Dossier zur Nutzenbewertung gemäß § 35a SGB V

Trastuzumab deruxtecan (Enhertu®)

Daiichi Sankyo Deutschland GmbH

Anhang 4-G

Erwachsene Patienten mit inoperablem oder metastasiertem HR-positivem, HER2-low oder HER2-ultralow Brustkrebs, die mindestens eine endokrine Therapie in der metastasierten Situation erhalten haben und die für eine endokrine Therapie als nächste Therapielinie nicht in Frage kommen

Analysen für das Nutzendossier

Stand: 23.04.2025

Table 2.3.1 Overall survival (OS) - Full Analysis Set

DESTINY Breast-06	T-DXd N=436		Chemotherapy N=430		T-DXd vs. Chemotherapy	
	n (%)	Median [95% CI] in months [a]	n (%)	Median [95% CI] in months [a]	HR [95% CI] p-value [b]	p-value [c]
Subjects with event	161 (36.9)	28.9 [26.4; 32.7]	174 (40.5)	27.4 [23.9; 29.9]	0.8142 [0.6566; 1.0089] 0.0603	0.0600
Subjects with censoring event	275 (63.1)		256 (59.5)			
Still in survival follow-up	265 (60.8)		223 (51.9)			
Withdrawn consent	10 (2.3)		33 (7.7)			

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation
b. Hazard ratio is from Cox proportional hazards model with treatment as the only categorical variable in the model.Inclusion of stratification factors is following the pooling strategy described in study SAP. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test. Inclusion of stratification factors is following the pooling strategy described in study SAP.
CI: confidence interval; HR: hazard ratio

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Two-sided exact CI based on Clopper-Pearson method for single proportion
b. OR and associated two-sided 95% profile likelihood CI based on a logistic regression model with treatment as categorical variable in the model. Inclusion of stratification factors is following the pooling strategy described in study SAP. p-value based on twice the change in log-likelihood. In case of zero cells a correction value of 0.5 is added to each cell frequency of the corresponding 2x2 contingency table.
c. Derived on percentage point scale based on the 2x2 contingency table with associated asymptotic two-sided CI. In case of zero cells a correction value of 0.5 is added to each cell frequency of the corresponding 2x2 contingency table.
d. Derived on percentage point scale based on the 2x2 contingency table with associated asymptomatic two-sided CI
BICR: blinded independent central review; CI: confidence interval; OR: odds ratio; ORR: objective response rate; RD: risk difference; RR: relative risk

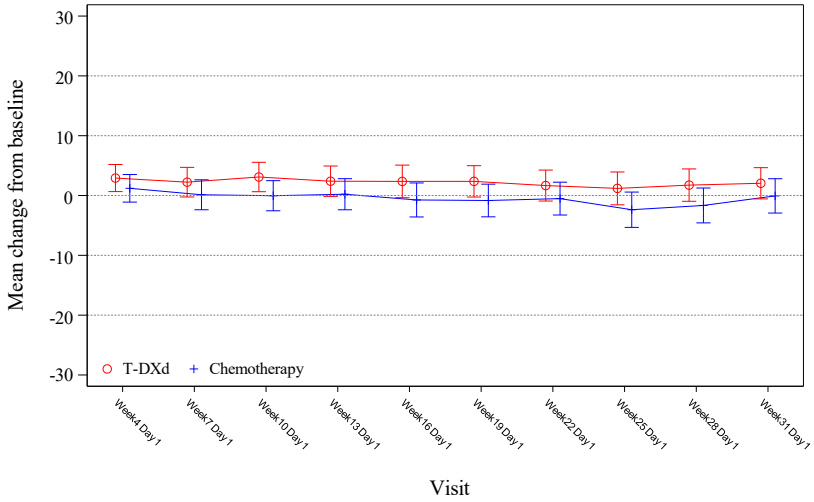
Figure 2.10.9 EQ-5D-5L VAS - Mean Change from Baseline - Full Analysis Set
EQ-5D-5L VAS
Mean baseline values: T-Dxd:72.0; Chemotherapy:70.2



Number of subjects with an observation:

T-DXd	241	227	224	208	205	199	194	187	178	166
Chemotherapy	247	234	213	201	180	182	162	141	132	116

Mean changes from baseline are estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
LS: least square; MMRM: mixed model for repeated measurement; CI: confidence interval

Difference of LS Means [95% CI]			1.72 [-0.87; 4.30]
Standard error for difference			1.32
p-value			0.1925
Hedges' g [95% CI]			0.09 [-0.08; 0.27]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

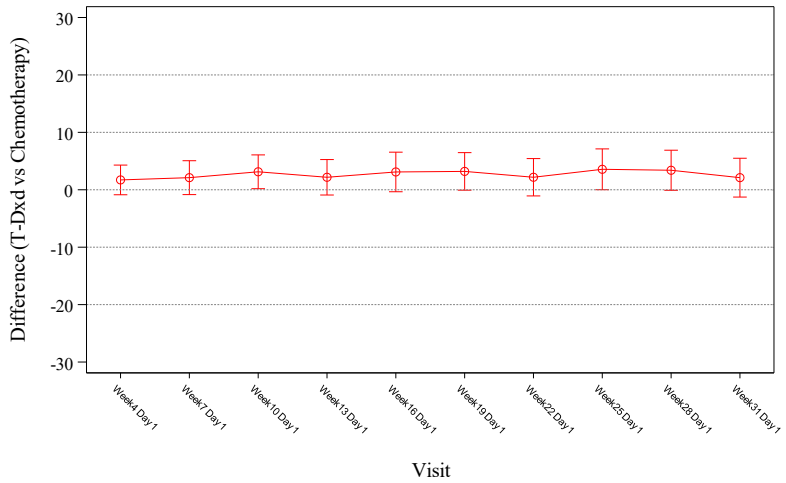
Figure 2.10.10 EQ-5D-5L VAS - Plot of least-square means of repeated measures analysis of change from baseline - Full Analysis Set
EQ-5D-5L VAS



Difference in LS Means based on mean changes from baseline estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
CI: Confidence Interval; LS: least square; MMRM: mixed model for repeated measurement.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

	n / Nsub (%)	Median [95% CI] in months [a]	n / Nsub (%)	Median [95% CI] in months [a]	HR [95% CI] p-value [b]	p-value [c]
Common Symptoms/Insomnia						
Prior Taxane Use In The Non-Metastatic Setting						0.0318
Yes	34 / 179 (19.0)	NE [17.3; NE]	51 / 177 (28.8)	13.8 [6.3; 16.8]	0.5130 [0.3273; 0.7939] 0.0025	
No	62 / 257 (24.1)	NE [12.4; NE]	57 / 253 (22.5)	21.3 [13.8; NE]	0.9820 [0.6852; 1.4100] 0.9167	

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test*.
*: The following parameters were analysed using a stratified Cox proportional hazards model (hazard ratio) and a stratified log-rank test (two-sided p-value): Functional Scales/Emotional Functioning, Functional Scales/Role Functioning, Functional Scales/Social Functioning, Global Health Status, Symptom Scales/Fatigue. Otherwise unstratified analyses have been conducted.
CI: confidence interval; HR: hazard ratio; NE: not estimable.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

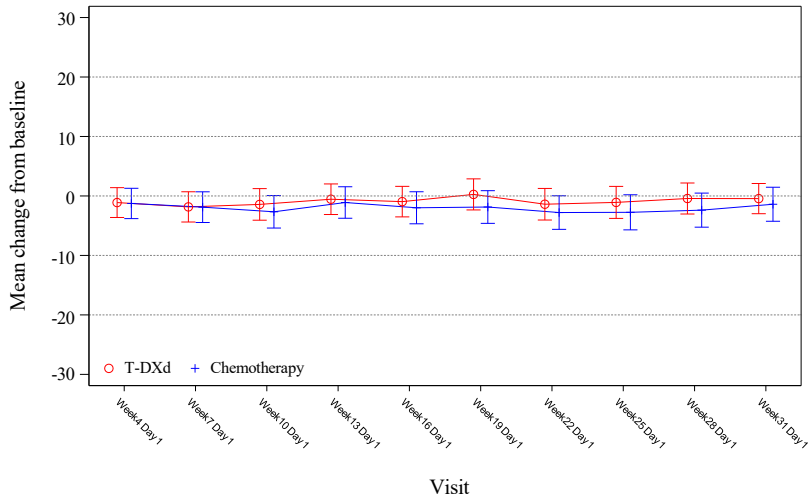
Abbildung 2.11.9 EORTC-QLQ-C30 – Mean change from baseline-Plot – FAS

Figure 2.11.9 EORTC-QLQ-C30 - Mean change from baseline- Full Analysis Set
Global Health Status
Mean baseline values: T-Dxd:69.5; Chemotherapy:65.9



Number of subjects with an observation:

T-DXd	265	248	244	226	224	217	212	204	194	181
Chemotherapy	259	245	226	211	188	188	170	146	137	119

Mean changes from baseline are estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
LS: least square; MMRM: mixed model for repeated measurement; CI: confidence interval

Standard error	1.28	1.30	
Difference of LS Means [95% CI]			0.15 [-2.80; 3.10]
Standard error for difference			1.50
p-value			0.9203
Hedges' g [95% CI]			0.01 [-0.16; 0.18]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

p-value			0.2492
Hedges' g [95% CI]			0.11 [-0.11; 0.33]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

Hedges' g [95% CI]			0.09 [-0.09; 0.27]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

p-value			0.7540
Hedges' g [95% CI]			0.03 [-0.17; 0.22]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

p-value			0.4202
Hedges' g [95% CI]			-0.05 [-0.21; 0.11]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

Hedges' g [95% CI]			-0.26 [-0.46; -0.07]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

Hedges' g [95% CI]			0.31 [0.10; 0.51]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

Table 2.11.15 EORTC-QLQ-C30 - Mixed Model for Repeated Measurement - Full Analysis Set

DESTINY Breast-06	T-DXd N=436	Chemotherapy N=430	T-DXd vs. Chemotherapy
Week 25 Day 1			
Estimated change from baseline [a]			
n	204	146	
LS Means [95% CI]	0.91 [-2.45; 4.26]	2.86 [-0.76; 6.48]	
Standard error	1.71	1.84	
Difference of LS Means [95% CI]			-1.96 [-6.23; 2.32]
Standard error for difference			2.17
p-value			0.3685
Hedges' g [95% CI]			-0.08 [-0.30; 0.13]
Week 28 Day 1			
Estimated change from baseline [a]			
n	194	137	
LS Means [95% CI]	2.08 [-1.18; 5.33]	0.61 [-2.96; 4.17]	
Standard error	1.66	1.82	
Difference of LS Means [95% CI]			1.47 [-2.70; 5.63]
Standard error for difference			2.12
p-value			0.4895
Hedges' g [95% CI]			0.07 [-0.15; 0.28]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

Figure 2.11.10 EORTC-QLQ-C30 - Plot of least-square means of repeated measures analysis of change from baseline - Full Analysis Set
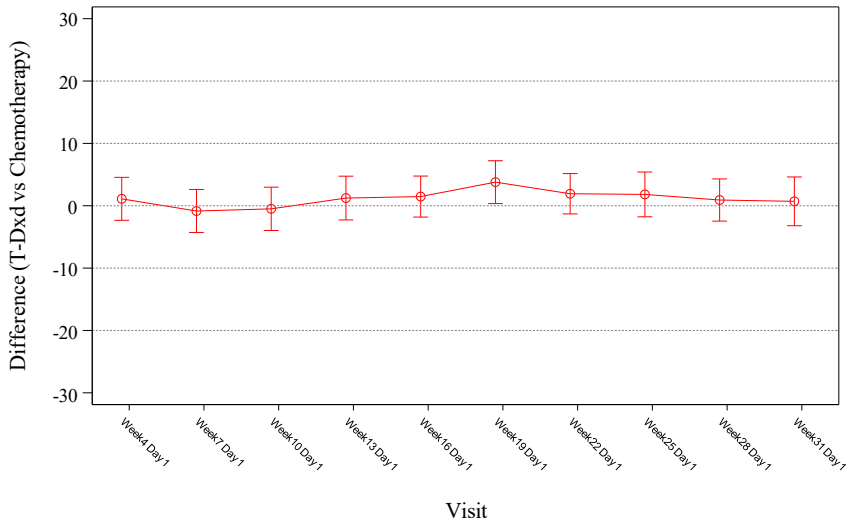
Common Symptoms/Diarrhea



Difference in LS Means based on mean changes from baseline estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
CI: Confidence Interval; LS: least square; MMRM: mixed model for repeated measurement.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

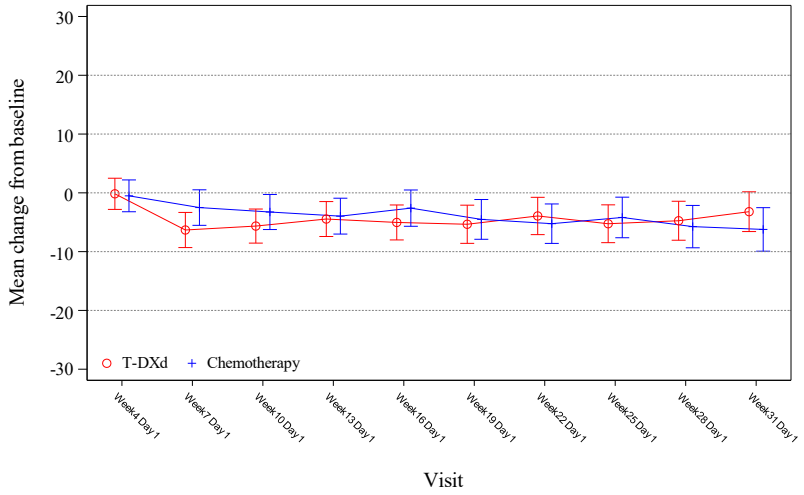
Abbildung 2.12.9 EORTC-QLQ-BR45 – Mean change from baseline-Plot – FAS

Figure 2.12.9 EORTC-QLQ-BR45 - Mean change from baseline- Full Analysis Set
Functional Scales/Body Image
Mean baseline values: T-Dxd:78.9; Chemotherapy:78.1



Number of subjects with an observation:

T-DXd	251	234	234	216	214	206	203	194	183	171
Chemotherapy	254	238	220	206	184	184	166	143	135	118

Mean changes from baseline are estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
LS: least square; MMRM: mixed model for repeated measurement; CI: confidence interval

Data source: DS8201_az_transfers/dev/transfer/eg_analysis/DB06_09670C00001/rstrct_DCO20240318_eg/eg_rd_copy/adam/adam

Mean changes from baseline are estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
LS: least square; MMRM: mixed model for repeated measurement; CI: confidence interval

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

Hedges' g [95% CI]			-0.12 [-0.34; 0.10]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

p-value			0.1770
Hedges' g [95% CI]			0.11 [-0.08; 0.31]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

Hedges' g [95% CI]			-0.25 [-0.41; -0.08]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

Hedges' g [95% CI]			0.13 [-0.07; 0.33]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

n	251	254	
LS Means [95% CI]	1.63 [-0.19; 3.44]	3.78 [1.93; 5.62]	
Standard error	0.92	0.94	
Difference of LS Means [95% CI]			-2.15 [-4.16; -0.13]
Standard error for difference			1.03
p-value			0.0371
Hedges' g [95% CI]			-0.14 [-0.32; 0.03]

N: number of patients in analysis set; n: number of observations
a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.
CI: confidence interval; LS: least square; MMRM: mixed model for repeated measurements; Q1: 1st quartile; Q3: 3rd quartile

Difference of LS Means [95% CI]			4.25 [0.92; 7.58]
Standard error for difference			1.69
p-value			0.0125
Hedges' g [95% CI]			0.24 [0.02; 0.45]
Week 28 Day 1			
Estimated change from baseline [a]			
n	183	134	
LS Means [95% CI]	3.49 [0.80; 6.17]	1.48 [-1.44; 4.39]	
Standard error	1.37	1.49	
Difference of LS Means [95% CI]			2.01 [-1.43; 5.46]
Standard error for difference			1.75
p-value			0.2519
Hedges' g [95% CI]			0.11 [-0.11; 0.33]

N: number of patients in analysis set; n: number of observations

a. LS Means of changes from baseline reflect an overall average over the analyzed period and were estimated by application of a MMRM model including treatment, visit, treatment-by-visit interaction and the stratification factors as fixed effects, baseline score and baseline-by-visit interaction. The within-subject error was modelled as described in the GE-PSAP. Estimates were derived along two-sided 95% CI and a two-sided p-value for the estimated treatment difference.Hedges' g were derived based on the LS Means.
b. The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale. Time has been converted in months using 1 month = 30.4375 days.

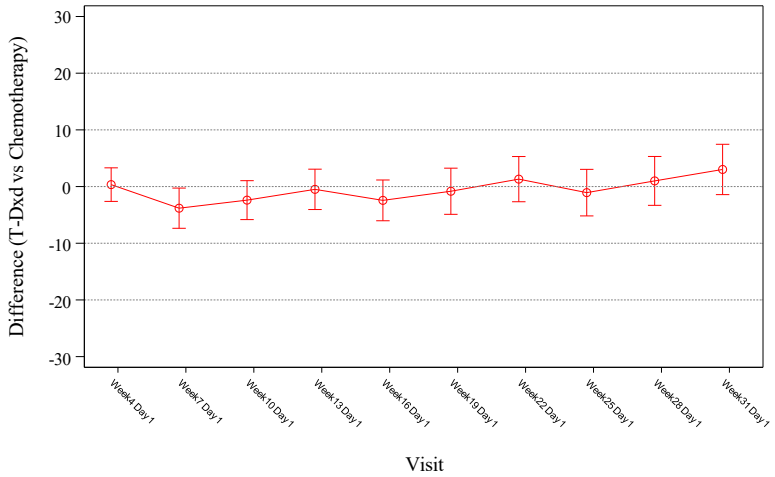
Functional Scales/Body Image



Difference in LS Means based on mean changes from baseline estimated LS means (error bars: 95% CI) from MMRM model. Error bars are not displayed if number of subjects with an observation at the visit is less than 10. Lines are not displayed if number of subjects with an observation at the nominal time point is less than 5. Visit allocation as described in study SAP.
The analyzed period is computed as the time from baseline until Investigator records PD or 7 months after randomization (whichever occurs first) with <= 75% missing data per scale.
Time has been converted in months using 1 month = 30.4375 days.
CI: Confidence Interval; LS: least square; MMRM: mixed model for repeated measurement.

Anhang 4-G 3.4 PGI-S

Tabelle 2.13.1 PGI-S – Zeit bis zur bestätigten Verschlechterung – FAS

Table 2.13.1 PGI-S - Time to confirmed deterioration - Full Analysis Set

DESTINY Breast-06	T-DXd N=436		Chemotherapy N=430		T-DXd vs. Chemotherapy	
	n (%)	Median [95% CI] in months [a]	n (%)	Median [95% CI] in months [a]	HR [95% CI] p-value [b]	p-value [c]
Subjects with event	125 (28.7)	13.8 [9.6; 20.8]	149 (34.7)	8.3 [4.9; 10.4]	0.7574 [0.5948; 0.9624] 0.0235	0.0235
Subjects with censoring event	311 (71.3)		281 (65.3)			
Baseline score not allowing for deterioration	3 (0.7)		3 (0.7)			
Deterioration after 2 or more missed assessments	3 (0.7)		3 (0.7)			
No baseline data	157 (36.0)		87 (20.2)			
No deterioration	128 (29.4)		129 (30.0)			
No evaluable visit	20 (4.6)		59 (13.7)			

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation
b. Hazard ratio is from Cox proportional hazards model with treatment as the only categorical variable in the model.Inclusion of stratification factors is following the pooling strategy described in study SAP. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test. Inclusion of stratification factors is following the pooling strategy described in study SAP.
CI: confidence interval; HR: hazard ratio; NE: not estimable

b. Hazard ratio is from Cox proportional hazards model with treatment as the only categorical variable in the model.Inclusion of stratification factors is following the pooling strategy described in study SAP. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test. Inclusion of stratification factors is following the pooling strategy described in study SAP.
CI: confidence interval; HR: hazard ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

		Evaluability rate[e] (%)	100.0	100.0

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

[a] A questionnaire that is expected to be completed at a scheduled assessment time.
[b] A questionnaire that is expected to be completed, has been received and has a completion date and at least one individual item completed.
[c] A questionnaire that is expected to be completed, has a completion date and at least one subscale that is non-missing.
[d] The number of evaluable forms divided by the number of expected forms multiplied by 100.
[e] The number of evaluable forms divided by the number of received forms multiplied by 100.
[f] The total number of patients expected to have completed at least a baseline questionnaire.
[g] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire (as defined above).
[h] The total number of patients with an evaluable baseline and at least one evaluable follow-up questionnaire divided by the total number of patients expected to have completed at least a baseline questionnaire multiplied by 100.
Baseline is defined as the last assessment on or prior to randomization, or before the first dose if assessment only available after randomization.
EORTC = European Organization for the Research and Treatment of Cancer. PGI-TT = Patient Global Impression of Treatment Tolerability. QLQ = Quality of Life Questionnaire. T-DXd = trastuzumab deruxtecan.

Statistical analyses for AMNOG (HTA Germany)

Table 2.15.1 Adverse events - Safety Analysis Set

DESTINY Breast-06	T-DXd N=434		Chemotherapy N=417		T-DXd vs. Chemotherapy	
	n (%)	Median [95% CI] in months [a]	n (%)	Median [95% CI] in months [a]	HR [95% CI] p-value [b]	p-value [c]
Adverse Events	429 (98.8)	0.1 [0.1; 0.1]	397 (95.2)	0.3 [0.2; 0.3]	1.6872 [1.4656; 1.9428] <.0001	<.0001
Serious Adverse Events	88 (20.3)	NE [NE; NE]	67 (16.1)	NE [23.1; NE]	0.9494 [0.6888; 1.3147] 0.7525	0.7530
Adverse Events with CTCAE grade 3 or higher	229 (52.8)	10.3 [6.8; 13.1]	185 (44.4)	11.0 [6.2; NE]	1.0146 [0.8346; 1.2348] 0.8848	0.8919
Adverse Events leading to discontinuation of study medication	62 (14.3)	NE [NE; NE]	39 (9.4)	NE [NE; NE]	1.1420 [0.7651; 1.7244] 0.5206	0.5207

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation
b. Hazard ratio is from Cox proportional hazards model with treatment as the only categorical variable in the model. Inclusion of stratification factors is following the pooling strategy described in study SAP*. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test*.
*: The following parameters were analysed using a stratified Cox proportional hazards model (hazard ratio) and a stratified log-rank test (two-sided p-value): Adverse Events. Otherwise unstratified analyses have been conducted.
CI: confidence interval; HR: hazard ratio; NE: not estimable

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable
