Dossier zur Nutzenbewertung gemäß § 35a SGB V

Dostarlimab (JEMPERLI)

GlaxoSmithKline GmbH & Co. KG

Anhang 4-G

Therapie des primär fortgeschrittenen oder rezidivierenden Endometriumkarzinoms, wenn eine systemische Therapie infrage kommt

Analysen für das Nutzendossier

Stand: 11.02.2025

Inhaltsverzeichnis

Studie 213361 (RUBY)

*Die in den Tabellen 3.3002, 3.3102, 3.3202, 3.3802, 3.3902 und 3.4002 dargestellten Subgruppenanalysen beziehen sich auf „Schwere unerwünschte Ereignisse (CTCAE-Grad ≥ 3)“.

Table 2.1602 Summary of Return Rates in EORTC-QLQ-C30 by Visit (ITT Analysis Set): MMRp/MSS Subjects

Scale/Item: EORTC Global QOL Score

Visit		Dostarlimab + Carboplatin/Paclitaxel (N=192)	Placebo + Carboplatin/Paclitaxel (N=184)
BASELINE	Number of subjects expected to complete	192	184
	Number of completed questionnaires	186	178
	Return Rate[a]	96.9%	96.7%
	Return Rate[b]	96.9%	96.7%
CYCLE 2 DAY 1	Number of subjects expected to complete	183	178
	Number of completed questionnaires	180	174
	Return Rate[a]	98.4%	97.8%
	Return Rate[b]	93.8%	94.6%
CYCLE 3 DAY 1	Number of subjects expected to complete	176	170
	Number of completed questionnaires	174	168
	Return Rate[a]	98.9%	98.8%
	Return Rate[b]	90.6%	91.3%
CYCLE 4 DAY 1	Number of subjects expected to complete	171	164
	Number of completed questionnaires	169	162
	Return Rate[a]	98.8%	98.8%
	Return Rate[b]	88.0%	88.0%

a. Return Rate calculated as (Number of completed questionnaires/Number of subjects expected to complete)*100

Table 2.1102 Summary of Analysis of EORTC-QLQ-C30 Dimension Scores Change from Baseline over Time – Mixed-effects Model for Repeated Measures (ITT Analysis Set): MMRp/MSS Subjects

Scale/Item: EORTC Global QOL Score

Analysis Timepoint	Variable	Statistic	Dostarlimab + Paclitaxel/Carboplatin (N=192)	Placebo + Paclitaxel/Carboplatin (N=184)
Overall	Change from Baseline	n (%)	181 (94.3%)	176 (95.7%)
		LS Mean (SE)	-2.5 (1.00)	-1.9 (1.09)
		95% CI	-4.4, -0.5	-4.0, 0.3
		Difference from placebo		
		LS Mean (SE)	-0.6 (1.50)	
		95% CI	-3.6, 2.3	
		p-value	0.6818	
		Corrected Hedges' g (95% CI)	-0.04 (-0.25, 0.16)	
Week 4	Change from Baseline	n (%)	177 (92.2%)	174 (94.6%)
		LS Mean (SE)	0.3 (1.31)	-0.5 (1.32)
		95% CI	-2.3, 2.9	-3.1, 2.1
		Difference from placebo		
		LS Mean (SE)	0.8 (1.86)	
		95% CI	-2.8, 4.5	
		p-value	0.6553	
		Corrected Hedges' g (95% CI)	0.05 (-0.16, 0.26)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		Corrected Hedges' g (95% CI)	-0.04 (-0.51, 0.44)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

Analysis Timepoint	Variable	Statistic	Dostarlimab + Paclitaxel/Carboplatin (N=192)	Placebo + Paclitaxel/Carboplatin (N=184)
Week 67	Change from Baseline	n (%)	80 (41.7%)	72 (39.1%)
		LS Mean (SE)	-7.3 (1.72)	-5.0 (1.80)
		95% CI	-10.6, -3.9	-8.6, -1.5
		Difference from placebo		
		LS Mean (SE)	-2.2 (2.49)	
		95% CI	-7.1, 2.6	
		p-value	0.3689	
		Corrected Hedges' g (95% CI)	-0.15 (-0.46, 0.17)	
Week 73	Change from Baseline	n (%)	72 (37.5%)	62 (33.7%)
		LS Mean (SE)	-6.2 (1.78)	-5.9 (1.88)
		95% CI	-9.7, -2.7	-9.6, -2.2
		Difference from placebo		
		LS Mean (SE)	-0.3 (2.58)	
		95% CI	-5.4, 4.7	
		p-value	0.8942	
		Corrected Hedges' g (95% CI)	-0.02 (-0.36, 0.32)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		Corrected Hedges' g (95% CI)	0.23 (-0.16, 0.62)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		LS Mean (SE)	3.5 (4.40)	4.5 (4.61)
		95% CI	-5.1, 12.1	-4.5, 13.6
		Difference from placebo		
		LS Mean (SE)	-1.0 (6.35)	
		95% CI	-13.5, 11.4	
		p-value	0.8720	
		Corrected Hedges' g (95% CI)	-0.07 (-1.03, 0.88)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		LS Mean (SE)	-7.0 (4.15)	2.9 (4.63)
		95% CI	-15.2, 1.1	-6.1, 12.0
		Difference from placebo		
		LS Mean (SE)	-9.9 (6.24)	
		95% CI	-22.2, 2.3	
		p-value	0.1107	
		Corrected Hedges' g (95% CI)	-0.51 (-1.16, 0.14)	
Week 169	Change from Baseline	n (%)	17 (8.9%)	11 (6.0%)
		LS Mean (SE)	-3.8 (4.76)	1.8 (5.63)
		95% CI	-13.1, 5.5	-9.2, 12.9
		Difference from placebo		
		LS Mean (SE)	-5.6 (7.28)	
		95% CI	-19.9, 8.6	
		p-value	0.4396	
		Corrected Hedges' g (95% CI)	-0.28 (-1.05, 0.48)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		Corrected Hedges' g (95% CI)	0.04 (-0.31, 0.39)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		95% CI	0.3, 15.3	
		p-value	0.0427	
		Corrected Hedges' g (95% CI)	0.49 (0.01, 0.97)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

Table 2.1802 Summary of Analysis of EORTC-QLQ-EN24 Dimension Scores Change from Baseline over Time – Mixed-effects Model for Repeated Measures (ITT Analysis Set): MMRp/MSS Subjects

Scale/Item: EN24 Sexual Activity Score

Analysis Timepoint	Variable	Statistic	Dostarlimab + Paclitaxel/Carboplatin (N=192)	Placebo + Paclitaxel/Carboplatin (N=184)
Week 127	Change from Baseline	n (%)	41 (21.4%)	37 (20.1%)
		LS Mean (SE)	0.8 (1.97)	0.9 (2.08)
		95% CI	-3.0, 4.7	-3.2, 4.9
		Difference from placebo		
		LS Mean (SE)	-0.0 (2.88)	
		95% CI	-5.7, 5.6	
		p-value	0.9934	
		Corrected Hedges' g (95% CI)	-0.00 (-0.45, 0.44)	
Week 133	Change from Baseline	n (%)	41 (21.4%)	37 (20.1%)
		LS Mean (SE)	3.8 (1.99)	1.4 (2.08)
		95% CI	-0.1, 7.7	-2.7, 5.5
		Difference from placebo		
		LS Mean (SE)	2.4 (2.90)	
		95% CI	-3.2, 8.1	
		p-value	0.3992	
		Corrected Hedges' g (95% CI)	0.19 (-0.26, 0.64)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 7 subjects in either of the treatment arms were excluded from analysis.

		95% CI	0.7, 18.8	-5.1, 14.0
		Difference from placebo		
		LS Mean (SE)	5.3 (6.83)	
		95% CI	-8.1, 18.7	
		p-value	0.4390	
		Corrected Hedges' g (95% CI)	0.32 (-0.51, 1.14)	
Week 181	Change from Baseline	n (%)	9 (4.7%)	7 (3.8%)
		LS Mean (SE)	5.3 (5.64)	1.2 (5.91)
		95% CI	-5.8, 16.3	-10.4, 12.8
		Difference from placebo		
		LS Mean (SE)	4.1 (8.34)	
		95% CI	-12.2, 20.5	
		p-value	0.6219	
		Corrected Hedges' g (95% CI)	0.24 (-0.75, 1.23)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.
Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.
Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.
Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		Corrected Hedges' g (95% CI)	-0.09 (-0.45, 0.28)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

		LS Mean (SE)	-2.2 (1.81)	3.1 (2.17)
		95% CI	-5.7, 1.4	-1.1, 7.4
		Difference from placebo		
		LS Mean (SE)	-5.3 (2.80)	
		95% CI	-10.8, 0.2	
		p-value	0.0587	
		Corrected Hedges' g (95% CI)	-0.56 (-1.18, 0.05)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

Analysis Timepoint	Variable	Statistic	Dostarlimab + Paclitaxel/Carboplatin (N=192)	Placebo + Paclitaxel/Carboplatin (N=184)
Week 91	Change from Baseline	n (%)	54 (28.1%)	48 (26.1%)
		LS Mean (SE)	11.4 (3.09)	10.0 (3.28)
		95% CI	5.4, 17.5	3.6, 16.5
		Difference from placebo		
		LS Mean (SE)	1.4 (4.50)	
		95% CI	-7.4, 10.2	
		p-value	0.7588	
		Corrected Hedges' g (95% CI)	0.06 (-0.33, 0.45)	
Week 97	Change from Baseline	n (%)	63 (32.8%)	52 (28.3%)
		LS Mean (SE)	17.7 (2.92)	8.7 (3.21)
		95% CI	11.9, 23.4	2.4, 14.9
		Difference from placebo		
		LS Mean (SE)	9.0 (4.35)	
		95% CI	0.5, 17.5	
		p-value	0.0385	
		Corrected Hedges' g (95% CI)	0.39 (0.02, 0.76)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.
Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.
Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.
Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis.

Analysis Timepoint	Variable	Statistic	Dostarlimab + Paclitaxel/Carboplatin (N=192)	Placebo + Paclitaxel/Carboplatin (N=184)
Week 79	Change from Baseline	n (%)	64 (33.3%)	56 (30.4%)
		LS Mean (SE)	6.3 (2.81)	10.4 (2.98)
		95% CI	0.8, 11.8	4.5, 16.2
		Difference from placebo		
		LS Mean (SE)	-4.1 (4.10)	
		95% CI	-12.2, 3.9	
		p-value	0.3167	
		Corrected Hedges' g (95% CI)	-0.18 (-0.54, 0.18)	
Week 85	Change from Baseline	n (%)	68 (35.4%)	58 (31.5%)
		LS Mean (SE)	7.2 (2.79)	10.1 (2.98)
		95% CI	1.8, 12.7	4.3, 16.0
		Difference from placebo		
		LS Mean (SE)	-2.9 (4.09)	
		95% CI	-10.9, 5.1	
		p-value	0.4788	
		Corrected Hedges' g (95% CI)	-0.13 (-0.48, 0.22)	

LS = Least squares; SE = Standard error, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Corrected Hedges' g (95% CI) are derived from the LS Means and associated SEs.

Note: Analysis timepoints with less than 3 subjects in either of the treatment arms were excluded from analysis.

Figure 2.1402 EORTC-QLQ-EN24 Domain Scores: Adjusted Mean Change from Baseline and 95% Confidence Intervals (ITT Analysis Set): MMRp/MSS Subjects

CI = Confidence Intervals, Only patients who have a baseline assessment are included.

Note: Adjusted means, 95% CI and p-values from a mixed model for repeated measures (MMRM) with treatment, analysis timepoint, and treatment-by-analysis timepoint interaction as fixed effects, baseline as a continuous covariate along with baseline-by-analysis timepoint interaction (fixed effects), and subject is a random effect. An AR(1) covariance matrix is used to model the within subject variance and the Kenward-Roger approximation is used to estimate the degrees of freedom.

Note: Analysis timepoints with less than 1 subjects in either of the treatment arms were excluded from analysis

Program: f_2_1402_en24_mmrm.sas, Output: f_2_1402_en24_mmrm.rtf, Generated on: 08AUG2024 11:27, Data Cutoff Date: 22SEP2023

Analysis Timepoint	Actual/ Change	Statistic	Dostarlimab + Carboplatin/Paclitaxel (N=192)	Placebo + Carboplatin/Paclitaxel (N=184)
Post-Baseline Minimum	Actual	n	184	178
		Mean (std)	57.6 (24.50)	61.0 (23.83)
		Median	58.0	67.0
		Q1, Q3	42.0, 75.0	50.0, 75.0
		Min, Max	0, 100	0, 100
	Change from BL	n	181	176
		Mean (std)	-19.2 (21.79)	-18.7 (21.80)
		Median	-16.0	-16.0
		Q1, Q3	-33.0, -8.0	-33.0, 0
		Min, Max	-92, 17	-83, 50
Post-Baseline Maximum	Actual	n	184	178
		Mean (std)	92.4 (12.62)	93.2 (12.05)
		Median	100.0	100.0
		Q1, Q3	83.0, 100.0	92.0, 100.0
		Min, Max	25, 100	25, 100
	Change from BL	n	181	176
		Mean (std)	15.7 (16.36)	13.4 (18.11)
		Median	16.0	9.0
		Q1, Q3	0, 25.0	0, 21.0
		Min, Max	-58, 75	-42, 92

Note: n for 'Actual' is number of subjects with non-missing values at the analysis timepoint. n for 'Change from BL' is number of subjects with non-missing values at both baseline and the analysis timepoint.
Note: For subjects with more than one assessment within the same analysis timepoint, the arithmetic mean value of the assessments within the timepoint is used for analyses.
