Cycle 8	7		--	7		--	--	--	--
Overall Treatment Effect	11	63.19 (29.83)	10.50 (4.57)	17	57.84 (25.08)	3.23 (3.46)	7.27 (-3.30, 17.85)	0.58 (-0.26, 1.43)	0.1680

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Cycle 8	7		--	7		--	--	--	--
Overall Treatment Effect	11	86.67 (21.84)	-1.63 (2.77)	17	87.06 (14.23)	-10.49 (2.10)	8.86 (2.53, 15.19)	1.22 (0.30, 2.14)	0.0081

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Table 14.2.6.2.1.1:
EORTC QLQ-C30: MMRM on change from baseline
ITT Analysis Set - Subpopulation with PD-L1 Score < 10% & >= 5%

	Tislelizumab + Chemotherapy (N = 13)			Placebo + Chemotherapy (N = 17)					
Domain	Total No. of Patients	Mean at Baseline (SD) [a]	Mean Change from Baseline (SE) [b]	Total No. of Patients	Mean at Baseline (SD) [a]	Mean Change from Baseline (SE) [b]	Difference in Mean Change from Baseline (95% CI) [c]	Hedges'g (95% CI) [d]	2-sided p-value [e]
Appetite loss									
Cycle 6	7		--	9		--	--	--	--
Cycle 8	7		--	7		--	--	--	--
Overall Treatment Effect	11	22.22 (32.82)	-13.72 (6.40)	17	21.57 (31.05)	2.38 (4.78)	-16.10 (-30.61, -1.59)	-0.97 (-1.88, -0.07)	0.0311

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADTTEQS1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADTTEQS1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADQS. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Positive changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+ chemotherapy arm. Positive changes are favorable.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADSL, ADEXSUM. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: SD, standard deviation; Q1, first quartile; Q3, third quartile; Min, minimum value; Max, maximum value.Percentages were based on m. m = number of patients taking at least one dose of chemotherapy agent under corresponding column.

[a] Duration of treatment (TD) for patients discontinued from treatment: For cisplatin on a Q3W schedule, TD = (min(last dose date + 20, death date) - first dose date + 1)/30.4375; For 5-FU, TD = (min(last dose date + 16, death date) - first dose date + 1)/30.4375.

[b] Cumulative Total Dose per patient is the sum of actual received doses of all visits per patient for each study drug.

[c] Actual Dose Intensity is max((last dose date + 21 - first dose date)/21, number of cycles in last CRF page) for cisplatin; max((last dose date + 17- first dose date)/21, number of cycles in last CRF page) for 5-FU.

[d] Relative Dose Intensity is actual dose intensity/planned dose intensity. The planned dose intensity is the total planned dose in first cycle.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were graded for severity using CTCAE v4.03.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v24.0, and graded for severity using CTCAE v4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0, and graded for severity using CTCAE v4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: imAE, immune-mediated adverse event; IRR, infusion-related reaction.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.

Abbreviations: imAE, immune-mediated adverse event; IRR, infusion-related reaction.

Adverse events were graded for severity using CTCAE v4.03.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Study completion date (Last Patient Last Visit): 22AUG2024. Data extraction: 11OCT2024.
Abbreviations: imAE, immune-mediated adverse event; IRR, infusion-related reaction. NE = not estimable; NR = not reached
Adverse events were graded for severity using CTCAE v4.03. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.
