[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Placebo	120	43 (35.8)	[0.856;2.388]	[0.956;1.753]	[-0.017;0.226]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Placebo (N=151)	Overall	134 (88.7)	1.15 (0.805)	127 (84.1) -0.41 (0.058)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

1.1.8 EQ-5D-5L VAS

Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EQ-5D-5L: European Quality of Life Five-Dimension Five-Level Scale; VAS: Visual analogue scale.

1.1.8.2 Change from baseline in EQ-5D-5L VAS (mITT Population) - POOLED

Table 2.14.2.1.3: Change from baseline in EQ-5D-5L VAS (mITT Population) - POOLED

Treatment	Study visit	n (%)[1]	Mean (SD)[1]	Change from baseline n (%)[2] LS-mean (SE)[3]	Difference LS-mean change [95% CI] p-value[3]	Standard Mean Difference Hedges' g [95% CI][3]
Relugolix+E2/NETA (N=418)	Baseline	411 (98.3)	56.14 (19.404)	NC (NC) NC (NC)	NC [NC; NC] NC	NC [NC; NC]
Placebo (N=416)	Baseline	410 (98.6)	58.13 (20.210)	NC (NC) NC (NC)		
Relugolix+E2/NETA (N=418)	Week 24	352 (84.2)	78.00 (17.938)	346 (82.8) 20.76 (1.182)	6.59 [3.80; 9.37] <.0001	0.36 [0.21; 0.51]
Placebo (N=416)	Week 24	332 (79.8)	72.04 (20.094)	327 (78.6) 14.17 (1.186)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on an analysis of covariance (ANCOVA) with study, treatment, visit, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as covariates. Hedges' g is calculated using a small sample bias correction.
The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EQ-5D-5L: European Quality of Life Five Dimension Five Level; VAS: Visual analogue scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio;

RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.

Patients with missing assessments are considered as non-responders.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction and geographic region (North America, Rest of World) as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and geographic region (North America, Rest of World).

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and geographic region (North America, Rest of World).

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study and geographic region (North America, Rest of World).

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.

Patients with missing assessments are considered as non-responders.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Dysmenorrhea NRS score at baseline, Interaction p-value: 0.9105						
< 7						
Relugolix+E2/NETA	176	90 (51.1)	1.858	1.406	0.151	0.0041
Placebo	186	68 (36.6)	[1.212;2.846]	[1.114;1.775]	[0.049;0.253]	
>= 7						
Relugolix+E2/NETA	242	130 (53.7)	1.919	1.419	0.160	0.0004
Placebo	230	88 (38.3)	[1.320;2.790]	[1.166;1.727]	[0.074;0.247]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.

Patients with missing assessments are considered as non-responders.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; EHP-30: Endometriosis Health Profile 30-item questionnaire.

Relugolix+E2/NETA	60	1 (1.7)	0.692	0.705	-0.015	0.6916
Placebo	64	2 (3.1)	[0.112;4.295]	[0.124;3.996]	[-0.070;0.040]	
>= 90 mL/min						
Relugolix+E2/NETA	358	7 (2.0)	1.388	1.380	0.005	0.5778
Placebo	352	5 (1.4)	[0.436;4.417]	[0.442;4.308]	[-0.014;0.024]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Hepatic disorders include drug-related hepatic disorder comprehensive standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Hepatic disorders include drug-related hepatic disorder comprehensive standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Placebo	230	10 (4.3)	[0.387;2.323]	[0.403;2.246]	[-0.039;0.034]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events are counted only once.
Adverse event grades are evaluated based on NCI-CTCAE (version 5).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; TEAE: Treatment Emergent Adverse Event; CTCAE: Common Terminology Criteria for Adverse Events.

Placebo	120	6 (5.0)	[0.423;3.733]	[0.442;3.432]	[-0.045;0.069]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events are counted only once.
Adverse event grades are evaluated based on NCI-CTCAE (version 5).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; TEAE: Treatment Emergent Adverse Event; CTCAE: Common Terminology Criteria for Adverse Events.

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Prior treatment for endometriosis, Interaction p-value: 0.9105						
Yes						
Relugolix+E2/NETA	289	8 (2.8)	1.378	1.366	0.007	0.5577
Placebo	296	6 (2.0)	[0.472;4.025]	[0.479;3.893]	[-0.017;0.032]	
No						
Relugolix+E2/NETA	129	4 (3.1)	1.238	1.221	0.006	0.7905
Placebo	120	3 (2.5)	[0.271;5.660]	[0.280;5.327]	[-0.035;0.046]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events are counted only once.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; TEAE: Treatment Emergent Adverse Event.

Adverse events with action taken of study treatment discontinuation are taken from the adverse events case report form.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; TEAE: Treatment Emergent Adverse Event.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Placebo	16	0	[0.077;25.438]	[0.095;20.071]		

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Placebo	262	21 (8.0)	[1.028;3.167]	[1.021;2.807]	[0.004;0.107]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Placebo	352	97 (27.6)	[1.202;2.272]	[1.128;1.724]	[0.041;0.177]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Rest of World [including US]						
Relugolix+E2/NETA	148	8 (5.4)	6.060	5.745	0.047	0.0233
Placebo	151	1 (0.7)	[1.050;34.973]	[1.028;32.099]	[0.009;0.086]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

Placebo	327	25 (7.6)	[1.212;3.372]	[1.179;2.980]	[0.019;0.115]	

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the Safety Population for each treatment group. Patients with multiple events for a given SOC or PT are counted only once for each SOC and PT. Only SOCs or PTs for which there are at least 10% of patients with an event in at least one treatment group OR at least 10 patients with an event in at least one treatment group AND at least 1% of patients with an event in at least one treatment group in the overall pooled Safety Population are considered. Further, only SOCs and PTs for which there is a significant treatment effect (p-value <0.05) in the overall pooled Safety Population are presented. Events are sorted alphabetically by SOC and PT and then by ascending subgroup-by-treatment interaction p-value within each. MedDRA Version 22.0.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.

The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.

The reference group for the OR, RR and RD is Placebo.

A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.3.1.2.3: Adverse Event Category: Bone health events, by Subgroup (Safety Population) - POOLED
System Organ Class: Any, Preferred Term: Any

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Prior treatment for endometriosis, Interaction p-value: 0.9215						
Yes						
Relugolix+E2/NETA	289	16 (5.5)	1.390	1.366	0.015	0.4005
Placebo	296	12 (4.1)	[0.645;2.995]	[0.658;2.837]	[-0.020;0.050]	
No						
Relugolix+E2/NETA	129	2 (1.6)	1.550	1.525	0.007	0.6794
Placebo	120	1 (0.8)	[0.201;11.929]	[0.205;11.360]	[-0.020;0.033]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Bone helath events include Osteoporosis/Osteopenia and fracture standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Bone helath events include Osteoporosis/Osteopenia and fracture standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Placebo	125	0	[0.305;28.983]	[0.305;27.375]	[-0.006;0.037]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Hepatic disorders include drug-related hepatic disorder comprehensive standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.4.1.2.3: Adverse Event Category: Vasomotor symptoms, by Subgroup (Safety Population) - POOLED
System Organ Class: Any, Preferred Term: Any

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Prior treatment for endometriosis, Interaction p-value: 0.4510						
Yes						
Relugolix+E2/NETA	289	39 (13.5)	1.768	1.663	0.054	0.0359
Placebo	296	24 (8.1)	[1.034;3.024]	[1.025;2.699]	[0.003;0.104]	
No						
Relugolix+E2/NETA	129	16 (12.4)	2.695	2.489	0.074	0.0410
Placebo	120	6 (5.0)	[1.018;7.137]	[0.994;6.230]	[0.005;0.143]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.4.1.2.3: Adverse Event Category: Vasomotor symptoms, by Subgroup (Safety Population) - POOLED

Treatment	**N**	**n (%)**	**OR[1] [95% CI]**	**RR[2] [95% CI]**	**RD[3] [95% CI]**	**p-value[4]**
Renal function, Interaction p-value: 0.6950						
>= 60 to < 90 mL/min						
Relugolix+E2/NETA	60	1 (1.7)	1.081	1.063	0.001	0.9497
Placebo	64	1 (1.6)	[0.147;7.935]	[0.158;7.154]	[-0.044;0.047]	
>= 90 mL/min						
Relugolix+E2/NETA	358	7 (2.0)	1.729	1.714	0.008	0.3819
Placebo	352	4 (1.1)	[0.501;5.962]	[0.505;5.815]	[-0.010;0.026]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Placebo	106	5 (4.7)	[0.883;6.764]	[0.876;5.898]	[-0.003;0.136]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing.
MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.4.1.2.3: Adverse Event Category: Vasomotor symptoms, by Subgroup (Safety Population) - POOLED
System Organ Class: Vascular disorders, Preferred Term: Any

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Dysmenorrhea NRS score at baseline, Interaction p-value: 0.9128						
< 7

Placebo	230	16 (7.0)	[1.044;3.702]	[1.033;3.286]	[0.005;0.112]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Vasomotor symptoms include preferred terms of Hyperhidrosis, Feeling hot, Hot flush, Night sweats and Flushing. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.5.1.2.3: Adverse Event Category: Mood disorders, by Subgroup (Safety Population) - POOLED
System Organ Class: Any, Preferred Term: Any

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Age category I, Interaction p-value: 0.4640						
< 35 years						
Relugolix+E2/NETA	223	18 (8.1)	1.174	1.159	0.011	0.6611
Placebo	216	15 (6.9)	[0.575;2.396]	[0.600;2.236]	[-0.038;0.060]	
>= 35 years						
Relugolix+E2/NETA	195	15 (7.7)	1.776	1.711	0.032	0.1833
Placebo	200	9 (4.5)	[0.757;4.165]	[0.767;3.818]	[-0.015;0.079]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Placebo	113	8 (7.1)	[0.269;2.402]	[0.304;2.267]	[-0.077;0.053]	
>= 40 years						
Relugolix+E2/NETA	89	8 (9.0)	5.895	5.577	0.079	0.0265
Placebo	87	1 (1.1)	[1.011;34.370]	[0.991;31.396]	[0.015;0.142]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.5.1.2.3: Adverse Event Category: Mood disorders, by Subgroup (Safety Population) - POOLED

Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup and a subgroup-by-treatment interaction as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study.
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study.
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR and p-value if zero events are observed in a given treatment group/study or if 100% of patients have an event in a given treatment group/study. No continuity correction is applied in estimation of the RD.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with ≥ 1 event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; NE: Non-estimable; E2: Estradiol; NETA: Norethindrone acetate; SOC: System organ class; PT: Preferred term.

Table 3.5.1.2.3: Adverse Event Category: Mood disorders, by Subgroup (Safety Population) - POOLED
System Organ Class: Psychiatric disorders, Preferred Term: Mood swings

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
BMI (kg/m2) at baseline category I, Interaction p-value: 0.6109						
< 30

>= 30						
Relugolix+E2/NETA	87	3 (3.4)	1.595	1.568	0.014	0.5774
Placebo	98	2 (2.0)	[0.307;8.302]	[0.318;7.720]	[-0.034;0.062]	

Post hoc analysis. The denominator for percentages is the number of patients in the safety population for each treatment group. Patients with multiple events for a given PT or SOC are counted only once for each PT and SOC. Events are sorted by SOC alphabetically and then by decreasing frequency of PT in the Relugolix+E2/NETA group.
Mood disorders include depression and suicide/self injury (broad) standardized MedDRA query. MedDRA (version 22.0).
