N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation
b. Hazard ratio is from Cox proportional hazards model with treatment as the only categorical variable in the model.Inclusion of stratification factors is following the pooling strategy described in study SAP. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from log-rank test. Inclusion of stratification factors is following the pooling strategy described in study SAP.
CI: confidence interval; HR: hazard ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Secondary	33 / 307 (10.7)	NE [NE; NE]	10 / 279 (3.6)	NE [NE; NE]	2.2205 [1.1297; 4.7706] 0.0243	

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Figure 2.28.2 Adverse events by SOC and PT with incidence >= 10% in at least one arm - Kaplan-Meier plot - Analysis by subgroup - Safety Analysis Set
SOC: Nervous system disorders; PT: Peripheral sensory neuropathy

Notes: Hazard ratio (HR) is from unstratified Cox proportional hazards model and two-sided p-value is based on unstratified log-rank test. CI: confidence interval; NE: Not estimable.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from unstratified log-rank test.
Includes Adverse Events with an onset date or worsening on or after the date of first dose and up to and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Confidence limits are based on the profile-likelihood approach. p-value is two-sided and based on the profile-likelihood approach.
c. Two-sided p-value from unstratified log-rank test.
Includes Adverse Events with an onset date or worsening on or after the date of first dose and up to and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: confidence interval; HR: hazard ratio; NE: not estimable; PT: preferred term; SOC: system organ class

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Secondary	15 / 307 (4.9)	NE [NE; NE]	2 / 279 (0.7)	NE [NE; NE]	5.2718 [1.4759; 33.5630] 0.0141	

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

	n / Nsub (%)	Median [95% CI] in months [a]	n / Nsub (%)	Median [95% CI] in months [a]	HR [95% CI] p-value [b]	p-value [c]
Liver metastases						0.0498
Yes	127 / 294 (43.2)	18.9 [13.1; NE]	76 / 275 (27.6)	NE [NE; NE]	1.4631 [1.1021; 1.9553] 0.0088	
No	70 / 140 (50.0)	10.0 [5.6; NE]	31 / 142 (21.8)	NE [20.8; NE]	2.3942 [1.5833; 3.7070] <.0001	

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Figure 2.29.1 Adverse events by SOC and PT observed for >= 10 patients (in total) and >= 1% of the patients in at least one arm - Kaplan-Meier plot - Safety Analysis Set
SOC: Respiratory, thoracic and mediastinal disorders; PT: Pneumonitis

Notes: Hazard ratio (HR) is from Cox proportional hazards model and two-sided p-value is based on log-rank test. CI: confidence interval; NE: Not estimable.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Figure 2.29.2 Adverse events by SOC and PT observed for ≥ 10 patients (in total) and ≥ 1% of the patients in at least one arm - Kaplan-Meier plot - Analysis by subgroup - Safety Analysis Set
SOC: Metabolism and nutrition disorders; PT: All (any PT)

Notes: Hazard ratio (HR) is from unstratified Cox proportional hazards model and two-sided p-value is based on unstratified log-rank test. CI: confidence interval; NE: Not estimable.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

No	0 / 237 (0.0)	NE [NE; NE]	14 / 219 (6.4)	NE [NE; NE]	NE [NE; NE] NE	

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

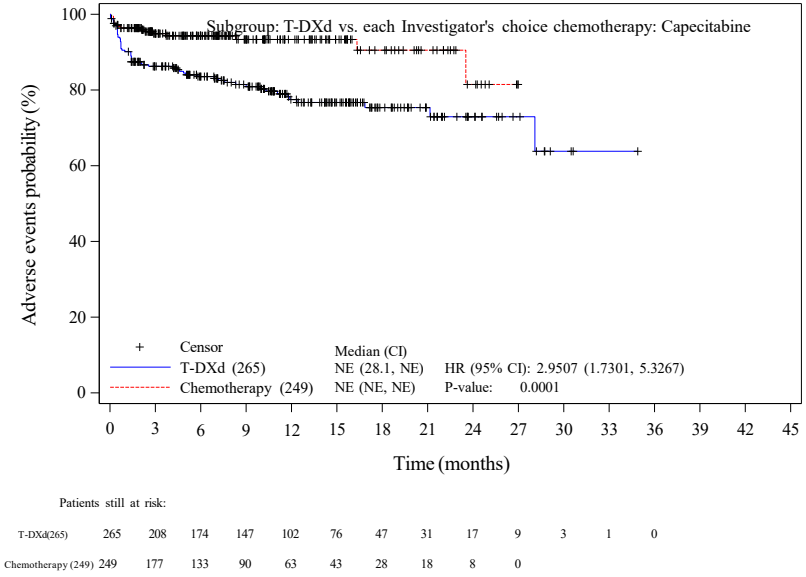
Figure 2.32.2 Adverse events with CTCAE grade 3 or higher by SOC and PT with incidence ≥ 5% in at least one arm - Kaplan-Meier plot - Analysis by subgroup - Safety Analysis Set
SOC: Investigations; PT: All (any PT)



Notes: Hazard ratio (HR) is from unstratified Cox proportional hazards model and two-sided p-value is based on unstratified log-rank test. CI: confidence interval; NE: Not estimable.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Subgroup analyses conducted for the SOC and PT identified as relevant on safety analysis set level.
N: number of subjects in analysis set; Nsub: number of subjects in subgroup category; n: number of subjects with events; %: proportion of number of subjects in subgroup category;
a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

a. Median time to first event is from Kaplan-Meier estimate. Confidence interval for median was computed using the log-log transformation.
b. Hazard ratio is from unstratified Cox proportional hazards model with treatment as the only categorical variable in the model. Two-sided p-value from unstratified log-rank test.
c. Two-sided interaction p-value is for the interaction term from unstratified Cox proportional hazards model with treatment, subgroup, and treatment-by-subgroup interaction as categorical variables in the model. The p-value is based on the profile-likelihood approach.
Includes AEs with an onset date or worsening on or after the date of first dose and upto and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
CI: Confidence Interval; HR: Hazard Ratio; NE: not estimable

Tabelle 14.3.5.1.1.2 Unerwünschte Ereignisse nach SOC und PT, die zum Therapieabbruch führten

AstraZeneca Page 1 of 4
D9670C00001 Final PFS (unblinded) - Data Cut-off date: 18Mar2024

Table 14.3.5.1.1.2
Number of patients with adverse events leading to discontinuation of investigational product,
by system organ class and preferred term
Safety analysis set

System organ class / Preferred term	Number (%) of patients[a] T-DXd (N=434)	Chemotherapy (N=417)
Patients with any AE leading to discontinuation of IP[b]	62 (14.3)	39 (9.4)
Infections and infestations	2 (0.5)	0
Pneumocystis jirovecii pneumonia	1 (0.2)	0
Pneumonia	1 (0.2)	0
Blood and lymphatic system disorders	2 (0.5)	0
Anaemia	1 (0.2)	0
Pancytopenia	1 (0.2)	0
Immune system disorders	0	2 (0.5)
Anaphylactic shock	0	1 (0.2)
Hypersensitivity	0	1 (0.2)
Metabolism and nutrition disorders	3 (0.7)	0
Decreased appetite	1 (0.2)	0
Hypokalaemia	2 (0.5)	0
Nervous system disorders	2 (0.5)	12 (2.9)
Dysaesthesia	0	1 (0.2)
Dysgeusia	1 (0.2)	0
Leukoencephalopathy	1 (0.2)	0
Neuromuscular toxicity	0	1 (0.2)

[a] Number (%) of patients with AEs leading to discontinuation of IP, sorted by international order for system organ class and alphabetically for preferred term. Patients with multiple events in the same preferred term are counted only once in that preferred term. Patients with events in more than one preferred term are counted once in each of those preferred terms. Patients with events in more than one preferred term within the same system organ class are counted only once in that system organ class.
[b] Action taken = Drug permanently discontinued.
Includes AEs with an onset date or worsening on or after the date of first dose and up to and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).
MedDRA version 26.1.
IP = investigational product. T-DXd = trastuzumab deruxtecan.
ASTRAZENECA\TRASTUZUMAB\SZA63961\BIOSTATISTICS\PRODUCTION\TABLES\PSC\T_S19I_R01_SAF.SAS t14_03_05_01_01_02 03MAY24:12:19

Table 14.3.5.1.1.2
Number of patients with adverse events leading to discontinuation of investigational product, by system organ class and preferred term
Safety analysis set

System organ class / Preferred term	Number (%) of patients[a] T-DXd (N=434)	Chemotherapy (N=417)
Nervous system disorders (continued)		
Neuropathy peripheral	0	2 (0.5)
Peripheral motor neuropathy	0	1 (0.2)
Peripheral sensory neuropathy	0	6 (1.4)
Spinal cord compression	0	1 (0.2)
Cardiac disorders	1 (0.2)	5 (1.2)
Angina pectoris	0	3 (0.7)
Atrial fibrillation	0	1 (0.2)
Left ventricular dysfunction	1 (0.2)	0
Ventricular tachycardia	0	1 (0.2)
Vascular disorders	0	1 (0.2)
Lymphoedema	0	1 (0.2)
Respiratory, thoracic and mediastinal disorders	39 (9.0)	1 (0.2)
Interstitial lung disease	15 (3.5)	0
Nasal inflammation	0	1 (0.2)
Pneumonitis	23 (5.3)	0
Pulmonary embolism	1 (0.2)	0
Gastrointestinal disorders	1 (0.2)	4 (1.0)
Ascites	1 (0.2)	0

[a] Number (%) of patients with AEs leading to discontinuation of IP, sorted by international order for system organ class and alphabetically for preferred term. Patients with multiple events in the same preferred term are counted only once in that preferred term. Patients with events in more than one preferred term are counted once in each of those preferred terms. Patients with events in more than one preferred term within the same system organ class are counted only once in that system organ class.
[b] Action taken = Drug permanently discontinued.
Includes AEs with an onset date or worsening on or after the date of first dose and up to and including 47 days following the date of last dose of study medication or before the initiation of the first subsequent cancer therapy (whichever occurs first).

Tabelle 2.34.1 Nicht-Schwerwiegende UE und Nicht-Schwere Unerwünschte Ereignisse von besonderem Interesse – SAF

Table 2.34.1 Non-Serious AE and Non-Severe Adverse Events of Special Interest - Descriptive Summary-Safety Analysis Set

DESTINY Breast-06	T-DXd N=434	Chemotherapy N=417
	n (%)	n (%)
Number of subjects with at least one non-serious AE	428 (98.6)	393 (94.2)
Number of subjects with at least one non-severe AESI of adjudicated drug-related ILD/pneumonitis (NCI CTCAE grade <3)	43 (9.9)	1 (0.2)
Number of subjects with at least one non-severe AESI of ILD/pneumonitis (NCI CTCAE grade <3)	46 (10.6)	1 (0.2)
Number of subjects with at least one non-severe AESI of LVEF decrease (NCI CTCAE grade <3)	32 (7.4)	13 (3.1)

N: number of subjects in analysis set; n: number of subjects with event; %: proportion of number of subjects in analysis set; AE:Adverse Event; AESI:Adverse Event of Special Interest; NCI CTCAE: National Cancer Institute-Common Terminology Criteria for Adverse Events
