[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADRS. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel.

Percentages were based on N.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 responders, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of responders are displayed.

ORR is unconfirmed and defined as proportion of number of patients with a PR or CR per RECIST v1.1 (i.e. ORR = CR+PR).

[a] Odds ratio and relative risk were assumed to be log normally distributed. Mantel-Haenszel common risk difference was estimated. 95% CI was constructed by a normal approximation and Sato's variance estimator.

[b] P-value was based on unstratified chi-squared test. P-value for the interaction was based on Breslow-Day test testing for differences in treatment effect across subgroups.

Source: ADSL, ADQS. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Only patients with baseline and postbaseline value are included in analysis.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Physical functioning									
Cycle 4	139		-3.61 (1.11)	75		-6.55 (1.38)	2.94 (-0.45, 6.32)	0.21 (-0.03, 0.45)	0.0886
Cycle 6	94		-4.02 (1.20)	36		-8.60 (1.68)	4.59 (0.59, 8.58)	0.33 (0.04, 0.62)	0.0248
Overall Treatment Effect	229	87.38 (13.88)	-2.98 (0.86)	209	84.40 (16.59)	-5.89 (1.02)	2.91 (0.41, 5.41)	0.26 (0.04, 0.49)	0.0225

Source: ADSL, ADQS. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Only patients with baseline and postbaseline value are included in analysis.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADSL, ADQS. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.
Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.
Only patients with baseline and postbaseline value are included in analysis.
The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.
[a] Sample mean and SD at baseline based on the patients with baseline value.
[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.
[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.
[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.
[e] P-value was calculated based on testing whether treatment effect is zero or not.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEQS1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEQS1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEQS1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.
The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Source: ADSL, ADQS. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Only patients with baseline and postbaseline value are included in analysis.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab.

[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. Negative differences favor tislelizumab.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.
[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.
[c] P-value for treatment effect was based on a log rank test stratified by baseline ECOG status and ICC options.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Source: ADSL, ADTTEQS1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EQ-5D VAS is defined as the >= 15 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Table 14.3.1.1.1.b:
Study Medication Administration - Tislelizumab
Safety Analysis Set - Subpopulation without Irinotecan

	Tislelizumab (N = 139)
Duration of Exposure (Days)	
n	139
Mean (SD)	191.7 (270.97)
Median	84.0
Q1, Q3	43.0, 229.0
Min, Max	10, 1513

Source: Listing 16.2.5.1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Percentages were based on N.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/cycle) is defined as total dose (mg) / duration of exposure (day) * cycle length in days.

[c] RDI is defined as the ratio of the actual dose intensity (mg/cycle) and the planned dose intensity (mg/cycle) = dose intensity / (200 mg/cycle). The planned dose intensity is the total planned dose in a cycle. For a patient in the tislelizumab arm, the planned dose intensity is 200 mg once every three weeks.

[d] A patient was counted only once within each category but may be counted in multiple categories.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/ m^2/cycle) = (total dose received / BSA) / Duration of Treatment in cycle * cycle length in days. Baseline weights are used to derive BSA, unless the change of the BSA at the visit are at least 10% or greater than the baseline (increased or decreased).

[c] Relative dose intensity (RDI) is defined as the ratio of the actual dose intensity (mg/ m^2/cycle) and the planned dose intensity (mg/ m^2/cycle). The planned dose intensity is the total planned dose in a cycle.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Source: Listing 16.2.5.2. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Percentages were based on N. Paclitaxel Grp1: 135-175mg/m^2 IV on Day 1, given every 21 days. Paclitaxel may also be given in doses of 80-100mg/m^2 IV on a weekly schedule; Paclitaxel Grp2--Paclitaxel (Japan): 100 mg/m^2 IV on Day 1, 8, 15, 22, 29, and 36, followed by one week of rest. Docetaxel Grp1: 75 mg/m^2 IV on Day 1, given every 21 days; Docetaxel Grp2--70 mg/m^2 IV on Day 1, given every 21 days for Japan patients.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/ m^2/cycle) = (total dose received / BSA) / Duration of Treatment in cycle * cycle length in days. Baseline weights are used to derive BSA, unless the change of the BSA at the visit are at least 10% or greater than the baseline (increased or decreased).

[c] Relative dose intensity (RDI) is defined as the ratio of the actual dose intensity (mg/ m^2/cycle) and the planned dose intensity (mg/ m^2/cycle). The planned dose intensity is the total planned dose in a cycle.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Min, Max	37.6, 126.0	44.0, 95.4	37.6, 126.0	66.7, 292.4	78.6, 101.4	66.7, 292.4	37.6, 292.4

Source: Listing 16.2.5.2. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Percentages were based on N. Paclitaxel Grp1: 135-175mg/m^2 IV on Day 1, given every 21 days. Paclitaxel may also be given in doses of 80-100mg/m^2 IV on a weekly schedule; Paclitaxel Grp2--Paclitaxel (Japan): 100 mg/m^2 IV on Day 1, 8, 15, 22, 29, and 36, followed by one week of rest. Docetaxel Grp1: 75 mg/m^2 IV on Day 1, given every 21 days; Docetaxel Grp2--70 mg/m^2 IV on Day 1, given every 21 days for Japan patients.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/ m^2/cycle) = (total dose received / BSA) / Duration of Treatment in cycle * cycle length in days. Baseline weights are used to derive BSA, unless the change of the BSA at the visit are at least 10% or greater than the baseline (increased or decreased).

[c] Relative dose intensity (RDI) is defined as the ratio of the actual dose intensity (mg/ m^2/cycle) and the planned dose intensity (mg/ m^2/cycle). The planned dose intensity is the total planned dose in a cycle.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] P-value for treatment effect was based on a log rank test stratified by baseline ECOG status and ICC options.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0 and graded for severity using CTCAE version 4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] P-value for treatment effect was based on a log rank test stratified by baseline ECOG status and ICC options.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 28DEC2022. Data extraction: 13FEB2023.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v25.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.
