Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.3938
Hedges' G (SE)		-0.11 (0.13)
Hedges' 95% CI		(-0.38, 0.15)
Hedges' P-value		0.3925

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

P-value within Treatment	0.2857	0.7064
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.12 (-0.38, 0.63)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.6296
Hedges' G (SE)		0.05 (0.11)
Hedges' 95% CI		(-0.17, 0.27)
Hedges' P-value		0.6295

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	6.96 (0.28)	6.53 (0.28)
95% CI of LS mean	(6.41, 7.50)	(5.98, 7.08)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.42 (-1.20, 0.35)
Absolute Change at Week 52 (MMRM)		
n	99	98
LS mean (SE)	-0.42 (0.28)	-0.49 (0.28)
95% CI of LS mean	(-0.97, 0.12)	(-1.04, 0.06)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.07 (-0.84, 0.71)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Mean (SD)	0.19 (1.98)	-0.48 (1.68)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.02 (-0.32, 0.27)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Full Analysis Set

Domain: Work/School Limitation
Region = North America

	ELX/TEZ/IVA N = 91	VNZ/TEZ/D-IVA N = 87
Baseline		
n	88	85
Mean (SD)	4.84 (1.89)	4.95 (1.92)
Week 4 (MMRM)		
n	85	84
LS mean (SE)	4.94 (0.22)	4.87 (0.22)
95% CI of LS mean	(4.50, 5.37)	(4.43, 5.31)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.07 (-0.69, 0.55)
Absolute Change at Week 4 (MMRM)		
n	82	82
LS mean (SE)	0.04 (0.14)	-0.09 (0.14)
95% CI of LS mean	(-0.23, 0.32)	(-0.37, 0.19)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.13 (-0.52, 0.26)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once with the maximum severity in that category.
- SOCs and PTs are reported only if corresponding events are either 1) occurring in at least 10% of patients in any treatment group; OR 2) occurring in at least 10 patients in the total study population and also occurring in at least 1% of patients in any treatment group.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Table 1.3.2.1.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for TEAEs by SOC and PT
(Excluding Infective Pulmonary Exacerbation of Cystic Fibrosis)
Safety Set

System Organ Class Preferred Term Subgroup	P-value for Interaction Based on Relative Risk
Subjects with any TEAEs	
ppFEV$_1$ at baseline (<70 % vs. ≥70 %)	0.3533
Age at screening (<18 years vs. ≥18 years)	0.5689
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.9338
Sex (Male vs. Female)	0.0768
Region (North America vs. Rest of the World)	0.4257

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- P-values are reported at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, p-value will be reported if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Table 1.3.2.2.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for Grade 3/4/5 TEAEs by SOC and PT
Safety Set

System Organ Class Preferred Term Subgroup	P-value for Interaction Based on Relative Risk
Subjects with any Grade 3/4/5 TEAEs	
ppFEV$_1$ at baseline (<70 % vs. ≥70 %)	0.5128
Age at screening (<18 years vs. ≥18 years)	0.4712
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.0136
Sex (Male vs. Female)	0.7569
Region (North America vs. Rest of the World)	0.4202

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by "*".
- P-values are reported at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, p-value will be reported if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- "-" indicates that point estimate, CI or p-value is not estimable.

Table 1.3.2.3.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for Serious TEAEs by SOC and PT
Safety Set

System Organ Class Preferred Term Subgroup	P-value for Interaction Based on Relative Risk
Subjects with any TEAEs	
ppFEV$_1$ at baseline (<70 % vs. ≥70 %)	0.4570
Age at screening (<18 years vs. ≥18 years)	0.3688
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L)	0.0264
Sex (Male vs. Female)	0.8530
Region (North America vs. Rest of the World)	0.8550

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by "*".
- P-values are reported at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, p-value will be reported if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- N/C: model does not converge.

Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [2]		0.9199
Risk Difference (RD) (95% CI)		0.0045 (-0.0841, 0.0932)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]		0.9199

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup analyses are performed at SOC/PT level only if 1) Respective analysis on the study level is done and relative risk of respective treatment effect at study level is statistically significant (p-value <0.05); 2) there are at least 10 subjects in each subgroup (per factor); and 3) there are at least 10 subjects with events in at least one of the subgroups (per factor). For the overall rate, it is performed if conditions (2) and (3) are met.
- Table is sorted in descending order of frequency of the VNZ/TEZ/D-IVA column by System Organ Class, and by Preferred Term within each System Organ Class.
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- "-" indicates that point estimate, CI or p-value is not estimable.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- Subgroup Analysis will be performed if 1) there are at least 10 subjects in each subgroup (per factor), and 2) there are at least 10 subjects with events in at least one of the subgroups (per factor).
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Table 1.3.2.8.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for AESI of Treatment-emergent Cataract Events
Safety Set

	P-value for Interaction Based on Relative Risk

No data met the criteria for this table.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- P-values are reported only if 1) there are at least 10 subjects in each subgroup (per factor), and 2) there are at least 10 subjects with events in at least one of the subgroups (per factor).
- N/C: model does not converge.

Table 1.3.2.11.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for Death
Safety Set

	P-value for Interaction Based on Relative Risk

No data met the criteria for this table.

- Include death during Treatment-emergent Period for the Treatment Period from two sources: 1) treatment/study discontinuation due to death; 2) TEAEs leading to death.
- P-values are for Relative Risk obtained from Generalized Linear Model for Outcome = treatment, subgroup (one factor at a time), treatment*subgroup; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- P-values are reported only if 1) there are at least 10 subjects in each subgroup (per factor), and 2) there are at least 10 subjects with events in at least one of the subgroups (per factor).
- N/C: model does not converge.

- MedDRA version 26.1.
- A subject with multiple events within a category is counted only once in that category.
- P-values are reported only if 1) there are at least 10 subjects in each subgroup (per factor), and 2) there are at least 10 subjects with events in at least one of the subgroups (per factor).
- [1] Relative risk from 2x2 table.
- [2] Odds ratio from 2x2 table.
- [3] Risk difference estimate from 2x2 table.
- '-' indicates that point estimate, CI or p-value is not estimable.

Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority [3]	-	N/C

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- [1] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), and baseline ppFEV$_1$ and baseline sweat chloride as covariates; Distribution: binomial with log link. If the log-binomial model does not converge, modified Poisson regression model with log link is used and indicated by '*'.
- [2] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), and baseline ppFEV$_1$ and baseline sweat chloride as covariates; Distribution: binomial with logit link.
- [3] Generalized Linear Model: treatment group, age at screening (<18 vs ≥18 years), and baseline ppFEV$_1$ and baseline sweat chloride as covariates; Distribution: binomial with identity link.
- N/C: model does not converge.

Domain: Global Satisfaction

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from Week 52 only. The model includes fixed categorical effect for treatment, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.

Program: GMA\VX121\germandossier\clinstat_prod\121-102\f-qs-abs-tsqm-52wks-102.sas Creation: 17DEC2024 13:47

ppFEV$_1$ at baseline <70 %

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

ppFEV$_1$ at baseline ≥70 %

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Health Perceptions
Age at screening <18 years

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Role
Age at screening ≥18 years

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.

Table 2.1.1.1
Study VX20-121-103: Summary of Duration of Observation (Weeks) per Endpoint
Full Analysis Set

Duration of observation (weeks)	ELX/TEZ/IVA N = 289	VNZ/TEZ/D-IVA N = 284
Overall Study Observation Time		
n	289	284
Mean (SD)	51.26 (5.63)	50.42 (7.77)
Median	52.14	52.14
Min, Max	4.29, 56.86	4.57, 56.14
$ppFEV_1$ (percentage points)		
n	289	284
Mean (SD)	50.69 (6.46)	49.73 (8.84)
Median	52.14	52.14
Min, Max	4.29, 56.86	2.00, 56.14
BMI (kg/m^2)		
n	289	284
Mean (SD)	50.92 (6.17)	49.81 (8.69)
Median	52.14	52.14
Min, Max	4.29, 56.86	4.43, 56.00
BMI z-score		
n	42	53
Mean (SD)	48.21 (11.70)	45.76 (13.32)
Median	52.00	52.14
Min, Max	4.29, 56.86	4.43, 53.00
Sweat Chloride (mmol/L)		
n	286	283
Mean (SD)	50.54 (6.74)	48.62 (10.80)
Median	52.14	52.14
Min, Max	4.29, 53.71	0.14, 55.86

- Observation duration [weeks] is defined as (date of last observation - date of randomization +1)/7
- For $ppFEV_1$, observation duration is derived from dates of accepted results. For sweat chloride, observation duration is derived from dates of evaluable results.

Table 2.1.2.1
Study VX20-121-103: Summary of Patients with Ongoing Antibiotic Medications at Baseline or at Week 52
Safety Set

	ELX/TEZ/IVA N = 289 n (%)	VNZ/TEZ/D-IVA N = 284 n (%)
Baseline, N1	289	284
Subjects with 0 ongoing AB	121 (41.87)	128 (45.07)
Subjects with 1 ongoing AB	104 (35.99)	88 (30.99)
Subjects with ≥ 2 ongoing AB	64 (22.15)	68 (23.94)
Subjects with ≥ 1 ongoing IV AB	1 (0.35)	1 (0.35)
Week 52, N1	278	264
Subjects with 0 ongoing AB	122 (43.88)	116 (43.94)
Subjects with 1 ongoing AB	94 (33.81)	95 (35.98)
Subjects with ≥ 2 ongoing AB	62 (22.30)	53 (20.08)
Subjects with ≥ 1 ongoing IV AB	5 (1.80)	2 (0.76)

- AB: Antibiotic medications are defined as those medications with the ATC level 2 names of "ANTIBACTERIALS FOR SYSTEMIC USE" and "ANTIMYCOBACTERIALS".
- Antibiotic medications included in this summary refer to those with route being "INTRAMUSCULAR", "INTRAVENOUS", "INTRAVENOUS BOLUS", "NASAL", "ORAL", or "RESPIRATORY (INHALATION)".
- IV antibiotic medications refer to those with route being "INTRAVENOUS" or "INTRAVENOUS BOLUS".
- Ongoing antibiotic medications at baseline refer to those with start date < first dose date of study drug in the Treatment Period and end date ≥ first dose date of study drug in the Treatment Period or end date is missing.
- The ongoing antibiotic medications at Week 52 refer to those with start date < Week 52 visit date and the end date ≥ Week 52 visit date or end date is missing.
- N1 refers to the number of subjects with a Day 1 visit and the number of subjects with a Week 52 visit, respectively. The percentages in this table are calculated based on N1.

Baseline		
n	286	279
Mean (SD)	66.42 (14.85)	67.24 (14.63)
Week 52		
n	271	257
Mean (SD)	66.38 (15.28)	66.82 (14.85)
Absolute Change at Week 52		
n	269	254
Mean (SD)	-0.08 (5.39)	0.14 (4.87)
Absolute Change through Week 52 (MMRM)		
n	277	271
LS mean (SE)	-0.01 (0.24)	0.31 (0.24)
95% CI of LS mean	(-0.48, 0.47)	(-0.17, 0.79)
P-value within Treatment	0.9806	0.2061

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 52 (MMRM)		
n	269	258
LS mean (SE)	84.91 (0.89)	87.09 (0.91)
95% CI of LS mean	(83.15, 86.66)	(85.30, 88.88)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.18 (-0.32, 4.69)
Absolute Change at Week 52 (MMRM)		
n	262	254
LS mean (SE)	-0.76 (0.96)	1.33 (0.97)
95% CI of LS mean	(-2.64, 1.13)	(-0.57, 3.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.09 (-0.59, 4.77)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 8	266 (92.04)	263 (92.61)
Week 16	264 (91.35)	261 (91.90)
Absolute Change at Week 16	260 (89.97)	258 (90.85)
Week 24	264 (91.35)	257 (90.49)
Absolute Change at Week 24	260 (89.97)	255 (89.79)
Week 52	266 (92.04)	250 (88.03)
Absolute Change at Week 52	257 (88.93)	247 (86.97)
Through Week 52	273 (94.46)	263 (92.61)
Absolute Change through Week 52	264 (91.35)	260 (91.55)

- n (%): For "Through Week 52", n is the number of patients for whom the average between Week 16 , 24 and 52 can be calculated, i.e. for whom at least one of Week 16, 24 or 52 is non-missing. For "Change at Week X" or "Change through Week 52", n is the number of patients for which the stated change is calculable, i.e. for whom both Baseline and the given post-Baseline visit (or through Week 52 average) are non-missing. Otherwise, n is the number of patients with non-missing values at the given visits.
- % is the compliance rate = n expressed as a percentage of N.

95% CI of LS mean	(86.50, 98.06)	(86.08, 96.72)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.88 (-8.79, 7.04)
Absolute Change at Week 8 (MMRM)		
n	8	11
LS mean (SE)	-0.89 (3.41)	-0.33 (2.94)
95% CI of LS mean	(-8.09, 6.31)	(-6.56, 5.91)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.56 (-8.99, 10.11)
Week 16 (MMRM)		
n	9	11
LS mean (SE)	89.46 (4.78)	89.40 (4.37)
95% CI of LS mean	(79.50, 99.42)	(80.29, 98.52)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.06 (-13.59, 13.47)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, genotype group (F/F, non-F/F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 52	9 (64.29)	10 (66.67)
Through Week 52	14 (100.00)	15 (100.00)
Absolute Change through Week 52	12 (85.71)	12 (80.00)

- n (%): For "Through Week 52", n is the number of patients for whom the average between Week 16 , 24 and 52 can be calculated, i.e. for whom at least one of Week 16, 24 or 52 is non-missing. For "Change at Week X" or "Change through Week 52", n is the number of patients for which the stated change is calculable, i.e. for whom both Baseline and the given post-Baseline visit (or through Week 52 average) are non-missing. Otherwise, n is the number of patients with non-missing values at the given visits.
- % is the compliance rate = n expressed as a percentage of N.

n	277	273
LS mean (SE)	78.47 (1.33)	79.34 (1.34)
95% CI of LS mean	(75.85, 81.08)	(76.71, 81.97)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.87 (-2.84, 4.58)
Absolute Change at Week 8 (MMRM)		
n	270	270
LS mean (SE)	2.45 (0.89)	0.55 (0.88)
95% CI of LS mean	(0.71, 4.18)	(-1.19, 2.29)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-1.90 (-4.36, 0.56)
Week 16 (MMRM)		
n	273	267
LS mean (SE)	78.36 (1.25)	79.61 (1.26)
95% CI of LS mean	(75.90, 80.81)	(77.13, 82.08)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.25 (-2.24, 4.74)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Mean (SD)	92.77 (14.46)	94.23 (11.95)
Week 8 (MMRM)		
n	277	274
LS mean (SE)	92.56 (0.82)	94.04 (0.83)
95% CI of LS mean	(90.94, 94.18)	(92.41, 95.67)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.48 (-0.82, 3.78)
Absolute Change at Week 8 (MMRM)		
n	270	271
LS mean (SE)	0.16 (0.66)	-0.15 (0.66)
95% CI of LS mean	(-1.14, 1.46)	(-1.45, 1.15)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.31 (-2.15, 1.53)
Week 16 (MMRM)		
n	273	268
LS mean (SE)	92.65 (0.87)	93.15 (0.88)
95% CI of LS mean	(90.93, 94.36)	(91.42, 94.87)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.50 (-1.94, 2.93)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-103: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52
Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Health Perceptions

	ELX/TEZ/IVA N = 289	VNZ/TEZ/D-IVA N = 284
Absolute Change at Week 52		
n	260	248
Mean (SD)	2.39 (15.83)	0.47 (14.83)
Week 52 (MMRM)		
n	259	245
LS mean (SE)	73.64 (1.19)	73.10 (1.21)
95% CI of LS mean	(71.30, 75.97)	(70.72, 75.48)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.53 (-3.87, 2.81)
Absolute Change at Week 52 (MMRM)		
n	253	242
LS mean (SE)	2.31 (0.97)	0.20 (0.99)
95% CI of LS mean	(0.40, 4.21)	(-1.74, 2.14)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-2.11 (-4.83, 0.61)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-103: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52
Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Social

	ELX/TEZ/IVA N = 289	VNZ/TEZ/D-IVA N = 284
Baseline		
n	282	280
Mean (SD)	72.51 (17.81)	75.03 (17.85)
Week 8 (MMRM)		
n	277	273
LS mean (SE)	73.78 (1.05)	75.71 (1.06)
95% CI of LS mean	(71.72, 75.84)	(73.64, 77.78)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.93 (-1.00, 4.85)
Absolute Change at Week 8 (MMRM)		
n	270	270
LS mean (SE)	0.87 (0.83)	0.48 (0.83)
95% CI of LS mean	(-0.76, 2.49)	(-1.15, 2.10)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.39 (-2.69, 1.91)
Week 16 (MMRM)		
n	273	267
LS mean (SE)	74.64 (1.05)	76.13 (1.06)
95% CI of LS mean	(72.58, 76.71)	(74.05, 78.22)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.49 (-1.45, 4.43)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), genotype group (F/F, F/G, F/RF, TCR/non-F) and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) divided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 2.2.1.9.3
