Anhang 4-G: Ergänzende Daten zu den in Abschnitt 4.3.1.3 gezeigten Ergebnissen für die Studie RATIONALE 306

Table 14.1.1.2.1:
Patient Disposition and Reasons for Discontinuation
ITT Analysis Set - Subpopulation with PD-L1 Score < 10% & >= 5%

Description	Tislelizumab + Chemotherapy (N = 13) n (%)	Placebo + Chemotherapy (N = 17) n (%)	Total (N = 30) n (%)
Number of Patients Randomized	13 (100.0)	17 (100.0)	30 (100.0)
Patients Randomized, But not Treated	0 (0.0)	0 (0.0)	0 (0.0)
Primary Reason for not Treated [a]			
Number of Patients Treated	13 (100.0)	17 (100.0)	30 (100.0)
Number of Patients Discontinued from Treatment	10 (76.9)	15 (88.2)	25 (83.3)

Source: ADSL. Data cutoff: 28FEB2022. Data extraction: 06APR2022.
Percentages were based on N.
[a] Patients randomized but not treated with any treatment component.
[b] Reason for patients discontinued from treatment is the reason for treatment component whichever discontinued last. If tislelizumab and chemotherapy discontinued at the same date, the reason for discontinuation of tislelizumab will be presented.
[c] Patients with confirmed CR, PR or SD after 2 years of study treatment may stop the treatment.
[d] Study follow-up duration is defined as the duration from the randomization date to the study discontinuation date (due to death, consent withdrawal, lost to follow-up etc.) or to the cutoff date if a patient is still ongoing.
[e] Minimum study follow-up time is defined as a difference between the date of cutoff and the date of last patient randomized.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Percentages were based on N.
Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on/after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.
Medication are sorted by decreasing frequency of ATC class then descending frequency of preferred name within ATC class in Tislelizumab + Chemotherapy column.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Percentages were based on N.
Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on/after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.
Medication are sorted by decreasing frequency of ATC class then descending frequency of preferred name within ATC class in Tislelizumab + Chemotherapy column.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Hazard ratio (Tislelizumab+Chemotherapy vs. Placebo+Chemotherapy) was based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

Source: ADSL, ADTTE. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: NE, not estimable.

Percentages were based on N. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

ORR is unconfirmed and defined as proportion of number of patients with a PR or CR per RECIST v1.1 (i.e. ORR = CR+PR); DCR is defined as proportion of number of patients with a PR or CR or a SD per RECIST v1.1 (i.e. DCR = CR+PR+SD).

[a] Odds ratio and relative risk were assumed to be log normally distributed. Mantel-Haenszel common risk difference was estimated. 95% CI was constructed by a normal approximation and Sato's variance estimator, stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

[b] P-value was calculated using the Cochran-Mantel-Haenszel Chi-square test, stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

[c] Not evaluable is based on RECIST v1.1.

[d] Patients with no post-baseline tumor assessment by the data cutoff, including those who discontinued study (any reason) or died without having any post-baseline tumor assessment.

[e] SD includes SD and non-CR/non-PD.

Source: ADQS. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Overall Treatment Effect	11	72.92 (27.55)	13.40 (5.91)	17	75.49 (20.08)	0.54 (4.17)	12.87 (-0.63, 26.36)	0.79 (-0.06, 1.64)	0.0606

Source: ADQS. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADQS. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Abbreviations: NE = not estimable; NR = not reached

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Kaplan-Meier Plot of Time to Deterioration of EORTC QLQ-C30
ITT Analysis Set - Subpopulation with PD-L1 Score < 10% & >= 5%

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.
Abbreviations: NE = not estimable; NR = not reached
Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
Two-sided p-value was estimated from log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT, for descriptive purpose only.
The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

unblind/bgb_a317/bgb_a317_306/gba_2024q3/dev/pgm/tlfs/t-eff-tteqs-subgrp.sas 21OCT2024 08:57 t-14-2-6-2-1-2-s-eff-tteqs-subgrp-c30-pop1-ia.rtf

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Cycle 8	7		--	7		--	--	--	--
Overall Treatment Effect	11	22.22 (32.82)	7.19 (5.42)	17	15.69 (29.15)	13.10 (4.12)	-5.91 (-18.43, 6.62)	-0.42 (-1.31, 0.46)	0.3397

Source: ADQS. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: NE = not estimable; NR = not reached

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. Datapoints represent means and 95% CI.
Increases in scores for dysphagia, eating, reflux, pain, trouble swallowing saliva, choked when swallowing, dry mouth, trouble with taste, trouble with coughing and trouble talking are deteriorations for OES18.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
Two-sided p-value was estimated from log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT, for descriptive purpose only.
The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Source: ADQS. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Positive changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+ chemotherapy arm. Positive changes are favorable.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v24.0, and graded for severity using CTCAE v4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event. NE = not estimable; NR = not reached.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0.

System organ classes or preferred terms will only be included if they have occurred in at least 10% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0, and graded for severity using CTCAE v4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.

Abbreviations: TEAE, treatment-emergent adverse event.

Adverse events were classified based on MedDRA v24.0, and graded for severity using CTCAE v4.03.

System organ classes or preferred terms will only be included if they have occurred in at least 5% of patients in one study arm or occurred in at least 10 patients and in at least 1% of patients in one study arm, and 2-sided p-value for the treatment effect in the main analysis < 0.05.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Adverse events were graded for severity using CTCAE v4.03.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were based on Cox regression model including treatment as covariate, and pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as strata.

[c] P-value for treatment effect was based on a log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEAE1. Data cutoff: 28FEB2022. Data extraction: 06APR2022.
Abbreviations: imAE, immune-mediated adverse event; IRR, infusion-related reaction. NE = not estimable; NR = not reached
Adverse events were graded for severity using CTCAE v4.03. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Number of Patients Randomized	13 (100.0)	17 (100.0)	30 (100.0)
Patients Randomized, But not Treated	0 (0.0)	0 (0.0)	0 (0.0)
Primary Reason for not Treated [a]			
Number of Patients Treated	13 (100.0)	17 (100.0)	30 (100.0)
Number of Patients Discontinued from Treatment	12 (92.3)	17 (100.0)	29 (96.7)

Source: ADSL. Data cutoff: 28APR2023. Data extraction: 09JUN2023.
Percentages were based on N.
[a] Patients randomized but not treated with any treatment component.
[b] Reason for patients discontinued from treatment is the reason for treatment component whichever discontinued last. If tislelizumab and chemotherapy discontinued at the same date, the reason for discontinuation of tislelizumab will be presented.
[c] Patients with confirmed CR, PR or SD after 2 years of study treatment may stop the treatment.
[d] Study follow-up duration is defined as the duration from the randomization date to the study discontinuation date (due to death, consent withdrawal, lost to follow-up etc.) or to the cutoff date if a patient is still ongoing.
[e] Minimum study follow-up time is defined as a difference between the date of cutoff and the date of last patient randomized.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADSL. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Percentages were based on N.

[a] Patients randomized but not treated with any treatment component.

[b] Reason for patients discontinued from treatment is the reason for treatment component whichever discontinued last. If tislelizumab and chemotherapy discontinued at the same date, the reason for discontinuation of tislelizumab will be presented.

[c] Patients with confirmed CR, PR or SD after 2 years of study treatment may stop the treatment.

[d] Study follow-up duration is defined as the duration from the randomization date to the study discontinuation date (due to death, consent withdrawal, lost to follow-up etc.) or to the cutoff date if a patient is still ongoing.

[e] Minimum study follow-up time is defined as a difference between the date of cutoff and the date of last patient randomized.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on/after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.
Medication are sorted by decreasing frequency of ATC class then descending frequency of preferred name within ATC class in Tislelizumab + Chemotherapy column.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on/after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.
Medication are sorted by decreasing frequency of ATC class then descending frequency of preferred name within ATC class in Tislelizumab + Chemotherapy column.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Concomitant medications include medications that either
(1) started before the first dose of study drug and were continuing at the time of the first dose of study drug, or
(2) started on/after the day of the first dose of study drug up to 30 days after the last dose of study drug.
Patients with two or more medications within a class level and preferred term were counted only once within that class level and preferred term.
Medication terms were coded using World Health Organization Drug Dictionary Global-B3.
Medication are sorted by decreasing frequency of ATC class then descending frequency of preferred name within ATC class in Tislelizumab + Chemotherapy column.
Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

[a] Time from randomization to death or censoring date.

[b] Time from randomization to the last progression-free survival event or censoring date.

[c] Time from randomization to the last tumor assessment by investigator per RECIST 1.1. For patients without post-baseline tumor assessment, their last tumor assessment is considered as on date of randomization. Post-baseline tumor assessment after the initiation of new anti-cancer therapy were not considered.

[d] Time from randomization to the last adequate PRO assessment. For patients without baseline or post-baseline PRO assessment, their last PRO assessment is considered as on date of randomization.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

[a] Time from randomization to death or censoring date.

[b] Time from randomization to the last progression-free survival event or censoring date.

[c] Time from randomization to the last tumor assessment by investigator per RECIST 1.1. For patients without post-baseline tumor assessment, their last tumor assessment is considered as on date of randomization. Post-baseline tumor assessment after the initiation of new anti-cancer therapy were not considered.

[d] Time from randomization to the last adequate PRO assessment. For patients without baseline or post-baseline PRO assessment, their last PRO assessment is considered as on date of randomization.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Stratified Hazard Ratio (95% CI) [c]	0.580 (0.216, 1.557)	
Unstratified Hazard Ratio (95% CI) [d]	0.608 (0.260, 1.420)	

Source: ADSL, ADTTE. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Abbreviations: NE, not estimable; NR, not reached.

Percentages were based on N.

Medians and other quartiles were estimated by Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley. Progression free rates (cumulative probabilities of PFS) were estimated by Kaplan-Meier method with 95% CIs estimated using the Greenwood's formula.

[a] Patients ongoing without PD and with no Post-baseline assessments are counted in 'No PD/Death Ongoing Without Events' category.

[b] Two-sided p-value was estimated from log rank test stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT, for descriptive purpose only .

[c] Hazard ratio (Tislelizumab+Chemotherapy vs. Placebo+Chemotherapy) was based on Cox regression model including treatment arm as a covariate and stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

[d] Unstratified Hazard ratio (Tislelizumab+Chemotherapy vs. Placebo+Chemotherapy) was based on unstratified Cox regression model only including treatment arm as a covariate.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADSL, ADTTE. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Abbreviations: NE, not estimable.

Percentages were based on N. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

ORR is unconfirmed and defined as proportion of number of patients with a PR or CR per RECIST v1.1 (i.e. ORR = CR+PR); DCR is defined as proportion of number of patients with a PR or CR or a SD per RECIST v1.1 (i.e. DCR = CR+PR+SD).

[a] Odds ratio and relative risk were assumed to be log normally distributed. Mantel-Haenszel common risk difference was estimated. 95% CI was constructed by a normal approximation and Sato's variance estimator, stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

[b] P-value was calculated using the Cochran-Mantel-Haenszel Chi-square test, stratified by pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT.

[c] Not evaluable is based on RECIST v1.1.

[d] Patients with no post-baseline tumor assessment by the data cutoff, including those who discontinued study (any reason) or died without having any post-baseline tumor assessment.

[e] SD includes SD and non-CR/non-PD.

Source: ADQS. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADQS. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. For global health status or functional scales, positive changes from baseline are favorable; for symptom scales, negative changes are favorable.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. For global health status or functional scales, positive differences favor tislelizumab+chemotherapy arm; for symptom scales, negative differences favor tislelizumab+chemotherapy arm.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADTTEQS1. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-C30 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

Source: ADQS. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

Source: ADQS. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

Only patients with baseline and postbaseline value are included in analysis. Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

The mixed effect model only includes visits where both arms have at least 10 patients. All subsequent visits after the first visit with less than 10 patients in one or two arms will be excluded in the modelling. Total number of patients will be displayed.

The mixed effect model with repeated measures uses the post-baseline score as the response variable, and treatment, visit, treatment-by-visit interaction, baseline score, pooled geographic region (Asia vs. Rest of World) per IRT, and prior definitive therapy (Yes vs. No) per IRT as covariates, and an AR(1) covariance structure for repeated measures on patient level.

[a] Sample mean and SD at baseline based on the patients with baseline value.

[b] Modelled mean change from baseline for treatment arm. Negative differences favor tislelizumab+chemotherapy.

[c] Modelled mean change from baseline of tislelizumab+chemotherapy arm minus that of placebo+chemotherapy arm. Negative differences favor tislelizumab+chemotherapy.

[d] Hedges'g was calculated as estimated difference in mean changes divided by modelled standard deviation multiplied by a correction factor.

[e] P-value was calculated based on testing whether treatment effect is zero or not.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Source: ADTTEQS1. Data cutoff: 28APR2023. Data extraction: 09JUN2023.

The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Subgroup was included in this table only if each of its subgroups has at least 10 patients. If one or more subgroup had at least 10 events, subgroup analyses would be performed and displayed. Otherwise, number of patients and number of patients with events are displayed.

[a] Median time to event (month) was estimated by Kaplan-Meier method with 95% CI estimated using the method of Brookmeyer and Crowley.

[b] The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.

[c] P-value for treatment effect in each subgroup was based on an unstratified log rank test. P-value for the interaction was based on an unstratified Cox regression model with treatment, subgroup and treatment by subgroup interaction term as covariates to test for differences in treatment effect across subgroups.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included.

Only patients receiving chemotherapy of Cisplatin and 5-FU are included. The deterioration of EORTC QLQ-OES18 is defined as the >= 10 points of change from baseline derived score in the worsen direction.
The Kaplan-Meier plots for individual subgroups are only presented for subgroup analyses with a statistically significant interaction term (p-value < 0.05). If any subgroups are not displayed, the respective criteria for subgroup analyses are not met.
The hazard ratio and its 2-sided 95% CI were estimated from an unstratified Cox regression model.
