1 Subgruppenanalysen – Tabellen

1.1 Morbidität

1.1.1 Reduktion der blutungsbedingten Schmerzen

1.1.1.1 Proportion of responders at Week 24/EOT pain assessment period, based on dysmenorrhea NRS scores - Primary endpoint I by Subgroup (mITT Population) - POOLED

Table 2.1.1.2.3: Proportion of responders at Week 24/EOT pain assessment period, based on dysmenorrhea NRS scores - Primary endpoint I by Subgroup (mITT Population) - POOLED

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Dysmenorrhea NRS score at baseline, Interaction p-value: 0.0265						
< 7						
Relugolix+E2/NETA	176	138 (78.4)	12.305	3.201	0.548	<.0001
Placebo	186	45 (24.2)	[7.455;20.310]	[2.471;4.146]	[0.461;0.634]	
>= 7						
Relugolix+E2/NETA	242	175 (72.3)	5.991	2.238	0.401	<.0001
Placebo	230	74 (32.2)	[3.984;9.009]	[1.833;2.733]	[0.320;0.483]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.8 points or a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.8) on the NRS for dysmenorrhea and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Table 2.1.1.2.3: Proportion of responders at Week 24/EOT pain assessment period, based on dysmenorrhea NRS scores - Primary endpoint I by Subgroup (mITT Population) - POOLED

Placebo	64	18 (28.1)	[4.875;25.542]	[1.842;3.946]	[0.360;0.650]	
>= 90 mL/min						
Relugolix+E2/NETA	358	264 (73.7)	7.560	2.537	0.445	<.0001
Placebo	352	101 (28.7)	[5.373;10.639]	[2.134;3.016]	[0.380;0.510]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.8 points or a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.8) on the NRS for dysmenorrhea and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Dysmenorrhea NRS score at baseline, Interaction p-value: 0.0677						
< 7						
Relugolix+E2/NETA	176	134 (76.1)	10.816	3.108	0.525	<.0001
Placebo	186	45 (24.2)	[6.611;17.697]	[2.396;4.031]	[0.437;0.612]	
>= 7						
Relugolix+E2/NETA	242	175 (72.3)	6.009	2.238	0.401	<.0001
Placebo	230	74 (32.2)	[3.994;9.040]	[1.833;2.733]	[0.320;0.483]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.8 points on the NRS for dysmenorrhea and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo	106	32 (30.2)	[2.987;9.410]	[1.655;3.069]	[0.263;0.500]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.8 points on the NRS for dysmenorrhea and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=64)	Week 12	58 (90.6)	5.08 (2.725)	58 (90.6) -1.72 (0.342)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=200)	Overall	200 (100.0)	5.08 (2.133)	200 (100.0) -1.67 (0.150)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.1 points or a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.1) on the NRS for NMPP and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.1 points or a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.1) on the NRS for NMPP and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Placebo	308	128 (41.6)	[1.738;3.368]	[1.274;1.735]	[0.128;0.278]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a reduction of at least 2.1 points or a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.1) on the NRS for NMPP and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

1.1.2.2 Proportion of responders at Week 24/EOT pain assessment period, based on NMPP NRS scores - Post hoc analysis: Component 1 by Subgroup (mITT Population) - POOLED

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, treatment group and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Responders are patients with a week 24/EOT value <= 0.1 points (patients with a baseline value < 2.8) on the NRS for NMPP and no increase in analgesic use at Week 24/EOT. Patients who completed < 5 weeks of treatment are considered non-responders.
[1] OR (95% CI) based on
[2] RR (95% CI) based on
[3] RD (95% CI) based on
[4] P-value based on
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.

The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Placebo (N=154)	Week 12	139 (90.3)	3.77 (2.375)	139 (90.3) -1.48 (0.188)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale; NMPP: Non-menstrual pelvic pain.

[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Treatment	N	n (%)	OR[1] [95% CI]	RR[2] [95% CI]	RD[3] [95% CI]	p-value[4]
Prior hormonal treatment, Interaction p-value: 0.9279						
Yes						
Relugolix+E2/NETA	138	95 (68.8)	2.307	1.385	0.192	0.0009
Placebo	154	77 (50.0)	[1.422;3.741]	[1.141;1.681]	[0.082;0.302]	
No						
Relugolix+E2/NETA	280	195 (69.6)	2.372	1.392	0.195	<.0001
Placebo	262	129 (49.2)	[1.659;3.391]	[1.207;1.605]	[0.115;0.275]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=113)	Overall	113 (100.0)	4.30 (2.087)	113 (100.0) -1.42 (0.183)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=42)	Overall	42 (100.0)	3.78 (1.723)	42 (100.0) -1.46 (0.298)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=213)	Week 12	193 (90.6)	4.09 (2.468)	193 (90.6) -1.71 (0.153)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Relugolix+E2/NETA (N=85)	Week 12	79 (92.9)	1.80 (1.541)	79 (92.9) -2.33 (0.282)	-0.51 [-1.15; 0.13] 0.1208	-0.36 [-0.68; -0.05]
Placebo (N=88)	Week 12	81 (92.0)	2.50 (1.347)	81 (92.0) -1.82 (0.276)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=154)	Overall	153 (99.4)	4.23 (2.106)	153 (99.4) -1.41 (0.162)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=350)	Week 12	319 (91.1)	4.21 (2.326)	319 (91.1) -1.52 (0.122)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Relugolix+E2/NETA (N=195)	Overall	195 (100.0)	3.61 (2.354)	195 (100.0) -2.27 (0.142)	-0.66 [-1.04; -0.29] 0.0005	-0.33 [-0.52; -0.13]
Placebo (N=200)	Overall	200 (100.0)	4.19 (2.108)	200 (100.0) -1.61 (0.140)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=151)	Week 12	95 (62.9)	3.72 (2.770)	95 (62.9) -1.51 (0.222)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Placebo (N=376)	Overall	288 (76.6)	3.68 (2.414)	288 (76.6) -1.52 (0.131)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group. Patients with average dyspareunia NRS score of 0 at baseline were excluded from analysis.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; NRS: Numerical rating scale.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients who were not using a Tier 2 analgesic, including tramadol (37.5 mg) / paracetamol (325 mg), tramadol (50 mg), codeine (30 mg), codeine (30 mg) / paracetamol (300 mg), codeine (30 mg) / paracetamol (500 mg), codeine (15 mg) / paracetamol (500 mg), and hydrocodone (5 mg) / acetaminophen (325 mg), at Week 24/EOT.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate.

Prior treatment for endometriosis, Interaction p-value: 0.3412						
Yes						
Relugolix+E2/NETA	289	156 (54.0)	3.708	2.234	0.302	<.0001
Placebo	296	73 (24.7)	[2.601;5.287]	[1.787;2.794]	[0.228;0.376]	
No						
Relugolix+E2/NETA	129	75 (58.1)	2.729	1.765	0.251	<.0001
Placebo	120	40 (33.3)	[1.621;4.594]	[1.306;2.386]	[0.130;0.372]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients who were not using either Tier 1 or Tier 2 analgesics, including Ibuprofen (200 mg), tramadol (37.5 mg) / paracetamol (325 mg), tramadol (50 mg), codeine (30 mg), codeine (30 mg) / paracetamol (300 mg), codeine (30 mg) / paracetamol (500 mg), codeine (15 mg) / paracetamol (500 mg), and hydrocodone (5 mg) / acetaminophen (325 mg), at Week 24/EOT.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate.

Placebo	230	56 (24.3)	[2.201;4.860]	[1.615;2.700]	[0.183;0.351]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients who were not using either Tier 1 or Tier 2 analgesics, including Ibuprofen (200 mg), tramadol (37.5 mg) / paracetamol (325 mg), tramadol (50 mg), codeine (30 mg), codeine (30 mg) / paracetamol (300 mg), codeine (30 mg) / paracetamol (500 mg), codeine (15 mg) / paracetamol (500 mg), and hydrocodone (5 mg) / acetaminophen (325 mg), at Week 24/EOT.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate.

Placebo	98	43 (43.9)	[0.771;2.537]	[0.815;1.519]	[-0.094;0.193]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
PGIC response scale: much better, better, a little better, the same, a little worse, worse, much worse. Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; PGIC: Patients' global impression of change; NMPP: Non-menstrual pelvic pain.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; PGIC: Patients' global impression of change.

4 to < 7						
Relugolix+E2/NETA	210	176 (83.8)	7.130	1.931	0.405	<.0001
Placebo	222	97 (43.7)	[4.491;11.319]	[1.642;2.270]	[0.323;0.488]	
7 to 10						
Relugolix+E2/NETA	123	92 (74.8)	3.546	1.573	0.274	<.0001
Placebo	106	50 (47.2)	[2.002;6.282]	[1.265;1.955]	[0.155;0.394]	

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a visit-by-treatment interaction, and baseline value as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Placebo (N=26)	Week 12	22 (84.6)	1.40 (0.708)	22 (84.6) -0.31 (0.138)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a visit-by-treatment interaction, and baseline value as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman.

Patients with missing assessments are considered as non-responders.
[1] OR (95% CI) based on a logistic regression model adjusting for study, treatment group, subgroup, a subgroup-by-treatment interaction, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World) as covariates.
[2] RR (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[3] RD (95% CI) based on a Cochran-Mantel-Haenszel approach stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
[4] P-value based on a Cochran-Mantel-Haenszel test stratified by study, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years) and geographic region (North America, Rest of World).
The Interaction p-value is based on the subgroup-by-treatment interaction term in the logistic regression model used to compute the OR and 95% CI.
A continuity correction is applied in estimation of OR, RR, RD and p-value if zero events are observed in a given treatment group/stratum or if 100% of patients have an event in a given treatment group/stratum.
The reference group for the OR, RR and RD is Placebo.
Abbreviations: N: Number of patients in treatment group; n: Number of patients with an event; OR: Odds ratio; RR: Risk ratio; RD: Risk difference; CI: Confidence interval; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.

[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
Abbreviations: N: Number of patients in treatment group; n: number of patients with data; SD: standard deviation; SE: Standard error; LS: least squares; CI: confidence interval; mITT: Modified intent-to-treat; NC: Not calculated; EOT: End-of-treatment; E2: Estradiol; NETA: Norethindrone acetate; sB&B: Subject Modified Biberoglu and Behrman; NMPP: Non-menstrual pelvic pain.

Placebo (N=87)	Overall	86 (98.9)	1.07 (0.587)	86 (98.9) -0.52 (0.062)		

Post hoc analysis. The denominator for percentages is the number of patients in the mITT Population for each treatment group.
[1] Summary statistics are based on observed data. For the Overall visit, summary statistics are calculated based on the mean observed value across all post-baseline visits within each patient.
[2] Number of patients with non-missing change from baseline.
[3] LS means, LS mean differences (and 95% CIs), p-value and Hedges' g (95% CIs) are based on a mixed model with repeated measures (MMRM) with study, treatment, visit, subgroup, a subgroup-by-treatment interaction, a subgroup-by-visit interaction, a visit-by-treatment interaction, a subgroup-by-visit-by-treatment interaction, baseline value, time since initial surgical diagnosis of endometriosis (< 5 years, >= 5 years), and geographic region (North America, Rest of World) as fixed effects using an unstructured covariance matrix. Hedges' g is calculated using a small sample bias correction.
The interaction p-value is based on the subgroup-by-treatment interaction term in the MMRM used to compute the Overall visit estimates. The reference group for the LS mean difference and Hedges' g is Placebo.
