Note: Baseline score refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: MC-QoL = Mastocytosis Quality of Life Questionnaire, CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: MC-QoL = Mastocytosis Quality of Life Questionnaire, CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Baseline score refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
