Dossier zur Nutzenbewertung gemäß § 35a SGB V

Deutivacaftor/Tezacaftor/Vanzacaftor (Alyftrek®)

Vertex Pharmaceuticals (Ireland) Limited

Anhang 4-G

Behandlung der zystischen Fibrose bei Patienten ab 6 Jahren, die mindestens eine Nicht-Klasse-I-Mutation im CFTR-Gen aufweisen

Zusatzanalysen für das Nutzendossier

Stand: 23.07.2025

Inhaltsverzeichnis

Zusatzanalysen Studie VX20-121-102
Zusatzanalysen Studie VX20-121-103
Zusatzanalysen Studie VX21-121-105

Zusatzanalysen Studie VX20-121-102

Table of Contents

Table 1.1.1.1 Study VX20-121-102: Summary of Duration of Observation (Weeks) per Endpoint Full Analysis Set
Table 1.1.2.1 Study VX20-121-102: Summary of Patients with Ongoing Antibiotic Medications at Baseline or at Week 52 Safety Set
Table 1.1.2.2 Study VX20-121-102: Summary of Patients with Antibiotic Medications during the Study Treatment Period Safety Set
Table 1.1.3.1 Study VX20-121-102: Summary of Patients with Ongoing Physiotherapies at Baseline or at Week 52 Safety Set
Table 1.1.3.2 Study VX20-121-102: Summary of Patients with Physiotherapies during the Study Treatment Period Safety Set
Table 1.1.4.1 Study VX20-121-102: Summary of Patients with Ongoing Inhaled Medications at Baseline or at Week 52 Safety Set
Table 1.1.4.2 Study VX20-121-102: Summary of Patients with Inhaled Medications during the Study Treatment Period Safety Set
Table 1.1.4.3 Study VX20-121-102: Summary of Patients with Ongoing Inhaled Medications for Mucolytics at Baseline or at Week 52 Safety Set
Table 1.1.4.4 Study VX20-121-102: Summary of Patients with Inhaled Medications for Mucolytics during the Study Treatment Period Safety Set
Table 1.1.4.5 Study VX20-121-102: Summary of Patients with Ongoing Inhaled Medications for Obstructive Airway Disease at Baseline or at Week 52 Safety Set
Table 1.1.4.6 Study VX20-121-102: Summary of Patients with Inhaled Medications for Obstructive Airway Disease during the Study Treatment Period Safety Set
Table 1.1.5.1 Study VX20-121-102: Summary of Patients with Ongoing CF-related Medications at Baseline or at Week 52 Safety Set
Table 1.2.1.1 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in ppFEV$_1$ (percentage points) through Week 52 Full Analysis Set
Table 1.2.1.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in BMI (kg/m^2) at Week 52 Full Analysis Set
Table 1.2.1.3 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in BMI-for-age Z-score at Week 52 for Subjects ≤20 Years at Baseline Full Analysis Set
Table 1.2.1.4.1 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in Sweat Chloride (mmol/L) through Week 52 Full Analysis Set
Table 1.2.1.4.2 Study VX20-121-102: Proportion of Subjects with Sweat Chloride <60 mmol/L at Week 52 Full Analysis Set
Table 1.2.1.4.3 Study VX20-121-102: Proportion of Subjects with Sweat Chloride <30 mmol/L at Week 52 Full Analysis Set
Table 1.2.1.5 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in Weight (kg) at Week 52 Full Analysis Set
Table 1.2.1.6.1 Study VX20-121-102: Time-to-First Pulmonary Exacerbation through Week 52 Full Analysis Set
Table 1.2.1.7.1 Study VX20-121-102: Time-to-First Pulmonary Exacerbation Requiring Hospitalization through Week 52 Full Analysis Set
Table 1.2.1.8.1 Study VX20-121-102: Time-to-First Pulmonary Exacerbation Requiring Intravenous Antibiotics through Week 52 Full Analysis Set
Table 1.2.1.9.1 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Respiratory Domain Score through Week 52 Full Analysis Set
Table 1.2.1.9.1.1 Study VX21-121-102: Compliance Rate for CFQ-R by Visit (All Domains) Full Analysis Set
Table 1.2.1.9.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Respiratory Domain Score through Week 52 Full Analysis Set
Table 1.2.1.9.2.1 Study VX21-121-102: Compliance Rate for CFQ-R by Visit (All Domains) Full Analysis Set
Table 1.2.1.9.3 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52 Full Analysis Set

Table 1.2.1.9.4 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52 Full Analysis Set
Table 1.2.1.12.1 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in TSQM Domain Score at Week 52 for Subjects Aged ≥ 12 Years to <18 Years at the Date of Informed Consent Full Analysis Set
Table 1.2.1.12.1.1 Study VX21-121-102: Compliance Rate for TSQM Domain Score at Week 52 for Subjects Aged ≥ 12 Years to <18 Years at the Date of Informed Consent Full Analysis Set
Table 1.2.1.13.1 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CF-IQ Domain Score through Week 52 Full Analysis Set
Table 1.2.1.13.1.1 Study VX21-121-102: Compliance Rate for CF-IQ by Visit (All Domains) Full Analysis Set
Table 1.2.2.1.1 Study VX20-121-102: Treatment by Subgroup Factor Interactions for MMRM Analysis of Absolute Change from Baseline in $ppFEV_1$ through Week 52 Full Analysis Set
Table 1.2.2.1.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in $ppFEV_1$ (percentage points) through Week 52 by Subgroups Full Analysis Set
Table 1.2.2.2.1 Study VX20-121-102: Treatment by Subgroup Factor Interactions for MMRM Analysis of Absolute Change from Baseline in BMI (kg/m^2) at Week 52 Full Analysis Set
Table 1.2.2.2.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in BMI (kg/m^2) at Week 52 by Subgroups Full Analysis Set
Table 1.2.2.3.1 Study VX20-121-102: Treatment by Subgroup Factor Interactions for MMRM Analysis of Absolute Change from Baseline in BMI-for-age Z-score at Week 52 for Subjects ≤20 Years at Baseline Full Analysis Set
Table 1.2.2.3.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in BMI-for-age Z-score at Week 52 by Subgroups for Subjects ≤20 Years at Baseline Full Analysis Set
Table 1.2.2.4.1.1 Study VX20-121-102: Treatment by Subgroup Factor Interactions for MMRM Analysis of Absolute Change from Baseline in Sweat Chloride (mmol/L) through Week 52 Full Analysis Set
Table 1.2.2.4.1.2 Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in Sweat Chloride (mmol/L) through Week 52 by Subgroups Full Analysis Set
Table 1.2.2.4.2.1 Study VX20-121-102: Treatment by Subgroup Factor Interactions for Proportion of Subjects with Sweat Chloride <60 mmol/L at Week 52 Full Analysis Set
Table 1.2.2.4.2.2 Study VX20-121-102: Proportion of Subjects with Sweat Chloride <60 mmol/L at Week 52 by Subgroups Full Analysis Set

Table 1.1.1.1
Study VX20-121-102: Summary of Duration of Observation (Weeks) per Endpoint
Full Analysis Set

Duration of observation (weeks)	ELX/TEZ/IVA N = 202	VNZ/TEZ/D-IVA N = 196
Overall Study Observation Time		
n	202	196
Mean (SD)	50.85 (6.86)	51.03 (6.27)
Median	52.14	52.14
Min, Max	2.29, 58.86	7.00, 57.57
$ppFEV_1$ (percentage points)		
n	202	196
Mean (SD)	50.10 (7.59)	50.15 (7.77)
Median	52.14	52.14
Min, Max	2.00, 58.86	7.00, 57.57
BMI (kg/m^2)		
n	202	196
Mean (SD)	50.46 (7.34)	50.88 (6.67)
Median	52.14	52.14
Min, Max	2.00, 58.86	7.00, 57.57
BMI z-score		
n	40	32
Mean (SD)	46.91 (12.68)	47.48 (13.24)
Median	52.14	52.14
Min, Max	2.00, 58.86	7.57, 53.71
Sweat Chloride (mmol/L)		
n	202	195
Mean (SD)	49.86 (8.55)	49.32 (8.88)
Median	52.14	52.14
Min, Max	0.57, 53.86	3.43, 57.57

- Observation duration [weeks] is defined as (date of last observation - date of randomization +1)/7
- For $ppFEV_1$, observation duration is derived from dates of accepted results. For sweat chloride, observation duration is derived from dates of evaluable results.

Program: GMA\VX121\germandossier\clinstat_prod\121-102\t-dur-obst-102.sas

Table 1.1.2.1
Study VX20-121-102: Summary of Patients with Ongoing Antibiotic Medications at Baseline or at Week 52
Safety Set

	ELX/TEZ/IVA N = 202 n (%)	VNZ/TEZ/D-IVA N = 196 n (%)
Baseline, N1	202	196
Subjects with 0 ongoing AB	79 (39.11)	74 (37.76)
Subjects with 1 ongoing AB	72 (35.64)	67 (34.18)
Subjects with ≥ 2 ongoing AB	51 (25.25)	55 (28.06)
Subjects with ≥ 1 ongoing IV AB	0	0
Week 52, N1	191	184
Subjects with 0 ongoing AB	74 (38.74)	72 (39.13)
Subjects with 1 ongoing AB	78 (40.84)	61 (33.15)
Subjects with ≥ 2 ongoing AB	39 (20.42)	51 (27.72)
Subjects with ≥ 1 ongoing IV AB	1 (0.52)	0

- AB: Antibiotic medications are defined as those medications with the ATC level 2 names of "ANTIBACTERIALS FOR SYSTEMIC USE" and "ANTIMYCOBACTERIALS".
- Antibiotic medications included in this summary refer to those with route being "INTRAMUSCULAR", "INTRAVENOUS", "INTRAVENOUS BOLUS", "NASAL", "ORAL", or "RESPIRATORY (INHALATION)".
- IV antibiotic medications refer to those with route being "INTRAVENOUS" or "INTRAVENOUS BOLUS".
- Ongoing antibiotic medications at baseline refer to those with start date < first dose date of study drug in the Treatment Period and end date ≥ first dose date of study drug in the Treatment Period or end date is missing.
- The ongoing antibiotic medications at Week 52 refer to those with start date < Week 52 visit date and the end date ≥ Week 52 visit date or end date is missing.
- N1 refers to the number of subjects with a Day 1 visit, and the number of subjects with a Week 52 visit, respectively. The percentages in this table are calculated based on N1.

95% CI of LS mean	(-0.26, 0.97)	(-0.15, 1.11)
P-value within Treatment	0.2508	0.1361
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.12 (-0.76, 1.00)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.7918
Hedges' G (SE)		0.03 (0.10)
Hedges' 95% CI		(-0.17, 0.23)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- N is the number of subjects in the Full Analysis Set who are ≤20 years of age at baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 1.2.1.9.1
Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Respiratory Domain Score through Week 52
Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version

	ELX/TEZ/IVA N = 202	VNZ/TEZ/D-IVA N = 196
Absolute Change through Week 52 (MMRM)		
n	192	186
LS mean (SE)	-1.60 (0.95)	0.81 (0.97)
95% CI of LS mean	(-3.47, 0.28)	(-1.10, 2.72)
P-value within Treatment	0.0954	0.4072
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.40 (-0.28, 5.08)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.0788
Hedges' G (SE)		0.18 (0.10)
Hedges' 95% CI		(-0.02, 0.38)
Hedges' P-value		0.0793

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 8 (MMRM)		
n	7	5
LS mean (SE)	4.09 (3.88)	0.11 (4.76)
95% CI of LS mean	(-5.10, 13.28)	(-11.31, 11.52)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-3.98 (-18.87, 10.91)
Week 16 (MMRM)		
n	9	5
LS mean (SE)	89.16 (4.61)	90.75 (6.39)
95% CI of LS mean	(79.10, 99.23)	(76.91, 104.59)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.59 (-15.90, 19.07)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 8	7 (70.00)	4 (66.67)
Week 16	9 (90.00)	5 (83.33)
Absolute Change at Week 16	8 (80.00)	4 (66.67)
Week 24	9 (90.00)	5 (83.33)
Absolute Change at Week 24	8 (80.00)	4 (66.67)
Week 52	9 (90.00)	5 (83.33)
Absolute Change at Week 52	8 (80.00)	4 (66.67)
Through Week 52	9 (90.00)	5 (83.33)
Absolute Change through Week 52	8 (80.00)	4 (66.67)

- n (%): For "Through Week 52", n is the number of patients for whom the average between Week 16 , 24 and 52 can be calculated, i.e. for whom at least one of Week 16, 24 or 52 is non-missing. For "Change at Week X" or "Change through Week 52", n is the number of patients for which the stated change is calculable, i.e. for whom both Baseline and the given post-Baseline visit (or through Week 52 average) are non-missing. Otherwise, n is the number of patients with non-missing values at the given visits.
- % is the compliance rate = n expressed as a percentage of N.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.11 (-2.16, 6.37)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 52		
n	193	184
Mean (SD)	93.72 (12.46)	91.18 (18.30)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

n	197	188
LS mean (SE)	80.60 (1.44)	82.79 (1.48)
95% CI of LS mean	(77.77, 83.44)	(79.89, 85.69)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.19 (-1.87, 6.25)
Absolute Change at Week 8 (MMRM)		
n	193	186
LS mean (SE)	-2.09 (1.08)	0.04 (1.10)
95% CI of LS mean	(-4.21, 0.04)	(-2.12, 2.21)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.13 (-0.90, 5.16)
Week 16 (MMRM)		
n	196	189
LS mean (SE)	80.68 (1.41)	83.34 (1.44)
95% CI of LS mean	(77.92, 83.45)	(80.51, 86.16)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.65 (-1.30, 6.61)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.24 (-3.59, 3.12)
Absolute Change at Week 52 (MMRM)		
n	187	177
LS mean (SE)	3.21 (1.00)	2.82 (1.03)
95% CI of LS mean	(1.24, 5.18)	(0.80, 4.84)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.39 (-3.21, 2.43)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-14.47 (-26.30, -2.64)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.0219
Hedges' G (SE)		-1.71 (0.66)
Hedges' 95% CI		(-3.18, -0.23)
Hedges' P-value		0.0279

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	6.21 (-21.88, 34.30)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-12.29, 33.30)	(-14.74, 50.49)
P-value within Treatment	0.3218	0.2454
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	7.37 (-33.05, 47.79)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.6896
Hedges' G (SE)		0.24 (0.57)
Hedges' 95% CI		(-1.02, 1.50)
Hedges' P-value		0.6818

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 52 (MMRM)		
n	186	178
LS mean (SE)	4.94 (0.14)	4.82 (0.15)
95% CI of LS mean	(4.65, 5.22)	(4.53, 5.11)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.12 (-0.53, 0.29)

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. Covariance structure=UN, DF=Kenward-Roger.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 171	VNZ/TEZ/D-IVA N = 170
Baseline		
n	170	168
mean (SD)	65.23 (13.85)	65.21 (15.08)
Week 52		
n	159	153
mean (SD)	65.04 (13.97)	65.13 (15.66)
Absolute Change at Week 52		
n	159	152
mean (SD)	0.07 (5.20)	0.25 (5.38)
Absolute Change through Week 52 (MMRM)		
n	167	165
LS mean (SE)	0.27 (0.33)	0.52 (0.34)
95% CI of LS mean	(-0.38, 0.93)	(-0.15, 1.18)
P-value within Treatment	0.4163	0.1268

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Hedges' G (SE)		-0.04 (0.14)
Hedges' 95% CI		(-0.31, 0.23)
Hedges' P-value		0.7631

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 1.2.2.2.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for
MMRM Analysis of Absolute Change from Baseline in BMI (kg/m^2) at Week 52
Full Analysis Set

Subgroup	P-value for Interaction
$ppFEV_1$ at baseline (<70 % vs. ≥70 %) [1]	0.9662
Age at screening (<18 years vs. ≥18 years) [2]	0.5181
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L) [1]	0.5200
Sex (Male vs. Female) [1]	0.8992
Region (North America vs. Rest of the World) [1]	0.4571

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- P-values are reported for each subgroup factor only when Subgroup Criteria are fulfilled. If not, display '-'.
- [1] P-values are obtained from MMRM with treatment, visit, subgroup, treatment*visit, and treatment*subgroup as fixed effects, with adjustment for baseline $ppFEV_1$ and baseline sweat chloride, age at screening (<18 vs ≥18 years) as covariates.
- [2] P-values are obtained from MMRM with treatment, visit, subgroup, treatment*visit, and treatment*subgroup as fixed effects, with adjustment for baseline $ppFEV_1$ and baseline sweat chloride as covariates.
- N/C: model does not converge.

SwCl at baseline ≥30 mmol/L

	ELX/TEZ/IVA N = 36	VNZ/TEZ/D-IVA N = 31

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≤20 years of age at baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 111	VNZ/TEZ/D-IVA N = 109
Baseline		
n	111	109
mean (SD)	52.02 (18.94)	52.21 (17.01)
Week 52		
n	100	98
mean (SD)	49.79 (18.75)	44.66 (20.94)
Absolute Change at Week 52		
n	100	98
mean (SD)	-2.66 (11.43)	-7.91 (13.75)
Absolute Change through Week 52 (MMRM)		
n	106	103
LS mean (SE)	0.32 (0.98)	-6.26 (1.00)
95% CI of LS mean	(-1.62, 2.26)	(-8.23, -4.29)
P-value within Treatment	0.7468	<0.0001

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, 36, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

$ppFEV_1$ at baseline (<70 % vs. ≥70 %) [1]	0.9963
Age at screening (<18 years vs. ≥18 years) [2]	0.3480
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L) [1]	0.0951
Sex (Male vs. Female) [1]	0.4719
Region (North America vs. Rest of the World) [1]	0.8818

-Subgroup Criteria (SC): subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
-P-values are reported for each subgroup factor only when SC are fulfilled. If not, display '-'.
- [1] P-values are for the Hazard ratio from the Cox proportional hazards regression model for time to first event or censoring, with treatment, subgroup, treatment*subgroup, and adjustment for baseline $ppFEV_1$ and baseline sweat chloride, and age at screening (<18 vs ≥18 years).
- [2] P-values are for the Hazard ratio from the Cox proportional hazards regression model for time to first event or censoring, with treatment, subgroup, treatment*subgroup, and adjustment for baseline $ppFEV_1$ and baseline sweat chloride.

Two-sided P-value, superiority*	-	0.6880

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
- CI: Confidence interval.
- Subjects without any protocol-defined pulmonary exacerbation during the PEx analysis period were censored at the PEx analysis period end date.
- *Cox regression: time is the time-to-first pulmonary exacerbation or censoring, with adjustment for treatment, baseline ppFEV$_1$ and baseline SwCl, and age at screening (<18 vs ≥18 years).
- For "Age at screening" subgroup factor, age covariate is removed from analysis model.

Table 1.2.2.8.1.1
Study VX20-121-102: Treatment by Subgroup Factor Interactions for Time-to-First Pulmonary Exacerbation Requiring Intravenous Antibiotics through Week 52
Full Analysis Set

Subgroup	P-value for Interaction based on Hazard Ratio
$ppFEV_1$ at baseline (<70 % vs. ≥70 %) [1]	0.3101
Age at screening (<18 years vs. ≥18 years) [2]	0.7359
SwCl at baseline (<30 mmol/L vs. ≥30 mmol/L) [1]	0.9888
Sex (Male vs. Female) [1]	0.6524
Region (North America vs. Rest of the World) [1]	0.9544

- Subgroup Criteria (SC): subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
- P-values are reported for each subgroup factor only when SC are fulfilled. If not, display '-'.
- [1] P-values are for the Hazard ratio from the Cox proportional hazards regression model for time to first event or censoring, with treatment, subgroup, treatment*subgroup, and adjustment for baseline $ppFEV_1$ and baseline sweat chloride, and age at screening (<18 vs ≥18 years).
- [2] P-values are for the Hazard ratio from the Cox proportional hazards regression model for time to first event or censoring, with treatment, subgroup, treatment*subgroup, and adjustment for baseline $ppFEV_1$ and baseline sweat chloride.

Hazard Ratio (95% CI)*	-	0.4894 (0.2303, 1.0397)
Two-sided P-value, superiority*	-	0.0631

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- Pulmonary exacerbation (PEx): new or change in antibiotic therapy (intravenous (IV), inhaled, or oral) for ≥4 sinopulmonary signs/symptoms.
- CI: Confidence interval.
- Subjects without any protocol-defined pulmonary exacerbation during the PEx analysis period were censored at the PEx analysis period end date.
- *Cox regression: time is the time-to-first pulmonary exacerbation or censoring, with adjustment for treatment, baseline ppFEV$_1$ and baseline SwCl, and age at screening (<18 vs ≥18 years).
- For "Age at screening" subgroup factor, age covariate is removed from analysis model.

n	83	90
LS mean (SE)	84.14 (1.64)	86.14 (1.57)
95% CI of LS mean	(80.90, 87.37)	(83.03, 89.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.00 (-2.48, 6.49)
Absolute Change at Week 8 (MMRM)		
n	82	90
LS mean (SE)	-1.20 (1.82)	-2.09 (1.74)
95% CI of LS mean	(-4.80, 2.39)	(-5.53, 1.35)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.89 (-5.87, 4.09)
Week 16 (MMRM)		
n	83	91
LS mean (SE)	85.40 (1.69)	87.80 (1.62)
95% CI of LS mean	(82.06, 88.74)	(84.60, 91.00)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.40 (-2.23, 7.02)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-4.22, 0.97)	(-2.32, 2.91)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.92 (-1.76, 5.60)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 182	VNZ/TEZ/D-IVA N = 177
Absolute Change through Week 52 (MMRM)		
n	173	170
LS mean (SE)	-1.53 (0.98)	0.29 (0.99)
95% CI of LS mean	(-3.46, 0.41)	(-1.66, 2.25)
P-value within Treatment	0.1210	0.7694
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.82 (-0.93, 4.57)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.1940
Hedges' G (SE)		0.14 (0.11)
Hedges' 95% CI		(-0.07, 0.35)
Hedges' P-value		0.1944

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version

Region = North America

	ELX/TEZ/IVA N = 91	VNZ/TEZ/D-IVA N = 87
Absolute Change at Week 16 (MMRM)		
n	87	83
LS mean (SE)	-0.79 (1.50)	2.24 (1.54)
95% CI of LS mean	(-3.75, 2.18)	(-0.79, 5.28)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.03 (-1.22, 7.28)
Week 24 (MMRM)		
n	89	83
LS mean (SE)	82.51 (1.92)	83.92 (1.98)
95% CI of LS mean	(78.71, 86.31)	(80.00, 87.84)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.41 (-4.05, 6.87)
Absolute Change at Week 24 (MMRM)		
n	87	81
LS mean (SE)	-1.90 (1.90)	-1.77 (1.96)
95% CI of LS mean	(-5.65, 1.84)	(-5.64, 2.09)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.13 (-5.25, 5.51)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Program: GMA\VX121\germandossier\clinstat_prod\121-102\t-qs-mmrm-abs-cfqr-rd-ag12-52wks-sub-102.sas Creation: 17DEC2024 14:19

Sex = Female

	ELX/TEZ/IVA N = 3	VNZ/TEZ/D-IVA N = 5

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Mean (SD)	1.94 (14.96)	2.78 (14.79)
Week 52 (MMRM)		
n	112	93
LS mean (SE)	77.46 (2.07)	77.13 (2.24)
95% CI of LS mean	(73.38, 81.54)	(72.72, 81.54)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.33 (-6.36, 5.70)
Absolute Change at Week 52 (MMRM)		
n	109	91
LS mean (SE)	1.88 (1.44)	3.21 (1.57)
95% CI of LS mean	(-0.97, 4.72)	(0.12, 6.30)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.34 (-2.88, 5.55)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.53 (-6.85, 7.91)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.8866
Hedges' G (SE)		0.04 (0.28)
Hedges' 95% CI		(-0.52, 0.60)
Hedges' P-value		0.8860

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 16 (MMRM)		
n	177	173
LS mean (SE)	77.44 (1.60)	80.66 (1.62)
95% CI of LS mean	(74.29, 80.59)	(77.47, 83.86)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.22 (-1.27, 7.71)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-0.90, 3.34)	(0.86, 5.15)
P-value within Treatment	0.2586	0.0062
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.79 (-1.23, 4.80)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.2442
Hedges' G (SE)		0.16 (0.14)
Hedges' 95% CI		(-0.11, 0.43)
Hedges' P-value		0.2449

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(77.64, 95.07)	(72.12, 91.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-4.67 (-17.64, 8.29)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 119	VNZ/TEZ/D-IVA N = 116
Absolute Change through Week 52 (MMRM)		
n	111	113
LS mean (SE)	-0.91 (1.05)	-0.66 (1.04)
95% CI of LS mean	(-2.97, 1.16)	(-2.71, 1.39)
P-value within Treatment	0.3864	0.5266
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.25 (-2.67, 3.17)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.8664
Hedges' G (SE)		0.02 (0.13)
Hedges' 95% CI		(-0.24, 0.28)
Hedges' P-value		0.8659

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(78.67, 85.67)	(78.87, 85.99)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.26 (-4.73, 5.25)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.52 (-1.68, 4.72)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 119	VNZ/TEZ/D-IVA N = 116
Baseline		
n	114	115
Mean (SD)	92.98 (13.57)	92.85 (13.34)
Week 8 (MMRM)		
n	116	116
LS mean (SE)	91.56 (1.34)	92.87 (1.35)
95% CI of LS mean	(88.91, 94.21)	(90.21, 95.52)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.31 (-2.45, 5.06)
Absolute Change at Week 8 (MMRM)		
n	112	115
LS mean (SE)	-1.59 (1.08)	0.01 (1.06)
95% CI of LS mean	(-3.71, 0.53)	(-2.09, 2.10)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.59 (-1.39, 4.58)
Week 16 (MMRM)		
n	115	115
LS mean (SE)	91.93 (1.22)	92.54 (1.22)
95% CI of LS mean	(89.53, 94.34)	(90.13, 94.95)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.60 (-2.81, 4.02)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52 by Subgroups
Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Eat
Region = North America

	ELX/TEZ/IVA N = 91	VNZ/TEZ/D-IVA N = 87
Absolute Change at Week 16 (MMRM)		
n	87	83
LS mean (SE)	-1.57 (1.19)	0.17 (1.22)
95% CI of LS mean	(-3.92, 0.79)	(-2.24, 2.58)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.73 (-1.64, 5.11)
Week 24 (MMRM)		
n	89	84
LS mean (SE)	90.67 (1.96)	89.23 (2.01)
95% CI of LS mean	(86.80, 94.54)	(85.26, 93.20)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-1.44 (-6.99, 4.11)
Absolute Change at Week 24 (MMRM)		
n	87	82
LS mean (SE)	-2.46 (1.33)	0.17 (1.37)
95% CI of LS mean	(-5.08, 0.16)	(-2.53, 2.87)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.63 (-1.13, 6.40)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 52 (MMRM)		
n	112	93
LS mean (SE)	80.32 (1.69)	82.43 (1.83)
95% CI of LS mean	(76.98, 83.66)	(78.82, 86.03)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.11 (-2.82, 7.04)
Absolute Change at Week 52 (MMRM)		
n	109	91
LS mean (SE)	-0.20 (1.31)	2.52 (1.42)
95% CI of LS mean	(-2.78, 2.38)	(-0.27, 5.31)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.72 (-1.08, 6.53)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

P-value within Treatment	0.0052	0.4832
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-7.17 (-12.98, -1.36)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.0166
Hedges' G (SE)		-0.69 (0.29)
Hedges' 95% CI		(-1.26, -0.12)
Hedges' P-value		0.0193

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 16 (MMRM)		
n	177	173
LS mean (SE)	81.81 (1.34)	82.79 (1.35)
95% CI of LS mean	(79.18, 84.43)	(80.13, 85.46)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.99 (-2.75, 4.73)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-1.90, 2.41)	(-0.49, 3.86)
P-value within Treatment	0.8188	0.1286
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.43 (-1.63, 4.50)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.3571
Hedges' G (SE)		0.13 (0.14)
Hedges' 95% CI		(-0.15, 0.40)
Hedges' P-value		0.3575

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-3.66, 7.72)	(-8.23, 3.74)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-4.28 (-12.56, 4.00)
Week 16 (MMRM)		
n	20	19
LS mean (SE)	72.28 (3.77)	74.63 (3.91)
95% CI of LS mean	(64.63, 79.94)	(66.69, 82.57)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.35 (-8.71, 13.40)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 24 (MMRM)		
n	19	16
LS mean (SE)	-8.53 (4.55)	2.49 (4.96)
95% CI of LS mean	(-17.81, 0.76)	(-7.64, 12.62)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	11.02 (-2.79, 24.82)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-1.11 (-4.62, 2.41)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(74.66, 83.86)	(78.18, 87.62)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.65 (-2.95, 10.24)
Absolute Change at Week 8 (MMRM)		
n	86	82
LS mean (SE)	-3.51 (1.63)	0.22 (1.67)
95% CI of LS mean	(-6.73, -0.30)	(-3.07, 3.52)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.74 (-0.86, 8.34)
Week 16 (MMRM)		
n	89	85
LS mean (SE)	81.62 (2.18)	82.87 (2.24)
95% CI of LS mean	(77.31, 85.93)	(78.46, 87.28)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.25 (-4.92, 7.43)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	6.12 (1.81, 10.42)
Week 24 (MMRM)		
n	109	97
LS mean (SE)	86.14 (1.61)	87.06 (1.70)
95% CI of LS mean	(82.97, 89.30)	(83.72, 90.41)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.92 (-3.69, 5.54)
Absolute Change at Week 24 (MMRM)		
n	107	94
LS mean (SE)	0.35 (1.44)	3.22 (1.53)
95% CI of LS mean	(-2.48, 3.18)	(0.21, 6.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.87 (-1.27, 7.02)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 52 (MMRM)		
n	18	19
LS mean (SE)	84.85 (3.51)	89.72 (3.49)
95% CI of LS mean	(77.75, 91.95)	(82.64, 96.79)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	4.87 (-5.17, 14.91)
Absolute Change at Week 52 (MMRM)		
n	18	19
LS mean (SE)	-1.84 (3.32)	1.12 (3.31)
95% CI of LS mean	(-8.55, 4.88)	(-5.61, 7.84)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	2.95 (-6.58, 12.48)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Hedges' P-value		0.0307

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(67.68, 85.47)	(67.74, 87.20)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.90 (-12.56, 14.37)
Absolute Change at Week 8 (MMRM)		
n	19	16
LS mean (SE)	2.28 (2.34)	6.32 (2.56)
95% CI of LS mean	(-2.50, 7.06)	(1.10, 11.54)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	4.04 (-3.13, 11.21)
Week 16 (MMRM)		
n	19	16
LS mean (SE)	73.94 (4.69)	75.04 (5.13)
95% CI of LS mean	(64.34, 83.54)	(64.55, 85.53)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	1.10 (-13.37, 15.58)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.44 (-4.24, 3.35)
Week 24 (MMRM)		
n	115	115
LS mean (SE)	76.86 (1.64)	77.23 (1.65)
95% CI of LS mean	(73.62, 80.09)	(73.99, 80.48)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.38 (-4.22, 4.97)
Absolute Change at Week 24 (MMRM)		
n	111	114
LS mean (SE)	1.83 (1.21)	1.94 (1.20)
95% CI of LS mean	(-0.56, 4.22)	(-0.42, 4.30)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.11 (-3.26, 3.48)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 52 (MMRM)		
n	85	75
LS mean (SE)	2.52 (1.38)	2.39 (1.44)
95% CI of LS mean	(-0.20, 5.23)	(-0.46, 5.24)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.13 (-4.07, 3.82)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in CFQ-R Non-Respiratory Domain Score through Week 52 by Subgroups
Full Analysis Set

Version: Pooled 'Children Ages 12 and 13' Version and 'Adolescents and Adults' Version
Domain: Treatment Burden
Sex = Female

	ELX/TEZ/IVA N = 83	VNZ/TEZ/D-IVA N = 80
Absolute Change through Week 52 (MMRM)		
n	81	72
LS mean (SE)	2.78 (1.51)	2.64 (1.61)
95% CI of LS mean	(-0.21, 5.76)	(-0.54, 5.82)
P-value within Treatment	0.0684	0.1027
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.13 (-4.51, 4.24)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.9515
Hedges' G (SE)		-0.01 (0.16)
Hedges' 95% CI		(-0.33, 0.31)
Hedges' P-value		0.9514

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	64.19 (1.89)	68.44 (1.99)
95% CI of LS mean	(60.47, 67.91)	(64.52, 72.36)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	4.25 (-1.16, 9.67)
Absolute Change at Week 8 (MMRM)		
n	107	96
LS mean (SE)	-2.96 (1.72)	0.69 (1.81)
95% CI of LS mean	(-6.34, 0.43)	(-2.89, 4.26)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.64 (-1.29, 8.57)
Week 16 (MMRM)		
n	109	98
LS mean (SE)	64.28 (1.97)	68.82 (2.08)
95% CI of LS mean	(60.40, 68.16)	(64.72, 72.91)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	4.54 (-1.11, 10.19)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-5.90 (-17.80, 5.99)
Week 24 (MMRM)		
n	20	19
LS mean (SE)	63.74 (3.78)	72.54 (3.90)
95% CI of LS mean	(56.07, 71.40)	(64.63, 80.45)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	8.80 (-2.25, 19.85)
Absolute Change at Week 24 (MMRM)		
n	20	19
LS mean (SE)	-1.79 (3.35)	1.38 (3.45)
95% CI of LS mean	(-8.58, 5.00)	(-5.62, 8.39)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.17 (-6.62, 12.96)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	6.31 (3.60)	3.36 (4.27)
95% CI of LS mean	(-1.06, 13.68)	(-5.38, 12.10)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-2.95 (-14.47, 8.57)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Absolute Change at Week 16 (MMRM)		
n	102	100
LS mean (SE)	-2.31 (1.69)	-2.01 (1.71)
95% CI of LS mean	(-5.64, 1.02)	(-5.38, 1.37)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.30 (-4.44, 5.05)
Week 24 (MMRM)		
n	104	101
LS mean (SE)	64.93 (2.05)	68.80 (2.08)
95% CI of LS mean	(60.89, 68.96)	(64.70, 72.91)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	3.88 (-1.88, 9.64)
Absolute Change at Week 24 (MMRM)		
n	102	100
LS mean (SE)	-1.73 (1.70)	-1.17 (1.72)
95% CI of LS mean	(-5.08, 1.61)	(-4.55, 2.22)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.57 (-4.19, 5.33)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

n	73	82
LS mean (SE)	84.77 (3.09)	82.14 (2.95)
95% CI of LS mean	(78.67, 90.87)	(76.32, 87.96)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-2.63 (-11.06, 5.80)
Absolute Change at Week 52 (MMRM)		
n	72	82
LS mean (SE)	0.28 (2.93)	-1.95 (2.77)
95% CI of LS mean	(-5.51, 6.06)	(-7.43, 3.52)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-2.23 (-10.20, 5.74)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Hedges' 95% CI		(-0.15, 0.28)
Hedges' P-value		0.5439

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

LS mean (SE)	78.64 (3.05)	77.20 (2.98)
95% CI of LS mean	(72.64, 84.65)	(71.33, 83.07)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-1.45 (-9.86, 6.96)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-5.62, 4.76)	(-5.12, 5.33)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.54 (-6.83, 7.91)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 7	VNZ/TEZ/D-IVA N = 2

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

	ELX/TEZ/IVA N = 10	VNZ/TEZ/D-IVA N = 6

Subgroup criteria are not met for this subgroup factor.

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- Treatment effect through Week 52 is estimated by averaging Weeks 16, 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effect for treatment, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Study VX20-121-102: MMRM Analysis of Absolute Change from Baseline in TSQM Domain Score at Week 52 by Subgroups for Subjects Aged ≥ 12 Years to <18 Years at the Date of Informed Consent
Full Analysis Set

Domain: Side Effects
Sex = Male

	ELX/TEZ/IVA N = 19	VNZ/TEZ/D-IVA N = 11
Absolute Change at Week 52 (MMRM)		
n	18	10
LS mean (SE)	0.57 (2.47)	-4.15 (3.32)
95% CI of LS mean	(-4.53, 5.66)	(-11.00, 2.71)
P-value within Treatment	0.8201	0.2239
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-4.71 (-13.29, 3.87)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.2681
Hedges' G (SE)		-0.44 (0.39)
Hedges' 95% CI		(-1.23, 0.36)
Hedges' P-value		0.2699

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effect for treatment, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effect for treatment, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Table 1.2.2.12.1.2

Full Analysis Set

Domain: Global Satisfaction
$ppFEV_1$ at baseline ≥70 %

	ELX/TEZ/IVA N = 22	VNZ/TEZ/D-IVA N = 20
Absolute Change at Week 52 (MMRM)		
n	20	17
LS mean (SE)	3.37 (3.67)	3.18 (3.99)
95% CI of LS mean	(-4.10, 10.84)	(-4.93, 11.29)
P-value within Treatment	0.3654	0.4307
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.19 (-11.27, 10.89)
Two-sided P-value (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), superiority	-	0.9724
Hedges' G (SE)		-0.01 (0.32)
Hedges' 95% CI		(-0.67, 0.64)
Hedges' P-value		0.9722

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- N is the number of subjects in each subgroup in the Full Analysis Set who are ≥12 to <18 years of age at the date of informed consent.
- Baseline is defined as the pre-dose Day 1 value. If the pre-dose Day 1 value is missing, the most recent pre-dose, non-missing value on or after the Day -14 visit, including unscheduled visits, is used as baseline.
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from Week 52 only. The model includes fixed categorical effect for treatment, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

95% CI of LS mean	(-1.37, 0.52)	(-1.11, 0.94)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	0.34 (-1.06, 1.74)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline $ppFEV_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.

Week 4 (MMRM)		
n	111	114
LS mean (SE)	10.90 (0.37)	10.76 (0.36)
95% CI of LS mean	(10.18, 11.62)	(10.04, 11.48)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.14 (-1.16, 0.88)
Absolute Change at Week 4 (MMRM)		
n	107	111
LS mean (SE)	-0.14 (0.29)	-0.28 (0.29)
95% CI of LS mean	(-0.72, 0.43)	(-0.84, 0.28)
LS mean Diff (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA), 95% CI	-	-0.14 (-0.94, 0.67)

- Subgroup Criteria: subgroup analyses are performed only when the following conditions are fulfilled 1)at least 10 subjects in each subgroup (per factor), and 2)for dichotomous endpoints, at least 10 subjects with events occurred in at least one of subgroups (per factor).
- CI: Confidence interval; LS Mean Diff: Least Squares Mean difference; SD: Standard deviation; SE: Standard error.
- MMRM includes data from all available visits up to Week 52. The model includes fixed categorical effects for treatment, visit, age at screening (<18 vs ≥18 years), and treatment-by-visit interaction, with baseline ppFEV$_1$ and baseline sweat chloride as continuous covariates. For "Age at screening" subgroup factor, Age at screening (<18 years vs ≥18 years) covariate is removed from MMRM.
- Treatment effect through Week 52 is estimated by averaging Weeks 24, and 52.
- SMD (standardized mean difference) is the LS mean difference (VNZ/TEZ/D-IVA vs ELX/TEZ/IVA) devided by the pooled standard deviation. The unbiased estimate of Hedges' G is the product of SMD and the correction factor 1-3/(4m-1), where m is the degree of freedom.
- N/C: model does not converge.
