Dossier zur Nutzenbewertung gemäß § 35a SGB V

Resmetirom (Rezdiffra®)

Madrigal Pharmaceuticals EU Limited

Modul 4 A – Anhang 4-G

Resmetirom ist indiziert in Kombination mit Ernährung und Bewegung zur Behandlung von Erwachsenen mit nicht zirrhotischer, nicht alkoholischer Steatohepatitis (MASH), bei denen eine mäßige bis fortgeschrittene Leberfibrose (Fibrosestadien F2 bis F3) besteht.

Weitere Analysen zu den in Abschnitt 4.3.1.3 gezeigten Ergebnissen

Stand: 15.09.2025

Table Of Contents

AMNOG Table P1.2.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Age (Label Population) --->42

AMNOG Table P1.3.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Sex (Label Population) --->45

AMNOG Table P1.4.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Region (Label Population) --->48

AMNOG Table P1.5.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Weight (Label Population) --->51

AMNOG Table P1.6.1 NASH Resolution Response (P1): Summary of Results at Week 52; by BMI (Label Population) --->54

AMNOG Table P1.7.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Diabetes Status at Baseline (Label Population) --->58

AMNOG Table P1.8.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Fibrosis Stage at Baseline (Label Population) --->61

AMNOG Table P1.9.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Baseline GLP-1 Analogues (Label Population) --->64

AMNOG Table P1.10.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Thyroxine at Baseline (Label Population) --->67

AMNOG Table P1.11.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Weight Change at Week 52 (Label Population) --->70

AMNOG Table P1.12.1 NASH Resolution Response (P1): Summary of Results at Week 52; by SHBG at Week 52 (Label Population) --->74

AMNOG Table P1.13.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Reduction in MRI-PDFF at Week 16 (Label Population) --->77

AMNOG Table P1.14a.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Genetic NASH SNP - PNPLA3 (Label Population) --->80

AMNOG Table P1.14b.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Genetic NASH SNP - TM6SF2 (Label Population) --->84

AMNOG Table P1.14c.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Genetic NASH SNP - TMC4 (Label Population) --->88

AMNOG Table P1.15.1 NASH Resolution Response (P1): Summary of Results at Week 52; by Statin Status (Label Population) --->92

AMNOG Table P1.2.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Age
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

AMNOG Table P1.2.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Age
(Label Population)

Age: < 65 years
Total Subjects with Event of Interest in Subgroup Category: 123

by Region
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

AMNOG Table P1.9.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

AMNOG Table P1.13.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; CFB = Change from Baseline; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

AMNOG Table P1.14c.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel; SNP = Single Nucleotide Polymorphism.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

AMNOG Table P1.15.1
NASH Resolution Response (P1): Summary of Results at Week 52;
by Statin Status
(Label Population)

Abbreviations: NASH = nonalcoholic steatohepatitis; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: If there is a zero count in one treatment arm in the respective subgroup category and in the treatment arm in the respective subgroup category without the zero count, (1) the event is occurring in at least 5% of patients, or (2) the event is occurring in at least 10 patients AND in at least 1% of patients, a zero-count correction value of 0.5 is added to each cell frequency of the corresponding table before the respective estimates, 95% CIs, and p-values are calculated. If this rule is not fulfilled, then only the absolute risk difference and 95% CI is calculated, and other statistics are represented in the output by a '-'.

1-Stage Fibrosis Response with No Worsening in Activity (P2): Summary of Results at Week 52;
by Age
(Label Population)

Age: >= 65 years
Total Subjects with Event of Interest in Subgroup Category: 30

Statistic/Category	MGL-3196 80 mg (N=41)	MGL-3196 100 mg (N=25)	Placebo (N=78)
Responders at Week 52, n (%) [1]			
1 - (1,1)	10 (24.4)	2 (8.0)	6 (7.7)
0.5 - (1,0) or (0,1)	6 (14.6)	1 (4.0)	5 (6.4)
0 - (0,0)	25 (61.0)	22 (88.0)	67 (85.9)
Average Percentage of Responders [2]	31.7	10.0	10.9
Difference in percentage of responders, CMH, MGL-3196 treatment group - placebo (SD) [3]	21.5 (6.85)	1.9 (6.57)	
95% CI of the difference	(8.1, 34.9)	(-10.9, 14.8)	
p-value	0.0022	0.4239	
Inverse odds ratio, CMH, MGL-3196 treatment group / Placebo [4]	0.26	0.66	
95% CI of the inverse odds ratio	(0.13, 0.51)	(0.25, 1.77)	
Inverse risk ratio, CMH, MGL-3196 treatment group / Placebo [4]	0.35	0.72	
95% CI of the inverse risk ratio	(0.20, 0.59)	(0.33, 1.56)	
p-value	<0.0001	0.4287	
p-value of Breslow-Day Test for Homogeneity [5]	0.1074	0.1103	

AMNOG Table P2.3.1
Fibrosis Response (P2): Summary of Results at Week 52;
by Sex
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.4.1b
1-Stage Fibrosis Response with No Worsening in Activity (P2): Summary of Results at Week 52;
by Region
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.6.1a
1-Stage Fibrosis Response with No Worsening in Any NAS Component (P2): Summary of Results at Week 52;
by BMI
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.7.1b
1-Stage Fibrosis Response with No Worsening in Activity (P2): Summary of Results at Week 52;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.9.1a
1-Stage Fibrosis Response with No Worsening in Any NAS Component (P2): Summary of Results at Week 52;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.11.1
Fibrosis Response (P2): Summary of Results at Week 52;
by Weight Change at Week 52
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.12.1a
1-Stage Fibrosis Response with No Worsening in Any NAS Component (P2): Summary of Results at Week 52;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.14a.1
Fibrosis Response (P2): Summary of Results at Week 52;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel; SNP = Single Nucleotide Polymorphism.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.14b.1
Fibrosis Response (P2): Summary of Results at Week 52;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel; SNP = Single Nucleotide Polymorphism.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.14b.1a
1-Stage Fibrosis Response with No Worsening in Any NAS Component (P2): Summary of Results at Week 52;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel; SNP = Single Nucleotide Polymorphism.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.14c.1a
1-Stage Fibrosis Response with No Worsening in Any NAS Component (P2): Summary of Results at Week 52;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel; SNP = Single Nucleotide Polymorphism.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.15.1b
1-Stage Fibrosis Response with No Worsening in Activity (P2): Summary of Results at Week 52;
by Statin Status
(Label Population)

Abbreviations: N = number of subjects in Label Population; n = number of subjects in the category; SD = standard deviation; CI = confidence interval; CMH = Cochran-Mantel-Haenszel.
[1] The ordered pair indicates (result according to pathologist A, result according to pathologist B). 1 indicates yes/responder; 0 indicates no/non-responder.
[2] The average percentage of responders is the sum of the responder values (1, 0.5, 0) divided by the number of subjects in the Label Population.
[3] The difference in percentage of responders is estimated by averaging the CMH estimates of the difference in percentage of responders for each pathologist and the 95% CI is constructed using the associated variance for this estimate (See SAP Appendix E for details). The p-value is obtained from the CMH test using table scores to compare the active and placebo treatments.
[4] The inverse odds ratio, inverse risk ratio, 95% CIs, and p-values were obtained using a stratified CMH approach, with pathologist, Baseline type 2 diabetes status and fibrosis stage at baseline as the stratification factors. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[5] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients with no valid biopsy within the Week 52 window are considered non-responders for the Week 52 analysis, as are patients who experience a composite clinical endpoint (e.g., liver transplant, death) prior to their Week 52 biopsy.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table P2.15.1b
1-Stage Fibrosis Response with No Worsening in Activity (P2): Summary of Results at Week 52;
by Statin Status

AMNOG Table S1.2.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Age
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.2.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Age
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.2.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Age
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.3.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Sex
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.3.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Sex
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.3.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Sex
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.4.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Region
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.4.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Region
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.4.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Region
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.5.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Weight
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.5.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Weight
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.5.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Weight
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.
Note: PT 'Contusion' has statistically significant results in table S1.1.3, but is not included in this table due to patient counts being less than 10 in all subgroup categories.

AMNOG Table S1.6.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by BMI
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.6.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by BMI
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

p-value	NE	NE		
p-value of Breslow-Day Test for Homogeneity [2]	NE	NE		

AMNOG Table S1.6.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by BMI
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.
Note: PT 'Contusion' has statistically significant results in table S1.1.3, but is not included in this table due to patient counts being less than 10 in all subgroup categories.

AMNOG Table S1.7.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.7.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Diabetes Status at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.7.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Diabetes Status at Baseline
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.8.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.8.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.8.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.8.3

AMNOG Table S1.9.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.9.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.9.2

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.2 are presented in this table.

AMNOG Table S1.9.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.9.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term; by Baseline GLP-1 Analogues (Label Population)

AMNOG Table S1.10.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Thyroxine at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.10.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Thyroxine at Baseline
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.10.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Thyroxine at Baseline
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.10.3

(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.11.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Weight Change at Week 52
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.11.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Weight Change at Week 52
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.11.3

AMNOG Table S1.12.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by SHBG at Week 52
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; CFB = Change from Baseline; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.12.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by SHBG at Week 52
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; CFB = Change from Baseline; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.12.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by SHBG at Week 52
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; CFB = Change from Baseline; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.13.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; CFB = Change from Baseline; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.13.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; CFB = Change from Baseline; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

p-value of Breslow-Day Test for Homogeneity [2]	NE	NE		

AMNOG Table S1.13.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; CFB = Change from Baseline; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.
Note: PT 'Contusion' has statistically significant results in table S1.1.3, but is not included in this table due to patient counts being less than 10 in all subgroup categories.

AMNOG Table S1.13.3

AMNOG Table S1.14a.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14a.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14a.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.
Note: PT 'Contusion' has statistically significant results in table S1.1.3, but is not included in this table due to patient counts being less than 10 in all subgroup categories.

AMNOG Table S1.14b.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14b.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14b.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.14c.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14c.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14c.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable; SNP = Single Nucleotide Polymorphism.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.15.1.1
TEAE (S1): Treatment-Emergent Adverse Events - Overall Summary;
by Statin Status
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.14c.1.2
TEAE (S1): Treatment-Emergent Adverse Events Excluding Disease Related Events - Overall Summary
by Statin Status
(Label Population)

Abbreviations: AE = adverse event; TEAE = treatment-emergent adverse event; MACE = major adverse cardiac events; DILI = drug-induced liver injury; NE = Not estimable.
Note: disease related events include the following preferred terms: Hepatic cirrhosis; Ascites; Varices oesophageal; Oesophageal varices haemorrhage; Hepatic encephalopathy.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment).
Note: A patient with multiple TEAEs is counted only once by maximum severity under the patients heading, but for all events under the events heading. If severity is missing, the TEAE will be classified as 'Grade 3'. Severity is assessed according to the National Cancer Institute Common Terminology Criteria for Adverse Events, Version 4.03.
Note: If the relationship is missing for an AE, the event is assumed to be related.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
[3] 3-pt MACE AE includes nonfatal stroke, nonfatal myocardial infarction, and cardiovascular death.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S1.15.3

TEAE (S1): Treatment-Emergent Adverse Events Occurring in at Least 10 Patients and at Least 1% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Statin Status
(Label Population)

Abbreviation: TEAE = Treatment-emergent adverse event; NE = Not estimable.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Walds asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Note: Only SOCs and PTs that have statistically significant results in table S1.1.3 are presented in this table.

AMNOG Table S1.15.3
