System Organ Class Preferred Term	MGL-3196 80 mg (N=124) Patients n (%)	 Events n	MGL-3196 100 mg (N=126) Patients n (%)	 Events n	Placebo (N=224) Patients n (%)	 Events n	Overall (N=474) Patients n (%)	 Events n

Not enough data to perform this subgroup analysis.

Abbreviation: TEAE = Treatment-emergent adverse event; CTCAE = Common Terminology Criteria for Adverse Events.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT) at the maximum CTCAE grade. TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency. If the CTCAE grade is missing for an AE, the event is assumed to have the maximum CTCAE grade (i.e., Grade 5).
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio (MGL-3196 treatment group / Placebo), risk ratio (MGL-3196 treatment group / Placebo), absolute risk difference (MGL-3196 treatment group - Placebo), 95% CIs, and p-values were obtained from chi-square test. Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT) at the maximum CTCAE grade. TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency. If the CTCAE grade is missing for an AE, the event is assumed to have the maximum CTCAE grade (i.e., Grade 5).
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio (MGL-3196 treatment group / Placebo), risk ratio (MGL-3196 treatment group / Placebo), absolute risk difference (MGL-3196 treatment group - Placebo), 95% CIs, and p-values were obtained from chi-square test.Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

System Organ Class Preferred Term	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n

Not enough data to perform this subgroup analysis.

Abbreviation: TEAE = Treatment-emergent adverse event; CTCAE = Common Terminology Criteria for Adverse Events; SNP = Single Nucleotide Polymorphism.
Note: Adverse events are coded using MedDRA version 25.0.
Note: A TEAE is defined as any AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT) at the maximum CTCAE grade. TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency. If the CTCAE grade is missing for an AE, the event is assumed to have the maximum CTCAE grade (i.e., Grade 5).
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio (MGL-3196 treatment group / Placebo), risk ratio (MGL-3196 treatment group / Placebo), absolute risk difference (MGL-3196 treatment group - Placebo), 95% CIs, and p-values were obtained from chi-square test. Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviation: SE-TEAE = Serious treatment-emergent adverse event.
Note: Adverse events are coded using MedDRA version 25.0.
Note: An SE-TEAE is defined as any serious AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). SE-TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table S4.10.1

SE-TEAE (S4): Serious Treatment-Emergent Adverse Events Occurring in at Least 5% of Patients in Any Study Arm - by System Organ Class and Preferred Term;
by Thyroxine at Baseline
(Label Population)

Thyroxine at Baseline: No

System Organ Class Preferred Term	MGL-3196 80 mg (N=148)		MGL-3196 100 mg (N=135)		Placebo (N=260)		Overall (N=543)	
	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n

Results for the overall population are not statistically significant.

Abbreviation: SE-TEAE = Serious treatment-emergent adverse event.
Note: Adverse events are coded using MedDRA version 25.0.
Note: An SE-TEAE is defined as any serious AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). SE-TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Genetic NASH SNP: TMC4 rs641738 - Mutation - Heterozygous

	MGL-3196 80 mg (N=72)		MGL-3196 100 mg (N=65)		Placebo (N=139)		Overall (N=276)	
System Organ Class Preferred Term	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n	Patients n (%)	Events n

Results for the overall population are not statistically significant.

Abbreviation: SE-TEAE = Serious treatment-emergent adverse event; SNP = Single Nucleotide Polymorphism.
Note: Adverse events are coded using MedDRA version 25.0.
Note: An SE-TEAE is defined as any serious AE with onset on or after the first dose of study medication and within 30 days of the last dose of study medication (and, if applicable, prior to the first dose of open label treatment). Patients are counted only once within each system organ class (SOC) and preferred term (PT). SE-TEAEs are presented by decreasing frequency of SOC and, within SOC, PTs are sorted by decreasing frequency.
Note: Percentages are based on the number of patients in the label population.
[1] The odds ratio, risk ratio, absolute risk difference, 95% CIs, and p-values were obtained from chi-square test. Wald's asymptotic 95% CIs are reported. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[2] The Breslow-Day Test for homogeneity of treatment effect was performed based on the risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.2.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Age
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.2.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Age
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.3.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Sex
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.3.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Sex
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.4.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Region
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.4.3
Liver Disease Quality of Life (SE21): Summary of Results - MMRM Model by Domain/Component;
by Region
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.4.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Region
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: LDQOL = Liver Disease Quality of Life; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE21.5.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Weight
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.5.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Weight
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: LDQOL = Liver Disease Quality of Life; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE21.6.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by BMI
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.6.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by BMI
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.7.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.7.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.7.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Diabetes Status at Baseline
(Label Population)

Diabetes status at baseline: Yes

Parameter Response Statistic/Category	MGL-3196 80 mg (N=118)	MGL-3196 100 mg (N=100)	Placebo (N=201)
Total LDQOL			
Minimal Clinically Important Difference of 15% [1], n (%)			
Yes	4 (3.4)	1 (1.0)	8 (4.0)
No	114 (96.6)	99 (99.0)	193 (96.0)
Inverse odds ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.18	4.10	
95% CI of the inverse odds ratio	(0.35, 4.01)	(0.51, 33.27)

Abbreviations: LDQOL = Liver Disease Quality of Life; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.8.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.8.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.9.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.9.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: LDQOL = Liver Disease Quality of Life; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE21.10.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Thyroxine at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.10.3
Liver Disease Quality of Life (SE21): Summary of Results - MMRM Model by Domain/Component;
by Thyroxine at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.10.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Thyroxine at Baseline
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.11.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Weight Change at Week 52
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.11.3
Liver Disease Quality of Life (SE21): Summary of Results - MMRM Model by Domain/Component;
by Weight Change at Week 52
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.11.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Weight Change at Week 52
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CFB = Change from Baseline; LDQOL = Liver Disease Quality of Life; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.12.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.12.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.13.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; CFB = Change from Baseline; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; CFB = Change from Baseline; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.13.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; CFB = Change from Baseline; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14a.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
byGenetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14a.3
Liver Disease Quality of Life (SE21): Summary of Results - MMRM Model by Domain/Component;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14a.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14b.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14b.3
Liver Disease Quality of Life (SE21): Summary of Results - MMRM Model by Domain/Component;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14b.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14c.2
Liver Disease Quality of Life (SE21): Summary of Total LDQOL - MMRM Model;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE21.14c.4
Liver Disease Quality of Life (SE21): Summary of Response at Week 52 by Domain/Component;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: LDQOL = Liver Disease Quality of Life; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size.
[2] The (inverse) odds ratio, (inverse) risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
[3] The Breslow-Day Test for homogeneity of treatment effect was performed based on inverse risk ratio with respective subgroup as the only stratification factor.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
