a. 95% Confidence intervals generated using the method of Brookmeyer and Crowley (1982).
b. Stratified Cox regression.
c. Based on a Stratified Cox Regression model for the interaction of age group (<65 vs. >=65) and treatment; in a model containing covariates: treatment group and age group (<65 vs. >=65).
NE = Not Estimable.
Note: For QLQ-C30 Global health status/QoL and Functional Scales, the scale score change from baseline are categorized as follows: Improvement: change from baseline >= 10; Stable: -10 < change from baseline < 10; Deterioration: change from baseline <= -10.
For QLQ-C30 Symptom Scales, the scale score change from baseline are categorized as follows: Improvement: change from baseline <= -10; Stable: -10 < change from baseline < 10; Deterioration: change from baseline >= 10.
