Anhang 4-G: Ergänzende Daten zu den in Abschnitt 4.3.1.3 gezeigten Ergebnissen für die Studie RATIONALE 302

Datenschnitt 01.12.2020 – finale Analyse	**Seite**
Baselinecharakteristika und Patientendisposition	1
Gesamtüberleben (OS)	227
Hauptanalysen	227
Subgruppenanalysen	233
Progressionsfreies Überleben (PFS)	243
Hauptanalysen	243
Subgruppenanalysen	251
Objektive Ansprechrate (ORR)	261
Hauptanalysen	261
Subgruppenanalysen	263
Rücklaufquoten EORTC QLQ-C30/EORTC QLQ-OES18/EQ-5D VAS	273
EORTC QLQ-C30	291
Hauptanalysen	291
Subgruppenanalysen	483
EORTC QLQ-OES18	651
Hauptanalysen	651
Subgruppenanalysen	783
EQ-5D-VAS	898
Hauptanalysen	898
Subgruppenanalysen	912
Folgetherapien und Study Medication Administration	924
Folgetherapien	924 – 925 1899 – 1908
Study Medication Administration	926 – 943
Unerwünschte Ereignisse – Gesamtraten	944
Hauptanalysen	944
Subgruppenanalysen	954
Unerwünschte Ereignisse nach SOC und PT	1004
Hauptanalysen	1004 – 1032 1038 – 1225
Subgruppenanalysen	1226 – 1898
Therapieabbruch aufgrund von UE nach SOC und PT	1033 – 1037
Unerwünschte Ereignisse von besonderem Interesse	1909
Hauptanalysen	1909
Subgruppenanalysen	1919

Datenschnitt 01.06.2021 – 120 Tage-Safety-Update	**Seite**
Beobachtungsdauern und Study Medication Administration	1961
Unerwünschte Ereignisse – Gesamtraten	1981
Hauptanalysen	1981
Subgruppenanalysen	1991
Unerwünschte Ereignisse nach SOC und PT	2039
Hauptanalysen	203 – 2067 2073 – 2260
Subgruppenanalysen	2261 – 2933
Therapieabbruch aufgrund von UE nach SOC und PT	2068 – 2072
Unerwünschte Ereignisse von besonderem Interesse	2934
Hauptanalysen	2934
Subgruppenanalysen	2944

Datenschnitt 28.12.2022 – Studienabschluss	**Seite**
Baselinecharakteristika und Patientendisposition	2986
Gesamtüberleben (OS)	3218
Hauptanalysen	3218
Subgruppenanalysen	3226
Progressionsfreies Überleben (PFS)	3236
Hauptanalysen	3236

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel.
Percentages were based on N.
Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on or after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Concomitant systemically administered corticosteroids/immunosuppressive medications are summarized up to 90 days after last dose of study treatment.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.

Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on or after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Concomitant systemically administered corticosteroids/immunosuppressive medications are summarized up to 90 days after last dose of study treatment.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.

ITT Analysis Set

	Tislelizumab (N = 256)	ICC (N = 256)
Number of Patients		
Death, n (%)	197 (77.0)	213 (83.2)
Censored, n (%)	59 (23.0)	43 (16.8)
Ongoing Without Event	54 (21.1)	27 (10.5)
Lost to Follow-up	0 (0.0)	2 (0.8)
Withdrew Consent	5 (2.0)	14 (5.5)
Two-Sided Stratified Log-Rank Test P-value [a]	0.0003	--
Stratified Hazard Ratio (95% CI) [b]	0.695 (0.571, 0.846)	--
Unstratified Hazard Ratio (95% CI) [c]	0.695 (0.572, 0.844)	--
Overall Survival (months)		
Median (95% CI)	8.6 (7.5, 10.4)	6.3 (5.3, 7.0)
1st Quartile (95% CI)	4.0 (3.5, 4.6)	3.3 (2.6, 4.0)
3rd Quartile (95% CI)	18.0 (14.7, 21.0)	11.4 (10.6, 12.9)

Source: Listing 16.2.6.1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE=Not Evaluable.

Percentages were based on N.

In absence of death on or before data cut-off, patients will be censored either at the date that the patient was last known to be alive or the date of data cut-off, whichever comes earlier.

Medians and other quartiles were estimated by Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley.

Overall Survival rates (cumulative probability of OS) were estimated by Kaplan-Meier method with 95% CIs estimated using the Greenwood's formula.

Median follow-up time was estimated by the reverse Kaplan-Meier method.

[a] Two-sided p-value was estimated from log rank test stratified by ECOG performance status and ICC option.

[b] Hazard ratio (Tislelizumab vs. ICC) was based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] Hazard ratio (Tislelizumab vs. ICC) was based on unstratified Cox regression model only including treatment arm as a factor.

Medians and other quartiles were estimated by Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley.

Overall Survival rates (cumulative probability of OS) were estimated by Kaplan-Meier method with 95% CIs estimated using the Greenwood's formula.

Median follow-up time was estimated by the reverse Kaplan-Meier method.

[a] Two-sided p-value was estimated from log rank test stratified by ECOG performance status and ICC option.

[b] Hazard ratio (Tislelizumab vs. ICC) was based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] Hazard ratio (Tislelizumab vs. ICC) was based on unstratified Cox regression model only including treatment arm as a factor.

Source: ADSL, ADTTE. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Percentages were based on N.

ORR is unconfirmed and defined as proportion of number of patients with a PR or CR per RECIST v1.1 (i.e. ORR = CR+PR); DCR is defined as proportion of number of patients with a PR or CR or a SD per RECIST v1.1 (i.e. DCR = CR+PR+SD).

[a] Odds ratio and relative risk were assumed to be log normally distributed. Mantel-Haenszel common risk difference was estimated. 95% CI was constructed by a normal approximation and Sato's variance estimator, stratified by randomization stratification factors.

[b] P-value was calculated using the Cochran-Mantel-Haenszel Chi-square test, stratified by ECOG performance status and ICC option.

[c] Not evaluable is based on RECIST v1.1.

[d] Patients with no post-baseline tumor assessment by the data cutoff, including those who discontinued study (any reason) or died without having any post-baseline tumor assessment.

Source: ADSL, ADQS. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Only patients with baseline and postbaseline value are included in analysis.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADSL, ADQS. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.
Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel.
Only patients with baseline and postbaseline value are included in analysis.
The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.
[a] Sample mean and SD at baseline based on the patients with baseline value.
[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.
[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.
[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.
[e] P-value was calculated based on testing whether treatment effect is zero or not.

Cycle 4	69		-4.46 (2.60)	51		-1.18 (2.98)	-3.28 (-10.98, 4.41)	-0.14 (-0.47, 0.19)	0.4003
Cycle 6	50		-5.43 (3.00)	25		-2.29 (3.89)	-3.14 (-12.79, 6.50)	-0.13 (-0.52, 0.26)	0.5198
Overall Treatment Effect	123	23.70 (30.21)	-4.79 (1.84)	119	26.32 (29.03)	-0.71 (2.06)	-4.07 (-9.35, 1.21)	-0.23 (-0.53, 0.07)	0.1297

Source: ADSL, ADQS. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.
Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel.
Only patients with baseline and postbaseline value are included in analysis.
The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.
[a] Sample mean and SD at baseline based on the patients with baseline value.
[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.
[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. For global health status or functional scales, positive differences favor tislelizumab arm; for symptom scales, negative differences favor tislelizumab arm.
[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.
[e] P-value was calculated based on testing whether treatment effect is zero or not.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEQS1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADQS. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan.

Only patients with baseline and postbaseline value are included in analysis.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, baseline ECOG status and ICC options as covariates, and an unstructured covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab.

[c] Modelled mean change from baseline of tislelizumab arm minus that of ICC arm. Negative differences favor tislelizumab.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADSL, ADTTEQS1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; NE = not estimable; NR = not reached.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on a Cox regression model stratified by subgroup with a treatment-by-subgroup interaction term to test for differences in treatment effect across subgroups.

Percentages were based on N.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/cycle) is defined as total dose (mg) / duration of exposure (day) * cycle length in days.

[c] RDI is defined as the ratio of the actual dose intensity (mg/cycle) and the planned dose intensity (mg/cycle) = dose intensity / (200 mg/cycle). The planned dose intensity is the total planned dose in a cycle. For a patient in the tislelizumab arm, the planned dose intensity is 200 mg once every three weeks.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Source: Listing 16.2.5.1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Percentages were based on N.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/cycle) is defined as total dose (mg) / duration of exposure (day) * cycle length in days.

[c] RDI is defined as the ratio of the actual dose intensity (mg/cycle) and the planned dose intensity (mg/cycle) = dose intensity / (200 mg/cycle). The planned dose intensity is the total planned dose in a cycle. For a patient in the tislelizumab arm, the planned dose intensity is 200 mg once every three weeks.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Source: Listing 16.2.5.2. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Percentages were based on N. Paclitaxel Grp1: 135-175mg/m^2 IV on Day 1, given every 21 days. Paclitaxel may also be given in doses of 80-100mg/m^2 IV on a weekly schedule; Paclitaxel Grp2--Paclitaxel (Japan): 100 mg/m^2 IV on Day 1, 8, 15, 22, 29, and 36, followed by one week of rest. Docetaxel Grp1: 75 mg/m^2 IV on Day 1, given every 21 days; Docetaxel Grp2--70 mg/m^2 IV on Day 1, given every 21 days for Japan patients.

Duration of exposure is based on minimum of (death date, last dose date, cut-off date) and cycle length, i.e., cycle length is depending on the planned frequency of study drug (Tislelizumab or each ICC options per protocol). For the patients with death occurred prior to end of planned cycle, the actual dose intensity (based on duration of exposure) will be higher than planned dose intensity (based on cycles in study treatment), thus these patients may have relative dose intensity (RDI) higher than 100%.

[a] Cumulative total dose (mg) per subject will be computed as the sum of all the doses received in each cycle for each study drug.

[b] Actual dose intensity (mg/ m^2/cycle) = (total dose received / BSA) / Duration of Treatment in cycle * cycle length in days. Baseline weights are used to derive BSA, unless the change of the BSA at the visit are at least 10% or greater than the baseline (increased or decreased).

[c] Relative dose intensity (RDI) is defined as the ratio of the actual dose intensity (mg/ m^2/cycle) and the planned dose intensity (mg/ m^2/cycle). The planned dose intensity is the total planned dose in a cycle.

[d] A patient was counted only once within each category but may be counted in multiple categories.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were graded for severity using CTCAE v4.03.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] P-value for treatment effect was based on a log rank test stratified by baseline ECOG status and ICC options.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Source: ADSL, ADTTEAE1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; TEAE = treatment-emergent adverse event; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v23.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and baseline ECOG status and ICC options as strata.

[c] P-value for treatment effect was based on a log rank test stratified by baseline ECOG status and ICC options.

Source: Listing 16.2.7.1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.
Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel; TEAE = Treatment-Emergent Adverse Event.
Percentages were based on N.
Patients with multiple events for a given preferred term and system organ class were counted only once for the preferred term and system organ class, respectively.
Adverse Events terms were coded using Medical Dictionary for Regulatory Activities (MedDRA) version 23.0.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v23.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

unblind/bgb_a317/bgb_a317_302/csr_close_gba/dev/pgm/tlfs/t-aesocpt-sub.sas 20AUG2024 03:24 t-14-03-01-02-02-02-01-s-aesocpt-sub-safety-fa.rtf

Table 14.3.1.2.2.2.1.s:
Time to Treatment-Emergent Adverse Events by System Organ Class and Preferred Term - Subgroup Analysis
Safety Analysis Set

Any TEAE: SOC - Blood and lymphatic system disorders

	Tislelizumab (N = 255)			ICC (N = 240)				
Subgroup	Total No. of Patients	Patients with events n (%)	Median time to event (95% CI) [a]	Total No. of Patients	Patients with events n (%)	Median time to event (95% CI) [a]	Hazard Ratio (95% CI) [b]	2-sided p-value [c]
Race								
Asian and other	203	76 (37.4)	12.4 (7.6, NE)	198	118 (59.6)	1.0 (0.8, 1.4)	0.404 (0.300, 0.546)	<0.0001
White	52	16 (30.8)	NR (4.9, NE)	42	21 (50.0)	4.7 (0.6, NE)	0.471 (0.245, 0.907)	0.0203
Interaction								0.6187

Source: ADSL, ADTTEAE1. Data cutoff: 01DEC2020. Data extraction: 15JAN2021.

Abbreviations: ICC = investigator chosen chemotherapy: paclitaxel vs docetaxel vs irinotecan; NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v23.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.
