AMNOG Table SE22.15.2
Liver Disease Quality of Life SF-36 (SE22): Summary of Results - MMRM Model by Domain/Component;
by Statin Status
(Label Population)

Abbreviations: SF-36 = 36-Item Short Form Survey; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE22.15.3
Liver Disease Quality of Life SF-36 (SE22): Summary of Response at Week 52 by Domain/Component;
by Statin Status
(Label Population)

Abbreviations: SF-36 = 36-Item Short Form Survey; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under “Visit Result” is the number of subjects with a result at the given visit; n under “Change from Baseline” is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE23.2.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Age
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.2.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Age
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE23.3.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Sex
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.3.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Sex
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under “Visit Result” is the number of subjects with a result at the given visit; n under “Change from Baseline” is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE23.4.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Region
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.4.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Region
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.5.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Weight
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.5.3
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Results - MMRM Model by Domain;
by Weight
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.5.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Weight
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.6.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by BMI
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.6.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by BMI
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.7.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.7.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.7.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;

AMNOG Table SE23.8.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.8.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.9.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.9.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.10.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Thyroxine at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.10.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Thyroxine at Baseline
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.11.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Weight Change at Week 52
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.11.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Weight Change at Week 52
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CFB = Change from Baseline; CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under “Visit Result” is the number of subjects with a result at the given visit; n under “Change from Baseline” is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.12.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.12.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.13.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; CFB = Change from Baseline; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.13.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; CFB = Change from Baseline; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.14a.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.14a.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under "Visit Result" is the number of subjects with a result at the given visit; n under "Change from Baseline" is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE23.14b.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.14b.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.14c.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.14c.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; N = number of subjects in Label Population; SD = standard deviation; SE = standard error; IQR = interquartile range; Q1 = first quartile; Q3 = third quartile; Min = minimum; Max = maximum; N/A = Not Applicable; NE = Not estimable.
Note: SD is reported for observed values; SE is reported for change from baseline values.
Note: m is the number of subjects in the study at the given visit; n under “Visit Result” is the number of subjects with a result at the given visit; n under “Change from Baseline” is the number of subjects with results at both baseline and the given visit.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.
Program: t-se21-02-01-subgroup.sas Date of creation: 23JUN2025

AMNOG Table SE23.15.2
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of CLDQ-NASH - MMRM Model;
by Statin Status
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.15.3
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Results - MMRM Model by Domain;
by Statin Status
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE23.15.4
Chronic Liver Disease Questionnaire-NASH (SE23): Summary of Response at Week 52 by Domain;
by Statin Status
(Label Population)

Abbreviations: CLDQ-NASH = Chronic Liver Disease Questionnaire for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an increase of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi—square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.2.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Age
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.2.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Age
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.3.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Sex
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.3.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Sex
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.4.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Region
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.5.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Weight
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.5.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Weight
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.6.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by BMI
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.6.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by BMI
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.7.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.7.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Diabetes Status at Baseline
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.8.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.8.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Fibrosis Stage at Baseline
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.9.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.9.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Baseline GLP-1 Analogues
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval;N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.10.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Thyroxine at Baseline
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.11.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Weight Change at Week 52
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.11.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Weight Change at Week 52
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.12.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.12.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by SHBG at Week 52
(Label Population)

Abbreviations: CFB = Change from Baseline; WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.13.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; CFB = Change from Baseline; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.13.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Reduction in MRI-PDFF at Week 16
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; CFB = Change from Baseline; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14a.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14a.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - PNPLA3
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14b.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14b.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - TM6SF2
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14c.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.14c.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Genetic NASH SNP - TMC4
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; SNP = Single Nucleotide Polymorphism; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.15.2
Work Productivity and Activity Impairment-NASH (SE24): Summary of Results - MMRM Model by Domain;
by Statin Status
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MMRM = mixed model for repeated measurements; SD = standard deviation; SE = standard error; LS = least squares; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
Note: m is the number of subjects in the study at the given visit; n is the number of subjects with results at both baseline and the given visit.
Note: The LS means, CIs, and p-values were obtained using a MMRM approach with baseline value, visit, baseline type 2 diabetes status, fibrosis stage at baseline as covariates with interaction terms for baseline value and visit and treatment group and visit. Hedge's g was calculated from the LS Means and associated SE, and corrected by multiplying a correction term based on the pooled sample size to account for potential bias in small samples.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

AMNOG Table SE24.15.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Statin Status
(Label Population)

Abbreviations: WPAI-NASH = Work Productivity and Activity Impairment for Non-Alcoholic Steatohepatitis; MCID = minimal clinically important difference; N = number of subjects in Label Population; n = number of subjects in the category; CI = confidence interval; N/A = Not Applicable; NE = Not estimable.
[1] For each score, the MCID of 15% (5%) is defined as 15% (5%) of the score range size. Meeting MCID is defined as an decrease of >= MCID from baseline.
[2] The inverse odds ratio, inverse risk ratio, absolute risk difference, 95% CIs, and p-values were obtained using an unadjusted approach and Chi-square Test. For this unadjusted analysis only Baseline and Week 52 data will be considered. Patients with no Week 52 change from baseline data will be considered as non-responders. A benefit in favour of the investigational treatment corresponds to a ratio below 1.
Note: Patients that were F3 at eligibility and re-evaluated as F4 at baseline by either pathologist are included in this analysis.

Minimal Clinically Important Difference of 5% [1], n (%)			
Yes	1 (1.1)	2 (3.1)	2 (1.3)
No	91 (98.9)	62 (96.9)	154 (98.7)
Inverse odds ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.18	0.40	
95% CI of the inverse odds ratio	(0.11, 13.22)	(0.06, 2.92)	
Inverse risk ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.18	0.41	
95% CI of the inverse risk ratio	(0.11, 12.83)	(0.06, 2.85)	
Absolute risk difference, Chi-square, MGL-3196 treatment group - Placebo [2]	-0.20	1.84	
95% CI of the absolute risk difference	(-2.95, 2.56)	(-2.77, 6.46)	
p-value	0.8920	0.3528	
p-value of Breslow-Day Test for Homogeneity [3]	0.9229	0.4118	

AMNOG Table SE24.15.3
Work Productivity and Activity Impairment-NASH (SE24): Summary of Response at Week 52 by Domain;
by Statin Status
(Label Population)

Statin Status: Not treated with Statins at baseline

Parameter Response Statistic/Category	MGL-3196 80 mg (N=92)	MGL-3196 100 mg (N=64)	Placebo (N=156)
Activity Impairment			
Minimal Clinically Important Difference of 15% [1], n (%)			
Yes	3 (3.3)	0	8 (5.1)
No	89 (96.7)	64 (100)	148 (94.9)
Inverse odds ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.60	7.38	
95% CI of the inverse odds ratio	(0.41, 6.20)	(0.42, 129.85)	
Inverse risk ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.57	7.04	
95% CI of the inverse risk ratio	(0.43, 5.78)	(0.41, 120.16)	
Absolute risk difference, Chi-square, MGL-3196 treatment group - Placebo [2]	-1.87	-4.64	
95% CI of the absolute risk difference	(-6.88, 3.15)	(-8.77, -0.52)	
p-value	0.4902	0.1103	
p-value of Breslow-Day Test for Homogeneity [3]	0.6851	0.0679	
Minimal Clinically Important Difference of 5% [1], n (%)			
Yes	5 (5.4)	2 (3.1)	9 (5.8)
No	87 (94.6)	62 (96.9)	147 (94.2)
Inverse odds ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.07	1.90	
95% CI of the inverse odds ratio	(0.35, 3.28)	(0.40, 9.04)	
Inverse risk ratio, Chi-square, MGL-3196 treatment group / Placebo [2]	1.06	1.85	
95% CI of the inverse risk ratio	(0.37, 3.07)	(0.41, 8.31)	
Absolute risk difference, Chi-square, MGL-3196 treatment group - Placebo [2]	-0.33	-2.64	
95% CI of the absolute risk difference	(-6.24, 5.57)	(-8.26, 2.97)	
p-value	0.9122	0.4137	
p-value of Breslow-Day Test for Homogeneity [3]	0.6135	0.2846
