[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	1 (0.9)	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: No							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data)[1] (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Investigations							
Neutrophil count increased	Grade 1	n (%)	1 (0.9)	1 (0.9)	- -	- -	- -
	Grade 2	n (%)	0	0	- -	- -	- -
	Grade 3	n (%)	0	0	- -	- -	- -
	Grade 4	n (%)	0	0	- -	- -	- -
	Grade 5	n (%)	0	0	- -	- -	- -

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Table Saf_92

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-2 Study (Safety Population)

Previous Anti VEGF Therapy: No							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data)[1] (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Vascular disorders							
Pulmonary congestion	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	1 (0.9)	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Previous Anti VEGF Therapy: No							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=110)	ONS-5010 (Masked Data)[1] (N=109)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Nervous system disorders	Grade 1	n (%)	3 (2.7)	3 (2.8)	-	-	-
					-	-	-
	Grade 2	n (%)	4 (3.6)	1 (0.9)	-	-	-
					-	-	-
	Grade 3	n (%)	1 (0.9)	0	-	-	-
					-	-	-
	Grade 4	n (%)	1 (0.9)	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group. NE = Not estimable

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

	Grade 4	n (%)	0	0	-	-	-
	Grade 5	n (%)	0	1 (0.9)	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Morb_5

BCVA Change from Baseline - Trimmed Means Fixed Approach in NORSE-1 Study
 (ITT Population)

Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
BCVA Score Change from Baseline to 11 Months [1]	n	20	23
	Mean (SD)	8.0 (9.30)	3.2 (8.33)
	Median	8.0	4.0
	Min, Max	-5, 27	-14, 20
LS Means (Q1, Q3) [2]		9.441 (8.417, 10.530)	9.187 (8.215, 10.265)
(95% CI)		(6.104, 12.296)	(5.950, 11.934)
LS Means Difference			-0.254
(95% CI)			(-6.230, 5.764)
p-value			0.7411
Corrected Hedges' G (95% CI)			-3.4861 (-4.4466, -2.5256)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2250.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Reference Listing: 16.2.6.1

Table Morb_6

BCVA Change from Baseline - Trimmed Means Adaptive Approach in NORSE-1 Study
(ITT Population)

Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
BCVA Score Change from Baseline to 11 Months [1]	n	20	23
	Mean (SD)	8.0 (9.30)	3.2 (8.33)
	Median	8.0	4.0
	Min, Max	-5, 27	-14, 20
LS Means (Q1, Q3) [2]		5.417 (4.445, 6.382)	6.272 (4.963, 7.522)
(95% CI)		(2.644, 8.235)	(2.814, 10.093)
LS Means Difference			0.856
(95% CI)			(-5.150, 6.999)
p-value			0.8318
Corrected Hedges' G (95% CI)			10.6502 (8.2801, 13.0204)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2830.

Table Morb_8

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation in NORSE-1 Study
(ITT Population)

Parameter [1]	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
BCVA Score Change from Baseline to 11 Months [2]	n	20	23
	Mean (SD)	8.0 (9.30)	3.2 (8.33)
	Median	8.0	4.0
	Min, Max	-5, 27	-14, 20
LS Means (SE)		7.294 (2.6419)	2.963 (2.4456)
(95% CI)		(2.106, 12.482)	(-1.836, 7.762)
LS Means Difference (SE)			-4.331 (3.5844)
(95% CI)			(-11.367, 2.705)
p-value [3]			0.2273
Corrected Hedges' G (95% CI)			-0.3612 (-0.9655, 0.2430)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_9

BCVA Change from Baseline over Time - Repeated Measures
(ITT Population)

Visit	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
Day 30	BCVA Score Change from Baseline	n	29	28
		Mean (SD)	5.3 (7.32)	2.5 (6.60)
		Median	5.0	2.0
		Min, Max	-9, 24	-11, 22
		LS Means (SE) [1] (95% CI)	5.276 (1.5365) (2.212, 8.340)	2.464 (1.5637) (-0.654, 5.583)
		LS Means Difference (SE) (95% CI)		-2.812 (2.1923) (-7.183, 1.560)
		p-value		0.2039
		Corrected Hedges' G (95% CI)		-0.3351 (-0.8582, 0.1879)
Day 60	BCVA Score Change from Baseline	n	28	27
		Mean (SD)	5.5 (7.71)	2.5 (6.05)
		Median	7.0	1.0
		Min, Max	-10, 20	-10, 14
		LS Means (SE) [1] (95% CI)	5.548 (1.4426) (2.665, 8.431)	2.642 (1.4684) (-0.292, 5.577)
		LS Means Difference (SE) (95% CI)		-2.906 (2.0584) (-7.020, 1.208)
		p-value		0.1629
		Corrected Hedges' G (95% CI)		-0.3754 (-0.9088, 0.1580)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

Absolute Risk Reduction [2] 95% CI	0.0430 (-0.1938, 0.2777)	
p-value [3]	0.7863	

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade in NORSE-1 Study (Safety Population)

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=30)	ONS-5010 (Masked Data)[1] (N=31)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI pvalue
Eye disorders							
Dry eye	Grade 1	n (%)	0	1 (3.2)	NE (NE, NE)	NE (NE, NE)	0.0323 (-0.0884, 0.1670) >0.9999
	Grade 2	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 3	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 4	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 5	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

NE = Not estimable

* There is not enough data to perform Chi-Square Test

	Grade 5	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

NE = Not estimable

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade in
NORSE-1 Study (Safety Population)

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=30)	ONS-5010 (Masked Data)[1] (N=31)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI pvalue
Investigations							
Blood lactate dehydrogenase increased	Grade 1	n (%)	1 (3.3)	0	NE (NE, NE)	1.0345 (0.9127, 1.2095)	0.0333 (-0.0870, 0.1744) 0.4918
	Grade 2	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 3	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 4	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 5	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

NE = Not estimable

* There is not enough data to perform Chi-Square Test

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

Table Saf_9

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade in NORSE-1 Study (Safety Population)

MedDRA System Organ Class	Maximum CTCAE Grade	Statistic	Ranibizumab (N=30)	ONS-5010 (Masked Data)[1] (N=31)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI pvalue
Injury, poisoning and procedural complications	Grade 1	n (%)	1 (3.3)	1 (3.2)	0.9667 (0.0119, 78.4650)	0.9677 (0.0293, 32.1244)	-0.0011 (-0.1516, 0.1395) >0.9999
	Grade 2	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 3	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 4	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)
	Grade 5	n (%)	0	0	NE (NE, NE)	NE (NE, NE)	NE (NE, NE)

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

NE = Not estimable

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding 95% CIs were calculated using PROC FREQ.

p-value was calculated using PROC FREQ by Fisher's exact test method.

Zero count correction was applied according to the method proposed by IQWiG.

Table Morb_15
BCVA Change from Baseline - Trimmed Means Fixed Approach by Age Group in NORSE-1 Study
(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
< 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	10	12
		Mean (SD)	7.6 (10.42)	3.7 (7.35)
		Median	7.0	6.5
		Min, Max	-5, 23	-14, 10
	LS Means (Q1, Q3) [2]		8.045 (6.552, 9.741)	8.113 (6.633, 9.794)
	(95% CI)		(2.844, 12.192)	(2.835, 12.223)
	LS Means Difference			0.068
	(95% CI)			(-9.087, 9.199)
≥ 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	10	11
		Mean (SD)	8.3 (8.60)	2.7 (9.63)
		Median	8.0	3.0
		Min, Max	-2, 27	-10, 20
	LS Means (Q1, Q3) [2]		9.302 (7.787, 10.951)	9.932 (8.505, 11.478)
	(95% CI)		(4.480, 13.521)	(5.396, 13.893)
	LS Means Difference			0.630
	(95% CI)			(-8.013, 9.245)
< 80 years	p-value			0.6210
	Corrected Hedges' G (95% CI)			0.8243 (-0.0523, 1.7009)
≥ 80 years	p-value			0.7710
	Corrected Hedges' G (95% CI)			8.3172 (5.5606, 11.0738)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2250.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Reference Listing: 16.2.6.1

Table Morb_16
BCVA Change from Baseline - Trimmed Means Adaptive Approach by Age Group in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
< 80 years	BCVA Score Change from Baseline to 11 Months [1]	n	10	12
		Mean (SD)	7.6 (10.42)	3.7 (7.35)
		Median	7.0	6.5
		Min, Max	-5, 23	-14, 10
	LS Means (Q1, Q3) [2]		5.617 (4.281, 6.976)	6.220 (4.503, 7.863)
	(95% CI)		(1.667, 9.468)	(1.643, 11.058)
	LS Means Difference			0.603
	(95% CI)			(-7.474, 8.847)
≥ 80 years	p-value			0.7258
	Corrected Hedges' G (95% CI)			7.6857 (5.1803, 10.1910)
	BCVA Score Change from Baseline to 11 Months [1]	n	10	11
		Mean (SD)	8.3 (8.60)	2.7 (9.63)
		Median	8.0	3.0
		Min, Max	-2, 27	-10, 20
	LS Means (Q1, Q3) [2]		5.596 (4.197, 6.957)	6.582 (5.061, 8.135)
	(95% CI)		(1.680, 9.646)	(2.106, 10.960)
	LS Means Difference			0.986
	(95% CI)			(-6.859, 8.758)
	p-value			0.8680
	Corrected Hedges' G (95% CI)			13.5113 (9.1695, 17.8532)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2830.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

DATE: 16MAY2024 6:57

Table Morb_18

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Age Group in NORSE-1 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
< 80 years	BCVA Score Change from Baseline to 11 Months [2]	n	10	12
		Mean (SD)	7.6 (10.42)	3.7 (7.35)
		Median	7.0	6.5
		Min, Max	-5, 23	-14, 10
		LS Means (SE)	7.737 (3.4083)	2.205 (3.3722)
		(95% CI)	(1.049, 14.426)	(-4.412, 8.822)
		LS Means Difference (SE)		-5.532 (4.9684)
		(95% CI)		(-15.284, 4.220)
	p-value [3]			0.2658
	Corrected Hedges' G (95% CI)			-0.4716 (-1.3233, 0.3800)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_19

BCVA Change from Baseline over Time - Repeated Measures by Age Group in NORSE-1 Study
(ITT Population)

Subgroup	Visit	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
< 80 years	Day 30	BCVA Score Change from Baseline	n	17	16
			Mean (SD)	5.3 (7.03)	2.3 (6.05)
			Median	6.0	2.5
			Min, Max	-9, 16	-11, 18
		LS Means (SE) [1]		5.294 (1.6959)	2.313 (1.7480)
		(95% CI)		(1.855, 8.733)	(-1.232, 5.857)
		LS Means Difference (SE)			-2.982 (2.4355)
		(95% CI)			(-7.921, 1.957)
< 80 years	Day 60	BCVA Score Change from Baseline	n	16	15
			Mean (SD)	5.9 (7.51)	2.3 (5.37)
			Median	6.5	2.0
			Min, Max	-8, 20	-9, 14
		LS Means (SE) [1]		6.030 (1.6848)	2.664 (1.7374)
		(95% CI)		(2.606, 9.455)	(-0.868, 6.195)
		LS Means Difference (SE)			-3.367 (2.4202)
		(95% CI)			(-8.286, 1.553)
		p-value			0.2288
		Corrected Hedges' G (95% CI)			-0.4160 (-1.1064, 0.2744)
		p-value			0.1733
		Corrected Hedges' G (95% CI)			-0.4869 (-1.2022, 0.2284)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

[1] LS Means, CI's, and p-values from the repeated measures model.

Table Morb_20

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Age Group in
NORSE-1 Study
(ITT Population)

Subgroup	Parameter	Ranibizumab (N=30)	ONS-5010 (N=31)
< 80 years	Number of Subjects, n/N1 (%) [1]	3/ 12 (25.0)	3/ 14 (21.4)
≥ 80 years	Number of Subjects, n/N1 (%) [1]	2/ 12 (16.7)	1/ 12 (8.3)
< 80 years	Number of Subjects, n/N (%) [1]	3/ 17 (17.6)	3/ 17 (17.6)
≥ 80 years	Number of Subjects, n/N (%) [1]	2/ 13 (15.4)	1/ 14 (7.1)

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.
20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
Male	BCVA Score Change from Baseline to 11 Months [1]	n	9	8
		Mean (SD)	8.7 (11.10)	4.8 (8.56)
		Median	12.0	4.5
		Min, Max	-5, 27	-8, 20
	LS Means (Q1, Q3) [2]		10.471 (8.913, 12.205)	9.764 (7.202, 12.603)
	(95% CI)		(5.348, 14.458)	(1.901, 15.889)
	LS Means Difference			-0.707
	(95% CI)			(-12.341, 10.252)
Female	BCVA Score Change from Baseline to 11 Months [1]	n	11	15
		Mean (SD)	7.4 (8.07)	2.4 (8.39)
		Median	7.0	4.0
		Min, Max	-2, 23	-14, 18
	LS Means (Q1, Q3) [2]		7.680 (6.165, 9.370)	8.323 (7.272, 9.448)
	(95% CI)		(2.832, 11.837)	(5.003, 11.099)
	LS Means Difference			0.643
	(95% CI)			(-6.717, 8.087)
	p-value			0.9151
	Corrected Hedges' G (95% CI)			-7.5736 (-10.4198, -4.7274)
				9.1087 (6.4364, 11.7810)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2250.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

		Median	7.0	4.0
		Min, Max	-2, 23	-14, 18
	LS Means (Q1, Q3) [2]		5.369 (3.556, 7.176)	4.630 (3.556, 5.687)
	(95% CI)		(0.605, 10.174)	(1.678, 7.621)
	LS Means Difference			-0.739
	(95% CI)			(-8.106, 6.630)
	p-value			0.5312
	Corrected Hedges' G (95% CI)			9.7561 (6.1722, 13.3400)
	p-value			0.5312
	Corrected Hedges' G (95% CI)			9.7561 (6.1722, 13.3400)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2830.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Table Morb_28

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Gender in NORSE-1 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
Male	BCVA Score Change from Baseline to 11 Months [2]	n	9	8
		Mean (SD)	8.7 (11.10)	4.8 (8.56)
		Median	12.0	4.5
		Min, Max	-5, 27	-8, 20
	LS Means (SE)		6.122 (3.6311)	4.991 (4.3805)
	(95% CI)		(-1.002, 13.245)	(-3.597, 13.580)
	LS Means Difference (SE)			-1.130 (5.6853)
	(95% CI)			(-12.279, 10.018)
	p-value [3]			0.8424
	Corrected Hedges' G (95% CI)			-0.0924 (-1.0453, 0.8606)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

			Corrected Hedges' G (95% CI)		-0.3322 (-1.0275, 0.3630)
Female	Day 120	BCVA Score Change from Baseline	n	14	18
			Mean (SD)	7.4 (8.39)	2.9 (7.60)
			Median	10.5	4.5
			Min, Max	-6, 18	-11, 14
			LS Means (SE) [1] (95% CI)	7.429 (2.1145) (3.170, 11.687)	2.101 (1.8034) (-1.527, 5.729)
			LS Means Difference (SE) (95% CI)		-5.328 (2.7791) (-10.922, 0.267)
			p-value		0.0615
			Corrected Hedges' G (95% CI)		-0.6688 (-1.3872, 0.0496)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

[1] LS Means, CI's, and p-values from the repeated measures model.

Table Morb_30

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Gender in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Ranibizumab (N=30)	ONS-5010 (N=31)
Male	Number of Subjects, n/N1 (%) [1]	3/ 12 (25.0)	0/ 8
Female	Number of Subjects, n/N1 (%) [1]	2/ 12 (16.7)	4/ 18 (22.2)
Male	Number of Subjects, n/N (%) [1]	3/ 15 (20.0)	0/ 9
Female	Number of Subjects, n/N (%) [1]	2/ 15 (13.3)	4/ 22 (18.2)

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing. 20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

[4] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

Table Morb_35
BCVA Change from Baseline - Trimmed Means Fixed Approach by Prior Anti-VEGF Therapy in NORSE-1 Study
(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab(N=30)	ONS-5010(N=31)
Yes	BCVA Score Change from Baseline to 11 Months [1]	n	9	17
		Mean (SD)	3.0 (7.71)	1.8 (7.21)
		Median	0.0	4.0
		Min, Max	-5, 17	-14, 10
		LS Means (Q1, Q3) [2]	4.449 (2.975, 6.080)	4.666 (3.748, 5.712)
		(95% CI)	(-0.237, 8.416)	(1.600, 7.165)
		LS Means Difference		0.216
		(95% CI)		(-6.698, 7.339)
		p-value		0.4044
		Corrected Hedges' G (95% CI)		3.3687 (2.1251, 4.6124)
No	BCVA Score Change from Baseline to 11 Months [1]	n	11	6
		Mean (SD)	12.0 (8.76)	7.3 (10.58)
		Median	12.0	6.0
		Min, Max	-1, 27	-8, 20
		LS Means (Q1, Q3) [2]	15.326 (14.383, 16.400)	14.996 (13.369, 17.359)
		(95% CI)	(12.123, 17.495)	(7.086, 19.802)
		LS Means Difference		-0.330
		(95% CI)		(-9.815, 6.916)
		p-value		0.6274
		Corrected Hedges' G (95% CI)		-5.1311 (-7.2028, -3.0595)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2250.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Reference Listing: 16.2.6.1

Table Morb_36
BCVA Change from Baseline - Trimmed Means Adaptive Approach by Prior Anti-VEGF Therapy in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
Yes	BCVA Score Change from Baseline to 11 Months [1]	n	9	17
		Mean (SD)	3.0 (7.71)	1.8 (7.21)
		Median	0.0	4.0
		Min, Max	-5, 17	-14, 10
	LS Means (Q1, Q3) [2]		2.531 (1.154, 3.872)	3.210 (1.980, 4.377)
	(95% CI)		(-1.237, 6.413)	(0.177, 6.639)
	LS Means Difference (95% CI)			0.678 (-5.423, 7.035)
	p-value			0.5624
No	BCVA Score Change from Baseline to 11 Months [1]	n	11	6
		Mean (SD)	12.0 (8.76)	7.3 (10.58)
		Median	12.0	6.0
		Min, Max	-1, 27	-8, 20
	LS Means (Q1, Q3) [2]		10.400 (9.472, 11.294)	11.344 (8.969, 13.992)
	(95% CI)		(7.773, 13.342)	(3.758, 17.403)
	LS Means Difference (95% CI)			0.944 (-9.129, 9.400)
	p-value			0.6837
	Corrected Hedges' G (95% CI)			9.9180 (7.0195, 12.8166)
				14.1721 (9.0555, 19.2887)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2830.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Table Morb_38

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Prior Anti-VEGF Therapy in NORSE-1 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
Yes	BCVA Score Change from Baseline to 11 Months [2]	n	9	17
		Mean (SD)	3.0 (7.71)	1.8 (7.21)
		Median	0.0	4.0
		Min, Max	-5, 17	-14, 10
	LS Means (SE)		4.884 (3.4759)	1.529 (2.7912)
	(95% CI)		(-1.939, 11.707)	(-3.953, 7.011)
	LS Means Difference (SE)			-3.355 (4.5478)
	(95% CI)			(-12.285, 5.574)
	p-value [3]			0.4609
	Corrected Hedges' G (95% CI)			-0.2911 (-1.1032, 0.5210)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

		LS Means (SE) [1] (95% CI)		1.420 (2.5322)	1.603 (1.9285)
				(-3.667, 6.506)	(-2.271, 5.478)
					0.184 (3.1830)
					(-6.210, 6.578)
		LS Means Difference (SE) (95% CI)	p-value		0.9542
			Corrected Hedges' G (95% CI)		0.0232 (-0.7935, 0.8399)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

Table Morb_40

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Prior Anti-VEGF Therapy in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Ranibizumab (N=30)	ONS-5010 (N=31)
Yes	Number of Subjects, n/N1 (%) [1]	2/ 10 (20.0)	4/ 20 (20.0)
No	Number of Subjects, n/N1 (%) [1]	3/ 14 (21.4)	0/ 6
Yes	Number of Subjects, n/N (%) [1]	2/ 15 (13.3)	4/ 25 (16.0)
No	Number of Subjects, n/N (%) [1]	3/ 15 (20.0)	0/ 6

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing. 20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

[4] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

Table Morb_45
BCVA Change from Baseline - Trimmed Means Fixed Approach by Baseline BCVA Score in NORSE-1 Study
(ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab(N=30)	ONS-5010(N=31)
≤ 67 letters BCVA Score Change from Baseline to 11 Months [1]	n		13	11
	Mean (SD)		9.7 (10.10)	3.2 (11.14)
	Median		9.0	4.0
	Min, Max		-5, 27	-14, 20
	LS Means (Q1, Q3) [2]		10.480 (8.871, 12.311)	10.077 (7.832, 12.552)
	(95% CI)		(5.178, 14.747)	(2.889, 16.053)
	LS Means Difference (95% CI)			-0.402 (-11.698, 10.750)
	p-value			0.7025
	Corrected Hedges' G (95% CI)			-3.8253 (-5.2040, -2.4465)
≥ 68 letters BCVA Score Change from Baseline to 11 Months [1]	n		7	12
	Mean (SD)		4.7 (7.16)	3.3 (5.10)
	Median		0.0	4.5
	Min, Max		-2, 13	-8, 9
	LS Means (Q1, Q3) [2]		6.112 (4.655, 7.704)	6.922 (6.103, 7.826)
	(95% CI)		(1.623, 9.748)	(4.402, 8.983)
	LS Means Difference (95% CI)			0.810 (-5.220, 7.167)
	p-value			0.5748
	Corrected Hedges' G (95% CI)			16.3555 (10.8322, 21.8787)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means fixed approach compares the 50% best (> median) observations in each treatment arm. Those observations with missing data at 11 months had values worse than the median imputed to calculate the adjusted median in which the best 50% were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2250.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Reference Listing: 16.2.6.1

Table Morb_46
BCVA Change from Baseline - Trimmed Means Adaptive Approach by Baseline BCVA Score in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
≤ 67 letters BCVA Score Change from Baseline to 11 Months [1]	n		13	11
	Mean (SD)		9.7 (10.10)	3.2 (11.14)
	Median		9.0	4.0
	Min, Max		-5, 27	-14, 20
	LS Means (Q1, Q3) [2]		6.710 (5.380, 8.031)	7.800 (5.472, 10.047)
	(95% CI)		(2.801, 10.616)	(1.289, 14.645)
	LS Means Difference (95% CI)			1.090 (-8.868, 11.315)
	p-value			0.8543
	Corrected Hedges' G (95% CI)			11.3877 (7.9558, 14.8196)
≥ 68 letters BCVA Score Change from Baseline to 11 Months [1]	n		7	12
	Mean (SD)		4.7 (7.16)	3.3 (5.10)
	Median		0.0	4.5
	Min, Max		-2, 13	-8, 9
	LS Means (Q1, Q3) [2]		4.258 (2.843, 5.709)	3.776 (3.037, 4.491)
	(95% CI)		(0.121, 8.186)	(1.702, 5.889)
	LS Means Difference (95% CI)			-0.482 (-6.323, 5.562)
	p-value			0.6425
	Corrected Hedges' G (95% CI)			-10.4535 (-14.0558, -6.8513)

Note: BCVA = Best Corrected Visual Acuity.

Note: The trimmed means adaptive approach assigns a percentile floor in the treatment arm based on the greatest proportion of dropouts observed between the two arms. Those observations with missing data at 11 months had values worse than the percentile floor imputed to calculate the adjusted floor in which the best observations were subset. Observations are ranked based on baseline adjusted 11-month scores. The p-value to test the LS Means difference was determined by taking the proportion of values in a 10,000 permutation distribution more extreme than the observed effect. The 95% CI surrounding the LS means difference was determined by taking the 2.5 and 97.5 percentiles from the same permutation distribution. The PROC MULTTEST procedure in SAS v9.4 was used to produce one dataset containing 10,000 permuted treatment effects. The procedure used seed 2830.

[1] Summary statistics based on observed changes from baseline to 11 months.

[2] Q1 = 25th percentile, Q3 = 75th percentile.

Table Morb_48

BCVA Change from Baseline - Analysis of Covariance Multiple Imputation by Baseline BCVA Score in NORSE-1 Study
(ITT Population)

Subgroup	Parameter [1]	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
≤ 67 letters	BCVA Score Change from Baseline to 11 Months [2]	n	13	11
		Mean (SD)	9.7 (10.10)	3.2 (11.14)
		Median	9.0	4.0
		Min, Max	-5, 27	-14, 20
	LS Means (SE)		7.427 (3.3785)	2.285 (3.9320)
	(95% CI)		(0.798, 14.057)	(-5.429, 10.000)
	LS Means Difference (SE)			-5.142 (5.1136)
	(95% CI)			(-15.174, 4.890)
	p-value [3]			0.3148
	Corrected Hedges' G (95% CI)			-0.3947 (-1.2059, 0.4166)

Note: BCVA = Best Corrected Visual Acuity.

Note: Missing 11-month BCVA values were replaced using the multiple imputation method with a set of plausible values that represented the uncertainty of the correct value based on the observed time matched data at all other visits. The multiple imputation was completed by two steps (1) impute these intermittent missing data using Markov chain Monte Carlo (MCMC) methods to get a monotone missingness data pattern; (2) then use regression method to impute missing data. Proc MI and Proc MIANALYZE in SAS were used to generate the datasets and run these analyses. This method of imputation assumed that missing data are missing at random (MAR).

[1] The 95% confidence intervals and the p-values are based on the overall estimates from 100 imputations, testing the ONS-5010 treatment group versus the ranibizumab treatment group using the difference between month 11 and baseline.

[2] Summary statistics based on observed changes from baseline to 11 months.

[3] p-value using analysis of covariance (ANCOVA) with treatment group as fixed effect and baseline BCVA as a continuous covariate. The p-value is testing the difference in LS Means between the treatment arms.

Table Morb_49

BCVA Change from Baseline over Time - Repeated Measures by Baseline BCVA Score in NORSE-1 Study
(ITT Population)

Subgroup	Visit	Parameter	Statistic	Ranibizumab (N=30)	ONS-5010 (N=31)
≤ 67 letters	Day 30	BCVA Score Change from Baseline	n	20	13
			Mean (SD)	5.3 (8.40)	3.5 (8.69)
			Median	2.0	3.0
			Min, Max	-9, 24	-11, 22
		LS Means (SE) [1]		5.250 (2.1890)	3.538 (2.7152)
		(95% CI)		(0.716, 9.784)	(-2.085, 9.162)
		LS Means Difference (SE)			-1.712 (3.4877)
		(95% CI)			(-8.935, 5.512)
≤ 67 letters	Day 60		p-value		0.6284
		Corrected Hedges' G (95% CI)			-0.1706 (-0.8701, 0.5290)
		BCVA Score Change from Baseline	n	20	13
			Mean (SD)	6.1 (7.94)	4.2 (7.06)
			Median	7.0	4.0
			Min, Max	-8, 20	-9, 14
		LS Means (SE) [1]		6.050 (1.9156)	4.231 (2.3760)
		(95% CI)		(2.038, 10.062)	(-0.746, 9.207)
		LS Means Difference (SE)			-1.819 (3.0520)
		(95% CI)			(-8.211, 4.573)
		p-value			0.5582
		Corrected Hedges' G (95% CI)			-0.2072 (-0.9073, 0.4930)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

[1] LS Means, CI's, and p-values from the repeated measures model.

		LS Means Difference (SE)			-4.322 (4.4042)
		(95% CI)			(-13.320, 4.675)
		p-value			0.3343
		Corrected Hedges' G (95% CI)			-0.3516 (-1.0799, 0.3767)

Note: Missing visit BCVA values will not be imputed. BCVA = Best Corrected Visual Acuity. The Proc Mixed procedure in SAS v9.4 was used. BCVA score was modeled using treatment, visit, and an interaction term of treatment and visit, as fixed effects. The repeated statement was used to specify a heterogeneous autoregressive covariance structure, which was determined based on modeling several covariance structures and comparing Akaike Information Criterion (AIC). The working covariance structure that produced the lowest AIC was used.

DATE: 30APR2024 15:18

Table Morb_60

Proportion of subjects with a visual acuity Snellen equivalent of 20/200 or worse at 11 months by Baseline BCVA Score and Previous Anti-VEGF Therapy in NORSE-1 Study (ITT Population)

Subgroup	Parameter	Ranibizumab (N=30)	ONS-5010 (N=31)
Yes and ≤ 67 letters	Number of Subjects, n/N1 (%) [1]	2/ 7 (28.6)	3/ 9 (33.3)
Yes and ≥ 68 letters	Number of Subjects, n/N1 (%) [1]	0/ 3	1/ 11 (9.1)
No and ≤ 67 letters	Number of Subjects, n/N1 (%) [1]	3/ 10 (30.0)	0/ 4
No and ≥ 68 letters	Number of Subjects, n/N1 (%) [1]	0/ 4	0/ 2
Yes and ≤ 67 letters	Number of Subjects, n/N (%) [1]	2/ 11 (18.2)	3/ 11 (27.3)
Yes and ≥ 68 letters	Number of Subjects, n/N (%) [1]	0/ 4	1/ 14 (7.1)
No and ≤ 67 letters	Number of Subjects, n/N (%) [1]	3/ 10 (30.0)	0/ 4
No and ≥ 68 letters	Number of Subjects, n/N (%) [1]	0/ 5	0/ 2

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing. 20/200 is the Visual-Acuity Snellen Equivalent of 35 letters.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

Table Morb_107

Subjects Loosing <=10 Letters from Baseline to 11 Months by Baseline BCVA Score in NORSE-1 Study
(ITT Population)

Subgroup	Parameter	Ranibizumab (N=30)	ONS-5010 (N=31)
≤ 67 letters	Number of Subjects, n/N1 (%) [1]	13/ 17 (76.5)	10/ 13 (76.9)
	Odds Ratio [2]	1.0256	
	95% CI	(0.1367, 8.6540)	
	Relative Risk [2]	1.0059	
	95% CI	(0.5762, 1.5759)	
	Absolute Risk Reduction [2]	0.0045	
	95% CI	(-0.3360, 0.3236)	
	p-value [3]	>0.9999	

Note: Those subjects who received rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as non-responders (or treatment failures). Those subjects who have missing 11-month values and did not receive rescue/prohibited therapy or discontinued treatment due to adverse event or lack-of-efficacy are treated as missing.

N = number of subjects in ITT population.

[1] n = number of subjects meeting criteria, N1 = number of subjects with Month 11 assessment.

[2] Odds Ratio, Relative Risk and Absolute Risk Reduction estimate with the corresponding 95% CIs were calculated using PROC FREQ.

[3] p-value was calculated using PROC FREQ by Fisher's exact test method.

[4] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

Neovascular age-related macular degeneration	n (%)	1 (5.9)	0	-	-	-	-
				-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Red blood cells urine positive		n (%)	0	1 (7.1)	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-1 Study (Safety Population)

< 80 years							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=17)	ONS-5010 (Masked Data)[1] (N=17)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Endocrine disorders							
Hyperthyroidism	Grade 1	n (%)	0	1 (5.9)	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Age Group in NORSE-1 Study (Safety Population)

>= 80 years								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=13)	ONS-5010 (Masked Data)[1] (N=14)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Neoplasms benign, malignant and unspecified (incl cysts and polyps)	Grade 1	n (%)	0	0	-	-	-	-
	Grade 2	n (%)	1 (7.7)	1 (7.1)	-	-	-	-
	Grade 3	n (%)	0	0	-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_22

Treatment-Emergent Adverse Events Leading to Study Withdrawal by MedDRA System Organ Class and Preferred Term by Age Group in NORSE-1 Study (Safety Population)

>= 80 years						
MedDRA System Organ Class	Statistic	Ranibizumab (N=13)	ONS-5010 (Masked Data)[1] (N=14)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value
At Least 1 TEAE Leading to Study Withdrawal	n (%)	2 (15.4)	1 (7.1)	-	-	-
Eye disorders	n (%)	2 (15.4)	0	-	-	-
Visual acuity reduced	n (%)	2 (15.4)	0	-	-	-
Infections and infestations	n (%)	0	1 (7.1)	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

				-	-		-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

General disorders and administration site conditions							
Injection site pain	n (%)	1 (6.7)	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related to either study drug or study medication administration procedure per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Reference Listing: 16.2.7.1, 16.2.7.2

Table Saf_28

Serious Study Procedure Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Gender in NORSE-1 Study (Safety Population)

Female						
MedDRA System Organ Class	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data) [1] (N=22)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_34

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Previous Anti-VEGF Therapy in NORSE-1 Study
(Safety Population)

Previous Anti VEGF Therapy: Yes							Absolute Risk Difference
MedDRA System Organ Class	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data) (N=25)	Odds Ratio 95% CI	Relative Risk 95% CI		95% CI p-value[2]
Investigations							
White blood cells urine positive	n (%)	1 (6.7)	4 (16.0)	-	-	-	-
Blood creatinine increased	n (%)	0	2 (8.0)	-	-	-	-
Protein urine present	n (%)	1 (6.7)	1 (4.0)	-	-	-	-
Blood albumin increased	n (%)	0	1 (4.0)	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related to study medication administration procedure per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related to study drug (ONS-5010 or Ranibizumab) per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_42

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: Yes							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data)[1] (N=25)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Investigations							
Blood urea increased	Grade 1	n (%)	0	1 (4.0)	- -	- -	- -
	Grade 2	n (%)	0	0	- -	- -	- -
	Grade 3	n (%)	0	0	- -	- -	- -
	Grade 4	n (%)	0	0	- -	- -	- -
	Grade 5	n (%)	0	0	- -	- -	- -

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Previous Anti VEGF Therapy: Yes								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data)[1] (N=25)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Immune system disorders	Grade 1	n (%)	0	1 (4.0)	-	-	-	-
					-	-	-	-
	Grade 2	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 3	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-
					-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: No							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data)[1] (N=6)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Eye disorders							
Visual acuity reduced	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	2 (13.3)	0	-	-	-
					-	-	-
	Grade 3	n (%)	1 (6.7)	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Previous Anti-VEGF Therapy in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: No							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=15)	ONS-5010 (Masked Data)[1] (N=6)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Gastrointestinal disorders							
Vomiting	Grade 1	n (%)	1 (6.7)	0	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_49

Related Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value in
NORSE-1 Study
(Safety Population)

MedDRA System Organ Class

MedDRA Preferred Term

At Least 1 TEAE Related to Either Study Drug or Study Medication Administration
Procedure

Statistic

p-value [3]

Interaction

0.4425

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related to either study drug or study medication administration procedure per investigator.

[3] p-value for the interaction term between subgroup and treatment was calculated using PROC LOGISTIC by subgroup*treatment model.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_53

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value in NORSE-1 Study (Safety Population)

<=67 letters								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=21)	ONS-5010 (Masked Data)[1] (N=15)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Musculoskeletal and connective tissue disorders	Grade 1	n (%)	1 (4.8)	0	-	-	-	-
					-	-	-	-
	Grade 2	n (%)	2 (9.5)	1 (6.7)	-	-	-	-
					-	-	-	-
	Grade 3	n (%)	1 (4.8)	0	-	-	-	-
					-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
					-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-
					-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value in NORSE-1 Study (Safety Population)

>=68 letters								
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=9)	ONS-5010 (Masked Data)[1] (N=16)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI	p-value[2]
Infections and infestations	Grade 1	n (%)	0	3 (18.8)	-	-	-	-
	Grade 2	n (%)	0	1 (6.3)	-	-	-	-
	Grade 3	n (%)	0	0	-	-	-	-
	Grade 4	n (%)	0	0	-	-	-	-
	Grade 5	n (%)	0	0	-	-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_56

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study
(Safety Population)

Previous Anti VEGF Therapy: Yes and <=67 letters							Absolute Risk Difference
MedDRA System Organ Class	MedDRA Preferred Term	Statistic	Ranibizumab (N=11)	ONS-5010 (Masked Data) (N=11)	Odds Ratio 95% CI	Relative Risk 95% CI	95% CI p-value[2]
Eye disorders							
Dry eye		n (%)	0	1 (9.1)	-	-	-
					-	-	-
Eye pain		n (%)	0	1 (9.1)	-	-	-
					-	-	-
Lenticular opacities		n (%)	0	1 (9.1)	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Zero count correction was applied according to the method proposed by IQWiG.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Zero count correction was applied according to the method proposed by IQWiG.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Zero count correction was applied according to the method proposed by IQWiG.

Previous Anti VEGF Therapy: Yes and >=68 letters

MedDRA System Organ Class	Statistic	Ranibizumab (N=4)	ONS-5010 (Masked Data)[1] (N=14)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value
MedDRA Preferred Term						
Eye disorders						
Keratopathy	n (%)	0	1 (7.1)	-	-	-
				-	-	-
Punctate keratitis	n (%)	0	1 (7.1)	-	-	-
				-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Related events are those identified as definitely, probably, or possibly related to study medication administration procedure per investigator.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup.

In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_64

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: Yes and <=67 letters							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=11)	ONS-5010 (Masked Data)[1] (N=11)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Infections and infestations							
Influenza	Grade 1	n (%)	0	1 (9.1)	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Table Saf_64

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: Yes and >=68 letters							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=4)	ONS-5010 (Masked Data)[1] (N=14)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Investigations							
Platelet morphology abnormal	Grade 1	n (%)	0	1 (7.1)	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=4)	ONS-5010 (Masked Data)[1] (N=14)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Renal and urinary disorders							
Renal tubular acidosis	Grade 1	n (%)	0	1 (7.1)	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: No and <=67 letters							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=10)	ONS-5010 (Masked Data)[1] (N=4)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Eye disorders							
Visual acuity reduced	Grade 1	n (%)	0	0	-	-	-
					-	-	-
	Grade 2	n (%)	2 (20.0)	0	-	-	-
					-	-	-
	Grade 3	n (%)	1 (10.0)	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: No and <=67 letters							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=10)	ONS-5010 (Masked Data)[1] (N=4)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Investigations							
Blood sodium increased	Grade 1	n (%)	1 (10.0)	0	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

Treatment-Emergent Adverse Events by MedDRA System Organ Class and Preferred Term by Maximum CTCAE Severity Grade by Baseline BCVA Value and Prior anti-VEGF in NORSE-1 Study (Safety Population)

Previous Anti VEGF Therapy: No and <=67 letters							
MedDRA System Organ Class MedDRA Preferred Term	Maximum CTCAE Grade	Statistic	Ranibizumab (N=10)	ONS-5010 (Masked Data)[1] (N=4)	Odds Ratio 95% CI	Relative Risk 95% CI	Absolute Risk Difference 95% CI p-value[2]
Gastrointestinal disorders							
Vomiting	Grade 1	n (%)	1 (10.0)	0	-	-	-
					-	-	-
	Grade 2	n (%)	0	0	-	-	-
					-	-	-
	Grade 3	n (%)	0	0	-	-	-
					-	-	-
	Grade 4	n (%)	0	0	-	-	-
					-	-	-
	Grade 5	n (%)	0	0	-	-	-
					-	-	-

Note: TEAE = Treatment-Emergent Adverse Event. Adverse events are coded using MedDRA version 23.0. Toxicity is graded using NCI CTCAE version 4.03. CTCAE = Common Terminology Criteria for Adverse Events.

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group

[1] Data obtained while subjects' randomization assignment were masked to the evaluating physician through the first 11 months of safety follow-up.

[2] p-value was calculated using PROC FREQ by Cochran-Mantel-Haenszel method.

Odds Ratio, Relative Risk and Absolute Risk Difference estimate with the corresponding asymptotic 95% CIs were calculated using PROC FREQ.

For binary endpoints subgroup analysis will only be performed, if there are at least 10 patients with the event of interest in at least one subgroup. In case of zero observations for both treatment groups, results are not shown, i.e. these tables only include cases with at least one observation in one treatment group
