psychosocial summary score is the mean score (sum of items scored/number of items answered in the emotional, social and school functioning domains).

Week 26		
n	13	8
Mean (SD)	79.87 (11.13)	65.31 (18.95)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Psychosocial summary score is the mean score (sum of items scored/number of items answered in the emotional, social and school functioning domains).

Mean (SD)	-11.43 (18.64)	-1.11 (20.12)
Median	-5.00	0.00
25th, 75th Percentile	-20.00, 0.00	-10.00, 15.00
Min, Max	-50.0, 5.0	-35.0, 25.0
Difference in change from baseline (95%CI)		10.32 (-10.76, 31.40)
P-value ^b		0.3116

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Emotional functioning score is the mean score (sum of items scored/number of items answered in emotional functioning domain).

Table 14.2.7.2.6.5
Self-Reported Pediatric Quality of Life Inventory (PedsQL) Over Time by Baseline Height Z-score: School Functioning Score for BMN111-301
Analysis Population: Full Analysis Set

Baseline Height Z-score Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Median	60.00	70.00
25th, 75th Percentile	45.00, 80.00	60.00, 75.00
Min, Max	45.0, 90.0	55.0, 90.0
Change from baseline to Week 26 ^a		
n	4	6
Mean (SD)	1.25 (11.09)	-1.67 (10.33)
Median	0.00	-2.50
25th, 75th Percentile	-7.50, 10.00	-10.00, 10.00
Min, Max	-10.0, 15.0	-15.0, 10.0
Week 52		
n	6	9
Mean (SD)	71.67 (16.93)	79.58 (15.31)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

A higher score reflects a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

School functioning score is the mean score (sum of items scored/number of items answered in school functioning domain).

Mean (SD)	53.10 (19.55)	58.63 (19.19)
Median	45.49	58.68

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Total score is the sum of the mean physical social and emotional scores, divided by 3.

Caregiver-Reported Quality of Life in Short Statured Youth (QoLISSY) Over Time by Baseline Tanner Stage: Total Score for BMN111-301
Analysis Population: Full Analysis Set

Baseline Tanner Stage Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
25th, 75th Percentile	50.63, 66.32	52.78, 80.56
Min, Max	8.7, 92.7	49.3, 94.8
Change from baseline to Week 26 ^a		
n	13	11
Mean (SD)	3.89 (9.66)	1.55 (15.93)
Median	0.35	-2.44
25th, 75th Percentile	-2.78, 9.37	-8.68, 5.21
Min, Max	-7.7, 27.0	-15.6, 41.3
Week 52		
n	13	10
Mean (SD)	58.15 (18.73)	66.70 (14.00)
Median	60.77	69.97

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Total score is the sum of the mean physical social and emotional scores, divided by 3.

Min, Max	10.1, 89.2	29.5, 85.4
Change from baseline to Week 52 ^a		
n	40	43
Mean (SD)	3.83 (16.75)	0.64 (12.92)
Median	1.91	-2.09
25th, 75th Percentile	-3.82, 14.24	-6.94, 10.41
Min, Max	-29.5, 50.7	-22.9, 34.4
Difference in change from baseline (95%CI)		-3.19 (-9.70, 3.32)
P-value ^b		0.3322
Hedges'g (95% CI) ^c		-0.21 (-0.64, 0.22)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Total score is the sum of the mean physical social and emotional scores, divided by 3.

Caregiver-Reported QoLISSY : Physical Score		
Baseline		
n	24	17
Mean (SD)	50.00 (25.09)	44.36 (18.51)
Median	54.17	41.67
25th, 75th Percentile	37.50, 64.59	37.50, 50.00
Min, Max	0.0, 95.8	16.7, 79.2
Week 26		
n	23	16
Mean (SD)	52.03 (21.97)	46.09 (19.51)
Median	55.00	43.75

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Table 14.2.8.2.4.6
Self-Reported Quality of Life in Short Statured Youth (QoLISSY) Over Time by Baseline AGV Category: Emotional Score for BMN111-301
Analysis Population: Full Analysis Set

Baseline AGV Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
> 3.5 to <= 4.5 cm/year		
Self-Reported QoLISSY : Emotional Score		
Baseline		
n	14	9
Mean (SD)	70.54 (15.10)	61.81 (26.51)
Median	75.00	71.88
25th, 75th Percentile	56.25, 75.00	37.50, 87.50
Min, Max	40.6, 100.0	21.9, 90.6
Week 26		
n	12	12
Mean (SD)	73.70 (12.32)	74.18 (20.87)
Median	73.44	75.00

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

Self-Reported Quality of Life in Short Statured Youth (QoLISSY) Over Time by Baseline AGV Category: Coping Score for BMN111-301
Analysis Population: Full Analysis Set

Baseline AGV Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
> 4.5 cm/year		
Self-Reported QoLISSY : Coping Score		
Baseline		
n	10	11
Mean (SD)	65.50 (18.35)	41.36 (23.44)
Median	65.28	37.50
25th, 75th Percentile	52.50, 77.50	25.00, 57.50
Min, Max	37.5, 100.0	5.0, 92.5
Week 26		
n	13	10
Mean (SD)	49.85 (23.03)	35.75 (23.39)
Median	47.50	26.25

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Scores are 0-100: scores closer to 100 are indicative of a higher quality of life.

Self-reported questionnaire is not available for subjects < 8 years old.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Score range 0-126: A higher score reflects a higher level of independence.

Total score is the sum of the mean physical social and emotional scores, divided by 3.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Score range 0-35: A higher score reflects a higher level of independence.

Ethnicity Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Non-White		
WeeFIM : Mobility Score		
Baseline		
n	20	15
Mean (SD)	31.50 (3.43)	30.27 (4.62)
Median	33.00	32.00
25th, 75th Percentile	29.00, 34.00	27.00, 34.00
Min, Max	22.0, 35.0	20.0, 35.0
Week 26		
n	19	14
Mean (SD)	32.68 (2.19)	31.64 (4.34)
Median	33.00	33.00

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Score range 0-35: A higher score reflects a higher level of independence.

Functional Independence Measure For Children (WeeFIM) Over Time by Baseline AGV Category: Cognitive Score for BMN111-301
Analysis Population: Full Analysis Set

Baseline AGV Score Visit Result	Placebo (N=61)	15 ug/kg BMN 111 (N=60)
Min, Max	11.0, 35.0	22.0, 35.0
Change from baseline to Week 52 ^a		
n	16	12
Mean (SD)	-1.56 (3.01)	0.75 (3.28)
Median	0.00	0.00
25th, 75th Percentile	-1.50, 0.00	0.00, 0.00
Min, Max	-9.0, 0.0	-2.0, 11.0
Difference in change from baseline (95%CI)		2.31 (-0.14, 4.77)
P-value ^b		0.0637
Hedges'g (95% CI) ^c		0.72 (-0.06, 1.48)

Max, maximum; Min, minimum; SD, standard deviation.

^a Change from baseline is based on the subjects with available measurements at both time points.

^b Two-sided p-value.

^c An effect size that represents standardized mean difference (SMD). The two-sided confidence interval of the SMD is based on a noncentral t-distribution.

Score range 0-35: A higher score reflects a higher level of independence.

AEs with onset or worsening after the initiation of study drug and up to 30 days after study drug discontinuation were included. AEs were coded using MedDRA version [Multiple] and graded for severity using NCI CTCAE version 4.0.

^a Percentages were calculated using the total number of subjects in the safety population (N for each treatment group) as the denominator. Subjects with more than one AE of the same category were counted only once for that category.

Table 14.3.1.12.1
Selected Adverse Events of Interest including Treatment Group Comparisons by Baseline Height Z-score: ≤ -6 for BMN111-301
Analysis Population: Safety Analysis Set

AE Category	Placebo (N=10)	15 ug/kg BMN 111 (N=15)	RR [95%CI] p-value	OR [95%CI] p-value	RD [95%CI] p-value
Subjects with any EOI, n (%) ^a					
Injection site reactions	7 (70.0)	10 (66.7)	0.95 (0.55; 1.64) 0.8597	0.86 (0.15; 4.82) 0.8611	-0.0333 (-0.40; 0.34) 0.8602
Hypersensitivity (SMQ Narrow Terms)	1 (10.0)	5 (33.3)	3.33 (0.45; 24.44) 0.2363	4.50 (0.44; 46.17) 0.2055	0.2333 (-0.07; 0.54) 0.1305

AE, adverse event; EOI, event of interest; CTCAE, common terminology criteria for adverse events; MedDRA, Medical Dictionary for Regulatory Activities; NCI, National Cancer Institute; SAE, serious adverse event; RR, relative risk; OR, odds ratio; RD, risk difference; NA, not applicable or not presented.

AEs with onset or worsening after the initiation of study drug and up to 30 days after study drug discontinuation were included. AEs were coded using MedDRA version [Multiple] and graded for severity using NCI CTCAE version 4.0.

^a Percentages were calculated using the total number of subjects in the safety population (N for each treatment group) as the denominator. Subjects with more than one AE of the same category were counted only once for that category.

AE, adverse event; EOI, event of interest; CTCAE, common terminology criteria for adverse events; MedDRA, Medical Dictionary for Regulatory Activities; NCI, National Cancer Institute; SAE, serious adverse event; RR, relative risk; OR, odds ratio; RD, risk difference; NA, not applicable or not presented.

AEs with onset or worsening after the initiation of study drug and up to 30 days after study drug discontinuation were included. AEs were coded using MedDRA version [Multiple] and graded for severity using NCI CTCAE version 4.0.

^a Percentages were calculated using the total number of subjects in the safety population (N for each treatment group) as the denominator. Subjects with more than one AE of the same category were counted only once for that category.
