Dokumentvorlage, Version vom 16.12.2021

Dossier zur Nutzenbewertung gemäß § 35a SGB V

Avapritinib (AYVAKYT®)

Blueprint Medicines (Germany) GmbH,
a Sanofi Company

Modul 4 A – Anhang 4-G

Avapritinib (AYVAKYT®) ist zur Behandlung erwachsener Patienten mit indolenter systemischer Mastozytose (ISM) mit mittelschweren bis schweren Symptomen indiziert, bei denen mit einer symptomatischen Behandlung keine ausreichende Kontrolle erzielt werden kann.

Medizinischer Nutzen und
medizinischer Zusatznutzen,
Patientengruppen mit therapeutisch
bedeutsamem Zusatznutzen

Stand: 30.10.2025

Anhang 4-G: Weitere Analysen und graphische Verläufe zu den in Abschnitt 4.3.1.3.2 gezeigten Ergebnissen der Subgruppenanalysen

Seite

Studienergebnisse 3

Subgruppenanalysen 3

Weitere Analysen – nicht-signifikante p-Interaktionsterme 3

Morbidität 3

Krankheitsspezifische Symptomatik gemäß ISM-SAF 3

Veränderung der Serum-Tryptasekonzentration 1017

Veränderung der KIT-D816V-MAF im Blut 1062

Veränderung des Anteils der Mastzellen im Knochenmark 1114

EQ-5D-5L VAS 1138

Schwere der Erkrankung gemäß PGIC/PGIS 1197

Veränderung im Gebrauch von BSC 1348

Anaphylaxie-Episoden mit Epinephrin-Einsatz 1353

Mastozytose auf der Haut 1358

Gesundheitsbezogene Lebensqualität 1488

MC-QoL 1488

SF-12 3241

Sicherheit 3787

Unerwünschte Ereignisse 3787

Graphische Verläufe – signifikante p-Interaktionsterme 4751

Altersgruppe 4751

Geschlecht 4771

Region 4775

ISM-Status zur Baseline 4779

Serum-Tryptasekonzentration zur Baseline 4781

ECOG PS Status	4793

Median	5.36	4.89	5.66	5.64	
Min, Max	0.7, 9.4	0.0, 9.9	0.0, 10.0	0.0, 10.0	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Intent-to-Treat Population , Part 2 (Part 2 Baseline)

Fatigue Severity

	Baseline serum tryptase level = <20 ng/mL		Baseline serum tryptase level = >=20 ng/mL		
	Placebo (N=15)	Avapritinib 25 mg (N=28)	Placebo (N=56)	Avapritinib 25 mg (N=113)	Test of Interaction p-value [1]
Baseline					
n	15	28	56	111	
Mean (StdDev)	6.93 (1.980)	6.91 (2.083)	6.66 (2.035)	6.59 (2.133)	
Median	6.54	7.11	6.68	6.86	
Min, Max	3.9, 10.0	1.5, 10.0	0.0, 10.0	0.1, 10.0	

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. CXD1 score is defined as the 14-day average of domain score prior to CXD1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

If a patient misses more than 7 days of the score from the 14 days period for calculating CXD1 score, then the CXD1 score is considered as missing.

[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Change from Baseline of Lead (Most Severe) Domains and Neurocognitive Symptom Cluster of the ISM-SAF by Country
Intent-to-Treat Population, Part 2 (Part 2 Baseline)

	Country = FRA		Country = GBR		Country = ITA	
	Placebo (N=6)	Avapritinib 25 mg (N=11)	Placebo (N=5)	Avapritinib 25 mg (N=11)	Placebo (N=0)	Avapritinib 25 mg (N=4)

By Country subgroup analysis is not performed due to several countries have less than 10 patients.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.
Note1: The "lead domain/symptom cluster" score refers to the domain/symptom cluster with highest score at Baseline in each patient. If patient has tie with multiple lead domain/symptom clusters, the average of change from baseline is used for the summary.
[1] Two-sided p-values for treatment-by-subgroup interaction are from ANCOVA model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.
[2] Change from baseline summary and difference of mean change from baseline between Avapritinib 25mg and Placebo are from least squares mean estimation of the ANCOVA model that controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).
[3] Two-sided p-value from ANCOVA model controlling for randomization stratification factor (tryptase) and Baseline ISM status (moderate vs severe).

Overall	21/ 71 (29.6) (19.3, 41.6)	64/141 (45.4) (37.0, 54.0)	2.07 (1.08, 3.99) 0.020	1.57 (1.05, 2.36) 0.028	0.17 (0.03, 0.30) 0.014	
Age Group (Years)						0.064
< 65	20/ 60 (33.3) (21.7, 46.7)	58/132 (43.9) (35.3, 52.8)	1.65 (0.83, 3.30) 0.127	1.36 (0.90, 2.05) 0.142	0.12 (-0.03, 0.27) 0.113	
>= 65	1/ 11 (9.1) (0.2, 41.3)	6/ 9 (66.7) (29.9, 92.5)	11.33 (0.74, 570.27) 0.032	7.89 (0.49, 127.50) 0.146	0.50 (0.08, 0.93) 0.020	

Abbreviations: TSS = total symptom score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

>= 20	6/ 56 (10.7) (4.0, 21.9)	31/113 (27.4) (19.5, 36.6)	3.22 (1.20, 10.03) 0.012	2.61 (1.16, 5.87) 0.021	0.17 (0.06, 0.29) 0.004	

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Patients with >=16.5 Point Reduction in TSS at C7D1	Placebo (N=71) n/N (%) (95% CIs)	Avapritinib 25 mg (N=141) n/N (%) (95% CIs)	Odds Ratio (95% CIs) p-value [1]	Relative Risk (95% CIs) p-value [1]	Risk Difference (95% CIs) p-value [1]	Interaction [2]
Baseline ISM Status						0.149
Moderate	1/ 26 (3.8) (0.1, 19.6)	12/ 52 (23.1) (12.5, 36.8)	6.68 (0.92, 314.09) 0.039	5.26 (0.83, 33.30) 0.078	0.19 (0.05, 0.33) 0.009	
Severe	18/ 45 (40.0) (25.7, 55.7)	42/ 87 (48.3) (37.4, 59.2)	1.39 (0.64, 3.14) 0.356	1.22 (0.78, 1.91) 0.387	0.09 (-0.10, 0.27) 0.361	
Baseline Serum Tryptase (ng/mL)						0.003
< 20	9/ 15 (60.0) (32.3, 83.7)	8/ 28 (28.6) (13.2, 48.7)	0.29 (0.07, 1.37) 0.074	0.51 (0.24, 1.07) >0.999	-0.28 (-0.59, 0.02) 0.067	
>= 20	10/ 56 (17.9) (8.9, 30.4)	46/113 (40.7) (31.6, 50.4)	3.60 (1.45, 8.74) 0.002	2.24 (1.26, 3.99) 0.006	0.23 (0.10, 0.35) <0.001	

Abbreviations: TSS = Total Symptom Score, ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14 day average of TSS from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of TSS prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient is missing more than 7 days of score 14 day prior to C7D1 visit, the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of domain score prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating C7D1 score, then the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: ISM-SAF = Indolent Systemic Mastocytosis-Symptom Assessment Form, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.

Note: Baseline score is defined as the 14-day average of domain score from C1D-14 to C1D-1. C7D1 score is defined as the 14-day average of domain score prior to C7D1 visit. If a patient is missing more than 7 days of score between C1D-14 and C1D-1, the baseline score is considered as missing for the patient. If a patient misses more than 7 days of the score from the 14 days period for calculating C7D1 score, then the C7D1 score is considered as missing for the patient. Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 score will be counted in the denominator.

Patients with high-dose steroid use within 7 days before C7D1, or greater than 14 consecutive days at any point from C1D1 to C7D1, will be counted in the denominator but not numerator.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).

[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Table 35.2.4.3.1a
Summary of KIT D816V Mutation Allele Fraction in Blood at C7D1
Intent-to-Treat Population, All Patients that reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline, Part 2 (Part 2 Baseline)

Patients with >= 50% Reductions in KIT D816V MAF or undetectable (<0.02%) for patients with detectable mutation at Baseline	Placebo (N=63) n/N (%) (95% CIs)	Avapritinib 25 mg (N=118) n/N (%) (95% CIs)	Odds Ratio (95% CIs) p-value [1]	Relative Risk (95% CIs) p-value [1]	Risk Difference (95% CIs) p-value [1]	Interaction [2]
Overall	4/ 63 (6.3) (1.8, 15.5)	80/118 (67.8) (58.6, 76.1)	39.34 (10.93, 140.56) <0.0001	11.18 (4.21, 29.65) <0.0001	0.63 (0.52, 0.73) <0.0001	
Age Group (Years)						0.943
< 65	4/ 52 (7.7) (2.1, 18.5)	71/109 (65.1) (55.4, 74.0)	26.77 (7.53, 97.61) <0.0001	8.52 (3.30, 22.02) <0.0001	0.58 (0.46, 0.70) <0.0001	
>= 65	0/ 11 (0.0) (0.0, 28.5)	9/ 9 (100.0) (66.4, 100.0)	NE (7.73, NE) <0.0001	NE (NE, NE) NE	1.00 (1.00, 1.00) NE	
Sex						0.047
Male	3/ 15 (20.0) (4.3, 48.1)	24/ 35 (68.6) (50.7, 83.1)	7.05 (1.31, 41.40) 0.008	3.10 (1.11, 8.66) 0.031	0.43 (0.16, 0.69) 0.002	
Female	1/ 48 (2.1) (0.1, 11.1)	56/ 83 (67.5) (56.3, 77.4)	176.56 (17.27, 5095.25) <0.0001	37.96 (4.75, 303.43) <0.001	0.68 (0.57, 0.79) <0.0001	

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Table 35.2.4.3.1a
Summary of KIT D816V Mutation Allele Fraction in Blood at C7D1
Intent-to-Treat Population, All Patients that reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline, Part 2 (Part 2 Baseline)

Patients with >= 50% Reductions in KIT D816V MAF or undetectable (<0.02%) for patients with detectable mutation at Baseline	Placebo (N=63) n/N (%) (95% CIs)	Avapritinib 25 mg (N=118) n/N (%) (95% CIs)	Odds Ratio (95% CIs) p-value [1]	Relative Risk (95% CIs) p-value [1]	Risk Difference (95% CIs) p-value [1]	Interaction [2]
ECOG Status						0.978
0 or 1	4/ 59 (6.8) (1.9, 16.5)	75/110 (68.2) (58.6, 76.7)	38.51 (10.39, 138.08) <0.0001	10.46 (3.97, 27.55) <0.0001	0.63 (0.52, 0.73) <0.0001	
2+	0/ 4 (0.0) (0.0, 60.2)	5/ 8 (62.5) (24.5, 91.5)	NE (0.63, NE) 0.069	NE (NE, NE) NE	0.60 (0.23, 0.97) 0.002	
Prior TKI therapy						0.976
Yes	0/ 4 (0.0) (0.0, 60.2)	4/ 6 (66.7) (22.3, 95.7)	NE (0.34, NE) 0.117	NE (NE, NE) NE	0.73 (0.40, 1.00) <0.0001	
No	4/ 59 (6.8) (1.9, 16.5)	76/112 (67.9) (58.4, 76.4)	36.31 (10.16, 132.53) <0.0001	10.23 (3.90, 26.83) <0.0001	0.62 (0.51, 0.73) <0.0001	

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with detectable mutation at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: CI = Confidence Interval
Note: Patient reached C7D1 or EOS prior to C7D1 with aggregates at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with aggregates at Baseline will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Note: Patient reached C7D1 or EOS prior to C7D1 with missing baseline or C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Abbreviations: PGIS = Patients Global Impression of Symptom Severity, CI = Confidence Interval
PGIS: 0=Absent, 1=Minimal, 2=Moderate, 3=Severe, 4=Very Severe
Note: Patient reached C7D1 or EOS prior to C7D1 with missing C7D1 assessment will be counted in the denominator.
[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

[1] Odds Ratio (OR), Relative Risk (RR) and Risk Difference (RD) are to compare Avapritinib 25 mg with Placebo. OR>1 or RR>1 or RD>0 suggest favoring Avapritinib 25 mg compared to placebo. Two-sided p-value for OR is from Cochran-Mantel-Haenszel test. Two-sided p-value for RR is based on asymptotic normal approximation of log transformed Mantel-Haenszel estimate of the common relative risk. Two-sided p-value for RD is based on the Mantel-Haenszel test. All three tests controlled for randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL) and Baseline ISM status (moderate vs. severe).
[2] Two-sided p-values for treatment-by-subgroup interaction are from logistic regression model with randomization stratification factor (Serum tryptase <20 ng/mL vs. >=20 ng/mL), Baseline ISM status (moderate vs. severe), treatment, subgroup, treatment*subgroup in the model.

Table 35.2.11.4.1.4a
Summary of Mastocytosis in Skin by Country
Safety Population, Part 2 (Part 2 Baseline)

Affected Surface Area (%): Front Torso

	Country = DEU		Country = DNK		Country = ESP	
	Placebo (N=15)	Avapritinib 25 mg (N=19)	Placebo (N=0)	Avapritinib 25 mg (N=1)	Placebo (N=3)	Avapritinib 25 mg (N=14)

By Country subgroup analysis is not performed due to several countries have less than 10 patients.

Abbreviations: CFB = Change From Baseline, LS Mean = Least Squares Mean, CI = Confidence Interval, NA = Not Available, NE = Not Estimable.
Note: Baseline refers to the last assessment value prior to C1D1 dosing in part 2 of the study.
