

Dossier zur Nutzenbewertung gemäß § 35a SGB V

Bevacizumab gamma (Lytenava™)

Outlook Therapeutics Limited

Modul 4 A – Anhang 4-G

Erwachsene mit nAMD

Weitere Ergebnisse zu
RCT mit dem zu bewertenden Arzneimittel
NORSE TWO und NORSE ONE

Stand: 01.05.2025

Table Morb_65: BCVA Change from Baseline – Trimmed Means Fixed Approach in NORSE-2 Study in NORSE-2 Study (ITT)	13
Table Morb_66: BCVA Change from Baseline – Trimmed Means Adaptive Approach in NORSE-2 Study in NORSE-2 Study (ITT)	14
Table Morb_67: BCVA Change from Baseline – Analysis of Covariance in NORSE-2 Study in NORSE-2 Study (ITT)	15
Table Morb_68: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation in NORSE-2 Study in NORSE-2 Study (ITT)	16
Table Morb_71: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	17
Table Morb_72: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	21
Table Morb_73: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	25
Table Morb_74: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	29
Table Morb_75: BCVA Change from Baseline – Trimmed Means Fixed Approach by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	33
Table Morb_76: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	34
Table Morb_77: BCVA Change from Baseline – Analysis of Covariance by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	35
Table Morb_78: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	36
Table Morb_79: BCVA Change from Baseline over Time – Repeated Measures by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	38
Table Morb_80: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Age Group in NORSE-2 Study in NORSE-2 Study (ITT)	50
Table Morb_81: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	54
Table Morb_82: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	58
Table Morb_83: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	62
Table Morb_84: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	66
Table Morb_85: BCVA Change from Baseline – Trimmed Means Fixed Approach by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	70
Table Morb_86: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	71
Table Morb_87: BCVA Change from Baseline – Analysis of Covariance by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	72
Table Morb_88: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	73
Table Morb_89: BCVA Change from Baseline over Time – Repeated Measures by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	75
Table Morb_90: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Gender in NORSE-2 Study in NORSE-2 Study (ITT)	87
Table Morb_91: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	88

Table Morb_92: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	89
Table Morb_93: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	90
Table Morb_94: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	91
Table Morb_95: BCVA Change from Baseline – Trimmed Means Fixed Approach by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	92
Table Morb_96: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	93
Table Morb_97: BCVA Change from Baseline – Analysis of Covariance by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	94
Table Morb_98: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	95
Table Morb_99: BCVA Change from Baseline over Time – Repeated Measures by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	96
Table Morb_100: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Prior Anti-VEGF Therapy in NORSE-2 Study in NORSE-2 Study (ITT)	98
Table Saf_74: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study (Safety Population)	102
Table Saf_75: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study (Safety Population)	185
Table Saf_76: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study (Safety Population)	201
Table Saf_77: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study (Safety Population)	213
Table Saf_78: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)	215
Table Saf_79: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)	539

Table Saf_80: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study (Safety Population) _____	596
Table Saf_81: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study (Safety Population) _____	600
Table Saf_82: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study (Safety Population) _____	684
Table Saf_83: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study (Safety Population) _____	701
Table Saf_84: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study (Safety Population) _____	712
Table Saf_85: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population) _____	714
Table Saf_86: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population) _____	1044
Table Saf_87: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study (Safety Population) _____	1102
Table Saf_88: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1106
Table Saf_89: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1198
Table Saf_90: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1213
Table Saf_91: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1223
Table Saf_92: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1226
Table Saf_93: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1499
Table Saf_94: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population) _____	1552

Table Saf_107: Severe AE (CTCAE Grade ≥ 3) by Age in NORSE-2 Study (Safety Population)	1556
Table Saf_108: Severe AE (CTCAE Grade ≥ 3) by Gender in NORSE-2 Study (Safety Population)	1559
Table Saf_109: Severe AE (CTCAE Grade ≥ 3) by Previous Anti-VEGF in NORSE-2 Study (Safety Population)	1562
Table Saf_110: Non-Severe AE (CTCAE Grade ≥ 3) by Age in NORSE-2 Study (Safety Population)	1565
Table Saf_111: Non-Severe AE (CTCAE Grade ≥ 3) by Gender in NORSE-2 Study (Safety Population)	1568
Table Saf_112: Non-Severe AE (CTCAE Grade ≥ 3) by Previous Anti-VEGF in NORSE-2 Study (Safety Population)	1571
Table Morb_1: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months in NORSE-1 Study in NORSE-1 Study (ITT)	1574
Table Morb_2: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months in NORSE-1 Study in NORSE-1 Study (ITT)	1576
Table Morb_3: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months in NORSE-1 Study in NORSE-1 Study (ITT)	1578
Table Morb_4: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months in NORSE-1 Study in NORSE-1 Study (ITT)	1580
Table Morb_5: BCVA Change from Baseline – Trimmed Means Fixed Approach in NORSE-1 Study in NORSE-1 Study (ITT)	1582
Table Morb_6: BCVA Change from Baseline – Trimmed Means Adaptive Approach in NORSE-1 Study in NORSE-1 Study (ITT)	1583
Table Morb_7: BCVA Change from Baseline – Analysis of Covariance in NORSE-1 Study (ITT)	1584
Table Morb_8: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation in NORSE-1 Study (ITT)	1585
Table Morb_9: BCVA Change from Baseline over Time – Repeated Measures in NORSE-1 Study (ITT)	1586
Table Morb_10: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months in NORSE-1 Study (ITT)	1592
Table Morb_101: Summary of Subgroup Interaction tests for All Morbidity Endpoints in NORSE-1 Study (ITT)	1594
Table Morb_103: Subjects Loosing ≤ 10 Letters from Baseline to 11 Months in NORSE-1 Study in NORSE-1 Study (ITT)	1596
Table Saf_1: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population)	1598
Table Saf_2: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population)	1617
Table Saf_3: Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term: in NORSE-1 Study (Safety Population)	1620
Table Saf_4: Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population)	1624
Table Saf_5: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population)	1627
Table Saf_6: Serious Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term: in NORSE-1 Study (Safety Population)	1631

Table Saf_7: Serious Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population) _____	1633
Table Saf_8: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population) _____	1635
Table Saf_9: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade in NORSE-1 Study (Safety Population) _____	1637
Table Saf_10: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade in NORSE-1 Study (Safety Population) _____	1728
Table Saf_11: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term in NORSE-1 Study (Safety Population) _____	1739
Table Saf_95: Summary of all Safety subgroups related analyses in NORSE-1 Study (Safety Population) _____	1741
Table Saf_100: Treatment-Emergent Adverse Events by Maximum CTCAE Severity Grade in NORSE-1 Study (Safety Population) _____	1745
Table Saf_101: Treatment-Emergent Adverse Events by severe (CTCAE Severity Grade ≥ 3) / non-severe (CTCAE Severity Grade < 3) in NORSE-1 Study (Safety Population) _____	1746
Table Morb_11: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1747
Table Morb_12: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1748
Table Morb_13: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1749
Table Morb_14: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1753
Table Morb_15: BCVA Change from Baseline – Trimmed Means Fixed Approach by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1757
Table Morb_16: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1758
Table Morb_17: BCVA Change from Baseline – Analysis of Covariance by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1759
Table Morb_18: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1760
Table Morb_19: BCVA Change from Baseline over Time – Repeated Measures by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1762
Table Morb_20: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT) _____	1774
Table Morb_21: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1775
Table Morb_22: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1776
Table Morb_23: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1777
Table Morb_24: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1781

Table Morb_25: BCVA Change from Baseline – Trimmed Means Fixed Approach by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1785
Table Morb_26: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1786
Table Morb_27: BCVA Change from Baseline – Analysis of Covariance by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1787
Table Morb_28: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1788
Table Morb_29: BCVA Change from Baseline over Time – Repeated Measures by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1790
Table Morb_30: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Gender in NORSE-1 Study in NORSE-1 Study (ITT) _____	1802
Table Morb_31: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1803
Table Morb_32: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1804
Table Morb_33: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1805
Table Morb_34: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1809
Table Morb_35: BCVA Change from Baseline – Trimmed Means Fixed Approach by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1813
Table Morb_36: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1814
Table Morb_37: BCVA Change from Baseline – Analysis of Covariance by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1815
Table Morb_38: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1816
Table Morb_39: BCVA Change from Baseline over Time – Repeated Measures by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1818
Table Morb_40: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT) _____	1830
Table Morb_41: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT) _____	1831
Table Morb_42: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study (ITT) _____	1832

Table Morb_43: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1833
Table Morb_44: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1837
Table Morb_45: BCVA Change from Baseline – Trimmed Means Fixed Approach by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1841
Table Morb_46: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1842
Table Morb_47: BCVA Change from Baseline – Analysis of Covariance by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1843
Table Morb_48: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1844
Table Morb_49: BCVA Change from Baseline over Time – Repeated Measures by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1846
Table Morb_50: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Baseline BCVA Score in NORSE-1 Study in NORSE-1 Study (ITT)	1858
Table Morb_51: Subjects Gaining ≥ 15 Letters from Baseline to 11 Months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1859
Table Morb_52: Subjects Gaining ≥ 10 Letters from Baseline to 11 Months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1860
Table Morb_53: Subjects Gaining ≥ 5 Letters from Baseline to 11 Months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1861
Table Morb_54: Subjects Loosing ≤ 15 Letters from Baseline to 11 Months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1862
Table Morb_55: BCVA Change from Baseline – Trimmed Means Fixed Approach by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1870
Table Morb_56: BCVA Change from Baseline – Trimmed Means Adaptive Approach by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1871
Table Morb_57: BCVA Change from Baseline – Analysis of Covariance by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1872
Table Morb_58: BCVA Change from Baseline – Analysis of Covariance Multiple Imputation by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1873

Table Morb_59: BCVA Change from Baseline over Time – Repeated Measures by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1874
Table Morb_60: Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1878
Table Morb_104: Subjects Loosing <=10 Letters from Baseline to 11 Months by Age Group in NORSE-1 Study in NORSE-1 Study (ITT)	1879
Table Morb_105: Subjects Loosing <=10 Letters from Baseline to 11 Months by Gender in NORSE-1 Study in NORSE-1 Study (ITT)	1883
Table Morb_106: Subjects Loosing <=10 Letters from Baseline to 11 Months by Prior Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1887
Table Morb_107: Subjects Loosing <=10 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study (ITT)	1891
Table Morb_108: Subjects Loosing <=10 Letters from Baseline to 11 Months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study in NORSE-1 Study (ITT)	1895
Table Saf_12: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1903
Table Saf_13: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1934
Table Saf_14: Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1938
Table Saf_15: Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1943
Table Saf_16: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1947
Table Saf_17: Serious Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1955
Table Saf_18: Serious Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1957
Table Saf_19: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)	1959
Table Saf_20: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-1 Study (Safety Population)	1962

Table Saf_21: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-1 Study (Safety Population) _____	2077
Table Saf_22: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population) _____	2089
Table Saf_23: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population) _____	2092
Table Saf_24: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population) _____	2121
Table Saf_25: Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gende in NORSE-1 Study (Safety Population) _____	2124
Table Saf_26: Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gende in NORSE-1 Study (Safety Population) _____	2131
Table Saf_27: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population) _____	2136
Table Saf_28: Serious Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gende in NORSE-1 Study (Safety Population) _____	2143
Table Saf_29: Serious Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gende in NORSE-1 Study (Safety Population) _____	2145
Table Saf_30: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population) _____	2147
Table Saf_31: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-1 Study (Safety Population) _____	2149
Table Saf_32: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-1 Study (Safety Population) _____	2260
Table Saf_33: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population) _____	2271
Table Saf_34: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2274
Table Saf_35: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2304

Table Saf_36: Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2308
Table Saf_37: Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2315
Table Saf_38: Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2320
Table Saf_39: Serious Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2327
Table Saf_40: Serious Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2330
Table Saf_41: Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2333
Table Saf_42: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2336
Table Saf_43: Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2448
Table Saf_44: Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population) _____	2461
Table Saf_45: Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value in NORSE-1 Study (Safety Population) _____	2464
Table Saf_46: Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value in NORSE-1 Study (Safety Population) _____	2493
Table Saf_47: Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value in NORSE-1 Study (Safety Population) _____	2497
Table Saf_48: Study Drug Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value in NORSE-1 Study (Safety Population) _____	2503

Table Morb_65

BCVA Change from Baseline - Trimmed Means Fixed Approach in NORSE-2 Study
(ITT Population)

Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
BCVA Score Change from Baseline to 11 Months [1]	n	96	104
	Mean (SD)	5.8 (14.80)	11.2 (12.19)
	Median	6.0	12.0
	Min, Max	-42, 42	-47, 40
LS Means [2]		14.575	19.310
LS Means Difference [2]			4.735
(95% CI)			(1.306, 8.163)
p-value			0.0035
Corrected Hedges' G (95% CI)			0.5616 (0.2788, 0.8445)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportions of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 7416.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Reference Listing: 16.2.6.1

Table Morb_66

BCVA Change from Baseline - Trimmed Means Adaptive Approach in NORSE-2 Study
(ITT Population)

Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
BCVA Score Change from Baseline to 11 Months [1]	n	96	104
	Mean (SD)	5.8 (14.80)	11.2 (12.19)
	Median	6.0	12.0
	Min, Max	-42, 42	-47, 40
LS Means [2]		6.260	13.652
LS Means Difference [2]			7.392
(95% CI)			(3.921, 11.825)
p-value			0.0002
Corrected Hedges' G (95% CI)			0.6150 (0.3311, 0.8989)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 4384.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Table Morb_68

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation in NORSE-2 Study
(ITT Population)

Parameter [1]	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
BCVA Score Change from Baseline to 11 Months [2]	n	96	104
	Mean (SD)	5.8 (14.80)	11.2 (12.19)
	Median	6.0	12.0
	Min, Max	-42, 42	-47, 40
LS Means (SE)		5.131 (1.3632)	11.191 (1.3112)
(95% CI)		(2.459, 7.803)	(8.621, 13.761)
LS Means Difference (SE)			6.060 (1.8927)
(95% CI)			(2.350, 9.770)
p-value [3]			0.0014
Corrected Hedges' G (95% CI)			0.4517 (0.1708, 0.7326)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_75

BCVA Change from Baseline - Trimmed Means Fixed Approach by Age Group in NORSE-2 Study
(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
< 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	44	59
		Mean (SD)	9.0 (16.68)	13.0 (11.01)
		Median	9.0	13.0
		Min, Max	-42, 42	-11, 40
		LS Means [2]	18.873	21.078
		LS Means Difference [2] (95% CI)		2.206 (-2.011, 6.597)
		p-value		0.1692
		Corrected Hedges' G (95% CI)		0.2696 (-0.1226, 0.6618)
≥ 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	52	45
		Mean (SD)	3.1 (12.54)	8.9 (13.35)
		Median	4.5	10.0
		Min, Max	-29, 24	-47, 31
		LS Means [2]	10.821	16.482
		LS Means Difference [2] (95% CI)		5.661 (1.244, 9.918)
		p-value		0.0041
		Corrected Hedges' G (95% CI)		0.8305 (0.4145, 1.2466)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportions of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 7416.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Table Morb_76
BCVA Change from Baseline - Trimmed Means Adaptive Approach by Age Group in NORSE-2 Study (ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
< 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	44	59
		Mean (SD)	9.0 (16.68)	13.0 (11.01)
		Median	9.0	13.0
		Min, Max	-42, 42	-11, 40
	LS Means [2]		8.729	15.724
	LS Means Difference [2]			6.995
	(95% CI)			(2.219, 12.963)
	p-value			0.0094
	Corrected Hedges' G (95% CI)			0.5155 (0.1187, 0.9123)
≥ 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	52	45
		Mean (SD)	3.1 (12.54)	8.9 (13.35)
		Median	4.5	10.0
		Min, Max	-29, 24	-47, 31
	LS Means [2]		3.773	10.081
	LS Means Difference [2]			6.307
	(95% CI)			(1.518, 12.616)
	p-value			0.0250
	Corrected Hedges' G (95% CI)			0.5734 (0.1661, 0.9806)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 4384.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Table Morb_78

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Age Group in NORSE-2 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
< 80 years	BCVA Score Change from Baseline to 11 Months [2]	n	44	59
		Mean (SD)	9.0 (16.68)	13.0 (11.01)
		Median	9.0	13.0
		Min, Max	-42, 42	-11, 40
		LS Means (SE)	7.351 (2.0866)	13.038 (1.8529)
		(95% CI)	(3.260, 11.441)	(9.406, 16.669)
		LS Means Difference (SE)		5.687 (2.7960)
		(95% CI)		(0.207, 11.167)
	p-value [3]			0.0420
	Corrected Hedges' G (95% CI)			0.4013 (0.0070, 0.7956)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_79

BCVA Change from Baseline over Time - Repeated Measures by Age Group in NORSE-2 Study
(ITT Population)

Subgroup	Visit	Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
< 80 years	Day 30	BCVA Score Change from Baseline	n	51	60
			Mean (SD)	7.6 (8.92)	7.9 (8.61)
			Median	7.0	7.0
			Min, Max	-8, 40	-11, 32
		LS Means (SE) [1]		7.935 (1.8613)	7.582 (1.7071)
		(95% CI)		(4.257, 11.612)	(4.208, 10.955)
		LS Means Difference (SE)			-0.353 (2.5256)
		(95% CI)			(-5.343, 4.637)
< 80 years	Day 60		p-value		0.8890
		Corrected Hedges' G (95% CI)			-0.0265 (-0.3998, 0.3469)
		BCVA Score Change from Baseline	n	49	58
			Mean (SD)	7.6 (11.20)	9.7 (8.61)
			Median	6.0	9.0
			Min, Max	-29, 34	-10, 34
		LS Means (SE) [1]		8.725 (1.7170)	9.494 (1.5731)
		(95% CI)		(5.331, 12.119)	(6.385, 12.604)
		LS Means Difference (SE)			0.769 (2.3287)
		(95% CI)			(-3.834, 5.372)
		p-value			0.7417
		Corrected Hedges' G (95% CI)			0.0636 (-0.3168, 0.4441)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a working autoregressive with heterogeneity (ARH(1)) correlation structure, which was determined based on modeling several correlation structures and comparing Akaike Information Criterion (AIC). The working correlation structure that produced the lowest AIC was used.

		(95% CI)		(-0.225, 6.404)	(5.184, 12.310)
		LS Means Difference (SE)			5.658 (2.4657)
		(95% CI)			(0.791, 10.524)
		p-value			0.0230
		Corrected Hedges' G (95% CI)			0.4635 (0.0590, 0.8679)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a working autoregressive with heterogeneity (ARH(1)) correlation structure, which was determined based on modeling several correlation structures and comparing Akaike Information Criterion (AIC). The working correlation structure that produced the lowest AIC was used.

[1] LS Means, CI's, and p-values from the repeated measures model.

Table Morb_80

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Age Group in NORSE-2 Study (ITT Population)

Subgroup	Parameter	Ranibizumab (N=115)	ONS-5010 (N=113)
< 80 years	Number of Subjects, n/N1 (%) [1]	14/ 49 (28.6)	6/ 60 (10.0)
	Odds Ratio [2] 95% CI	0.2778 (0.0806, 0.8687)	
	Relative Risk [2] 95% CI	0.3500 (0.1040, 0.8943)	
	Absolute Risk Reduction [2] 95% CI	-0.1857 (-0.3434, -0.0349)	
	p-value [3]	0.0235	

Note: Those patients who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders. Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

[4] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

Table Morb_85

BCVA Change from Baseline - Trimmed Means Fixed Approach by Gender in NORSE-2 Study
(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
Male	BCVA Score Change from Baseline to 11 Months [1]	n	40	41
		Mean (SD)	4.7 (15.49)	9.6 (9.31)
		Median	6.5	8.0
		Min, Max	-42, 34	-17, 30
	LS Means [2]		14.935	15.630
	LS Means Difference [2] (95% CI)			0.696 (-4.173, 5.496)
	p-value			0.3936
	Corrected Hedges' G (95% CI)			0.0871 (-0.3487, 0.5229)
Female	BCVA Score Change from Baseline to 11 Months [1]	n	56	63
		Mean (SD)	6.6 (14.37)	12.3 (13.72)
		Median	6.0	15.0
		Min, Max	-37, 42	-47, 40
	LS Means [2]		14.056	21.296
	LS Means Difference [2] (95% CI)			7.240 (2.492, 12.039)
	p-value			0.0013
	Corrected Hedges' G (95% CI)			0.8345 (0.4591, 1.2100)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportions of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 7416.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Reference Listing: 16.2.6.1

BCVA Change from Baseline - Trimmed Means Adaptive Approach by Gender in NORSE-2 Study (ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
Male	BCVA Score Change from Baseline to 11 Months [1]	n	40	41
		Mean (SD)	4.7 (15.49)	9.6 (9.31)
		Median	6.5	8.0
		Min, Max	-42, 34	-17, 30
	LS Means [2]		4.660	9.673
	LS Means Difference [2]			5.013
	(95% CI)			(-0.380, 11.585)
	p-value			0.0743
	Corrected Hedges' G (95% CI)			0.3933 (-0.0466, 0.8332)
Female	BCVA Score Change from Baseline to 11 Months [1]	n	56	63
		Mean (SD)	6.6 (14.37)	12.3 (13.72)
		Median	6.0	15.0
		Min, Max	-37, 42	-47, 40
	LS Means [2]		6.612	15.686
	LS Means Difference [2]			9.073
	(95% CI)			(4.317, 15.108)
	p-value			0.0006
	Corrected Hedges' G (95% CI)			0.7334 (0.3614, 1.1054)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by adding the 2.5 and 97.5 percentiles from the same permutation distribution to the observed LS Means Difference. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 4384.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] LS Means and difference estimated from ANCOVA model using the best 50% subset.

Table Morb_88

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Gender in NORSE-2 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=115)	ONS-5010 (N=113)
Male	BCVA Score Change from Baseline to 11 Months [2]	n	40	41
		Mean (SD)	4.7 (15.49)	9.6 (9.31)
		Median	6.5	8.0
		Min, Max	-42, 34	-17, 30
	LS Means (SE)		4.683 (2.0070)	9.617 (1.9617)
	(95% CI)		(0.749, 8.617)	(5.772, 13.462)
	LS Means Difference (SE)			4.934 (2.8048)
	(95% CI)			(-0.564, 10.431)
	p-value [3]			0.0786
	Corrected Hedges' G (95% CI)			0.3870 (-0.0527, 0.8267)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_90

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Gender in NORSE-2 Study (ITT Population)

Subgroup	Parameter	Ranibizumab (N=115)	ONS-5010 (N=113)
Male	Number of Subjects, n/N1 (%) [1]	11/ 42 (26.2)	6/ 43 (14.0)
	Odds Ratio [2]	0.4570	
	95% CI	(0.1516, 1.3774)	
	Relative Risk [2]	0.5328	
	95% CI	(0.2168, 1.3094)	
	Absolute Risk Reduction [2]	-0.1224	
	95% CI	(-0.3000, 0.0527)	
	p-value [3]	0.1842	
Female	Number of Subjects, n/N1 (%) [1]	14/ 62 (22.6)	8/ 65 (12.3)
	Odds Ratio [2]	0.4812	
	95% CI	(0.1862, 1.2439)	
	Relative Risk [2]	0.5451	
	95% CI	(0.2459, 1.2081)	
	Absolute Risk Reduction [2]	-0.1027	
	95% CI	(-0.2409, 0.0336)	
	p-value [3]	0.1609	
Interaction	p-value [4]	0.8084	

Note: Those patients who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders. Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment. Percentages based on N1.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

[4] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

				-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

				-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_74

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study
(Safety Population)

>= 80 years							Absolute Risk Difference
MedDRA System Organ Class	MedDRA Preferred Term	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data) (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	95% CI p-value[2]
Metabolism and nutrition disorders							
Hyperkalaemia		n (%)	1 (1.6)	0	-	-	-
					-	-	-
Hypokalaemia		n (%)	1 (1.6)	0	-	-	-
					-	-	-
Hypomagnesaemia		n (%)	1 (1.6)	0	-	-	-
					-	-	-
Malnutrition		n (%)	1 (1.6)	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Serious Adverse Events by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-2 Study
(Safety Population)

>= 80 years

MedDRA System Organ Class MedDRA Preferred Term	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Respiratory, thoracic and mediastinal disorders						
Respiratory failure	n (%)	0	1 (2.0)	- -	- -	- -
Renal and urinary disorders	n (%)	1 (1.6)	0	- -	- -	- -
Haemorrhage urinary tract	n (%)	1 (1.6)	0	- -	- -	- -

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Reference Listing: 16.2.7.1, 16.2.7.2

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_78

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

>= 80 years							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Eye disorders							
Vitreous detachment	Grade 1	n (%)	2 (3.3)	1 (2.0)	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_78

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

>= 80 years							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Cardiac disorders							
Atrial fibrillation	Grade 1	n (%)	0	0	-	-	-
	Grade 2	n (%)	2 (3.3)	2 (3.9)	-	-	-
	Grade 3	n (%)	0	0	-	-	-
	Grade 4	n (%)	0	0	-	-	-
	Grade 5	n (%)	0	0	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_78

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

>= 80 years							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Renal and urinary disorders							
Urinary retention	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	1 (1.6)	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_78

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

>= 80 years								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
General disorders and administration site conditions	Grade 1	n (%)	2 (3.3)	0	-	-	-	-
					-	-	-	-
	Grade 2	n (%)	1 (1.6)	1 (2.0)	-	-	-	-
					-	-	-	-
	Grade 3	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 5	n (%)	1 (1.6)	1 (2.0)	-	-	-	-
					-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic p-value [3]	Interaction
At Least 1 TEAE			0.2205
Eye disorders	Grade 1	p-value [3]	0.5481
Neovascular age-related macular degeneration	Grade 2	p-value [3]	0.6549
	Grade 1	p-value [3]	0.0235
Investigations	Grade 1	p-value [3]	0.9660

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[3] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model. For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Reference Listing: 16.2.7.1, 16.2.7.2

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_79

Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-2 Study (Safety Population)

>= 80 years

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=61)	ONS-5010 (Masked Data)[1] (N=51)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Cardiac disorders							
Pericardial effusion	Grade 1	n (%)	0	0	-	-	-
	Grade 2	n (%)	0	0	-	-	-
	Grade 3	n (%)	0	0	-	-	-
	Grade 4	n (%)	1 (1.6)	0	-	-	-
	Grade 5	n (%)	0	0	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

DATE: 16JUL2024 11:17

Table Saf_81

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-2 Study
(Safety Population)

Female							Absolute Risk Difference
MedDRA System Organ Class	Statistic	Ranibizumab (N=69)	ONS-5010 (Masked Data) (N=67)	Odds Ratio 95% CI	Relative Risk 95% CI		95% CI p-value[2]
Investigations							
Blood creatinine increased	n (%)	0	1 (1.5)	-	-	-	-
Blood triglycerides increased	n (%)	0	1 (1.5)	-	-	-	-
Haematocrit decreased	n (%)	0	1 (1.5)	-	-	-	-
Haemoglobin decreased	n (%)	0	1 (1.5)	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_85

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population)

Male							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=46)	ONS-5010 (Masked Data)[1] (N=46)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Infections and infestations							
Clostridium difficile infection	Grade 1	n (%)	0	0	- -	- -	- -
	Grade 2	n (%)	0	0	- -	- -	- -
	Grade 3	n (%)	0	1 (2.2)	- -	- -	- -
	Grade 4	n (%)	0	0	- -	- -	- -
	Grade 5	n (%)	0	0	- -	- -	- -

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_85

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population)

Male								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=46)	ONS-5010 (Masked Data)[1] (N=46)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Respiratory, thoracic and mediastinal disorders	Grade 1	n (%)	1 (2.2)	0	-	-	-	-
	Grade 2	n (%)	1 (2.2)	0	-	-	-	-
	Grade 3	n (%)	0	2 (4.3)	-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

	Grade 5	n (%)	0	0	-	-	-	-
					-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population)

Female							
MedDRA System Organ Class	Maximum CTCAE	Statistic	Ranibizumab (N=69)	ONS-5010 (Masked Data)[1] (N=67)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
MedDRA Preferred Term	Grade						
Musculoskeletal and connective tissue disorders							
Bursitis	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	1 (1.5)	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=46)	ONS-5010 (Masked Data)[1] (N=46)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Nervous system disorders							
Cerebrovascular accident	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	1 (2.2)	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population)

Male							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=46)	ONS-5010 (Masked Data)[1] (N=46)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Neoplasms benign, malignant and unspecified (incl cysts and polyps)							
Squamous cell carcinoma of the tongue	Grade 1	n (%)	0	0	-	-	-
	Grade 2	n (%)	0	0	-	-	-
	Grade 3	n (%)	1 (2.2)	0	-	-	-
	Grade 4	n (%)	0	0	-	-	-
	Grade 5	n (%)	0	0	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Serious Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Gender in NORSE-2 Study (Safety Population)

Female								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=69)	ONS-5010 (Masked Data)[1] (N=67)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Neoplasms benign, malignant and unspecified (incl cysts and polyps)	Grade 1	n (%)	0	0	-	-	-	-
	Grade 2	n (%)	0	0	-	-	-	-
	Grade 3	n (%)	0	1 (1.5)	-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: No							Absolute Risk Difference
MedDRA System Organ Class	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data) (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI		95% CI p-value[2]
Eye disorders							
Macular hole	n (%)	0	1 (0.9)	-	-	-	-
				-	-	-	-
Retinal pigment epithelial tear	n (%)	0	1 (0.9)	-	-	-	-
				-	-	-	-
Retinal pigmentation	n (%)	0	1 (0.9)	-	-	-	-
				-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Lymphocyte count decreased	n (%)	0	1 (0.9)	-	-	-	-
Monocyte count increased	n (%)	0	1 (0.9)	-	-	-	-
Protein urine present	n (%)	0	1 (0.9)	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: No							Absolute Risk Difference
MedDRA System Organ Class	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data) (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI		95% CI p-value[2]
Renal and urinary disorders							
Haemorrhage urinary tract	n (%)	1 (0.9)	0	-	-	-	-
Nephrolithiasis	n (%)	1 (0.9)	0	-	-	-	-
Renal cyst	n (%)	1 (0.9)	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Zero count correction was applied according to the method proposed by IQWiG.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Serious Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: No							Absolute Risk Difference
MedDRA System Organ Class	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data)[1] (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI		95% CI p-value
Nervous system disorders							
Cerebral infarction	n (%)	1 (0.9)	0	-	-	-	-
				-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Table Saf_92

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: Yes							
MedDRA System Organ Class	Maximum CTCAE Grade	Statistic	Ranibizumab (N=5)	ONS-5010 (Masked Data)[1] (N=4)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Cardiac disorders							
Cardiac arrest	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	1 (20.0)	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable
